FortiOS™ Handbook

01-567-497911-20190318

TABLE OF CONTENTS

Chapter 1 - What's New for FortiOS 5.6	56
What's new in FortiOS 5.6	56
How this guide is organized	56
What's New for FortiOS 5.6.4	58
Authentication	58
Firewall	58
FortiView	58
FortiWiFi and FortiAP	58
Hardware acceleration	59
High availability	59
IPsec VPN	59
Logging and reporting	59
Security profiles	59
SSL VPN	59
Virtual FortiOS	59
What's New in previous versions of FortiOS 5.6	60
FortiGate VM enhancements for AWS, Azure, Google, SDN connectors and more	60
Fortinet Security Fabric enhancements	60
Security Fabric Audit	60
Re-designed Dashboard	60
NGFW Policy Mode	60
Transparent web proxy	61
Controlled failover between wireless controllers	61
FortiView Endpoint Vulnerability chart	61
FortiClient Profile changes	61
Adding Internet services to firewall policies	61
Source and destination NAT in a single Firewall policy	61
Other highlights	61
New Fortinet Security Fabric features	62
Security Fabric Audit and Fabric Score	73
New Dashboard Features	79
FortiExplorer for iOS	86
Transparent web proxy (386474)	88
NGFW Policy Mode (397035)	96

New FortiView Endpoint Vulnerability Scanner chart (378647).....	99
FortiClient Profile changes (386267, 375049).....	100
Application Control is now standard with FortiCare support	102
Real time logging to FortiAnalyzer and FortiCloud	103
FortiGate Logs can be sent to syslog servers in Common Event Format (CEF) (300128).....	104
Controlled failover between wireless controllers.....	104
Multiple PSK for WPA Personal (393320).....	105
Hotspot 2.0 (443988) - FortiOS 5.6.3.....	105
VXLAN support (289354).....	109
New PPPoE features.....	110
Adding Internet services to firewall policies (389951).....	112
Combining source and destination NAT in the same policy (388718).....	113
NP6 Host Protection Engine (HPE) adds protection for DDoS attacks (363398).....	114
New feature catalog (5.6.3, 5.6.1 and 5.6).....	115
Getting Started (5.6.3).....	115
Getting Started (5.6.1).....	116
Getting Started (5.6).....	118
Authentication (5.6.3).....	121
Authentication (5.6.1).....	123
Authentication (5.6).....	126
FortiOS Carrier (5.6.3).....	129
FortiOS Carrier (5.6.1).....	132
Device identification (5.6).....	136
Diagnose command changes (5.6.1).....	137
Diagnose command changes (5.6).....	138
Explicit web proxy (5.6).....	152
Firewall (5.6.3).....	155
Firewall (5.6.1).....	159
Firewall (5.6).....	161
Managed FortiSwitch OS 3.6.0 (FortiOS 5.6.3).....	171
Managed FortiSwitch OS 3.6.0 (FortiOS 5.6.1).....	174
Managed FortiSwitch OS 3.6.0 (FortiOS 5.6).....	181
FortiView (5.6.3).....	183
FortiView (5.6.1).....	183
FortiView (5.6).....	183
FortiGate VM enhancements for AWS, Azure, Google, SDN connectors and more (5.6.3).....	186
FortiGate VM (5.6.0).....	191
Hardware acceleration (5.6.3).....	194
Hardware acceleration (5.6.1).....	195
Hardware acceleration (5.6).....	195

High Availability (5.6.1).....	198
High Availability (5.6).....	199
IPsec VPN (5.6.3).....	203
IPsec VPN (5.6.1).....	205
IPsec VPN (5.6).....	208
IPv6 (5.6.3).....	213
IPv6 (5.6).....	213
Logging and Reporting (5.6.3).....	216
Logging and Reporting (5.6.1).....	217
Logging and Reporting (5.6).....	218
Maximum values changes.....	220
Modem (5.6.1).....	220
Networking (5.6.3).....	224
Networking (5.6.1).....	225
Networking (5.6).....	227
New RFCs.....	232
Sandbox Integration (5.6.1).....	232
Security Fabric (5.6.3).....	233
Security Profiles (5.6.3).....	234
Security Profiles (5.6.1).....	234
Security Profiles (5.6).....	236
Server Load balancing (5.6.1).....	245
Server Load balancing (5.6).....	246
Session-aware Load Balancing (SLBC) (5.6.1).....	248
SSL VPN (5.6.3).....	249
SSL VPN (5.6.1).....	249
SSL VPN (5.6).....	250
System (5.6.3).....	254
System (5.6.1).....	254
System (5.6).....	254
Traffic shaping (5.6.3).....	258
VDOMs (5.6.0).....	259
VoIP/SIP (5.6).....	259
WiFi (5.6.3).....	261
WiFi (5.6.1).....	263
WiFi (5.6).....	265
Chapter 2 - Getting Started.....	274
Getting started.....	274
Differences between Models.....	274
What's New in FortiOS 5.6.....	275
FortiOS 5.6.3.....	275
FortiOS 5.6.1.....	275

FortiOS 5.6.....	277
Changing inspection modes (flow-based or proxy-based).....	284
Transparent Web proxy mode.....	285
NGFW profile-based and NGFW policy-based modes.....	285
Installation.....	288
Quick installation using DHCP.....	289
Installing a FortiGate in NAT mode.....	290
Using a Virtual Wire Pair.....	292
Using the GUI.....	294
Connecting to the GUI using a web browser.....	294
Menus.....	295
Dashboard.....	297
Feature Visibility.....	300
Tables.....	301
Text Strings.....	303
Using the CLI.....	305
Connecting to the CLI.....	305
Command syntax.....	310
Sub-commands.....	313
Permissions.....	317
Tips.....	318
FortiExplorer for iOS.....	326
Getting started with FortiExplorer.....	326
LED Specifications.....	331
Sample FortiGate faceplates.....	331
LED status codes.....	332
About alarm levels.....	333
LED status codes for ports.....	333
Inspection Mode.....	335
Basic Administration.....	339
Registration.....	339
System Settings.....	339
Passwords.....	343
Firmware.....	345
Configuration Backups.....	352
FortiGuard.....	356
FortiCloud.....	363
Troubleshooting your FortiGate Installation.....	366
Resources.....	368
Best Practices.....	368
The Fortinet Cookbook.....	368
The Fortinet Video Library.....	368

The FortiOS Handbook	368
Chapter 3 - Authentication	369
Authentication	369
Before you begin	369
How this guide is organized	369
Whats new in FortiOS 5.6	371
FortiOS 5.6.4	371
FortiOS 5.6.3	371
FortiOS 5.6.1	373
FortiOS 5.6.0	376
Introduction to authentication	380
What is authentication?	380
Methods of authentication	380
Types of authentication	382
Single Sign-On authentication for users	385
User's view of authentication	386
FortiGate administrator's view of authentication	387
General authentication settings	388
Authentication servers	389
FortiAuthenticator servers	389
RADIUS servers	389
LDAP servers	396
TACACS+ servers	405
POP3 servers	407
SSO servers	408
RSA ACE (SecurID) servers	410
Users and user groups	415
Users	415
User groups	429
Managing Guest Access	435
Configuring guest user access	435
Guest access in a retail environment	437
Configuring authenticated access	441
Authentication timeout	441
Password policy	442
Authentication protocols	444
Authentication in Captive Portals	445
Authentication in security policies	445
Authentication replacement messages	446
Kerberos authentication for explicit web and transparent web proxy users	451
VPN authentication	461
Captive portals	466

Introduction to Captive portals.....	466
Configuring a captive portal.....	466
Customizing captive portal pages.....	468
Certificate-based authentication.....	474
What is a security certificate?.....	474
Certificates overview.....	475
Managing X.509 certificates.....	478
Troubleshooting certificates.....	483
Configuring certificate-based authentication.....	487
Support for per-VDOM certificates.....	490
Example — Generate a CSR on the FortiGate unit.....	491
Example — Generate and Import CA certificate with private key pair on OpenSSL.....	492
Example — Generate an SSL certificate in OpenSSL.....	493
Single Sign-On using a FortiAuthenticator unit.....	496
User's view of FortiAuthenticator SSO authentication.....	496
Administrator's view of FortiAuthenticator SSO authentication.....	496
Configuring the FortiAuthenticator unit.....	497
Configuring the FortiGate unit.....	498
Configuring the FortiClient SSO Mobility Agent.....	499
Viewing SSO authentication events on the FortiGate unit.....	499
Single Sign-On to Windows AD.....	500
Introduction to Single Sign-On with Windows AD.....	500
Configuring Single Sign On to Windows AD.....	500
FortiOS FSSO log messages.....	505
Testing FSSO.....	506
Troubleshooting FSSO.....	506
Agent-based FSSO.....	508
Introduction to agent-based FSSO.....	508
FSSO NTLM authentication support.....	514
Agent installation.....	517
Configuring the FSSO Collector agent for Windows AD.....	522
Configuring the FSSO TS agent for Citrix.....	533
Configuring FSSO with Novell networks.....	534
Configuring FSSO Advanced Settings.....	536
Configuring FSSO on FortiGate units.....	541
FortiOS FSSO log messages.....	547
Testing FSSO.....	549
Troubleshooting FSSO.....	549
SSO using RADIUS accounting records.....	552
User's view of RADIUS SSO authentication.....	552
Configuration Overview.....	552
Configuring the RADIUS server.....	552

Creating the FortiGate RADIUS SSO agent	553
Defining local user groups for RADIUS SSO	555
Creating security policies	556
Example: webfiltering for student and teacher accounts	557
Monitoring authenticated users	560
Monitoring firewall users	560
Monitoring SSL VPN users	560
Monitoring IPsec VPN users	561
Monitoring users Quarantine	561
Examples and Troubleshooting	563
Firewall authentication example	563
LDAP Dial-in using member-attribute example	569
RADIUS SSO example	571
Troubleshooting	578
Chapter 4 - Best Practices	580
Best practices	580
General Considerations	580
Customer service and technical support	580
Fortinet Knowledge Base	580
System and performance	582
Performance	582
Shutting down	582
Migration	583
Information gathering	583
Object and policy migration	583
Testing and validation	583
Going live and obtaining feedback	584
Adding new services	584
Environmental specifications	585
Grounding	585
Rack mounting	585
Firmware	587
Firmware change management	587
Performing a firmware upgrade	590
Performing a firmware downgrade	591
Performing a configuration backup	591
Security Profiles (AV, Web Filtering etc.)	594
Firewall	594
Security	594
Authentication	595
Antivirus	595
Antispam	595

Intrusion Prevention System (IPS).....	595
Email filter.....	596
amURL filtering.....	596
Web filtering.....	597
Patch management.....	597
Policy configuration.....	597
Networking.....	599
Routing configuration.....	599
Advanced routing.....	599
Network Address Translation (NAT).....	600
Transparent Mode.....	600
Using Virtual IPs (VIPs).....	600
FGCP High Availability.....	601
Heartbeat interfaces.....	601
Interface monitoring (port monitoring).....	602
WAN Optimization.....	603
Virtual Domains (VDOMs).....	605
Per-VDOM resource settings.....	605
Virtual domains in NAT mode.....	605
Virtual clustering.....	605
Explicit proxy.....	606
Wireless.....	607
Encryption and authentication.....	607
Geographic location.....	607
Network planning.....	607
Lowering the power level to reduce RF interference.....	608
Wireless client load balancing.....	608
Local bridging.....	608
Advertising SSIDs.....	609
Using static IPs in a CAPWAP configuration.....	609
Logging and reporting.....	610
Log management.....	610
System memory and hard disks.....	611
Chapter 5 - FortiGate-6000.....	612
What's new for FortiGate-6000 5.6.7.....	612
What's new for FortiGate-6000 5.6.6.....	613
New IPsec VPN features.....	613
FortiGate-6000 overview.....	615
Front panel interfaces.....	616
FortiGate-6000 schematic.....	616
Getting started with FortiGate-6000.....	619
Interface groups and changing data interface speeds.....	620

Configuring the management interfaces.....	621
Using data interfaces for management traffic.....	622
FortiGate-6000 dashboard widgets.....	622
Changing the FortiGate-6301F and 6501F log disk and RAID configuration.....	623
Managing individual FPCs.....	624
Connecting to FPC CLIs using the console port.....	626
Default VDOM and management VDOM configuration.....	627
Firmware upgrades.....	627
Restarting the FortiGate-6000.....	628
NMI switch and NMI reset commands.....	628
Configuration synchronization.....	628
Failover in a standalone FortiGate-6000.....	629
Installing firmware on an individual FPC.....	630
Installing FortiGate-6000 firmware from the BIOS after a reboot.....	631
Packet sniffing for FPC and management board packets.....	633
Load balancing and flow rules.....	636
Setting the load balancing method.....	636
Flow rules for sessions that cannot be load balanced.....	637
Determining which FPC is operating as the primary FPC.....	638
SSL VPN load balancing.....	639
GTP load balancing.....	640
Default configuration for traffic that cannot be load balanced.....	640
FortiGate-6000 IPsec VPN.....	645
New IPsec VPN features.....	645
IPsec VPN load balancing.....	645
Adding source and destination subnets to IPsec VPN phase 2 configurations.....	646
Configuring the FortiGate-6000 as a dialup IPsec VPN server.....	648
FortiGate-6000 high availability (FGCP).....	651
Before you begin configuring HA.....	652
Connect the HA1 and HA2 interfaces for HA heartbeat communication.....	653
Basic FortiGate-6000 HA configuration.....	654
Managing individual management boards and FPCs in HA mode.....	657
Firmware upgrade.....	657
Distributed clustering.....	658
Modifying heartbeat timing.....	659
Session failover (session-pickup).....	661
FortiGate-6000 support for VRRP.....	662
FortiGate-6000 v5.6.7 special features and limitations.....	662
Remote console limitations.....	663
Default management VDOM.....	663
Maximum number of LAGs.....	663
Firewall.....	663

IP Multicast	663
High Availability	664
FortiOS features that are not supported by FortiGate-6000 v5.6.7	664
IPsec VPN tunnels terminated by the FortiGate-6000	665
SSL VPN	665
Traffic shaping	665
DDoS quotas	665
Sniffer mode (one-arm sniffer)	665
FortiGuard Web filtering and Spam filtering	665
Log messages include a slot field	665
Special notice for new deployment connectivity testing	665
Dedicated management interfaces not supported	666
FortiGate-6000 v5.6.6 special features and limitations	666
Remote console limitations	666
Default management VDOM	666
Maximum number of LAGs	666
Firewall	666
IP Multicast	666
High Availability	667
FortiOS features that are not supported by FortiGate-6000 v5.6.6	667
IPsec VPN tunnels terminated by the FortiGate-6000	668
SSL VPN	668
Traffic shaping	668
DDoS quotas	668
Sniffer mode (one-arm sniffer)	668
FortiGuard Web filtering and Spam filtering	669
Log messages include a slot field	669
Special notice for new deployment connectivity testing	669
Dedicated management interfaces not supported	669
FortiGate-6000 load balancing commands	670
Chapter 6 - FortiGate-7000	671
What's new for FortiGate-7000 v5.6.7	671
What's new for FortiGate-7000 5.6.6	672
FortiGate-7000 overview	674
Licenses, device registration, and support	674
FortiGate-7060E	674
FortiGate-7060E front panel	675
FortiGate-7060E schematic	675
FortiGate-7040E	676
FortiGate-7030E	678
FIM-7901E interface module	680
FIM-7904E interface module	682

FIM-7910E interface module.....	684
FIM-7920E interface module.....	686
FIM-7920E hardware schematic.....	688
FPM-7620E processing module.....	689
Accelerated IPS, SSL VPN, and IPsec VPN (CP9 content processors).....	691
Getting started with FortiGate-7000.....	692
Setting up management connections.....	692
Managing individual FIMs and FPMs.....	695
Using data interfaces for management traffic.....	696
FortiGate-7000 dashboard widgets.....	696
Connecting to module CLIs using the management module.....	697
Default VDOM configuration.....	698
Firmware upgrades.....	699
Restarting the FortiGate-7000.....	700
Configuration synchronization.....	700
Packet sniffing for FIM and FPM packets.....	700
FortiGate-7000 support for VRRP.....	701
Load balancing and flow rules.....	703
Setting the load balancing method.....	703
Flow rules for sessions that cannot be load balanced.....	704
Determining the primary FPM.....	705
SSL VPN load balancing.....	705
GTP load balancing.....	706
Default configuration for traffic that cannot be load balanced.....	707
Operating a FortiGate-7000.....	714
Failover in a standalone FortiGate-7000.....	714
Replacing a failed FPM or FIM.....	714
Installing firmware on individual FIMs and FPMs.....	715
IPsec VPN.....	722
New IPsec VPN features.....	722
Adding source and destination subnets to IPsec VPN phase 2 configurations.....	722
Configuring the FortiGate-7000 as a dialup IPsec VPN server.....	725
Troubleshooting.....	726
High availability.....	728
New HA features and changes.....	728
Before you begin configuring HA.....	729
Connect the M1 and M2 interfaces for HA heartbeat communication.....	730
Basic FortiGate-7000 HA configuration.....	732
Setting up HA management connections.....	735
Managing individual modules in HA mode.....	737
HA cluster firmware upgrades.....	738
Distributed clustering.....	739

Modifying heartbeat timing.....	740
Session failover (session-pickup).....	742
Primary FortiGate-7000 selection.....	743
Primary FortiGate-7000 selection and override.....	746
Link failover (port monitoring or interface monitoring).....	748
Remote link failover.....	750
FortiGate-7000 v5.6.7 special features and limitations.....	751
Managing the FortiGate-7000.....	752
Maximum number of LAGs.....	752
Firewall.....	752
IP multicast.....	752
High availability.....	753
Shelf manager module.....	753
FortiOS features not supported by FortiGate-7000 v5.6.7.....	753
IPsec VPN tunnels terminated by the FortiGate-7000.....	754
SSL VPN.....	754
Traffic shaping and DDoS policies.....	754
Sniffer mode (one-arm sniffer).....	754
FortiGuard web filtering.....	754
Log messages include a slot field.....	754
FortiOS Carrier.....	755
Special notice for new deployment connectivity testing.....	755
Dedicated management interfaces not supported.....	755
FortiGate-7000 v5.6.6 special features and limitations.....	755
Managing the FortiGate-7000.....	755
Maximum number of LAGs.....	756
Firewall.....	756
IP multicast.....	756
High availability.....	756
Shelf manager module.....	757
FortiOS features not supported by FortiGate-7000 v5.6.6.....	757
IPsec VPN tunnels terminated by the FortiGate-7000.....	757
SSL VPN.....	758
Traffic shaping and DDoS policies.....	758
Sniffer mode (one-arm sniffer).....	758
FortiGuard web filtering.....	758
Log messages include a slot field.....	758
FortiOS Carrier.....	758
Special notice for new deployment connectivity testing.....	758
Dedicated management interfaces not supported.....	758
FortiGate-7000 Load balancing commands.....	760
Chapter 7 - FortiOS Carrier.....	761

FortiOS Carrier.....	761
Before you begin.....	761
How this guide is organized.....	761
What's New in FortiOS 5.6.....	762
New features added in 5.6.3.....	762
New features added in 5.6.1.....	765
Overview of FortiOS Carrier features.....	769
Overview.....	769
MMS.....	769
GTP.....	769
MMS Concepts.....	769
MMS background.....	769
How FortiOS Carrier processes MMS messages.....	773
MMS protection profiles.....	783
Bypassing MMS protection profile filtering based on carrier endpoints.....	784
Applying MMS protection profiles to MMS traffic.....	784
MMS Configuration.....	784
MMS profiles.....	784
MMS Content Checksum.....	799
Notification List.....	800
Message Flood.....	802
Duplicate Message.....	804
Carrier Endpoint Filter Lists.....	805
Message flood protection.....	808
Duplicate message protection.....	819
Employing MMS Security features.....	826
GTP basic concepts.....	840
PDP Context.....	841
GPRS security.....	842
Parts of a GTPv1 network.....	843
Radio access.....	844
Transport.....	844
Billing and records.....	847
GPRS network common interfaces.....	848
GTP Configuration.....	849
Introduction to GTP.....	849
GTP Profile.....	851
Configuring GTP on FortiOS Carrier.....	871
GTP message type filtering.....	878
GTP identity filtering.....	885
SCTP Concepts.....	891
SCTP Firewall.....	893

Troubleshooting.....	895
FortiOS Carrier diagnose commands.....	895
Applying IPS signatures to IP packets within GTP-U tunnels.....	896
GTP packets are not moving along your network.....	897
Chapter 8 - PCI DSS Compliance.....	901
Compliance.....	901
Before you begin.....	901
How this guide is organized.....	901
FortiOS 5.4 PCI DSS compliance new features.....	901
Configuring FortiGate units for PCI DSS compliance.....	902
Introduction to PCI DSS.....	902
Running PCI DSS compliance checks.....	904
Network topology.....	906
Security policies for the CDE network.....	908
Wireless network security.....	909
Protecting stored cardholder data.....	911
Protecting communicated cardholder data.....	911
Protecting the CDE network from viruses.....	912
Monitoring the network for vulnerabilities.....	913
Restricting access to cardholder data.....	913
Controlling access to the CDE network.....	914
Chapter 9 - Firewall.....	917
Firewall.....	917
How this Guide is Organized.....	917
How does a FortiGate Protect Your Network?.....	919
What's new for Firewall in 5.6.....	920
New Firewall Features in 5.6.4.....	920
New Firewall Features in 5.6.3.....	921
New Firewall Features in 5.6.1.....	925
New Firewall Features in 5.6.0.....	927
New WAN Optimization Features in 5.6.....	937
New Proxy Features in 5.6.....	937
Firewall concepts.....	940
What is a Firewall?.....	940
FortiGate Modes.....	943
How Packets are handled by FortiOS.....	944
Interfaces and Zones.....	945
Access Control Lists.....	947
Firewall policies.....	948
Policy Modes.....	955
Security profiles.....	958
IPv6.....	968

NAT.....	971
IP Pools.....	984
Services and TCP ports.....	987
VPN Policies.....	1013
DSRI.....	1013
Interface Policies.....	1014
DoS Protection.....	1015
Local-In Policies.....	1020
Security Policy 0.....	1021
Deny Policies.....	1022
Accept Policies.....	1022
Fixed Port.....	1022
Endpoint Security.....	1022
Traffic Logging.....	1023
Network defense.....	1025
Monitoring.....	1025
Blocking external probes.....	1025
Defending against DoS attacks.....	1030
Inside FortiOS: Denial of Service (DoS) Protection.....	1034
About DoS and DDoS attacks.....	1034
FortiOS DoS and DDoS protection.....	1034
FortiOS DDoS Prevention.....	1035
Configuration options.....	1036
DoS policies.....	1037
Hardware acceleration.....	1037
The FortiGuard Center.....	1037
Firewall Policies.....	1038
Viewing Firewall Policies.....	1038
Policy Names.....	1040
IPv4 Policy.....	1041
IPv6 Policy.....	1045
NAT64 Policy.....	1047
NAT46 Policy.....	1048
Central SNAT.....	1050
IPv4 Access Control List.....	1053
IPv6 Access Control List.....	1053
IPv4 DoS Policy.....	1054
IPv6 DoS Policy.....	1060
Multicast Policy.....	1061
Object Configuration.....	1063
UUID Support.....	1064
Addresses.....	1065

Virtual IPs.....	1085
Configuring IP pools.....	1092
Services.....	1097
Firewall schedules.....	1104
Secure Web Gateway, WAN Optimization, Web Caching and WCCP.....	1110
Before you begin.....	1110
FortiGate models that support WAN optimization.....	1110
Distributing WAN optimization, explicit proxy, and web caching to multiple CPU Cores.....	1110
Toggling Disk Usage for logging or wan-opt.....	1111
Example topologies relevant to WAN Optimization.....	1112
Basic WAN optimization topology.....	1113
Out-of-path WAN Optimization topology.....	1113
Topology for multiple networks.....	1114
WAN optimization with web caching.....	1114
Explicit Web proxy topologies.....	1114
Explicit FTP proxy topologies.....	1115
Web caching topologies.....	1115
WCCP topologies.....	1115
Inside FortiOS: WAN Optimization.....	1116
Centralize without compromising your WAN performance.....	1116
FortiOS WAN Optimization.....	1116
Protocol optimization.....	1116
Web caching.....	1117
Byte caching.....	1117
Server Monitoring and Management.....	1118
SSL acceleration.....	1118
VPN replacement.....	1118
Road warriors and home workers.....	1118
WAN Optimization Concepts.....	1119
Client/server architecture.....	1119
WAN optimization peers.....	1120
Protocol optimization.....	1120
Protocol optimization and MAPI.....	1120
Byte caching.....	1121
WAN optimization transparent mode.....	1121
Operating modes and VDOMs.....	1122
WAN optimization tunnels.....	1123
WAN optimization and user and device identity policies, load balancing and traffic shaping.....	1124
WAN optimization and HA.....	1124
WAN optimization, web caching and memory usage.....	1125

WAN Optimization Configuration.....	1125
Manual (peer-to-peer) and active-passive WAN optimization.....	1125
WAN optimization profiles.....	1128
Monitoring WAN optimization performance.....	1130
WAN optimization configuration summary.....	1130
Best practices.....	1133
Example Basic manual (peer-to-peer) WAN optimization configuration.....	1134
Example Active-passive WAN optimization.....	1140
Example Adding secure tunneling to an active-passive WAN optimization configuration.....	1147
Peers and authentication groups.....	1154
Basic WAN optimization peer requirements.....	1154
How FortiGate units process tunnel requests for peer authentication.....	1154
Configuring peers.....	1155
Configuring authentication groups.....	1156
Secure tunneling.....	1158
Monitoring WAN optimization peer performance.....	1159
Web Cache Concepts.....	1159
Turning on web caching for HTTP and HTTPS traffic.....	1159
Turning on web caching for HTTPS traffic.....	1160
Changing the ports on which to look for HTTP and HTTPS traffic to cache.....	1162
Web caching and HA.....	1162
Web caching and memory usage.....	1163
Changing web cache settings.....	1163
Web Cache Configuration.....	1166
Forwarding URLs to forwarding servers and exempting web sites from web caching.....	1166
Monitoring Web caching performance.....	1168
Example Web caching of HTTP and HTTPS Internet content for users on an internal network.....	1168
Example reverse proxy web caching and SSL offloading for an Internet web server using a static one-to-one virtual IP.....	1171
Using a FortiCache as a cache service.....	1174
WCCP Concepts.....	1175
WCCP Configuration.....	1176
WCCP configuration overview.....	1176
WCCP service groups, service numbers, service IDs and well known services.....	1176
Example caching HTTP sessions on port 80 using WCCP.....	1180
Example caching HTTP sessions on port 80 and HTTPS sessions on port 443 using WCCP.....	1182
WCCP packet flow.....	1185
Configuring the forward and return methods and adding authentication.....	1185
WCCP Messages.....	1186
Troubleshooting WCCP.....	1186

Web Proxy Concepts	1187
Proxy Policy.....	1187
Proxy Authentication.....	1187
Proxy Addresses.....	1191
Web Proxy firewall services and service groups.....	1192
Learn client IP.....	1193
Web Proxy Configuration.....	1194
General web proxy configuration steps.....	1194
Policy Matching based on Referrer Headers and Query Strings.....	1198
Explicit Proxy Concepts.....	1200
The FortiGate explicit web proxy.....	1200
Other explicit web proxy options.....	1202
Proxy chaining (web proxy forwarding servers).....	1203
Security profiles, threat weight, device identification, and the explicit web proxy.....	1207
Explicit web proxy sessions and user limits.....	1207
Explicit Proxy Configuration.....	1209
Configuring an external IP address for the IPv4 explicit web proxy.....	1209
Configuring an external IP address for the IPv6 explicit web proxy.....	1209
Restricting the IP address of the IPv4 explicit web proxy.....	1209
Restricting the outgoing source IP address of the IPv4 explicit web proxy.....	1209
Restricting the IP address of the explicit IPv6 web proxy.....	1210
Restricting the outgoing source IP address of the IPv6 explicit web proxy.....	1210
Explicit proxy firewall address types.....	1210
Proxy auto-config (PAC) configuration.....	1211
Unknown HTTP version.....	1211
Authentication realm.....	1211
Implementing Botnet features.....	1212
Adding disclaimer messages to explicit proxy policies.....	1212
Changing HTTP headers.....	1212
Preventing the explicit web proxy from changing source addresses.....	1213
Kerberos and NTLM authentication.....	1218
Kerberos authentication for explicit proxy users.....	1218
Transparent Proxy Concepts.....	1227
More about the transparent proxy.....	1227
Transparent Proxy Configuration.....	1229
FTP Proxy Concepts.....	1233
The FortiGate explicit FTP proxy.....	1233
How to use the explicit FTP proxy to connect to an FTP server.....	1234
Security profiles, threat weight, device identification, and the explicit FTP proxy.....	1235
Explicit FTP proxy sessions and user limits.....	1236
FTP Proxy Configuration.....	1236
General explicit FTP proxy configuration steps.....	1236

Restricting the IP address of the explicit FTP proxy.....	1239
Restricting the outgoing source IP address of the explicit FTP proxy.....	1239
Example users on an internal network connecting to FTP servers on the Internet through the explicit FTP with RADIUS authentication and virus scanning.....	1239
Diagnose commands for WAN Optimization.....	1243
get test {wad wccpd} <test_level>.....	1243
diagnose wad.....	1244
diagnose wacs.....	1248
diagnose wadbd.....	1249
diagnose debug application {wad wccpd} [<debug_level>].....	1249
diagnose test application wad 2200.....	1249
Chapter 10 - FortiView.....	1252
FortiView.....	1252
Purpose.....	1253
What's new in FortiOS 5.6.....	1254
FortiOS 5.6.4.....	1254
FortiOS 5.6.3.....	1254
FortiOS 5.6.1.....	1254
FortiOS 5.6.0.....	1255
Overview.....	1257
Enabling FortiView.....	1258
FortiView Feature Support - Platform Matrix.....	1258
Configuration Dependencies.....	1262
FortiView interface.....	1264
FortiView consoles.....	1268
Sources.....	1269
Destinations.....	1270
Applications.....	1271
Cloud Applications.....	1272
Web Sites.....	1273
Threats.....	1274
WiFi Clients.....	1275
Traffic Shaping.....	1276
System Events.....	1277
VPN.....	1278
Endpoint Vulnerability.....	1279
Threat Map.....	1280
Policies.....	1281
Interfaces.....	1282
FortiSandbox.....	1283
All Sessions.....	1284
Reference.....	1285

Filtering options.....	1286
Drill-Down Options.....	1289
Columns displayed.....	1291
Risk level indicators.....	1297
Troubleshooting FortiView.....	1298
No logging data is displayed.....	1298
Logging is enabled, but data is not appearing.....	1298
Chapter 11 - Fortinet Communication Ports and Protocols.....	1299
Ports and protocols.....	1299
What's new in FortiOS 5.6.....	1300
FortiOS 5.6.3.....	1300
FortiGate open ports.....	1301
FortiAnalyzer open ports.....	1304
FortiAP-S open ports.....	1306
FortiAuthenticator open ports.....	1308
FortiClient open ports.....	1311
FortiCloud open ports.....	1312
FortiDB open ports.....	1313
FortiGuard open ports.....	1314
FortiMail open ports.....	1317
FortiManager open ports.....	1322
FortiPortal open ports.....	1324
FortiSandbox open ports.....	1325
Services and port numbers required for FortiSandbox.....	1326
3rd-party servers open ports.....	1327
Fortinet proprietary protocols.....	1329
FGCP - FortiGate Clustering Protocol.....	1330
FGSP - FortiGate Session Life Support Protocol.....	1337
FGFM - FortiGate to FortiManager Protocol.....	1342
SLBC - Session-aware Load Balancing Cluster.....	1345
Fortinet Security Fabric.....	1353
FortiTelemetry/On-Net/FortiClient Endpoint Compliance.....	1355
FortiGuard.....	1358
FortiLink.....	1362
FortiOS WAN optimization.....	1368
FSSO - Fortinet Single Sign-On.....	1372
OFTP - Optimized Fabric Transfer Protocol.....	1375
FortiClient EMS - Enterprise Management Server.....	1376
Chapter 12 - FortiWiFi and FortiAP Configuration Guide.....	1378
FortiAP and FortiWiFi configuration guide.....	1378
Before you begin.....	1378
How this guide is organized.....	1378

What's new in FortiOS 5.6.....	1380
FortiOS 5.6.4.....	1380
FortiOS 5.6.3.....	1380
FortiOS 5.6.1.....	1386
FortiOS 5.6.0.....	1388
Introduction to wireless networking.....	1397
Wireless concepts.....	1397
Security.....	1398
Authentication.....	1400
Wireless networking equipment.....	1400
Automatic Radio Resource Provisioning.....	1401
Captive portals.....	1403
Introduction to Captive portals.....	1403
Configuring a captive portal.....	1403
Customizing captive portal pages.....	1405
Configuration example - Captive portal WiFi access control.....	1411
Configuring a WiFi LAN.....	1414
Overview of WiFi controller configuration.....	1414
Setting your geographic location.....	1416
Creating a FortiAP Profile.....	1417
Defining a wireless network interface (SSID).....	1419
Defining SSID Groups.....	1428
Dynamic user VLAN assignment.....	1428
Configuring user authentication.....	1432
Configuring firewall policies for the SSID.....	1434
Configuring the built-in access point on a FortiWiFi unit.....	1435
Access point deployment.....	1437
Overview.....	1437
Network topology for managed APs.....	1437
Discovering and authorizing APs.....	1440
Advanced WiFi controller discovery.....	1446
Wireless client load balancing for high-density deployments.....	1448
FortiAP Groups.....	1450
LAN port options.....	1450
Preventing IP fragmentation of packets in CAPWAP tunnels.....	1453
LED options.....	1454
CAPWAP bandwidth formula.....	1455
Wireless Mesh.....	1457
Overview of Wireless Mesh.....	1457
Configuring a meshed WiFi network.....	1461
Configuring a point-to-point bridge.....	1464
Hotspot 2.0.....	1465

Combining WiFi and wired networks with a software switch	1470
Combining WiFi and wired networks with a software switch	1470
FortiAP local bridging (Private Cloud-Managed AP)	1472
Using bridged FortiAPs to increase scalability	1474
Using Remote WLAN FortiAPs	1476
Configuring the FortiGate for remote FortiAPs	1476
Configuring the FortiAP units	1478
Preauthorizing FortiAP units	1478
Features for high-density deployments	1479
Power save feature	1479
Broadcast packet suppression	1479
Multicast to unicast conversion	1480
Ignore weak or distant clients	1480
Turn off 802.11b protocol	1481
Disable low data rates	1481
Limit power	1481
Use frequency band load-balancing	1482
AP load balancing	1482
Application rate-limiting	1483
AP Group management and dynamic VLAN assignment	1483
Sharing Tunnel SSIDs within a single managed AP between VDOMs as a Virtual AP for multi-tenancy	1483
FortiAP LED Blinking	1484
Wireless controller optimization for large deployment - AP image upgrade	1484
Protecting the WiFi Network	1485
Wireless IDS	1485
WiFi data channel encryption	1486
Protected Management Frames and Opportunistic Key Caching support	1487
Bluetooth Low Energy (BLE) Scan	1487
Wireless network monitoring	1489
Monitoring wireless clients	1489
Monitoring rogue APs	1489
Suppressing rogue APs	1494
Monitoring wireless network health	1494
Configuring wireless network clients	1495
Windows XP client	1495
Windows 7 client	1500
Mac OS client	1504
Linux client	1506
Troubleshooting	1508
Wireless network examples	1511
Basic wireless network	1511

A more complex example	1516
Managing a FortiAP with FortiCloud	1526
FortiCloud-managed FortiAP WiFi	1526
FortiCloud-managed FortiAP WiFi without a key	1527
Using a FortiWiFi unit as a client	1529
Use of client mode	1529
Configuring client mode	1531
Support for location-based services	1533
Overview	1533
Configuring location tracking	1533
Viewing device location data on the FortiGate unit	1534
Troubleshooting	1536
FortiAP shell command through CAPWAP control tunnel	1536
Signal strength issues	1536
Throughput issues	1540
Connection issues	1541
General problems	1546
Packet sniffer	1549
Useful debugging commands	1553
Reference	1555
FortiAP web-based manager	1556
Wireless radio channels	1558
WiFi event types	1560
FortiAP CLI	1560
Chapter 13 - Hardening	1567
Hardening	1567
Building security into FortiOS	1567
Boot PROM and BIOS security	1567
FortiOS kernel and user processes	1567
Administration access security	1567
Network security	1569
FIPS and Common Criteria	1570
PSIRT advisories	1570
FortiOS ports and protocols	1571
FortiOS open ports	1571
Closing open ports	1574
Security best practices	1574
Install the FortiGate unit in a physically secure location	1574
Register your product with Fortinet Support	1574
Keep your FortiOS firmware up to date	1574
System administrator best practices	1575
Global commands for stronger and more secure encryption	1578

Disable sending Malware statistics to FortiGuard.....	1579
Disable auto USB installation.....	1579
Set system time by synchronizing with an NTP server.....	1580
Enable password policies.....	1580
Configure auditing and logging.....	1580
Disable interfaces that not used.....	1581
Disable unused protocols on interfaces.....	1581
Use local-in policies to close open ports or restrict access.....	1582
Chapter 14 - Hardware Acceleration.....	1584
Hardware acceleration.....	1584
Whats New in Hardware Acceleration for FortiOS 5.6.....	1584
Hardware acceleration overview.....	1589
Content processors (CP4, CP5, CP6, CP8, and CP9).....	1589
Security processors (SPs).....	1592
Network processors (NP1, NP2, NP3, NP4, NP4Lite, NP6 and NP6Lite).....	1594
Enabling strict protocol header checking disables all hardware acceleration.....	1598
sFlow and NetFlow and hardware acceleration.....	1598
Checking that traffic is offloaded by NP processors.....	1598
Dedicated Management CPU.....	1600
Offloading flow-based content inspection with NTurbo and IPSA.....	1601
Preventing packet ordering problems with NP4, NP6 and NP6lite FortiGates under heavy load.....	1602
NP6 and NP6lite Acceleration.....	1603
NP6 session fast path requirements.....	1603
NP6Lite processors.....	1605
NP6 and NP6Lite processors and sFlow and NetFlow.....	1605
NP6 processors and traffic shaping.....	1605
NP Direct.....	1606
Viewing your FortiGate NP6 processor configuration.....	1606
Optimizing NP6 performance by distributing traffic to XAUI links.....	1607
Increasing NP6 offloading capacity using link aggregation groups (LAGs).....	1609
NP6 processors and redundant interfaces.....	1609
Configuring Inter-VDOM link acceleration with NP6 processors.....	1610
Disabling offloading IPsec Diffie-Hellman key exchange.....	1613
Access control lists (ACLs).....	1613
Configuring individual NP6 processors.....	1614
Enabling per-session accounting for offloaded NP6 or NP6lite sessions.....	1620
Configuring NP6 session timeouts.....	1621
Configure the number of IPsec engines NP6 processors use.....	1622
Stripping clear text padding and IPsec session ESP padding.....	1622
Disable NP6 CAPWAP offloading.....	1622

Optionally disable NP6 offloading of traffic passing between 10Gbps and 1Gbps interfaces	1622
Enabling bandwidth control between the ISF and NP6 XAUI ports	1623
NP6 session drift	1623
FortiGate NP6 architectures	1625
FortiGate-300D fast path architecture	1625
FortiGate-300E and 301E fast path architecture	1625
FortiGate-400D fast path architecture	1627
FortiGate-500D fast path architecture	1628
FortiGate-500E and 501E fast path architecture	1628
FortiGate-600D fast path architecture	1629
FortiGate-800D fast path architecture	1630
FortiGate-900D fast path architecture	1632
FortiGate-1000D fast path architecture	1634
FortiGate-1200D fast path architecture	1636
FortiGate-1500D fast path architecture	1639
FortiGate-1500DT fast path architecture	1640
FortiGate-2000E fast path architecture	1642
FortiGate-2500E fast path architecture	1644
FortiGate-3000D fast path architecture	1647
FortiGate-3100D fast path architecture	1648
FortiGate-3200D fast path architecture	1649
FortiGate-3700D fast path architecture	1652
FortiGate-3700DX fast path architecture	1656
FortiGate-3800D fast path architecture	1660
FortiGate-3810D fast path architecture	1662
FortiGate-3815D fast path architecture	1663
FortiGate-3960E fast path architecture	1665
FortiGate-3980E fast path architecture	1666
FortiGate-5001D fast path architecture	1668
FortiGate-5001E and 5001E1 fast path architecture	1670
FortiController-5902D fast path architecture	1672
FortiGate-6000 series	1674
FortiGate-7030E fast path architecture	1676
FortiGate-7040E fast path architecture	1677
FortiGate-7060E fast path architecture	1677
FPM-7620E fast path architecture	1678
FIM-7901E fast path architecture	1679
FIM-7904E fast path architecture	1680
FIM-7910E fast path architecture	1681
FIM-7920E fast path architecture	1681
FortiGate NP6lite architectures	1682

FortiGate-200E and 201E fast path architecture.....	1682
NP4 and NP4Lite Acceleration.....	1685
Viewing your FortiGate's NP4 configuration.....	1685
NP4 and NP4Lite processors and sFlow and NetFlow.....	1686
Configuring NP4 traffic offloading.....	1686
Increasing NP4 offloading capacity using link aggregation groups (LAGs).....	1688
NP4 traffic shaping offloading.....	1688
NP4 IPsec VPN offloading.....	1689
Configuring Inter-VDOM link acceleration with NP4 processors.....	1689
Offloading NP4 anomaly detection.....	1693
FortiGate NP4 architectures.....	1696
FortiGate-600C.....	1696
FortiGate-800C.....	1697
FortiGate-1000C.....	1698
FortiGate-1240B.....	1699
FortiGate-3040B.....	1700
FortiGate-3140B.....	1701
FortiGate-3140B — load balance mode.....	1702
FortiGate-3240C.....	1702
FortiGate-3600C.....	1704
FortiGate-3950B and FortiGate-3951B.....	1705
FortiGate-3950B and FortiGate-3951B — load balance mode.....	1707
FortiGate-5001C.....	1708
FortiGate-5001B.....	1709
Setting switch-mode mapping on the ADM-XD4.....	1710
Hardware acceleration get and diagnose commands.....	1710
get hardware npu np6.....	1710
diagnose npu np6.....	1711
Using diagnose npu np6 npu-feature to verify enabled NP6 features.....	1712
Using the diagnose sys session/session6 list command.....	1713
diagnose npu np6 session-stats <np6-id> (number of NP6 IPv4 and IPv6 sessions).....	1717
diagnose npu np6 ipsec-stats (NP6 IPsec statistics).....	1718
diagnose sys mcast-session/session6 list (IPv4 and IPv6 multicast sessions).....	1719
diagnose npu np6 sse-stats <np6-id> (number of NP6 sessions and dropped sessions).....	1720
diagnose npu np6 dce <np6-id> (number of dropped NP6 packets).....	1720
diagnose hardware deviceinfo nic <interfac-name> (number of packets dropped by an interface).....	1721
dianose npu np6 synproxy-stats (NP6 SYN-proxied sessions and unacknowledged SYNs).....	1722
Chapter 15 - High Availability.....	1723
High availability.....	1723

FortiOS 5.6 HA new features	1723
Solving the high availability problem	1726
FortiGate Cluster Protocol (FGCP)	1726
FortiGate Session Life Support Protocol (FGSP)	1727
VRRP high availability	1728
Session-Aware Load Balancing Clustering (SLBC)	1729
Enhanced Load Balancing Clustering (ELBC)	1730
Content clustering	1730
An introduction to the FGCP	1732
About the FGCP	1732
Synchronizing the configuration (and settings that are not synchronized)	1735
Preparing the FortiGates before setting up an FGCP cluster	1736
Configuring FortiGates for FGCP HA operation	1737
Active-passive and active-active HA	1742
Identifying the cluster and cluster units	1743
Device failover, link failover, and session failover	1744
Primary unit selection	1744
HA override	1752
FortiGate HA compatibility with DHCP and PPPoE	1756
HA and distributed clustering	1757
Clusters of three or four FortiGates	1758
Disk storage configuration and HA	1761
FGCP high availability best practices	1762
FGCP HA terminology	1764
HA GUI options	1767
FGCP configuration examples and troubleshooting	1771
About the examples in this chapter	1771
How to set up FGCP clustering (recommended steps)	1771
Setting up two new FortiGates as an FGCP cluster	1778
Adding a new FortiGate to an operating cluster	1790
Active-active HA cluster in transparent mode	1791
FortiGate-5000 active-active HA cluster with FortiClient licenses	1802
Converting a standalone FortiGate to a cluster	1813
1. Setting up registration and licensing	1814
2. Configuring the primary FortiGate for HA	1814
3. Connecting the backup FortiGate	1815
4. Configuring the backup FortiGate for HA	1816
5. Viewing the status of the HA cluster	1817
6. Results	1819
7. (Optional) Upgrading the firmware for the HA cluster	1820
Replacing a failed cluster unit	1821
FGCP HA with 802.3ad aggregated interfaces	1823

Example HA and redundant interfaces	1834
Troubleshooting HA clusters	1845
Virtual clusters	1850
Virtual clustering overview	1850
Configuring virtual clustering	1852
Virtual clustering configuration examples	1856
Example inter-VDOM links in a virtual clustering configuration	1857
Troubleshooting virtual clustering	1859
Full mesh HA	1860
Full mesh HA overview	1860
Example full mesh HA configuration	1862
Troubleshooting full mesh HA	1872
Operating clusters and virtual clusters	1874
Operating a cluster	1874
Operating a virtual cluster	1874
Managing individual cluster units using a reserved out-of-band management interface	1875
Managing individual cluster units using an in-band management IP address	1881
Managing individual cluster units in a virtual cluster	1881
Shutting down or rebooting the primary unit	1882
The primary unit acts as a router for subordinate unit management traffic	1882
Cluster communication with RADIUS and LDAP servers	1883
Clusters and FortiGuard services	1883
Clusters and logging	1884
Clusters and SNMP	1887
Adding FortiClient licenses to a cluster	1890
Cluster members list	1892
Virtual cluster members list	1892
Viewing HA statistics	1893
Changing the HA configuration of an operating cluster	1893
Changing the HA configuration of an operating virtual cluster	1893
Changing the subordinate unit host name and device priority	1894
Upgrading cluster firmware	1894
Downgrading cluster firmware	1896
Backing up and restoring the cluster configuration	1897
Monitoring cluster units for failover	1897
Viewing cluster status from the CLI	1898
Managing individual cluster units	1905
Disconnecting a cluster unit from a cluster	1905
Adding a disconnected FortiGate back to its cluster	1906
diagnose sys ha dump-by command	1907
HA and failover protection	1909

About active-passive failover.....	1909
About active-active failover.....	1910
Device failover.....	1910
HA heartbeat and communication between cluster units.....	1911
Cluster virtual MAC addresses.....	1918
Synchronizing the configuration.....	1925
Synchronizing kernel routing tables.....	1933
Configuring graceful restart for dynamic routing failover.....	1935
Link failover (port monitoring or interface monitoring).....	1936
Monitoring VLAN interfaces.....	1942
Sub-second failover.....	1942
Remote link failover (remote IP monitoring).....	1943
Failover and attached network equipment.....	1946
Monitoring cluster units for failover.....	1946
NAT mode active-passive cluster packet flow.....	1946
Transparent mode active-passive cluster packet flow.....	1948
Failover performance.....	1951
Session failover (session-pickup).....	1953
Enabling session-pickup for TCP, UDP, ICMP, and multicast session failover.....	1953
If session pickup is disabled.....	1954
Improving session synchronization performance.....	1954
Session failover limitations for sessions passing through the cluster.....	1955
Session failover limitations for sessions terminated by the cluster.....	1958
Synchronizing IPsec VPN SAs.....	1960
WAN optimization and HA.....	1961
HA and load balancing.....	1962
Load balancing overview.....	1962
Selecting a load balancing schedule.....	1964
Load balancing TCP and UDP sessions.....	1965
Using NP4 or NP6 processors to offload load balancing.....	1965
Configuring weighted-round-robin weights.....	1965
Dynamically optimizing weighted load balancing according to how busy cluster units are.....	1966
Example weighted load balancing configuration.....	1968
NAT mode active-active cluster packet flow.....	1970
Transparent mode active-active cluster packet flow.....	1973
HA with FortiGate-VM and third-party products.....	1977
FortiGate-VM for VMware HA configuration.....	1977
FortiGate VM for Hyper-V HA configuration.....	1977
Troubleshooting layer-2 switches.....	1978
Failover issues with layer-3 switches.....	1978
Failover and attached network equipment.....	1978

Ethertype conflicts with third-party switches	1979
LACP, 802.3ad aggregation and third-party switches	1979
VRRP high availability	1980
Configuring VRRP	1981
Adding a VRRP virtual router to a FortiGate interface	1982
Setting up VRRP failover	1982
Setting up VRRP groups	1984
Using VRRP virtual MAC addresses	1985
Example VRRP configuration: two FortiGates in a VRRP domain	1986
Example VRRP configuration: VRRP load balancing two FortiGates and two VRRP groups	1988
Optional VRRP configuration settings	1989
FortiGate-6000 and FortiController-5000 support for VRRP HA	1989
FortiGate Session Life Support Protocol (FGSP)	1991
Configuring FGSP HA cluster-sync instances	1993
Synchronizing TCP and SCTP sessions	1994
Synchronizing the configuration	1995
FGSP and firmware upgrades	1996
Backing up and restoring the configuration of an FGSP cluster	1997
IPsec tunnel synchronization	1997
Synchronizing UDP and ICMP (connectionless) sessions	1997
Synchronizing NAT sessions	1998
Synchronizing asymmetric sessions	1998
Synchronizing expectation sessions	1999
Security profile flow-based inspection and asymmetric traffic	1999
Notes and limitations	2000
Configuring session synchronization links	2000
Basic example configuration	2000
Verifying the FGSP configuration and synchronization	2003
Chapter 16 - IPsec VPN	2005
IPsec VPN	2005
What's new in FortiOS 5.6	2007
FortiOS 5.6.4	2007
FortiOS 5.6.3	2007
FortiOS 5.6.1	2009
FortiOS 5.6.0	2012
IPsec VPN concepts	2017
VPN tunnels	2017
VPN gateways	2019
Clients, servers, and peers	2021
Encryption	2022
Authentication	2024

Phase 1 and Phase 2 settings.....	2024
Security Association.....	2025
IKE and IPsec packet processing.....	2026
IPsec VPN overview.....	2031
Types of VPNs.....	2031
Planning your VPN.....	2032
General preparation steps.....	2034
How to use this guide to configure an IPsec VPN.....	2034
IPsec VPN in the web-based manager.....	2035
Phase 1 configuration.....	2035
Phase 2 configuration.....	2042
Concentrator.....	2046
IPsec Monitor.....	2047
Phase 1 parameters.....	2048
Overview.....	2048
Defining the tunnel ends.....	2048
Choosing Main mode or Aggressive mode.....	2049
Choosing the IKE version.....	2049
Authenticating the FortiGate unit.....	2051
Authenticating remote peers and clients.....	2053
Defining IKE negotiation parameters.....	2059
Using XAuth authentication.....	2064
Dynamic IPsec route control.....	2065
Phase 2 parameters.....	2067
Phase 2 settings.....	2067
Configuring the Phase 2 parameters.....	2069
Defining VPN security policies.....	2073
Defining policy addresses.....	2073
Defining security policies for policy-based and route-based VPNs.....	2074
Gateway-to-gateway.....	2079
Configuration overview.....	2079
Gateway-to-gateway configuration.....	2081
How to work with overlapping subnets.....	2086
Testing.....	2091
Hub-and-spoke configurations.....	2094
Configuration overview.....	2094
Configure the hub.....	2096
Configure the spokes.....	2101
Dynamic spokes configuration example.....	2104
Dynamic DNS configuration.....	2111
Dynamic DNS over VPN concepts.....	2111
DDNS topology.....	2113

Configuration overview.....	2114
FortiClient dialup-client configuration.....	2124
Configuration overview.....	2124
FortiGate dialup-client configurations.....	2133
Configuration overview.....	2133
Supporting IKE Mode Config clients.....	2141
IKE Mode Config overview.....	2141
Automatic configuration overview.....	2141
IKE Mode Config method.....	2141
Internet-browsing configuration.....	2146
Configuration overview.....	2146
Routing all remote traffic through the VPN tunnel.....	2148
Redundant VPN configurations.....	2150
Configuration overview.....	2150
Transparent mode VPNs.....	2155
Configuration overview.....	2155
IPv6 IPsec VPNs.....	2160
Configuration examples.....	2161
L2TP and IPsec (Microsoft VPN).....	2172
Overview.....	2172
Assumptions.....	2173
Configuration overview.....	2173
GRE over IPsec (Cisco VPN).....	2181
Configuration overview.....	2182
Configuring the Cisco router.....	2187
Keep-alive support for GRE.....	2187
Protecting OSPF with IPsec.....	2189
Configuration overview.....	2189
Redundant OSPF routing over IPsec.....	2196
OSPF over dynamic IPsec.....	2200
BGP over dynamic IPsec.....	2203
IPsec Auto-Discovery VPN (ADVPN).....	2207
Example ADVPN configuration.....	2208
Logging and monitoring.....	2213
Monitoring VPN connections.....	2213
VPN event logs.....	2214
Troubleshooting.....	2215
Common IPsec VPN problems.....	2215
Troubleshooting connection issues.....	2219
General troubleshooting tips.....	2223
Troubleshooting L2TP and IPsec.....	2224
Troubleshooting GRE over IPsec.....	2227

Chapter 17 - IPv6	2230
IPv6	2230
IPv6 packet structure	2231
Benefits of IPv6	2231
What's new for IPv6 in FortiOS 5.6	2231
IPv6 (5.6.3)	2231
IPv6 Features	2235
IPv6 policies	2235
IPv6 Network Address Translation	2243
ICMPv6	2248
IPv6 in dynamic routing	2252
Dual stack routing	2253
IPv6 tunnelling	2253
SIP over IPv6	2254
New Fortinet FortiGate IPv6 MIB fields	2255
IPv6 Per-IP traffic shaper	2256
DHCPv6	2257
IPv6 forwarding	2258
Obtaining IPv6 addresses from an IPv6 DHCP server	2258
Authentication Support	2258
IPv6 Configuration	2260
IPv6 address groups	2260
IPv6 address ranges	2261
IPv6 firewall addresses	2261
ICMPv6	2263
IPv6 IPsec VPN	2264
TCP MSS values	2277
BGP and IPv6	2277
RIPng — RIP and IPv6	2278
IPv6 RSSO support	2284
IPv6 IPS	2284
Blocking IPv6 packets by extension headers	2284
IPv6 Denial of Service policies	2285
Configure hosts in an SNMP v1/2c community to send queries or receive traps	2285
IPv6 PIM sparse mode multicast routing	2285
Chapter 18 - Logging and Reporting	2286
Logging and reporting	2286
Before you begin	2286
What's new in FortiOS 5.6	2288
FortiOS 5.6.4	2288
FortiOS 5.6.3	2288
FortiOS 5.6.1	2290

FortiOS 5.6.0.....	2290
Logging and reporting overview.....	2292
What is logging?.....	2292
FortiOS features available for logging.....	2293
Log messages.....	2298
Log files and types.....	2304
Log database and datasets.....	2305
Log devices.....	2307
Reports.....	2311
Best Practices: Log management.....	2312
Logging and reporting for small networks.....	2314
Modifying default log device settings.....	2314
Configuring the backup solution.....	2316
Logging and reporting for large networks.....	2318
Modifying default log device settings.....	2318
Configuring the backup solution.....	2320
Advanced logging.....	2323
Log backup and restore tools.....	2323
Configuring logging to multiple Syslog servers.....	2323
Using Automatic Discovery to connect to a FortiAnalyzer unit.....	2324
Activating a FortiCloud account for logging purposes.....	2325
Viewing log storage space.....	2325
Customizing and filtering log messages.....	2326
Viewing logs from the CLI.....	2326
Configuring NAC quarantine logging.....	2327
Logging local-in policies.....	2327
Tracking specific search phrases in reports.....	2329
Troubleshooting and logging.....	2331
Using log messages to help in troubleshooting issues.....	2331
Connection issues between FortiGate unit and logging devices.....	2332
Log database issues.....	2332
Logging daemon (Miglogd).....	2334
Chapter 19 - Managing Devices.....	2335
Managing devices.....	2335
Before you begin.....	2335
How this guide is organized.....	2335
What's New in FortiOS 5.6.....	2335
FortiOS 5.6.1.....	2335
Managing “bring your own device”.....	2336
Device monitoring.....	2336
Device Groups.....	2337
Controlling access with a MAC Address Access Control List.....	2338

Security policies for devices	2339
Chapter 20 - Managing a FortiSwitch with a FortiGate	2343
Managing a FortiSwitch with a FortiGate	2343
Supported models	2343
Before you begin	2344
What's new for managed FortiSwitches in FortiOS 5.6.3 with FortiSwitch 3.6.3 (and later releases)	2345
What's new for managed FortiSwitches in FortiOS 5.6.1 with FortiSwitch 3.6.0 (and later releases)	2347
What's new for managed FortiSwitches in FortiOS 5.6 with FortiSwitch 3.6.0 (and later releases)	2354
What's new for managed FortiSwitches in FortiOS 5.6 with FortiSwitch 3.5.4 (and later releases)	2356
Before you begin	2362
How this guide is organized	2362
Connecting FortiLink ports	2363
1. Enable the switch controller on FortiGate	2363
2. Connect the FortiSwitch and FortiGate	2363
FortiLink configuration using the FortiGate GUI	2365
Summary of the procedure	2365
FortiLink split interface	2366
Authorizing the FortiSwitch	2366
Adding preauthorized FortiSwitches	2366
Managed FortiSwitch display	2367
Edit a managed FortiSwitch	2367
Network interface display	2368
Add link aggregation groups (Trunks)	2368
Configure DHCP blocking, IGMP snooping, STP, and loop guard on managed FortiSwitch ports	2368
FortiLink configuration using the FortiGate CLI	2370
Summary of the procedure	2370
Configure FortiLink as a single link	2370
Configure FortiLink as a logical interface	2371
Network topologies for managed FortiSwitches	2372
Supported topologies	2372
Single FortiGate managing a single FortiSwitch	2372
Single FortiGate managing a stack of several FortiSwitches	2373
HA-mode FortiGates managing a single FortiSwitch	2373
HA-mode FortiGates managing a stack of several FortiSwitches	2374
HA-mode FortiGates managing a FortiSwitch two-tier topology	2374
Single FortiGate managing multiple FortiSwitches (using a hardware or software switch interface)	2375
HA-mode FortiGates managing two-tier FortiSwitches with access rings	2376

Dual-homed servers connected to FortiLink tier-1 FortiSwitches using an MCLAG...	2377
Standalone FortiGate with dual-homed FortiSwitch access.....	2377
HA-mode FortiGates with dual-homed FortiSwitch access.....	2378
Grouping FortiSwitches.....	2378
Transitioning from a FortiLink split interface to a FortiLink MCLAG.....	2382
Optional setup tasks.....	2384
Configuring the FortiSwitch management port.....	2384
Converting to FortiSwitch standalone mode.....	2384
Changing the admin password on the FortiGate for all managed FortiSwitches.....	2385
FortiSwitch port features.....	2387
FortiSwitch ports display.....	2387
Configuring ports using the GUI.....	2388
Configuring ports using the FortiGate CLI.....	2388
FortiSwitch port security policy.....	2396
Configure the 802.1X settings for a virtual domain.....	2396
Override the virtual domain settings.....	2397
Define an 802.1X security policy.....	2398
Apply an 802.1X security policy to a FortiSwitch port.....	2399
Additional capabilities.....	2401
Execute custom FortiSwitch commands.....	2401
Firmware upgrade management and compatible version information.....	2402
FortiSwitch log export.....	2402
FortiSwitch per-port device visibility.....	2403
FortiGate CLI support for FortiSwitch features (on non-FortiLink ports).....	2403
Troubleshooting.....	2409
Troubleshooting FortiLink issues.....	2409
Chapter 21 - Networking.....	2411
Networking.....	2411
What's new in Networking.....	2411
FortiOS version 5.6.4.....	2412
FortiOS version 5.6.3.....	2412
FortiOS version 5.6.2.....	2412
FortiOS version 5.6.1.....	2413
FortiOS version 5.6.....	2413
Interfaces.....	2416
Administrative access.....	2416
Aggregate interfaces.....	2417
DHCP addressing mode on an interface.....	2418
DHCP servers and relays.....	2419
Interface MTU packet size.....	2426
Interface settings.....	2427
Loopback interfaces.....	2432

One-armed sniffer.....	2433
Physical ports.....	2436
PPPoE addressing mode on an interface.....	2437
Probing interfaces.....	2439
Redundant interfaces.....	2440
Dual Internet connections.....	2440
Secondary IP addresses to an interface.....	2443
Software switch.....	2443
Soft switch example.....	2444
Virtual switch.....	2445
Zones.....	2448
Virtual domains.....	2449
VXLANs.....	2450
Wireless.....	2451
VLANs.....	2452
Botnet and command-and-control protection.....	2465
DNS.....	2466
DNS settings.....	2466
Additional DNS CLI configuration.....	2466
DDNS.....	2467
DNS servers.....	2468
Advanced static routing.....	2473
Routing concepts.....	2473
Static routing tips.....	2488
Policy routing.....	2489
Transparent mode static routing.....	2493
Static routing example.....	2494
Dynamic routing overview.....	2503
What is dynamic routing?.....	2503
Comparison of dynamic routing protocols.....	2506
Choosing a routing protocol.....	2511
Dynamic routing terminology.....	2512
Controlling how routing changes affect active sessions.....	2517
IPv6 in dynamic routing.....	2518
RIP.....	2519
RIP background and concepts.....	2519
Troubleshooting RIP.....	2530
Simple RIP example.....	2534
RIPng: RIP and IPv6.....	2550
OSPF.....	2557
OSPF background and concepts.....	2557
Troubleshooting OSPF.....	2568

Basic OSPF example.....	2571
Advanced inter-area OSPF example.....	2583
Controlling redundant links by cost.....	2594
BGP.....	2598
BGP background and concepts.....	2598
Troubleshooting BGP.....	2612
Dual-homed BGP example.....	2616
Redistributing and blocking routes in BGP.....	2629
IS-IS.....	2637
IS-IS background and concepts.....	2637
How IS-IS works.....	2637
Troubleshooting IS-IS.....	2643
Simple IS-IS example.....	2645
Network layout and assumptions.....	2646
Expectations.....	2647
CLI configuration.....	2647
Verification.....	2649
Troubleshooting.....	2652
Multicast forwarding.....	2653
Sparse mode.....	2653
Dense mode.....	2654
PIM support.....	2655
Multicast forwarding and FortiGate units.....	2656
Configuring FortiGate multicast forwarding.....	2657
Multicast routing examples.....	2660
Troubleshooting.....	2684
Netflow support.....	2684
Using sFlow to monitor network traffic.....	2685
Packet capture.....	2688
Chapter 22 - Parallel Path Processing - Life of a Packet.....	2690
Parallel path processing - life of a packet.....	2690
Parallel Path Processing.....	2691
High-level list of processes that affect packets.....	2692
Packet flow ingress and egress: FortiGates without network processor offloading.....	2693
Ingress.....	2693
Admission control.....	2694
Kernel.....	2694
UTM/NGFW.....	2696
Content processors (CP8 and CP9).....	2696
Kernel.....	2698
Egress.....	2698
Packet flow: NP6 and NP6lite sessions.....	2699

Packet flow: NP6 and NP6lite offloaded session.....	2701
Packet flow: NTurbo.....	2702
UTM/NGFW packet flow: flow-based inspection.....	2704
UTM/NGFW packet flow: proxy-based inspection.....	2706
UTM/NGFW packet flow: explicit web proxy.....	2708
Comparison of inspection types.....	2710
Mapping security functions to inspection types.....	2710
More information about inspection methods.....	2710
Chapter 23 - Sandbox Inspection.....	2712
Sandbox inspection.....	2712
What's new in FortiOS 5.6.....	2712
FortiOS 5.6.1.....	2712
An Overview of Sandbox Inspection.....	2714
What is Sandbox Inspection?.....	2714
FortiSandbox Appliance vs FortiSandbox Cloud.....	2714
Sending Files for Sandbox Inspection.....	2715
Using FortiSandbox with a FortiGate.....	2716
Connecting a FortiGate to FortiSandbox.....	2716
FortiSandbox Console.....	2717
Sandbox Integration.....	2718
Overview.....	2718
Example Configuration.....	2719
Sandbox Inspection FAQ.....	2722
Chapter 24 - Fortinet Security Fabric.....	2723
Fortinet Security Fabric.....	2723
What's new in the Security Fabric.....	2724
FortiOS version 5.6.2.....	2724
FortiOS version 5.6.1.....	2724
FortiOS version 5.6.....	2725
Security Fabric overview.....	2727
Access security.....	2728
Client security.....	2728
Application security.....	2728
Cloud security.....	2729
NOC and SOC security.....	2729
Advanced threat intelligence.....	2729
Partner API.....	2730
The Security Fabric solution components.....	2731
Devices in the Security Fabric.....	2731
Security Fabric topology views.....	2734
Security Fabric Audit.....	2735
FortiTelemetry.....	2735

Configuring the Security Fabric.....	2736
System requirements.....	2736
Prerequisites.....	2736
Forming the Security Fabric.....	2737
Setting up data collection for the Security Fabric.....	2738
Using the Security Fabric to improve network security.....	2740
Understanding the Security Fabric dashboard widgets.....	2740
Viewing the Security Fabric topology.....	2741
Running a Security Fabric Audit.....	2743
Viewing monitoring information for devices in the Security Fabric.....	2746
Related resources.....	2747
Chapter 25 - Security Profiles.....	2748
Security profiles.....	2748
Before you begin.....	2748
How this chapter is organized.....	2748
What's new in FortiOS 5.6.....	2750
FortiOS 5.6.4.....	2750
FortiOS 5.6.3.....	2750
FortiOS 5.6.1.....	2751
FortiOS 5.6.0.....	2752
New FortiGuard Web Filter categories (407574).....	2757
Inside FortiOS: AntiVirus.....	2763
Advanced Protection against Malware and APTs.....	2763
Features.....	2763
Inside FortiOS: Application Control.....	2766
Enhance Control and Network Visibility.....	2766
Features.....	2767
Recipes.....	2770
Inside FortiOS: Intrusion Prevention System (IPS).....	2770
World Class Next Generation IPS Capabilities.....	2770
Features.....	2771
Inside FortiOS: Web Filtering.....	2774
Intelligent and Effective Content Control.....	2774
Features.....	2775
Security Profiles overview.....	2779
Traffic inspection.....	2779
Content inspection and filtering.....	2781
Security Profiles components.....	2784
Security Profiles/lists/sensors.....	2786
Inspection Modes.....	2786
Proxy-based inspection.....	2787
Flow-based inspection.....	2787

Changing between proxy and flow mode.....	2787
Comparison of inspection types.....	2789
Individual Security Profile considerations.....	2790
Proxy mode and flow mode antivirus and web filter profile options.....	2790
AntiVirus.....	2795
Antivirus concepts.....	2795
Enabling AntiVirus scanning.....	2807
Testing your antivirus configuration.....	2810
Example scenarios.....	2810
Web filter.....	2816
Web filter concepts.....	2816
Inspection Modes.....	2818
FortiGuard Web Filtering Service.....	2819
Configuring Web Filter Profiles.....	2825
Overriding FortiGuard website categorization.....	2830
Using cookies to authenticate users in a Web Filter override.....	2837
Web Profile Overrides.....	2837
SafeSearch.....	2838
YouTube Education Filter.....	2839
Static URL Filter.....	2840
Web content filter.....	2845
Web filtering example.....	2848
Advanced web filter configurations.....	2850
DNS Filter.....	2855
Application Control.....	2859
Application control concepts.....	2859
Cloud Access Security Inspection (CASI).....	2860
Enabling application control in profile-based modes.....	2860
Application Control actions.....	2864
Application considerations.....	2864
Application control monitor.....	2865
Application control examples.....	2865
Intrusion prevention.....	2870
IPS concepts.....	2870
Enabling IPS scanning.....	2873
IPS processing in an HA cluster.....	2877
Configure IPS options.....	2877
Enabling IPS packet logging.....	2881
Other IPS examples.....	2882
Anti-Spam filter.....	2888
Anti-Spam concepts.....	2888
Anti-Spam techniques.....	2888

Configuring Anti-Spam.....	2892
Order of spam filtering.....	2894
Spam actions.....	2895
Anti-Spam examples.....	2896
Data leak prevention.....	2898
Data leak prevention concepts.....	2898
Enable data leak prevention.....	2903
Creating/editing a DLP sensor.....	2904
DLP archiving.....	2906
DLP examples.....	2907
ICAP support.....	2912
The protocol.....	2912
Offloading using ICAP.....	2913
Configuring ICAP.....	2913
Example ICAP sequence.....	2914
Example ICAP scenario.....	2914
FortiClient Profiles.....	2916
Endpoint protection overview.....	2916
Configuring endpoint protection.....	2918
Configuring endpoint registration over a VPN.....	2921
Modifying the endpoint protection replacement messages.....	2923
Monitoring endpoints.....	2923
Proxy Options.....	2923
The use of different proxy profiles and profile options.....	2924
Proxy Options profile components.....	2924
SSL/SSH Inspection.....	2926
SSL inspection.....	2926
Why use SSL inspection.....	2930
SSL certificate inspection.....	2931
Creating or editing an SSL/SSH Inspection profile.....	2932
Secure white list database.....	2933
SSL server table for SSL offloading.....	2934
Custom Application & IPS Signatures.....	2935
Creating a custom IPS signature.....	2935
Custom signature syntax.....	2935
Custom signature keywords.....	2936
Creating a custom signature to block access to example.com.....	2948
Creating a custom signature to block the SMTP “vrfy” command.....	2950
Creating a custom signature to block files according to the file's hash value.....	2951
Other Security Profiles considerations.....	2953
Security Profiles and Virtual domains (VDOMs).....	2953
Conserve mode.....	2953

Using wildcards and Perl regular expressions.....	2955
Adding External Security Devices.....	2957
CPU allocation and tuning commands to survive reboot.....	2957
Excluding industrial IP signatures.....	2958
Chapter 26 - Server Load Balancing.....	2959
Server load balancing.....	2959
Before you begin.....	2959
How this chapter is organized.....	2959
What's new for server load balancing in FortiOS 5.6.1.....	2960
What's new for server load balancing in FortiOS 5.6.....	2961
Inside FortiOS: Server Load Balancing.....	2962
Server Load Balancing combined with NGFW and UTM protection.....	2962
SSL/TLS offloading.....	2963
SSL/TLS content inspection.....	2963
Health Check.....	2963
Server Monitoring and Management.....	2964
HTTP Multiplexing.....	2964
Basic load balancing configuration example.....	2964
Configuring load balancing.....	2969
Load balancing and other FortiOS features.....	2971
Configuring load balancing from the GUI.....	2971
Configuring load balancing from the CLI.....	2973
Load balancing methods.....	2974
Session persistence.....	2975
Real servers.....	2975
Health check monitoring.....	2977
Load balancing limitations.....	2979
Monitoring load balancing.....	2980
Load balancing diagnose commands.....	2981
HTTP and HTTPS load balancing, multiplexing, and persistence.....	2982
HTTP and HTTPS multiplexing.....	2983
HTTP and HTTPS persistence.....	2983
HTTP host-based load balancing.....	2985
SSL/TLS load balancing.....	2987
SSL/TLS offloading.....	2987
Separate virtual-server client and server TLS version and cipher configuration.....	2989
Setting the SSL/TLS versions to use for server and client connections.....	2989
Setting the SSL/TLS cipher choices for server and client connections.....	2990
Protection from TLS protocol downgrade attacks.....	2991
Setting 3072- and 4096-bit Diffie-Hellman values.....	2991
Additional SSL load balancing and SSL offloading options.....	2991
SSL offloading support for Internet Explorer 6.....	2992

Selecting the cipher suites available for SSL load balancing	2993
Disabling SSL/TLS re-negotiation	2993
IP, TCP, and UDP load balancing	2997
Example HTTP load balancing to three real web servers	2997
GUI configuration	2998
CLI configuration	3001
Example Basic IP load balancing configuration	3002
Example Adding a server load balance port forwarding virtual IP	3003
Example Weighted load balancing configuration	3004
GUI configuration	3004
CLI configuration	3006
Example HTTP and HTTPS persistence configuration	3007
CLI configuration: adding persistence for a specific domain	3010
Chapter 27 - SSL VPN	3012
SSL VPN	3012
What's new in FortiOS 5.6	3013
FortiOS 5.6.4	3013
FortiOS 5.6.3	3013
FortiOS 5.6.1	3013
FortiOS 5.6.0	3015
Overview	3018
SSL VPN modes of operation	3019
Port forwarding mode	3020
SSL VPN conserve mode	3021
Traveling and security	3022
SSL VPN and IPv6	3022
Basic configuration	3024
User accounts and groups	3024
Configuring SSL VPN web portals	3028
Configuring security policies	3037
Configuring encryption key algorithms	3043
Additional configuration options	3044
The SSL VPN client	3054
FortiClient	3054
Tunnel mode client configuration	3054
The SSL VPN web portal	3056
Connecting to the FortiGate unit	3056
Web portal overview	3056
Portal configuration	3057
Using the Bookmarks widget	3061
Using the Quick Connection Tool	3064
Using FortiClient	3067

Setup examples	3068
Secure Internet browsing	3068
Split Tunnel	3070
Multiple user groups with different access permissions	3073
Client device certificate authentication with multiple groups	3078
Troubleshooting	3079
Chapter 28 - System Administration	3082
System administration	3082
How this guide is organized	3082
What's New in FortiOS 5.6	3083
FortiOS 5.6.3	3083
FortiOS 5.6.1	3083
FortiOS 5.6	3084
Administrators	3088
Administrator profiles	3088
Adding a local administrator	3089
LDAP authentication for administrators	3090
Other methods of administrator authentication	3091
Administrator lockout	3092
Monitoring administrators	3093
Management access	3093
Security precautions	3094
Central management	3097
Adding a FortiGate to FortiManager	3097
Configuration updates through FortiManager	3099
FortiGuard	3100
Firmware updates	3108
Administrative domains	3109
Backup and restore configurations	3109
Monitoring	3110
Dashboard	3110
Monitor menus	3117
Logging	3117
Alert email	3118
SNMP	3120
SNMP get command syntax	3128
Replacement messages	3128
Administration for schools	3134
PPTP and L2TP	3137
How PPTP VPNs work	3137
FortiGate unit as a PPTP server	3139
Configuring the FortiGate unit for PPTP VPN	3142

Configuring the FortiGate unit for PPTP passthrough.....	3142
Testing PPTP VPN connections.....	3144
Logging VPN events.....	3144
Configuring L2TP VPNs.....	3145
L2TP configuration overview.....	3147
Session helpers.....	3151
Viewing the session helper configuration.....	3152
Changing the session helper configuration.....	3152
DCE-RPC session helper (dcerpc).....	3155
DNS session helpers (dns-tcp and dns-udp).....	3155
File transfer protocol (FTP) session helper (ftp).....	3155
H.323 and RAS session helpers (h323 and ras).....	3156
Media Gateway Controller Protocol (MGCP) session helper (mgcp).....	3156
ONC-RPC portmapper session helper (pmap).....	3157
PPTP session helper for PPTP traffic (pptp).....	3157
Remote shell session helper (rsh).....	3158
Real-Time Streaming Protocol (RTSP) session helper (rtsp).....	3158
Session Initiation Protocol (SIP) session helper (sip).....	3159
Trivial File Transfer Protocol (TFTP) session helper (tftp).....	3159
Oracle TNS listener session helper (tns).....	3159
Advanced concepts.....	3160
Single firewall vs. multiple virtual domains.....	3160
Modem.....	3162
Assigning IP address by MAC address.....	3165
IP addresses for self-originated traffic.....	3166
Disk.....	3166
CLI Scripts.....	3167
Rejecting PING requests.....	3168
Opening TCP 113.....	3169
Obfuscate HTTP responses from SSL VPN.....	3169
Blocking land attacks in Transparent mode.....	3169
Chapter 29 - Traffic Shaping.....	3171
Traffic shaping.....	3171
What's new in FortiOS 5.6.....	3172
FortiOS 5.6.3.....	3172
The purpose of traffic shaping.....	3173
Quality of Service.....	3173
Traffic policing.....	3174
Bandwidth guarantee, limit, and priority interactions.....	3175
FortiGate traffic.....	3175
Through traffic.....	3176
Important considerations.....	3180

Traffic shaping methods	3183
Traffic shaping options	3183
Shared policy shaping	3184
Per-IP shaping	3189
Application control shaping	3192
Reverse direction traffic shaping	3194
Enabling traffic shaping in the security policy	3195
Scheduling Traffic Shaping Policies	3195
Type of Service priority	3196
Differentiated Services	3197
DSCP examples	3198
ToS and DSCP traffic mapping	3202
Traffic Shaper Monitor	3203
Examples	3205
QoS using priority from security policies	3205
QoS using priority from ToS or differentiated services	3209
Example setup for VoIP	3210
Troubleshooting traffic shaping	3216
Interface diagnosis	3216
Shaper diagnose commands	3216
Packet lost with the debug flow	3218
Session list details with dual traffic shaper	3218
Additional Information	3218
Chapter 30 - Transparent Mode	3220
Transparent mode	3220
What's new in FortiOS 5.6	3221
Using the Management IP address to populate pac-file-url	3221
Introduction to Transparent Mode	3222
What is Transparent Mode?	3222
Transparent Mode Features	3222
Transparent Mode Installation	3224
Installing a FortiGate in Transparent mode	3224
Using a Virtual Wire Pair to Simplify Transparent Mode	3225
Management IP configuration	3226
Networking in Transparent Mode	3228
Packet Forwarding	3228
Network Address Translation (NAT)	3233
VLANs and Forwarding Domains	3234
Inter-VDOM links between NAT and Transparent VDOMs	3238
Replay Traffic Scenario	3238
Packet Forwarding using Cisco Protocols	3239
Configuration Example	3240

Firewalls and Security in Transparent Mode.....	3242
Firewall Policy Look Up.....	3242
Firewall Session List.....	3242
Security Scanning.....	3243
Integrated Switch Fabric Access Control List Policies.....	3244
IPsec VPN in Transparent Mode.....	3244
Using IPsec VPNs in Transparent Mode.....	3244
Example 1: Remote Sites with Different Subnets.....	3245
Example 2: Remote Sites on the Same Subnet.....	3251
Using FortiManager and FortiAnalyzer.....	3258
High Availability in Transparent Mode.....	3259
Virtual Clustering.....	3259
MAC Address Assignment.....	3260
Best Practices.....	3261
Chapter 31 - Troubleshooting.....	3262
Troubleshooting.....	3262
Before you begin.....	3262
How this guide is organized.....	3262
Troubleshooting methodologies.....	3262
Ensure you have administrator-level access to required equipment.....	3263
Establish a baseline.....	3263
Define the problem.....	3264
Create a troubleshooting plan.....	3265
Obtain any required equipment.....	3265
Consult Fortinet resources.....	3266
Troubleshooting tools.....	3266
FortiOS diagnostics.....	3266
FortiOS ports.....	3288
FortiAnalyzer and FortiManager ports.....	3289
FortiGuard troubleshooting.....	3289
Troubleshooting tips.....	3292
How to check hardware connections.....	3293
How to check FortiOS network settings.....	3294
How to check CPU and memory resources.....	3296
How to check modem status.....	3301
How to run ping and traceroute.....	3301
How to check the logs.....	3305
How to verify the contents of the routing table (in NAT mode).....	3305
How to verify the correct route is being used.....	3307
How to verify the correct firewall policy is being used.....	3308
How to check the bridging information in transparent mode.....	3308
How to check the number of sessions that UTM proxy uses.....	3309

How to examine the firewall session list	3310
How to check wireless information	3311
How to verify connectivity to FortiGuard	3312
How to perform a sniffer trace (CLI and packet capture)	3312
How to debug the packet flow	3315
Troubleshooting resources	3316
Technical documentation	3316
Fortinet video library	3316
Release notes	3316
Knowledge base	3316
Fortinet technical discussion forums	3317
Fortinet training services online campus	3317
Fortinet customer support	3317
Chapter 32 - Virtual Domains	3318
Virtual domains	3318
What's new in FortiOS 5.6	3318
VDOMs (5.6.3)	3318
VDOMs (5.6)	3319
Virtual Domains Overview	3320
Benefits of VDOMs	3320
Enabling and accessing VDOMs	3322
Configuring VDOMs	3328
VDOMs in NAT mode	3335
Using a VDOM in NAT mode	3335
Example configuration: VDOM in NAT mode	3342
VDOMs in transparent mode	3353
Transparent Mode Overview	3353
Operation mode differences in VDOMs	3354
Using a VDOM in Transparent mode	3355
Example configuration: VDOM in Transparent mode	3356
Inter-VDOM routing	3370
Benefits of inter-VDOM routing	3370
Inter-VDOM configurations	3371
Configuring VDOM links	3374
Dynamic routing over inter-VDOM links	3377
HA virtual clusters and VDOM links	3378
Example configuration: Inter-VDOM routing	3379
Troubleshooting Virtual Domains	3402
VDOM admin having problems gaining access	3402
FortiGate unit running very slowly	3402
General VDOM tips and troubleshooting	3403
Chapter 33 - Virtual FortiOS	3407

Virtual FortiOS.....	3407
Document scope.....	3407
What's new in VM in 5.6.....	3407
New Features in 5.6.6.....	3407
New Features in 5.6.4.....	3408
New Features in 5.6.0.....	3408
Virtual FortiOS Overview.....	3411
FortiGate VM models and licensing.....	3411
Registering FortiGate VM with Customer Service & Support.....	3412
Downloading the FortiGate VM deployment package.....	3412
Deployment package contents.....	3414
Deploying the FortiGate VM appliance.....	3415
Performance and optimization.....	3415
Other Virtual FortiOS Products.....	3416
Deployment example – VMware.....	3424
Open the FortiGate VM OVF file with the vSphere client.....	3424
Configure FortiGate VM hardware settings.....	3429
Transparent mode VMware configuration.....	3430
High Availability VMware configuration.....	3430
Power on your FortiGate VM.....	3431
Deployment example – MS Hyper-V.....	3432
Create the FortiGate VM virtual machine.....	3432
Configure FortiGate VM hardware settings.....	3439
High Availability Hyper-V configuration.....	3450
Start the FortiGate VM.....	3451
Deployment example – KVM.....	3452
Create the FortiGate VM virtual machine.....	3452
Configure FortiGate VM hardware settings.....	3454
Start the FortiGate VM.....	3455
Deployment example – OpenXen.....	3456
Create the FortiGate VM virtual machine (VMM).....	3456
Deployment example – Citrix XenServer.....	3462
Create the FortiGate VM virtual machine (XenCenter).....	3462
Configure virtual hardware.....	3465
FortiGate VM Initial Configuration.....	3469
Set FortiGate VM port1 IP address.....	3469
Connect to the FortiGate VM Web-based Manager.....	3472
Upload the FortiGate VM license file.....	3472
Validate the FortiGate VM license with FortiManager.....	3474
Configure your FortiGate VM.....	3476
Chapter 34 - VoIP Solutions: SIP.....	3477
VoIP solutions: SIP.....	3477

Before you begin.....	3477
How this guide is organized.....	3477
FortiOS 5.6 VoIP new features.....	3478
Inside FortiOS: Voice over IP (VoIP) Protection.....	3479
Advanced Voice over IP Protection.....	3480
Carrier Grade protection.....	3481
NAT/NAPT.....	3481
SIP ALG activation.....	3483
SIP over IPv6.....	3484
Platform support and hardware acceleration.....	3484
Common SIP VoIP configurations.....	3485
Peer to peer configuration.....	3485
SIP proxy server configuration.....	3485
SIP redirect server configuration.....	3486
SIP registrar configuration.....	3487
SIP with a FortiGate.....	3488
SIP messages and media protocols.....	3491
Hardware accelerated RTP processing.....	3493
SIP request messages.....	3493
SIP response messages.....	3494
SIP message start line.....	3496
SIP headers.....	3496
The SIP message body and SDP session profiles.....	3498
Example SIP messages.....	3501
The SIP session helper.....	3502
SIP session helper configuration overview.....	3502
Disabling and enabling the SIP session helper.....	3503
Changing the port numbers that the SIP session helper listens on.....	3504
Configuration example: SIP session helper in Transparent Mode.....	3504
SIP session helper diagnose commands.....	3507
The SIP ALG.....	3507
Enabling VoIP support from the GUI.....	3510
SIP ALG configuration overview.....	3510
VoIP profiles.....	3510
Changing the port numbers that the SIP ALG listens on.....	3512
Disabling the SIP ALG in a VoIP profile.....	3512
SIP ALG diagnose commands.....	3512
Conflicts between the SIP ALG and the session helper.....	3513
Stateful SIP tracking, call termination, and session inactivity timeout.....	3513
Adding a media stream timeout for SIP calls.....	3514
Adding an idle dialog setting for SIP calls.....	3515
Changing how long to wait for call setup to complete.....	3515

SIP and RTP/RTCP.....	3515
How the SIP ALG creates RTP pinholes.....	3516
Configuration example: SIP in Transparent Mode.....	3517
General configuration steps.....	3518
Configuration steps - GUI.....	3518
Configuration steps - CLI.....	3520
RTP enable/disable (RTP bypass).....	3520
Opening and closing SIP register, contact, via and record-route pinholes.....	3521
Accepting SIP register responses.....	3522
How the SIP ALG performs NAT.....	3522
SIP ALG source address translation.....	3523
SIP ALG destination address translation.....	3523
SIP Call Re-invite messages.....	3523
How the SIP ALG translates IP addresses in SIP headers.....	3524
How the SIP ALG translates IP addresses in the SIP body.....	3526
SIP NAT scenario: source address translation (source NAT).....	3527
SIP NAT scenario: destination address translation (destination NAT).....	3530
SIP NAT configuration example: source address translation (source NAT).....	3532
SIP NAT configuration example: destination address translation (destination NAT).....	3534
SIP and RTP source NAT.....	3538
SIP and RTP destination NAT.....	3538
Source NAT with an IP pool.....	3540
Different source and destination NAT for SIP and RTP.....	3540
NAT with IP address conservation.....	3541
Controlling how the SIP ALG NATs SIP contact header line addresses.....	3542
Controlling NAT for addresses in SDP lines.....	3543
Translating SIP session destination ports.....	3543
Translating SIP sessions to multiple destination ports.....	3545
Adding the original IP address and port to the SIP message header after NAT.....	3546
Enhancing SIP pinhole security.....	3547
Hosted NAT traversal.....	3549
Configuration example: Hosted NAT traversal for calls between SIP Phone A and SIP Phone B.....	3550
Hosted NAT traversal for calls between SIP Phone A and SIP Phone C.....	3554
Restricting the RTP source IP.....	3554
SIP over IPv6.....	3554
Deep SIP message inspection.....	3555
Actions taken when a malformed message line is found.....	3556
Logging and statistics.....	3557
Deep SIP message inspection best practices.....	3557
Configuring deep SIP message inspection.....	3557
Blocking SIP request messages.....	3560

SIP rate limiting.....	3562
Limiting the number of SIP dialogs accepted by a security policy.....	3564
SIP logging.....	3564
Inspecting SIP over SSL/TLS (secure SIP).....	3564
Adding the SIP server and client certificates.....	3567
Adding SIP over SSL/TLS support to a VoIP profile.....	3567
SIP and HA—session failover and geographic redundancy.....	3568
SIP geographic redundancy.....	3569
Supporting geographic redundancy when blocking OPTIONS messages.....	3569
Support for RFC 2543-compliant branch parameters.....	3570
SIP and IPS.....	3570
SIP debugging.....	3571
SIP debug log format.....	3571
SIP-proxy filter per VDOM.....	3572
SIP-proxy filter command.....	3572
SIP debug setting.....	3572
Display SIP rate-limit data.....	3573

Chapter 1 - What's New for FortiOS 5.6

What's new in FortiOS 5.6

This document highlights and describes new features for the following versions of FortiOS 5.6:

- FortiOS 5.6.4, see [What's New for FortiOS 5.6.4 on page 58](#).
- FortiOS 5.6.3, see [How this guide is organized](#) for links to 5.6.3 new feature descriptions.
- FortiOS 5.6.2, no new features were added to FortiOS 5.6.2. This is a bug fix release. See the Resolved Issues section of the FortiOS 5.6.2 Release Notes for details.
- FortiOS 5.6.1, see [How this guide is organized](#) for links to 5.6.1 new feature descriptions.
- FortiOS 5.6.0, see [How this guide is organized](#) for links to 5.6.0 new feature descriptions

Most new feature descriptions include a feature number that references the internal Fortinet ID used to track the feature.

How this guide is organized

The following sections highlight some of the higher profile new FortiOS 5.6 features.

- [What's New for FortiOS 5.6.4](#)
- [FortiGate VM enhancements for AWS, Azure, Google, SDN connectors and more \(5.6.3\)](#)
- [New Dashboard Features](#)
- [New Fortinet Security Fabric features](#)
- [Security Fabric Audit and Fabric Score](#)
- [FortiExplorer for iOS](#)
- [NGFW Policy Mode \(397035\)](#)
- [Transparent web proxy \(386474\)](#)
- [New FortiView Endpoint Vulnerability Scanner chart \(378647\)](#)
- [FortiClient Profile changes \(386267, 375049\)](#)
- [Application Control is now standard with FortiCare support](#)
- [Real time logging to FortiAnalyzer and FortiCloud](#)
- [FortiGate Logs can be sent to syslog servers in Common Event Format \(CEF\) \(300128\)](#)
- [Controlled failover between wireless controllers](#)
- [Multiple PSK for WPA Personal \(393320\)](#)
- [VXLAN support \(289354\)](#)
- [New PPPoE features](#)
- [Adding Internet services to firewall policies \(389951\)](#)
- [Combining source and destination NAT in the same policy \(388718\)](#)
- [NP6 Host Protection Engine \(HPE\) adds protection for DDoS attacks \(363398\)](#)

All of the other new features in FortiOS 5.6 are organized alphabetically by subject:

- [Getting Started \(5.6.3\)](#)
- [Getting Started \(5.6.1\)](#)
- [Getting Started \(5.6\)](#)
- [Authentication \(5.6.3\)](#)
- [Authentication \(5.6.1\)](#)
- [Authentication \(5.6\)](#)
- [FortiOS Carrier \(5.6.3\)](#)
- [FortiOS Carrier \(5.6.1\)](#)
- [Device identification \(5.6\)](#)
- [Device identification \(5.6\)](#)
- [Diagnose command changes \(5.6.1\)](#)
- [Diagnose command changes \(5.6\)](#)
- [Explicit web proxy \(5.6\)](#)
- [Firewall \(5.6.3\)](#)
- [Firewall \(5.6.1\)](#)
- [Firewall \(5.6\)](#)
- [Managed FortiSwitch OS 3.6.0 \(FortiOS 5.6.3\)](#)
- [Managed FortiSwitch OS 3.6.0 \(FortiOS 5.6.1\)](#)
- [Managed FortiSwitch OS 3.6.0 \(FortiOS 5.6\)](#)
- [FortiView \(5.6.3\)](#)
- [FortiView \(5.6.1\)](#)
- [FortiView \(5.6\)](#)
- [FortiGate VM enhancements for AWS, Azure, Google, SDN connectors and more \(5.6.3\)](#)
- [FortiGate VM \(5.6.0\)](#)
- [Hardware acceleration \(5.6.3\)](#)
- [Hardware acceleration \(5.6.1\)](#)
- [Hardware acceleration \(5.6\)](#)
- [High Availability \(5.6.1\)](#)
- [High Availability \(5.6\)](#)
- [IPsec VPN \(5.6.3\)](#)
- [IPsec VPN \(5.6.1\)](#)
- [IPsec VPN \(5.6\)](#)
- [IPv6 \(5.6.3\)](#)
- [IPv6 \(5.6.3\)](#)
- [Logging and Reporting \(5.6.3\)](#)
- [Logging and Reporting \(5.6.1\)](#)
- [Logging and Reporting \(5.6\)](#)
- [Modem \(5.6.1\)](#)
- [Networking \(5.6.3\)](#)
- [Networking \(5.6.1\)](#)
- [Networking \(5.6\)](#)
- [New RFCs](#)
- [Sandbox Integration \(5.6.1\)](#)

- [Security Profiles \(5.6.3\)](#)

- [SSL VPN \(5.6.3\)](#)
- [SSL VPN \(5.6.1\)](#)
- [SSL VPN \(5.6\)](#)
- [System \(5.6.3\)](#)
- [System \(5.6\)](#)
- [VDOMs \(5.6.0\)](#)
- [VDOMs \(5.6.0\)](#)
- [VoIP/SIP \(5.6\)](#)
- [WiFi \(5.6.3\)](#)
- [WiFi \(5.6.1\)](#)
- [WiFi \(5.6\)](#)

What's New for FortiOS 5.6.4

This section lists new features added to FortiOS 5.6.4 with links to the FortiOS Handbook for more information. FortiOS Handbook chapters will be updated for 5.6.4 only to document new features or to publish corrections or improvements to the content.

Authentication

- [Authentication binds to MAC address on page 382](#)
- [New RADIUS accounting start message options, see RADIUS accounting start message options on page 394](#)
- [IPv6 TACACS+ server IP address on page 407](#)
- [Login credentials for guest users shown in clear text on GUI and voucher on page 429](#)

Firewall

- [Using a FortiCache as a cache service on page 1174](#)

FortiView

- [Increased visibility of interactivity in FortiView on page 1254](#)
- [Automatic synchronization of log display location on page 1254](#)

FortiWiFi and FortiAP

- [FortiAP LED Blinking on page 1484](#)
- [Wireless controller optimization for large deployment - AP image upgrade on page 1484](#)

Hardware acceleration

- Per-session accounting is supported for FortiGates with NP6lite processors, [Enabling per-session accounting for offloaded NP6 or NP6lite sessions on page 1620](#)

High availability

- FGSP configuration synchronization changes, see [Synchronizing the configuration on page 1995](#)
- Changes to get system status ha command output, see [Viewing cluster status from the CLI on page 1898](#)

IPsec VPN

- Updates to IPsec VPN Wizard options on page 2018

Logging and reporting

- Automatic synchronization of log display location on page 2288

Security profiles

- Configuring the FortiClient offline grace period on page 2921
- Excluding industrial IP signatures on page 2958

SSL VPN

- Changes to Tunnel Mode Client Options logic on page 3032
- Changes to HTTP header information on page 3081

Virtual FortiOS

- SDN connector addressing on page 3418
- Support for KVM-based hypervisor in AWS on page 3419
- HA support for GCP on page 3422
- Other Virtual FortiOS Products on page 3416

What's New in previous versions of FortiOS 5.6

This chapter briefly highlights some of the higher profile new FortiOS 5.6 features, some of which have been enhanced for FortiOS 5.6.1 and FortiOS 5.6.3.

FortiGate VM enhancements for AWS, Azure, Google, SDN connectors and more

The realm of virtual computing has become mainstream and not only does this mean that security appliances can also be virtual, there is also a requirement for security appliances in a virtual environment. These environments can be the publicly available platforms such as Amazon Web Services, Azure and Google Cloud Platform or they can be Software Defined Networks (SDN) such as those made by Cisco, HP, Nuage and OpenStack. For that reason, not only is the number of Virtual FortiOS variations growing along with what they can do, a number of the new features being introduced deal with integrating FortiOS into these environments. See [FortiGate VM enhancements for AWS, Azure, Google, SDN connectors and more \(5.6.3\) on page 186](#).

Recipes are now being also published for the cloud-based and SDN environments on the Fortinet Cookbook website.

- <http://cookbook.fortinet.com/amazon-web-services-aws/>
- <http://cookbook.fortinet.com/cisco-ac/>
- <http://cookbook.fortinet.com/microsoft-azure/>
- <http://cookbook.fortinet.com/nuage-vsp/>

Fortinet Security Fabric enhancements

Security Fabric features and functionality continue to evolve. New features include improved performance and integration, a security audit function that finds possible problems with your network and recommends solutions, security fabric dashboard widgets, improved device detection, and the remote login to other FortiGates on the fabric. See [New Fortinet Security Fabric features on page 62](#).

Security Fabric Audit

The Security Fabric Audit allows you to analyze your Security Fabric deployment to identify potential vulnerabilities and highlight best practices that could be used to improve your network's overall security and performance. See [Security Fabric Audit and Fabric Score on page 73](#).

Re-designed Dashboard

The Dashboard has been enhanced to show more information with greater flexibility and more functionality. See [New Dashboard Features on page 79](#) for details.

NGFW Policy Mode

You can operate your FortiGate in NGFW policy mode to simplify applying Application control and Web Filtering to firewall traffic. See [NGFW Policy Mode \(397035\) on page 96](#).

Flow-based inspection with profile-based NGFW mode is the default inspection mode in FortiOS 5.6.

Transparent web proxy

In addition to the Explicit Web Proxy, FortiOS now supports a Transparent web proxy. You can use the transparent proxy to apply web authentication to HTTP traffic accepted by a firewall policy. See [Transparent web proxy \(386474\)](#) on page 88.

Controlled failover between wireless controllers

Administrators can now define the role of the primary and secondary controllers on the FortiAP unit, allowing the unit to decide the order in which the FortiAP selects a FortiGate unit and how the FortiAP unit fails over to a backup FortiGate unit if the primary FortiGate Fails. See [Controlled failover between wireless controllers on page 104](#).

FortiView Endpoint Vulnerability chart

A new FortiView chart that tracks vulnerability events detected by the FortiClients running on all devices registered with the FortiGate. See [New FortiView Endpoint Vulnerability Scanner chart \(378647\)](#) on page 99.

FortiClient Profile changes

FortiClient profiles have been re-organized and now use the FortiGate to warn or quarantine endpoints that are not compliant with a FortiClient profile. See [FortiClient Profile changes \(386267, 375049\)](#).

Adding Internet services to firewall policies

Internet service objects can be added to firewall policies instead of destination addresses and services. See [Adding Internet services to firewall policies \(389951\)](#).

Source and destination NAT in a single Firewall policy

Extensions to VIPs support more NAT options and other enhancements. See [Combining source and destination NAT in the same policy \(388718\)](#).

Other highlights

- Application Control is now standard with FortiCare support
- Real time logging to FortiAnalyzer and FortiCloud
- Multiple PSK for WPA Personal (393320)
- VXLAN support (289354)
- NP6 Host Protection Engine (HPE) adds protection for DDoS attacks (363398)
- FortiGate Logs can be sent to syslog servers in Common Event Format (CEF) (300128)
- New PPPoE features

New Fortinet Security Fabric features

In FortiOS 5.6, the Security Fabric (previously known as the Cooperative Security Fabric) has been expanded in several ways to add more functionality and visibility.

One of the most important functional changes is that FortiAnalyzer is now a required part of the Security Fabric configuration. Also, two important new features, Security Fabric Audit and Fabric Score, have been added to provide a method to continually monitor and improve the Security Fabric configuration.

Many changes have been made through FortiView to improve the visibility of the Security Fabric. More information is now displayed and you can access downstream FortiGates directly from the root FortiGate's FortiView display.

Other smaller improvements have been made throughout the Security Fabric, with a focus on improving communication between devices.

In FortiOS 5.6.1, the new updated GUI design consolidates the Security Fabric features together under a new menu and has many new topological changes to provide greater visibility into the connectivity of your networked devices. This includes adding more Fortinet products to the topology and widgets. Other topology improvements include enhanced IPsec VPN detection (which now includes detection of downstream FortiGates) and support for SD-WAN. Smaller changes have also been made to add more information to device tooltip alerts in the Physical and Logical Topology views.

Setting up the Fortinet Security Fabric in FortiOS 5.6

See the following FortiGate Cookbook recipes to get started in setting up the Security Fabric in FortiOS 5.6:

- [Installing a FortiGate in NAT mode](#)
- [Security Fabric installation](#)

Security Fabric between remote networks by enabling FortiTelemetry for IPsec VPN interfaces

You can now enable FortiTelemetry for IPsec VPN interfaces. The Security Fabric can now detect the downstream FortiGate through the IPsec VPN interface. This allows you to send FortiTelemetry communication over a Gateway-to-Gateway IPsec VPN tunnel between two remote networks. One of the networks would contain the root FortiGate and the network at the other end of the IPsec VPN tunnel can connect to the root FortiGate's Security Fabric.

In the GUI, to enable FortiTelemetry

1. Go to **Network > Interfaces** and edit your IPsec VPN interface.
2. Under Administrative Access enable FortiTelemetry.

Edit Interface

Interface Name: VPN-to-Branch

Alias:

Type: Tunnel Interface

Interface: port9

Role: Undefined

Address

Addressing mode: Manual

IP: 10.1.1.2

Network Mask: 255.255.255.255

Remote IP: 10.1.1.1

IPv6 Addressing mode: **Manual** DHCP

IPv6 Address/Prefix: ::/0

Administrative Access

IPv4

☐ HTTPS ☐ HTTP ☐ PING ☐ FMG-Access ☐ CAPWAP

☐ SSH ☐ SNMP ☐ FTM ☐ RADIUS Accounting

☒ **FortiTelemetry**

Your IPsec VPN interface will automatically be added to the FortiTelemetry enabled interface list under **Security Fabric > Settings**.

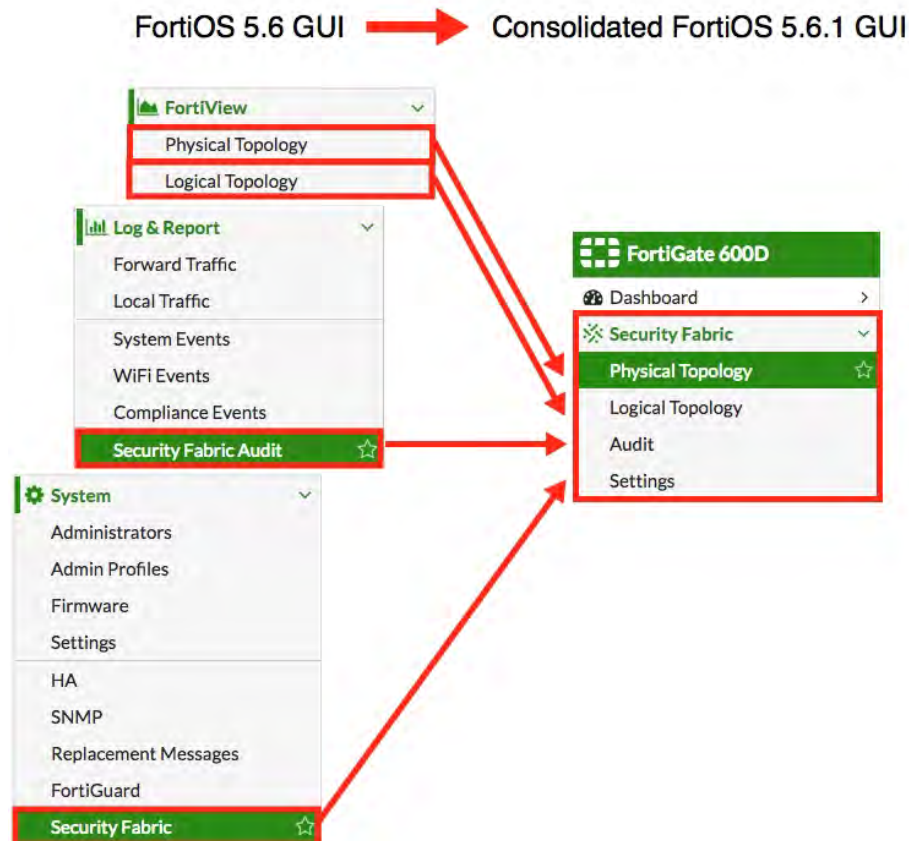

In the CLI, enter the following commands:

```
config system interface
  edit <vpn_name>
    set fortiheartbeat enable
  end
```

Re-designed Security Fabric setup

A new updated GUI menu consolidates the Security Fabric features in one location. This includes **Physical Topology**, **Logical Topology**, **Audit**, and **Settings**. For more details, see the illustration below:

Improved Security Fabric Settings page

The Security Fabric **Settings** page has been updated to act as a centralized location for you to enable connectivity to other Fortinet products. Navigate to **Security Fabric > Settings**.

Changes to the **Settings** page include the following:

- The previous **Enable Security Fabric** option has been replaced with an option to enable **FortiGate Telemetry**.
- The previous **Downstream FortiGates** option has been replaced with **Topology** to show multiple devices.

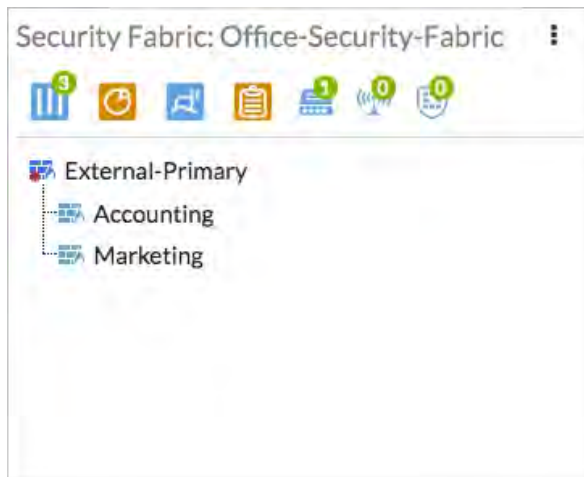

See the screen shot below:

Security Fabric dashboard widgets

New dashboard widgets for the Security Fabric put information about the status of the Security Fabric at your fingertips when you first log into your FortiGate.

The FortiGate dashboard widget has been updated to include the following Fortinet products: FortiGate (core), FortiAnalyzer (core), FortiSwitch, FortiClient, FortiSandbox, and FortiManager. See the screen shot below:

You can hover over the icons along the top of the Security Fabric widget to get a quick view of the status of the Security Fabric. Available information includes the FortiTelemetry status and the status of various components of in the Security Fabric.

The Security Fabric Score widget shows the Security Fabric Audit score for the Security Fabric and allows you to apply recommended changes right from the dashboard.

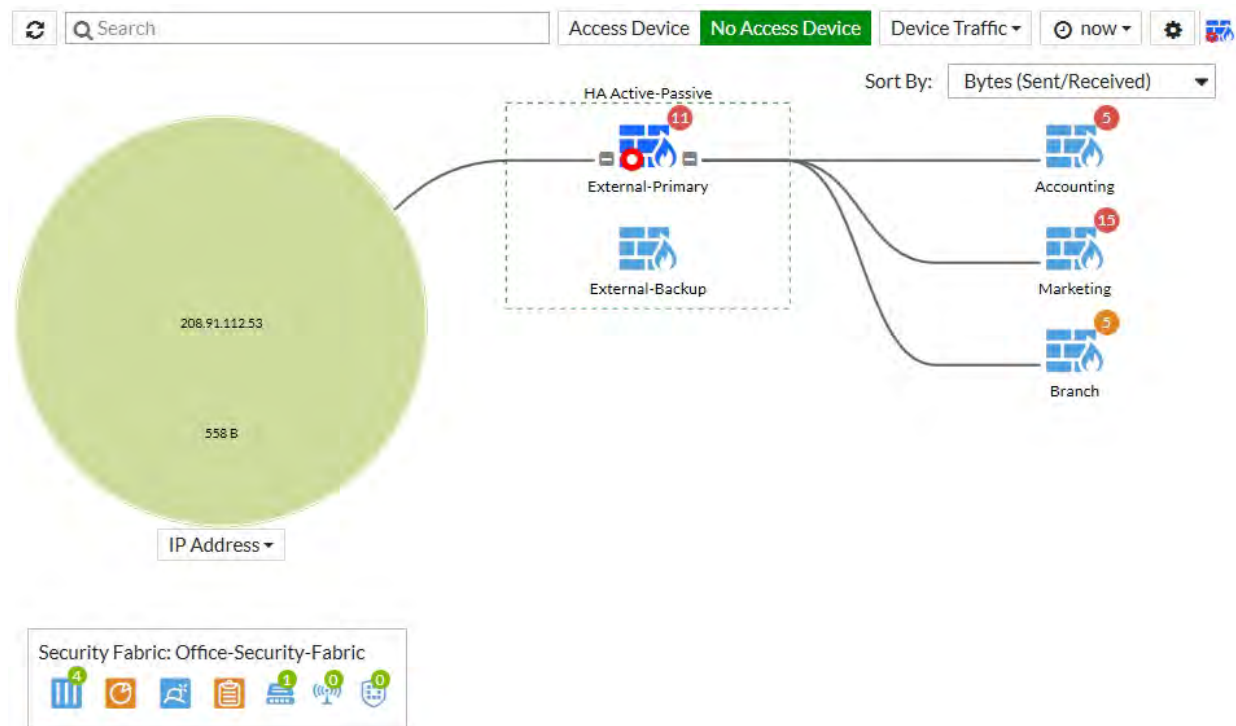

Physical and Logical FortiView improvements

The FortiView Physical and Logical Topology pages now display the following improvements:

- Shows both FortiGates in an HA configuration
- Shows FortiAPs
- Lists FortiAnalyzer and FortiSandbox as components of the Security Fabric
- Highlights the current FortiGate

- Displays Link Usage in different colors
- Ranks Endpoints by FortiClient Vulnerability Score and by Threat Score (see below, for more information)
- Displays user avatars
- Recognizes servers as a device type
- Introduces a search bar to help locate specific devices in the Security Fabric

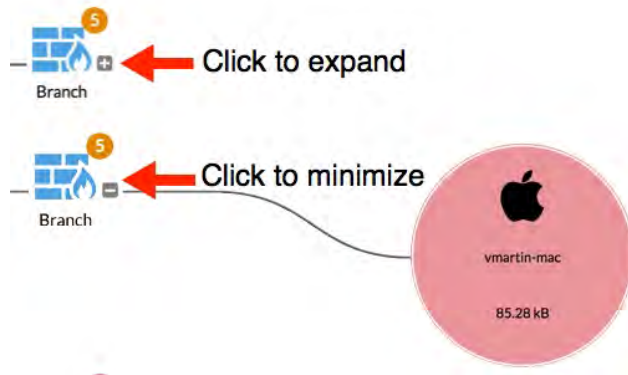

Updated Physical and Logical Topology legend

On the **Physical Topology** and **Logical Topology** pages, the Security Fabric legend has been updated. See the screenshot below:

New option to minimize the Topology

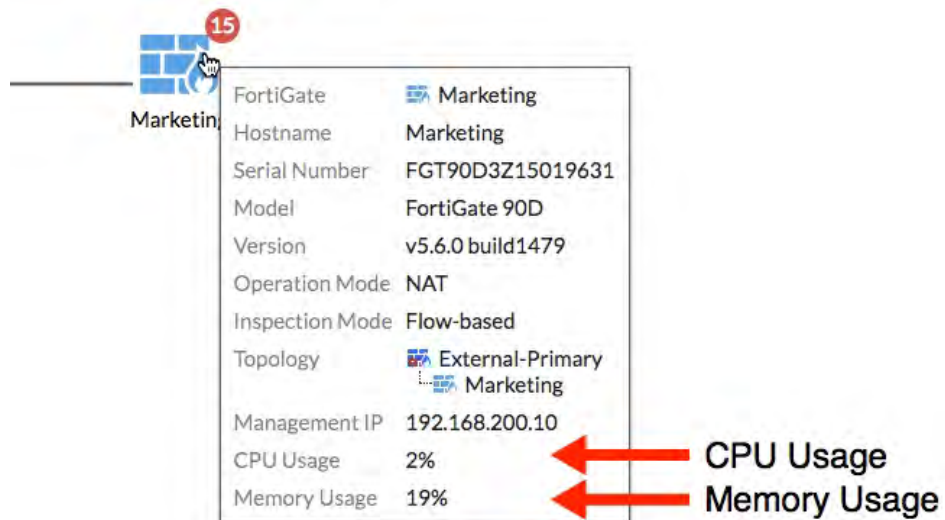

This new feature allows you to minimize portions of the Physical and Logical Topology. This makes it easy to view your entire topology, or minimize portions to focus in on a specific area. See the screenshot below:

Security Fabric Topology shows new resource information alerts

The enhanced Security Fabric topology now shows CPU Usage and Memory Usage alerts in the device information tooltip. It also displays a warning if the FortiGate is in conserve mode. Note that the CPU usage, memory usage and conserve mode data are drawn from the data that was last loaded from the FortiGate, not real-time data.

You can see the new CPU Usage and Memory Usage fields shown in the tooltip below:

The Conserve mode warning is shown below:

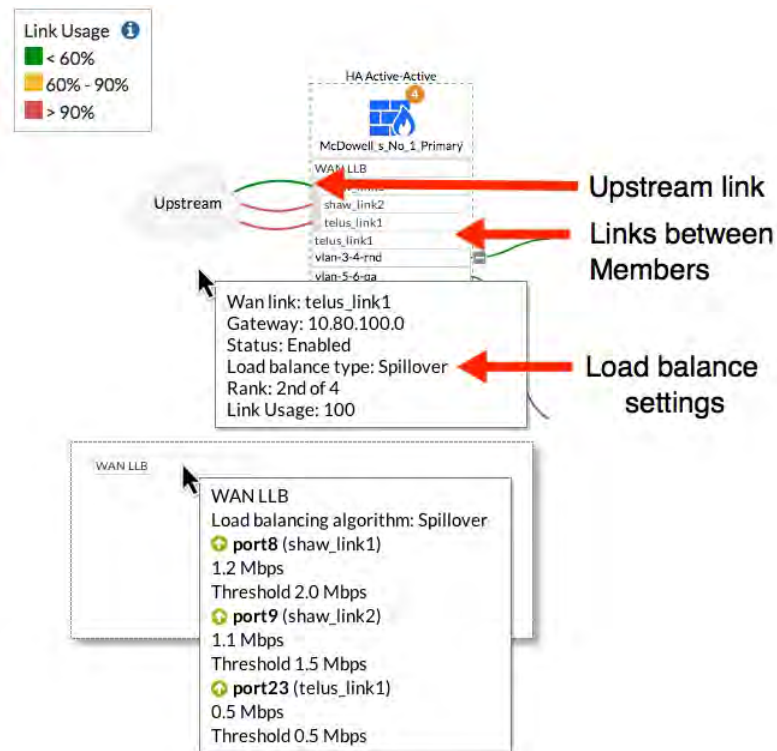

SD-WAN information added to Security Fabric topology

The Security Fabric topology now includes SD-WAN. Enhancements include greater visibility into where the data comes from and goes to, link saturation indicators, and detailed tooltip explanations.

The following SD-WAN information has been integrated into the Security Fabric topology:

- The tooltip for the SD-WAN interface now includes load balancing settings.
- In the Security Fabric Logical Topology, SD-WAN and its interface members will appear above all interfaces.
- If connected to an upstream FortiGate, one link between the exact SD-WAN member and the upstream FortiGate will appear.
- If connected to a destination bubble, links between each enabled member and the destination bubble appear.
- Interface bandwidth and link utilization for other interfaces (WAN role interface) have been temporarily removed and will be added back in later.
- Fixes have been made to show vulnerabilities for multiple MAC addresses (402495) and to show the FortiSwitch serial and port (389158).

For more details see the screenshot below:

SD-WAN Monitor Support added to Security Fabric (417210)

The Security Fabric now retrieves monitor information from all members of the Security Fabric and displays it in the GUI of the root FortiGate. Support was added for the Routing Monitor, DHCP Monitor and User Quarantine Monitor.

You can use the new drop down menu shown below to select the Security Fabric members:

FortiCache support for the Security Fabric (435830)

FortiGates in the Security Fabric can now use FortiCache as a remote cache service. Previously, FortiCache was supported via WCCP re-direct only, but now FortiGates can use it as a local cache rather than redirecting via WCCP.

In the GUI, follow the steps below:

1. Go to **Security Fabric > Settings** and enable **HTTP Service**.
2. Set **Device Type** to **FortiCache** and add the **IP addresses** of the FortiCache devices.
3. You can also select **Authentication** and add a password if required. See the screenshot below:

HTTP Service

Device type: **FortiCache** FortiWeb

FortiCache IPs: 10.10.10.10

Authentication: ☒

Password:

In the CLI, enter the following commands:

```
config wanopt forticache-service
  set status enable
  set local-cache-id <local-cache-id>
  set remote-forticache-id <remote-forticache-id>
  set remote-forticache-ip <remote-forticache-ip>
end
```

- `status` - Enable/disable using FortiCache as web-cache storage
- `disable` - Use local disks as web-cache storage
- `enable` - Use a remote FortiCache as web-cache storage
- `local-cache-id` - The cache ID that this device uses to connect to the remote FortiCache
- `remote-forticache-id` - The ID of the FortiCache that the device connects to
- `remote-forticache-ip` - The IP address of the FortiCache the device connects to

Enhanced Security Fabric audit tests for FortiGuard licenses (409156)

The Security Fabric audit now has separate audit tests for FortiGuard licenses based on whether the FortiGuard license is valid, expired, never been activated, or temporarily unavailable. Previously, the audit test performed one batch test on all FortiGuard licenses, regardless of the status of the licenses. Recommendations for individual licenses are also provided in the GUI tooltips.

You can see the new breakdown of pass or fail actions shown below:

- License valid = pass
- License expired = fail
- License never activated = fail
- License is unavailable (connection issue with FortiGuard) = pass

If a required **Feature Visibility** is disabled, the audit test for it will not show vulnerabilities. The audit will show a score of zero (or a pass). Go to **System > Feature Visibility** (previously the Feature Select menu) to make any changes.

In the GUI, follow the steps below to check the status of your FortiGuard licenses:

1. Go to **Security Fabric > Audit** to check the status of your FortiGuard licenses.
2. Follow the steps in the Security Fabric Audit wizard.

3. Expand **Firmware & Subscriptions**, and look at the **FortiGuard License Subscriptions** section to verify whether any recommended action is required. See the example below:

Issue	FortiGate	Result	Recommendation
Firmware & Subscriptions 5			
FortiCare Support FortiGate should be registered with FortiCare and have valid support coverage.	External-Primary	-50	Renew the following support coverage services that have expired: <ul style="list-style-type: none"> • Hardware Version (2017/05/08) • Firmware (2017/05/08) • Enhanced Support (2017/05/08) • Comprehensive Support (2017/05/08)
FortiGuard License Subscriptions All registered FortiGuard license subscriptions should be valid.	External-Primary	-50	Renew the following expired licenses: <ul style="list-style-type: none"> • AntiVirus (2017/05/08) • IPS (2017/05/08)

FortiClient Vulnerability Score

Endpoints in the Security Fabric topology are now ranked by their FortiClient Vulnerability Score. This score is calculated by the severity of vulnerabilities found on the endpoint:

- critical vulnerability = 100 points
- high vulnerability = 50 points
- medium vulnerability = 5 points
- low vulnerability = 2 points
- info vulnerability = 1 point

FortiView Consolidation

Information about the Security Fabric can now be seen throughout the FortiView dashboards on the upstream FortiGate, when the real-time view is used.

- You can right-click on an entry and select View Aggregated Details to see more information.
- The upstream FortiGate filters information to avoid counting traffic from the same hosts multiple times on each hop.

The upstream FortiGate also now has the option to end downstream FortiGate sessions or quarantine endpoints that connect to downstream FortiGates.

Remote login to downstream FortiGates

You can now log into downstream FortiGates from the upstream FortiGate, by right-clicking on the downstream FortiGate when viewing the Security Fabric's topology using FortiView.

Logging Consolidation and Improvements

Several changes have been made to improve logging for a Security Fabric.

Sending all logs to a single FortiAnalyzer

By default, all FortiGates in the Security Fabric now send logs to a single FortiAnalyzer. The connection to the FortiAnalyzer is configured on the upstream FortiGate, then the settings are pushed to all other FortiGates.

In FortiOS 5.6, a FortiAnalyzer is required for the root FortiGate in the Security Fabric; however, downstream devices can be configured to use other logging methods through the CLI:

```
config system csf
    set logging-mode local
end
```

Data Exchange with FortiAnalyzer

The following information about the Security Fabric configuration is now sent to the FortiAnalyzer:

- Topology info
- Interface roles
- LAT / LNG info
- Device asset tags

Security Fabric

Group name

Group password

Connect to upstream FortiGate ☐

FortiAnalyzer logging

IP Address [Test Connectivity](#) [View Permissions](#)

Storage Usage

59.00 MB / 23.13 GB

Upload Option Real Time Every Minute Every 5 Minutes

Encrypt Log Transmission [i](#) ☒

Retrieving Monitor Information

Monitors on the upstream FortiGate, such as the VPN Monitor, Route Monitor, and User Quarantine, can now view the information from downstream devices. You can use the button in the top right corner of the screen to change the FortiGate information that is displayed.

Log Settings

Log statistics for each FortiGate in the Security Fabric are now shown when you go to **Log & Report > Log Settings**.

Device Tree

The entire Security Fabric tree is now updated upward, and each node has an updated state of the whole subtree. The content is saved in the local file and upon request from the GUI or a diagnose command (dia sys csf downstream) it can be retrieved.

Security Fabric Audit and Fabric Score

This chapter contains information about the Security Fabric Audit and Fabric Score, which together provide a method to continually monitor and improve your Security Fabric's configuration.

What is the Security Fabric Audit?

The Security Fabric Audit is a feature on your FortiGate that allows you to analyze your Security Fabric deployment to identify potential vulnerabilities and highlight best practices that could be used to improve your network's overall security and performance.

Why should you run a Security Fabric Audit?

Using the Security Fabric Audit helps you to tune your network's configuration, deploy new hardware and/or software, and gain more visibility and control of your network. Also, by checking your Security Fabric Score, which is determined based on how many checks your network passes/fails during the Audit, you can have confidence that your network is getting more secure over time.

Running a Security Fabric Audit

The Security Fabric Audit must be run on the root FortiGate in the Security Fabric.

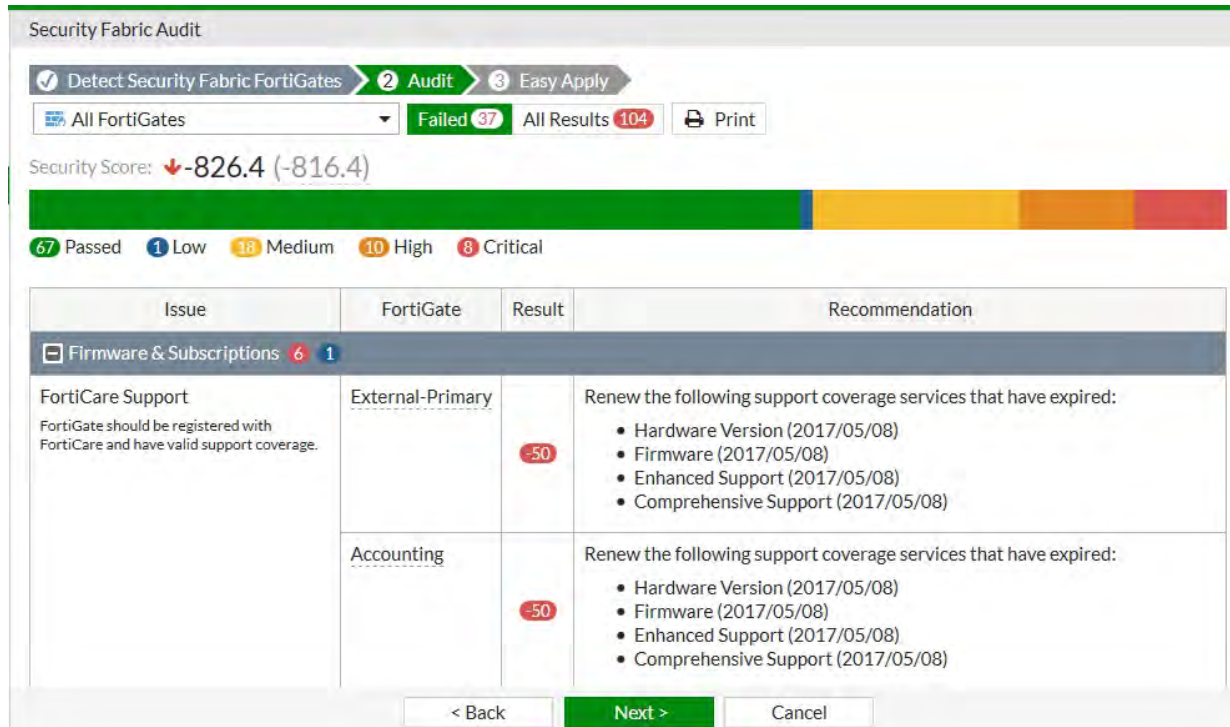

The Security Fabric Audit can be found by going to **Security Fabric > Audit**. In the first step, all detected FortiGates are shown.

1 Detect Security Fabric FortiGates
2 Audit
3 Easy Apply

i 4 FortiGate(s) detected in your security fabric.

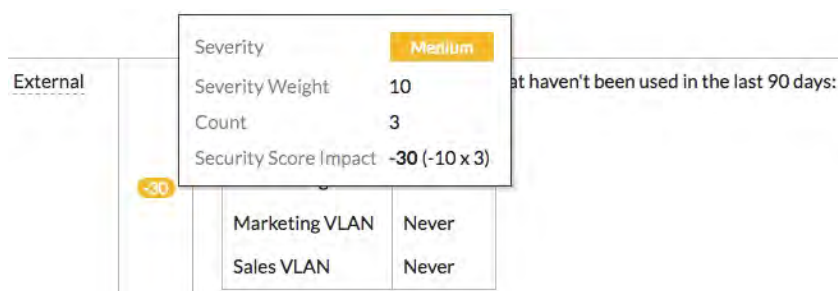

FortiGate	Model	Version
External	FortiGate 600D	v5.6.0 build1435
Sales	FortiGate 51E	v5.6.0 build1435
Accounting	FortiGate 140D	v5.6.0 build1435
Marketing	FortiGate 90D	v5.6.0 build1435

In the second step, the audit is performed and a list of recommendations are shown. Two views are available: **Failed** or **All Results**. These views can be further segmented so that you view results from all FortiGates or just a specific unit.

In each view, a chart appears showing the results of individual checks. The following information is shown: the name and a description of the check, which FortiGate the check occurred on, the checks result on your overall security score, and any necessary recommendations.

If you hover the mouse over the **Result** for a check, you can get a breakdown on how this score was determined. For more information about this, see ["Security Fabric Score" on page 78](#).

In Step Three of the Audit, **Easy Apply** recommendations are displayed and can be applied. By using **Easy Apply**, you can change the configuration of any FortiGate in the fabric.

For other recommendations, further action is required if you wish to follow the recommendation.

Issue	FortiGate	Result	Recommendation
Internal Segmentation Firewall (ISFW)			
Device Discovery Interfaces which are classified as "LAN" or "DMZ" should have device detection enabled.	Sales	❌	Enable device detection on the following interfaces: lan
	Marketing	❌	Enable device detection on the following interfaces: internal
Endpoint Compliance			
Endpoint Registration Interfaces which are classified as "LAN" should have FortiTelemetry enabled.	Marketing	❌	Enable FortiTelemetry on the following interfaces: internal
Security Best Practices			
Detect Botnet Connections Interfaces which are classified as "WAN" should block or monitor outgoing connections to botnet sites.	Sales	❌	Block outgoing connections to botnet sites on the following interfaces: wan0
	Accounting	❌	Block outgoing connections to botnet sites on the following interfaces: wan0
	Marketing	❌	Block outgoing connections to botnet sites on the following interfaces: wan0
	External	❌	Block outgoing connections to botnet sites on the following interfaces: wan0
Admin Password Policy A password policy should be set up for system administrators.	External	❌	Enable a strong password policy for system administrators.
	Sales	❌	Enable a strong password policy for system administrators.
	Accounting	❌	Enable a strong password policy for system administrators.
	Marketing	❌	Enable a strong password policy for system administrators.

You can also view Audit recommendations for specific devices using the FortiView Topology consoles. If a recommendation is available for a device, a circle containing a number appears. The number shows how many recommendations are available, while the color of the circle shows the severity of the highest check that failed (red is critical, orange is high, yellow is medium, and blue is low).

Logging for the Security Fabric Audit

An event filter subtype is available for the Security Audit. Every time an audit is run, event logs are created on the root FortiGate that summarize the results of the audit, as well as details into the individual tests.

Syntax

```
config log eventfilter
```

```

    set security-audit {enable | disable} (enabled by default)
end

```

Security Fabric Audit Checks

The Security Fabric Audit performs a variety of checks when analyzing your network. All checks are based on your current network configuration, using realtime monitoring. The Audit runs these checks across all FortiGate in the Security Fabric.

Firmware & Subscriptions

Goal	Severity	Check	Recommendation	Easy Apply?
Compatible Firmware	Critical	All FortiGates in the Security Fabric should run the same firmware version.	Run same version as root.	No
FortiCare Support	Critical	FortiGate should be registered with FortiCare.	Register with FortiCare.	No
FortiGuard License Subscriptions	High	All registered FortiGuard license subscriptions should be valid.	Renew subscriptions.	No
FortiAP Firmware Versions	Low	All FortiAPs should be running the latest firmware.	Upgrade FortiAP to recommended version.	No
FortiSwitch Firmware Versions	Low	All FortiSwitches should be running the latest firmware.	Update all FortiSwitches to use the latest firmware.	No

Internal Segmentation Firewall (ISFW)

Goal	Severity	Check	Recommendation	Easy Apply?
Interface Classification	High	All interfaces should be classified as either "LAN", "WAN", or "DMZ".	Configure the interface role.	Yes
Device Discovery	High	Interfaces which are classified as "LAN" or "DMZ" should have device detection enabled.	Enable device detection.	Yes
Third Party Router & NAT Devices	Medium	No third party router or NAT devices should be detected in the network.	Replace the device with a FortiGate.	No
VLAN Management	Medium	Non-FortiLink interfaces should not have multiple VLANs configured on them.	Use FortiSwitch and FortiLink.	No

Goal	Severity	Check	Recommendation	Easy Apply?
Centralized Logging & Reporting	High	Logging and reporting should be done in a centralized place throughout the Security Fabric.	Install FortiAnalyzer for logging & reporting.	No
LAN Segment	Medium	Servers should be placed behind interfaces classified as "DMZ".	All servers should be moved to interfaces with role "DMZ".	No
Unused Policies	Medium	All IPv4 policies should be used.	Review all IPv4 policies that haven't been used in the last 90 days.	No
Advanced Threat Protection	High	Suspicious files should be submitted to FortiSandbox or FortiSandbox Cloud for inspection.	Configure AntiVirus profiles to send files to FortiSandbox or FortiSandbox Cloud for inspection.	No
Unauthorized FortiAPs	Medium	All discovered FortiAPs should be authorized or disabled.	Authorize or disable unauthorized FortiAPs.	Yes
Unauthorized FortiSwitches	Medium	All discovered FortiSwitches should be authorized or disabled.	Authorize or disable unauthorized FortiSwitches.	Yes

Endpoint Compliance

Goal	Severity	Check	Recommendation	Easy Apply?
Endpoint Registration	High	Interfaces which are classified as "LAN" should have FortiTelemetry enabled.	Enable FortiTelemetry on "LAN" interfaces.	Yes
FortiClient Protected	Medium	All supported devices should be registered via FortiClient.	Register all devices via FortiClient.	No
FortiClient Compliance	Medium	All registered FortiClient devices should be compliant with FortiClient profile.	Investigate non-compliant reason(s) for FortiClient endpoints.	No
FortiClient Vulnerabilities	Critical	All registered FortiClient devices should have no critical vulnerabilities.	Have FortiClient fix the detected critical vulnerabilities.	No

Security Best Practices

Goal	Severity	Check	Recommendation	Easy Apply?
Detect Botnet Connections	High	Interfaces which are classified as "WAN" should block or monitor outgoing connections to botnet sites	Enable botnet detection on "WAN" interfaces.	Yes
Unsecure Protocol - HTTP	High	Interfaces which are classified as "WAN" should not allow HTTP administrative access.	Enable HTTPS redirection globally.	Yes
Unsecure Protocol - Telnet	High	Interfaces which are classified as "WAN" should not allow Telnet administrative access.	Disable Telnet.	Yes
Valid HTTPS Certificate - Administrative GUI	Medium	The administrative GUI should not be using a default built-in certificate.	Acquire a certificate for your domain, upload it, and configure the administrative GUI to use it.	No
Valid HTTPS Certificate - SSL VPN	Medium	SSL VPN should not be using a default built-in certificate.	Acquire a certificate for your domain, upload it, and configure SSL VPN to use it.	No
Explicit Interface Policies	Low	Policies that allow traffic should not be using the "any" interface.	Change the policy to use a specific interface.	No
Admin Password Policy	Medium	A password policy should be setup for system administrators.	Enable a simple password policy for system administrators.	Yes

Security Fabric Score

The **Security Fabric Score** widget has been added to the FortiGate Dashboard to give visibility into auditing trends. This widget uses information from the Security Fabric Audit to determine your score. Score can be positive or negative, with a higher score representing a more secure network.

Score is based on the number of checks failed and the severity of these checks. The weight for each severity level is as follows:

- Critical: 50 points
- High: 25 points
- Medium: 10 points
- Low: 5 points

You get points for passing a test only when it passes for all FortiGate in your fabric. If this occurs, the score is calculated using this formula:

$$+Severity\ Weight \times Secure\ FortiGate\ Multiplier$$

The Severity Weight is calculated as Severity divided by the number of FortiGate in the Fabric. The Secure FortiGate Multiplier is determined using logarithms and the number of FortiGate in the fabric. For example, if you have four FortiGate in your fabric that all pass the Compatible Firmware check, your score for each individual FortiGate is:

$$(50/4) \times 1.292 = 16.2\ points$$

If a test fails on any FortiGate in your Fabric, all other FortiGate that passed the check award 0 points. For the FortiGate the test failed on, the score is calculated using this formula:

$$-Severity\ Weight \times Count$$

Count is the number of times the check failed during the audit. For example, if two critical FortiClient vulnerabilities are discovered during the Audit, your score for that check is:

$$-50 \times 2 = -100\ points$$

For checks that do not apply, your score does not change. For example, if you have no FortiAPs in the fabric, you will receive no points for the FortiAP Firmware Versions check.

New Dashboard Features

The FortiOS 5.6 **Dashboard** has a new layout with a Network Operations Center (NOC) view with a focus on alerts. Widgets are interactive; by clicking or hovering over most widgets, the user can get additional information or follow links to other pages.

Enhancements to the GUI dashboard and its widgets are:

- Multiple dashboard support.
- VDOM and global dashboards.
- Updated resize control for widgets.
- Notifications moved to the top header bar (moved existing dashboard notifications to the header and added additional ones).
- Reorganization of **Add Widget** dialog.
- New **Host Scan Summary** widget.
- New **Vulnerabilities Summary** widget that displays endpoint vulnerability information much like the FortiClient Enterprise Management Server (EMS) summary.
- Multiple bug fixes.

Features that were only visible through old dashboard widgets have been placed elsewhere in the GUI:

- Restore configuration.
- Configuration revisions.
- Firmware management.
- Enabling / disabling VDOMs.
- Changing inspection mode.
- Changing operation mode.
- Shutdown / restart device.
- Changing hostname.
- Changing system time.

The following **widgets** are displayed by default:

- [System Information](#)
- [Licenses](#)
- [FortiCloud](#)

- [Security Fabric](#)
- [Administrators](#)
- [CPU](#)
- [Memory](#)
- [Sessions](#)
- [Bandwidth](#)
- [Virtual Machine](#) (on VMs and new to FortiOS 5.6.1)

The following **optional** widgets are available:

- Interface Bandwidth
- Disk Usage
- Security Fabric Risk
- Advanced Threat Protection Statistics
- Log Rate
- Session Rate
- Sensor Information
- HA Status
- Host Scan Summary
- Vulnerabilities Summary
- FortiView (new to FortiOS 5.6.1)

The following widgets have been **removed**:

- CLI Console
- Unit Operation
- Alert Message Console

System Information

System Information	
Hostname	FG100D3G15818864
Serial Number	FG100D3G15818864
Firmware	v5.6.0 build1435
Mode	NAT (Proxy-based)
System Time	2017/03/22 14:05:04
Uptime	00:00:31:34
WAN IP	209.87.240.98 (🇨🇦 Kanata, Ontario, Canada)

Only appears when you click on the widget. Click on the System page you want to go to.

FortiGuard WAN IP blacklist service is now online

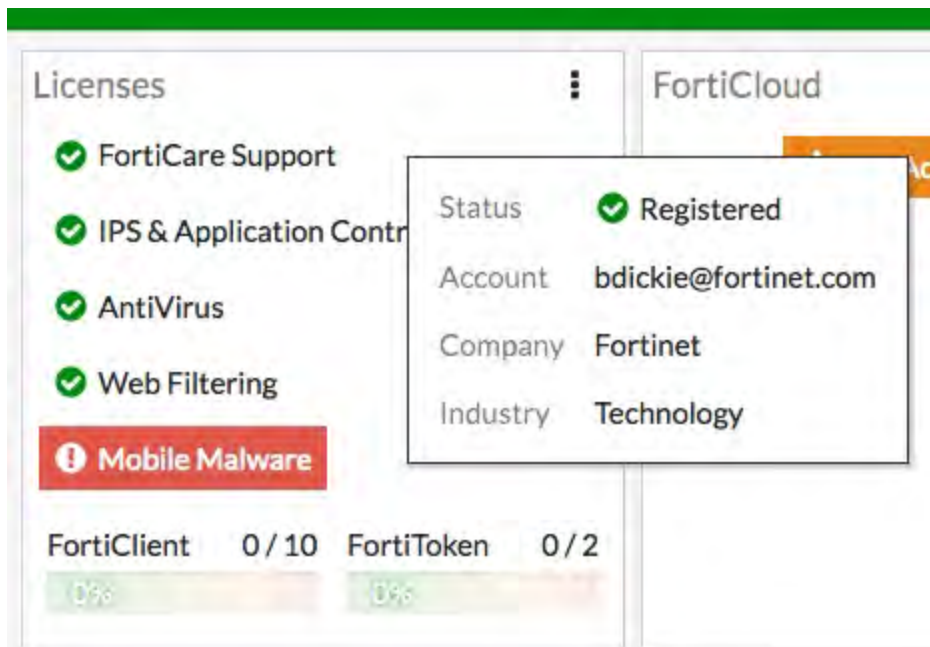

The FortiGuard WAN IP blacklist service was not online in FortiOS 5.6.0. In FortiOS 5.6.1, a notification appears on the **Dashboard** when WAN IP is blacklisted. Clicking on the notification (bell icon) brings up the blacklist details.

Licenses

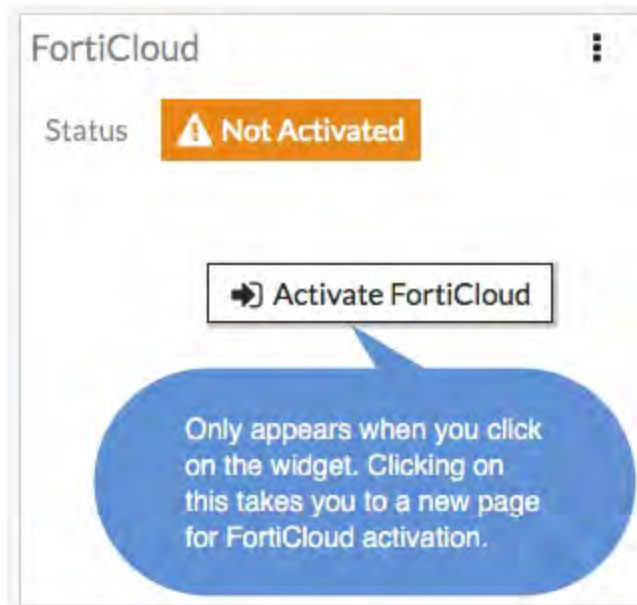

Hovering over the **Licenses** widget will cause status information (and, where applicable, database information) on the licenses to be displayed for **FortiCare Support**, **IPS & Application Control**, **AntiVirus**, **Web Filtering**, **Mobile Malware**, and **FortiClient**. The image below shows **FortiCare Support** information along with the registrant's company name and industry.

Clicking in the **Licenses** widget will provide you with links to other pages, such as **System > FortiGuard** or contract renewal pages.

FortiCloud

This widget displays FortiCloud status and provides a link to activate FortiCloud.

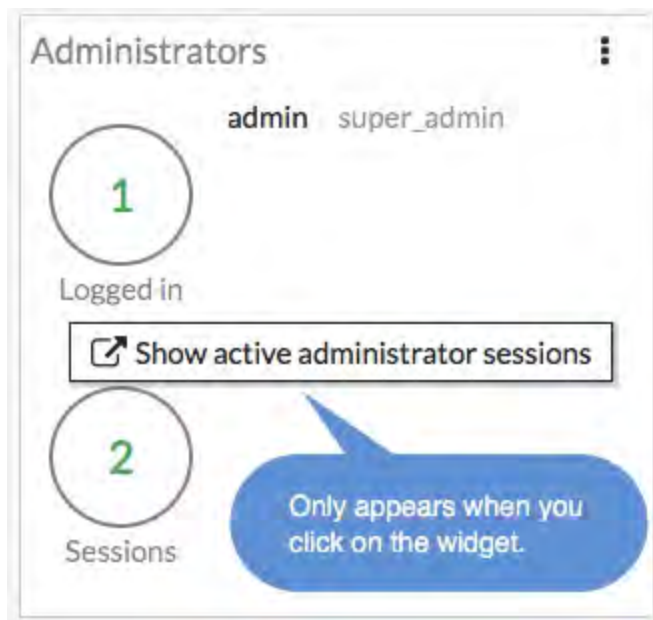

Fortinet Security Fabric

The **Security Fabric** widget is documented in the [Security Fabric](#) section of the **What's New** document.

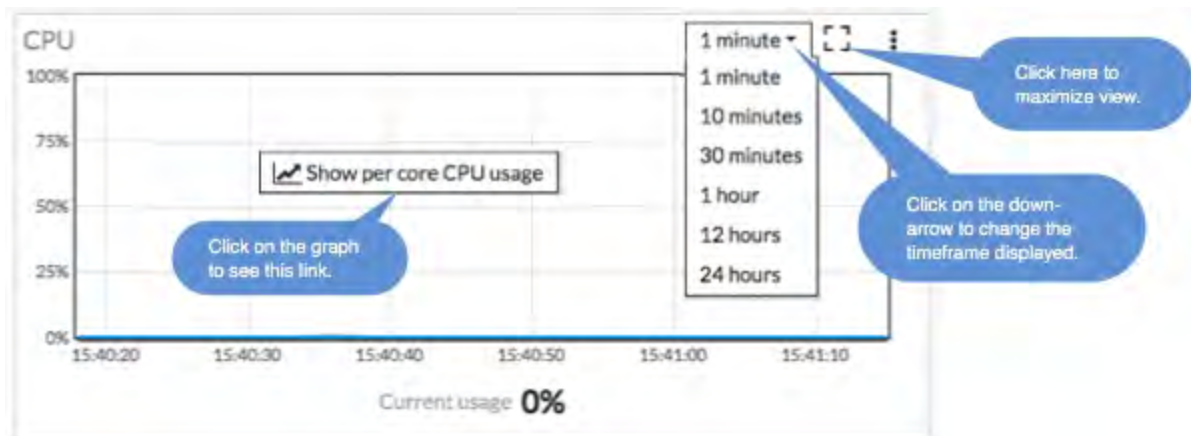

Administrators

This widget allows you to view which administrators are logged in and how many sessions are active. The link directs you to a page displaying active administrator sessions.

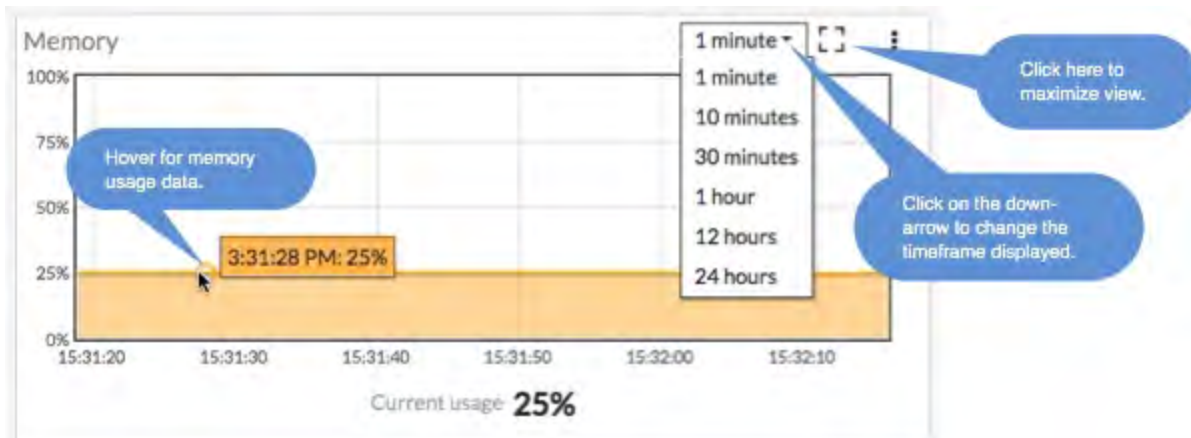

CPU

The real-time CPU usage is displayed for different timeframes.

Memory

Real-time memory usage is displayed for different time frames. Hovering over any point on the graph displays percentage of memory used along with a timestamp.

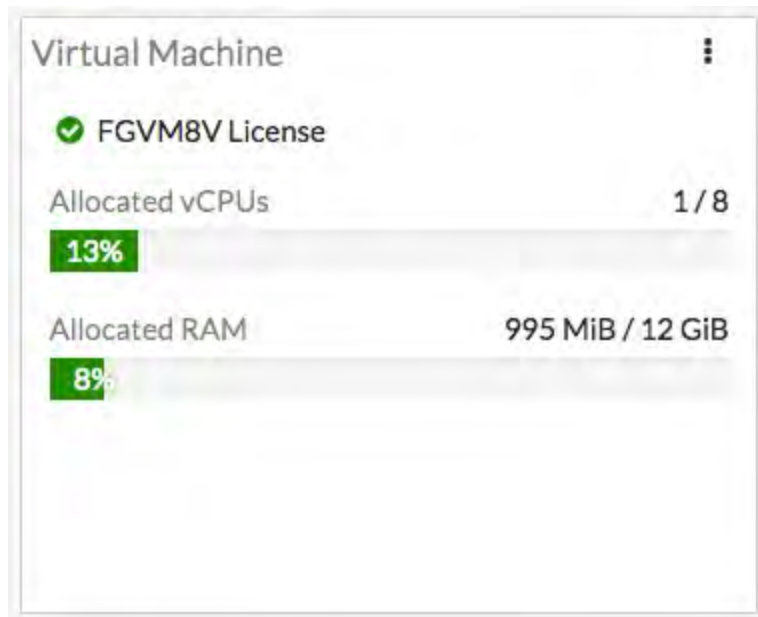

Sessions

Bandwidth

Virtual Machine

FortiOS 5.6.1 introduces a VM widget with these features:

- License status and type.
- CPU allocation usage.
- License RAM usage.
- VMX license information (if the VM supports VMX).
- If the VM license specifies 'unlimited' the progress bar is blank.
- If the VM is in evaluation mode, it is yellow (warning style) and the dashboard show evaluation days used.
- Widget is shown by default in the dashboard of a FortiOS VM device.
- Removed VM information from License widget at **Global > Dashboard**.
- License info and **Upload License** button provided on page **Global > System > FortiGuard**.
- Updated 'Upload VM License' page:
 - Added license RAM usage and VMX instance usage.
 - Replaced file input component.

FortiExplorer for iOS

A new iOS FortiExplorer app is available as of April 8, 2017.

FortExplorer for iOS is compatible with iPhone, iPad, and iPod Touch and supports configuration via REST API and display of FortiView and other security fabric components.

You can use FortiExplorer for iOS to perform most FortiOS configuration management tasks.

Advanced features will be available with the purchase of an add-on through the App Store. These paid features include the adding more than two devices and downloading firmware images from FortiCare.

With the release of FortiOS 5.6.1, FortiOS icons and colors are now exportable in the GUI shared project and FortiExplorer now uses these icons and colors. This change improves the icon colors only for the FortiExplorer GUI theme (seen only when accessing a web GUI page from within the FortiExplorer iOS app).

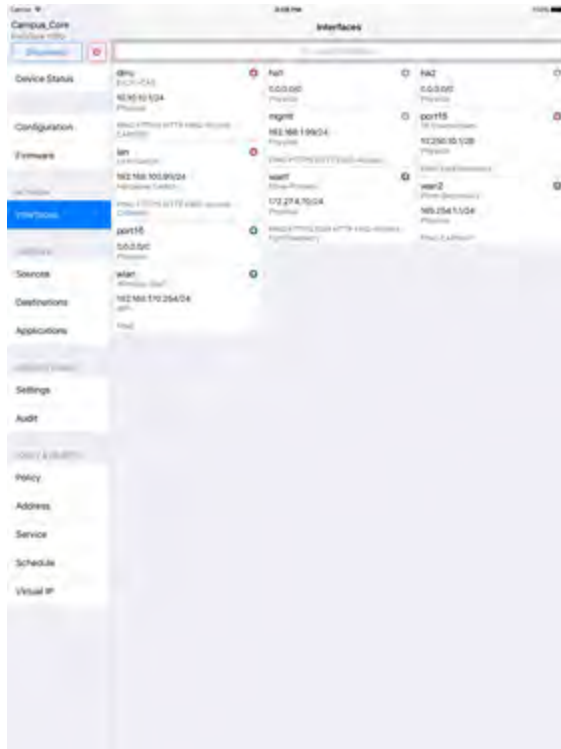

The images below offer a preview of a few of the new FortiExplorer iOS app's screens.

FortiExplorer iOS, v 1.0 - Device Status

FortiExplorer iOS, v. 1.0 - Sources

FortiExplorer iOS, v.1.0 - Device Interfaces

FortiExplorer iOS, v.1.0 - Firmware

Transparent web proxy (386474)

In addition to the Explicit Web Proxy, FortiOS now supports a Transparent web proxy. While it does not have as many features as Explicit Web Proxy, the transparent proxy has the advantage that nothing needs to be done on the user's system to forward supported web traffic over to the proxy. There is no need to reconfigure the browser or publish a PAC file. Everything is transparent to the end user, hence the name. This makes it easier to incorporate new users into a proxy deployment.

You can use the transparent proxy to apply web authentication to HTTP traffic accepted by a firewall policy. In previous versions of FortiOS, web authentication required using the explicit proxy.

Normal FortiOS authentication is IP address based. Users are authenticated according to their IP address and access is allowed or denied based on this IP address. On networks where authentication based on IP address will not work you can use the Transparent Web proxy to apply web authentication that is based on the user's browser and not on their IP address. This authentication method allows you to identify individual users even if multiple users on your network are connecting to the FortiGate from the same IP address.

Using the Transparent proxy

To implement the Transparent proxy, go to **System > Settings** and scroll down to **Operations Settings** and set the inspection mode to **Proxy**.

Then go to **System > Feature Visibility** and enable **Explicit Proxy**.

Then go to **Security Profiles > Proxy Options**, edit a proxy options profile and under **Web Options** enable **HTTP Policy Redirect**.

Then go to **Policy & Objects > IPv4 Policy** and create or edit a policy that accepts traffic that you want to apply web authentication to. This can be a general policy that accepts many different types of traffic as long as it also accepts the web traffic that you want to apply web authentication to.

Select a **Security Profile** and select the **Proxy Options** profile that you enabled **HTTP Policy Redirect** for.

Name 	General Internet Access Policy	
Incoming Interface	 port2	▼
Outgoing Interface	 port1	▼
Source	 all	✕
Destination	 all	✕
Schedule	 always	▼
Service	 ALL	✕
Action	<input checked="" type="checkbox"/> ACCEPT <input type="checkbox"/> DENY <input type="checkbox"/> LEARN	

Firewall / Network Options

NAT	<input checked="" type="checkbox"/>
IP Pool Configuration	<input checked="" type="radio"/> Use Outgoing Interface Address <input type="radio"/> Use Dynamic IP Pool

Security Profiles

AntiVirus	<input checked="" type="checkbox"/>	 default	✎
Web Filter	<input type="checkbox"/>		
DNS Filter	<input type="checkbox"/>		
Application Control	<input type="checkbox"/>		
IPS	<input type="checkbox"/>		
Proxy Options		 default	✎
SSL/SSH Inspection		 certificate-inspection	✎

Then go to **Policy & Objects > Proxy Policy** create a Transparent Proxy policy to accept the traffic that you want to apply web authentication to. Set the **Proxy Type** to **Transparent Web**. The incoming interface, outgoing interface, destination address, and schedule should either match or be a subset of the same options defined in the IPv4 policy. Addresses added to the Source must match or be a subset of the source addresses added to the IPv4 policy. You can also add the users to be authenticated by the transparent policy to the source field.

Select other transparent policy options as required.

Proxy Type	Explicit Web	Transparent Web	FTP
Incoming Interface	port2 ▼		
Outgoing Interface	port1 ▼		
Source	web_users ✕		
Destination Address	all ✕		
Schedule	always ▼

More about the transparent proxy

The following changes are incorporated into Transparent proxy, some of which affect Explicit Web Proxy as well.

Flat policies

The split policy feature has been removed. This will make the explicit policy more like the firewall policy.

Authentication

The new authentication design is intended to separate authentication from authorization. Authentication has been moved into a new table in the FortiOS. This leaves the authorization as the domain of the explicit proxy policy.

Previously, if authentication was to be used:

1. The policy would be classified as an identity based policy
2. The policy would be split to add the authentication parameters
3. The authentication method would be selected
4. The user/group would be configured

Now:

The user/group is configured in the proxy policy

1. A new authentication rule is added
2. This option refers to the authentication scheme
3. The authentication scheme has the details of the authentication method

The new authentication work flow for Transparent Proxy:

Toggle the transparent-http-policy match:

```
config firewall profile-protocol-options
  edit <profile ID>
    config http
      set http-policy <enable|disable>
```

If disabled, everything works like before. If enabled, the authentication is triggered differently.

- http-policy work flow:
- For transparent traffic, if there is a regular firewall policy match, when the Layer 7 check option is enabled, traffic will be redirected to WAD for further processing.
- For redirected traffic, layer 7 policy (HTTP policy) will be used to determine how to do security checks.
- If the last matching factor is down to user ID, then it will trigger a new module to handle the L7 policy user authentication.
- Then propagate learned user information back to the system so that it can be used to match traffic for L4 policy.

New Proxy Type

There is a new subcategory of proxy in the proxy policy called **Transparent Web**. The old **Web Proxy** is now referred to as **Explicit Web Proxy**.

- This is set in the firewall policy
- It is available when the HTTP policy is enabled in the profile-protocol options for the firewall policy
- This proxy type supports OSI layer 7 address matching.
- This proxy type should include a source address as a parameter
- Limitations:
 - It can be used for HTTPS traffic, if deep scanning is not used
 - It only supports SNI address matching, i.e. domain names

- It does not support header types of address matching
- It only supports SSO authentication methods, no active authentication methods.

IP pools support

Proxies are now supported on outgoing IP pools.

SOCKSv5

SOCKSv5 authentication is now supported for explicit proxies.

To configure:

```
config authentication rule
edit <name of rule>
set protocol socks
end
```

Forwarding

Proxies support URL redirect/forwarding. This allows a non-proxy forwarding server to be assigned a rule that will redirect web traffic from one URL to another, such as redirecting traffic destined for youtube.com to restrict.youtube.com.

- A new option called "Redirect URL" has been added to the policy
- Traffic forwarding by VIP is supported

Support for explicit proxy address objects & groups into IPv4 firewall policies

This would allow the selection of web filter policy, SSL inspection policy, and proxy policy based on source IP + destination (address|explicit proxy object|category|group of any of those). This enables things like "do full SSL interception on www.google.com, but not the rest of the Search Engines category".

Support application service in the proxy based on HTTP requests.

The application service can be configured using the following CLI commands:

```
config firewall service custom
edit <name of service>
set explicit-proxy enable
set app-service-type <disable|app-id|app-category>
set app-category <application category ID, integer>
set application <application ID, integer>
end
```

CLI

Changes:

Previous	New
<code>config firewall explicit-proxy-policy</code>	<code>config firewall proxy-policy</code>

Previous	New
<code>config firewall explicit-proxy-address</code>	<code>config firewall proxy-address</code>
<code>config firewall explicit-proxy-addrgrp</code>	<code>config firewall proxy-addrgrp</code>
<pre>config firewall explicit-proxy-policy edit <policy ID> set proxy web end</pre>	<pre>config firewall proxy-policy edit <policy ID> set proxy explicit-web end</pre>

Removals:

- "split-policy" from firewall explicit-proxy-policy.

The previous method to set up a split policy was:

```
config firewall explicit-proxy-policy
edit 1
set proxy web
set identity-based enable
config identity-based-policy
edit 1
set schedule "always"
set utm-status enable
set users "guest"
set profile-protocol-options "default"
next
end
next
end
```

- "auth relative" from firewall explicit-proxy-policy

The following attributes have been removed from firewall explicit-proxy-policy:

- identity-based
- ip-based
- active-auth-method
- sso-auth-method
- require-tfa

Moves:

users and groups from

```
firewall explicit-proxy-policy identity-based-policy
to
config firewall proxy-policy
edit 1
set groups <Group name>
set users <User name>
end
```

Additions:

authentication scheme

```
config authentication scheme
edit <name>
set method [ntlm|basic|digest|form|negotiate|fsso|rsso|none]
```

- `ntlm` - NTLM authentication.
- `basic` - Basic HTTP authentication.
- `digest` - Digest HTTP authentication.
- `form` - Form-based HTTP authentication.
- `negotiate` - Negotiate authentication.
- `fsso` - FSSO authentication.
- `rsso` - RADIUS Single Sign-On authentication.
- `none` - No authentication.

authentication setting

```
config authentication setting
set active-auth-scheme <string>
set sso-auth-scheme <string>
set captive-portal <string>
set captive-portal-port <integer value from 1 to 65535>
```

- `active-auth-scheme` - Active authentication method.
- `sso-auth-scheme` - SSO authentication method.
- `captive-portal` - Captive portal host name.
- `captive-portal-port` - Captive portal port number.

authentication rule

```
config authentication rule
edit <name of rule>
set status [enable|disable]
set protocol [http|ftp|socks]
set srcaddr <name of address object>
set srcaddr6 <name of address object>
set ip-based [enable|disable]
set active-auth-method <string>
set sso-auth-method <string>
set web-auth-cookie [enable|disable]
set transaction-based [enable|disable]
set comments
```

- `status` - Enable/disable auth rule status.
- `protocol` - set protocols to be matched
- `srcaddr` / `srcaddr6` - Source address name. [`srcaddr` or `srcaddr6`(web proxy only) must be set].
- `ip-based` - Enable/disable IP-based authentication.
- `active-auth-method` - Active authentication method.
- `sso-auth-method` - SSO authentication method (require `ip-based` enabled)

- `web-auth-cookie` - Enable/disable Web authentication cookie.
- `transaction-based` - Enable/disable transaction based authentication.
- `comments` - Comment.

NGFW Policy Mode (397035)

You can operate your FortiGate or individual VDOMs in **Next Generation Firewall (NGFW) Policy Mode**.

You can enable NGFW policy mode by going to **System > Settings**, setting the **Inspection mode** to **Flow-based** and setting the NGFW mode to **Policy-based**. When selecting **NGFW policy-based** mode you also select the SSL/SSH Inspection mode that is applied to all policies

Flow-based inspection with profile-based **NGFW mode** is the default in FortiOS 5.6.

Or use the following CLI command:

```
config system settings
  set inspection-mode flow
  set policy-mode {standard | ngfw}
end
```

NGFW policy mode and NAT

If your FortiGate is operating in NAT mode, rather than enabling source NAT in individual NGFW policies you go to **Policy & Objects > Central SNAT** and add source NAT policies that apply to all matching traffic. In many cases you may only need one SNAT policy for each interface pair. For example, if you allow users on the internal network (connected to port1) to browse the Internet (connected to port2) you can add a port1 to port2 Central SNAT policy similar to the following:

New Central SNAT Policy

Incoming Interface	 port1	+	×
Outgoing Interface	 port2	+	×
Source address	 all	+	×
Destination address	 all	+	×

☒ NAT

IP Pool Configuration **Use Outgoing Interface Address** Use Dynamic IP Pool

Protocol **ANY** TCP UDP SCTP Specify 0

Application control in NGFW policy mode

You configure **Application Control** simply by adding individual applications to security policies. You can set the action to accept or deny to allow or block the applications.

Name 	Block YouTube		
Incoming Interface	 port1		▼
Outgoing Interface	 port2		▼
Source	 all	+	✕
Destination	 all	+	✕
Schedule	 always		▼
Service	 ALL	+	✕
Application	<div>  YouTube ✕ </div> <div>  YouTube_Channel.Access ✕ </div> <div>  YouTube_HD.Streaming ✕ </div> <div>  YouTube_Video.Access ✕ </div> <div>  YouTube_Video.Embedded ✕ </div> <div>+</div>		
URL Category	+		
Action	<div>  ACCEPT </div> <div>  DENY </div> <div>  LEARN </div>		

Web Filtering in NGFW mode

You configure **Web Filtering** by adding URL categories to security policies. You can set the action to accept or deny to allow or block the applications.

Name 	Block Streaming Websites	
Incoming Interface	 port1	▼
Outgoing Interface	 port2	▼
Source	 all	✕
	+	
Destination	 all	✕
	+	
Schedule	 always	▼
Service	 ALL	✕
	+	
Application	+	
URL Category	Streaming Media and Download	✕
	+	
Action	 ACCEPT  DENY  LEARN	

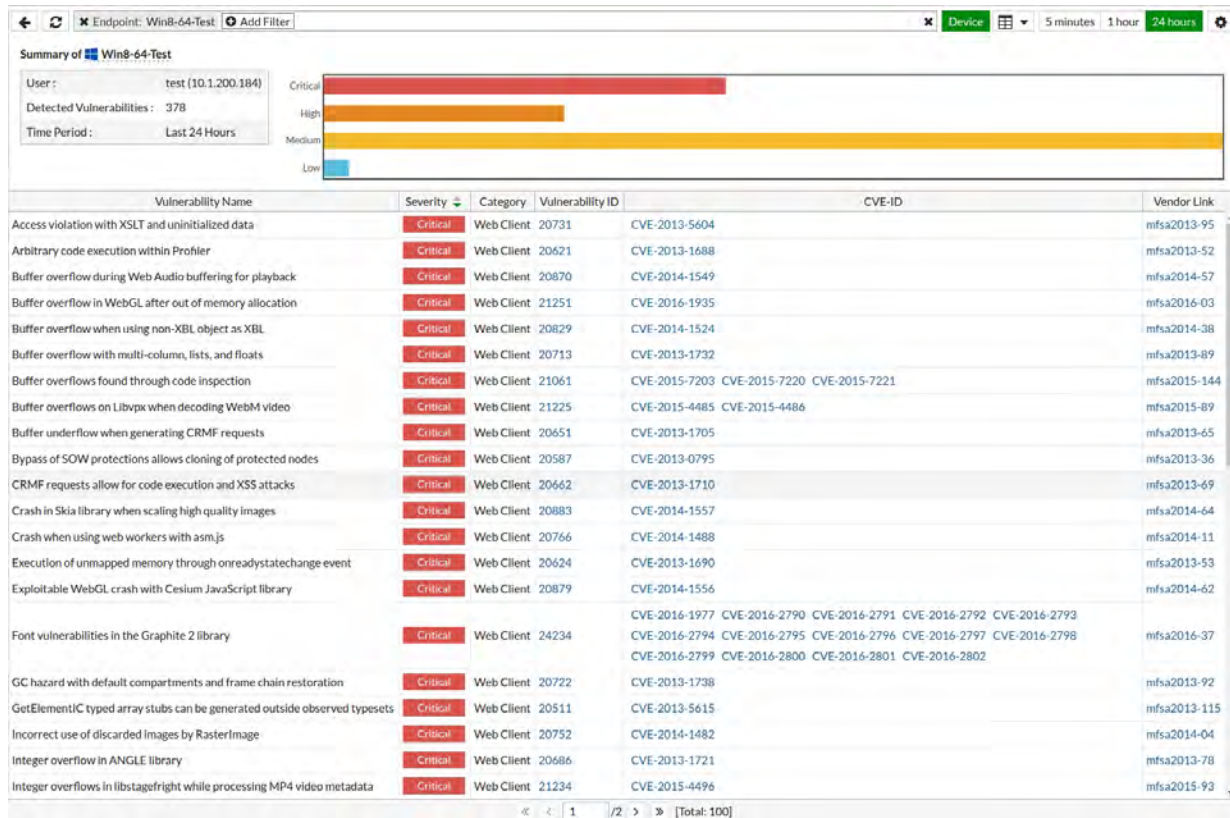

Other NGFW policy mode options

You can also combine both application control and web filtering in the same NGFW policy mode policy. Also if the policy accepts applications or URL categories you can also apply Antivirus, DNS Filtering, and IPS profiles in NGFW mode policies as well a logging and policy learning mode.

New FortiView Endpoint Vulnerability Scanner chart (378647)

FortiOS 5.6.0 adds a new chart to illustrate Endpoint Control events: **Endpoint Vulnerability**.

This is a list/bubble chart, that tracks vulnerability events detected by the FortiClients running on all devices registered with the FortiGate. FortiView displays information about the vulnerability and the device on which it was detected.

Notes about the Endpoint Vulnerability Chart:

- You can sort the list by **Device** or **Vulnerability**.
- You can drill down into any device to see the Vulnerabilities detected. From there, you can drill down to see the exact Vulnerability Scan events that triggered the detection.
- Select any Vulnerability Scan event to see the associated Log data.

FortiClient Profile changes (386267, 375049)

FortiClient profile improvements (386267, 375049)

FortiClient profiles have been changed in FortiOS 5.6 to include new protection features and to change organization of the GUI options. FortiClient profiles also use the FortiGate to warn or quarantine endpoints that are not compliant with a FortiClient profile.

A bug that prevented the Dialog and Device Inventory pages from loading when there is a large number of devices (for example, 10,000) has been fixed.

Default FortiClient profile

FortiClient profiles allow you to perform vulnerability scans on endpoints and make sure endpoints are running compliant versions of FortiClient. Also, security posture features cause FortiClient to apply realtime protection, AntiVirus, web filtering, and application control on endpoints.

Profile Name

Comments 0/255

Telemetry Data

Endpoints must send telemetry data to FortiGate for Security Fabric.
Non-compliant endpoints will be issued a warning.

Non-compliance action

Endpoint Vulnerability Scan on Client

System Compliance

Security Posture Check

The default FortiClient profile also allows you to set a general **Non-compliance action** for endpoints that don't have FortiClient installed on them. The non-compliance action can be block or warning and is applied by the FortiGate. Blocked endpoints are quarantined by the FortiGate.

Endpoint vulnerability scanning

Similar to FortiOS 5.4 you can set the FortiClient Profile to run the FortiClient vulnerability scanner on endpoints and you can set the Vulnerability quarantine level to quarantine endpoints that don't comply.

Endpoint Vulnerability Scan on Client

Vulnerability quarantine level

High

Non-compliance action

Block

The vulnerability scan **Non-compliance action** can block or warn endpoints if the vulnerability scan shows they do not meet the vulnerability quarantine level.

System compliance

FortiOS 5.6 system compliance settings are similar to those in 5.4 with the addition of a non-compliance action. System compliance checking is performed by FortiClient but the non-compliance action is applied by the FortiGate.

System Compliance

Minimum FortiClient version 

Windows endpoints

Mac endpoints

Upload Logs to FortiAnalyzer   ☒ Traffic ☒ Vulnerability
☒ Event

Non-compliance action

Security posture checking

Security posture checking collects realtime protection, antivirus protection, web filtering and application firewall features under the **Security Posture Check** heading.

Security Posture Check

Realtime Protection 

Up-to-date signatures 

Scan with FortiSandbox  

Third party AntiVirus on Windows   

Web Filter 

Profile

Application Firewall 

Application Control sensor

Non-compliance action

Application Control is now standard with FortiCare support

Application Control is now a standard part of any FortiCare support contract and the database for Application Control signatures is separate from the Intrusion Prevention System (IPS) database. However, botnet application signatures are still part of the IPS signature database since these are more closely related to security issues than application detection.

With the release of FortiOS 5.6.1, the Application Control signature database information is displayed under the **System > FortiGuard** page, in the FortiCare section. The botnet category is no longer available when you search for the Application Signatures list.

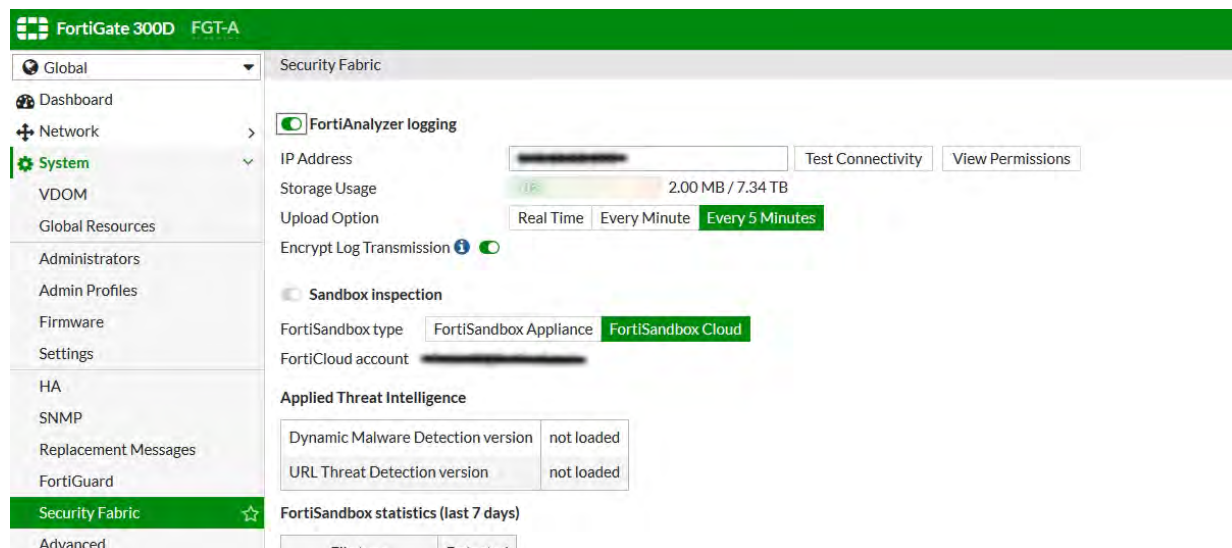

To receive updates to the Application Control signature database, you must have a valid FortiCare support contract.

IPS / Application Control logging performance

There is a major boost to Application Control and IPS when logging is enabled. With the latest changes, the performance difference with or without logging enabled is negligible.

Real time logging to FortiAnalyzer and FortiCloud

FortiOS 5.6.0 adds new real-time logging options for FortiAnalyzer in **System > Security Fabric** and for FortiCloud in **Log & Report > Log Settings**. The default option is still every 5 minutes, but this will allow near real-time uploading and consistent high-speed compression and analysis.

For FortiAnalyzer, the CLI syntax to enable real-time is:

```
config log fortianalyzer setting
  set upload-option [realtime/1-minute/5-minute]
```

For FortiCloud:

```
config log fortiguard setting
  set upload-option [realtime/1-minute/5-minute]
```

Reliable Logging updated for real-time functionality (378937)

Previously, reliable logging was a feature for buffering and collecting logs for upload, to guarantee that no logs would be dropped before being passed to logging solutions. Reliable logging has been updated for 5.6.0 so that real-time logs do not outpace upload speed.

It can be configured in the CLI with:

```
config log fortianalyzer setting
  set reliable [enable/disable]
```

FortiGate Logs can be sent to syslog servers in Common Event Format (CEF) (300128)

You can configure FortiOS to send log messages to remote syslog servers in CEF format. CEF is an open log management standard that provides interoperability of security-related information between different network devices and applications. CEF data can be collected and aggregated for analysis by enterprise management or Security Information and Event Management (SIEM) systems such as FortiSIEM.

FortiOS supports logging to up to four remote syslog servers. Each server can now be configured separately to send log messages in CEF or CSV format. Previously only CSV format was supported.

Use the following command to configure syslog3 to use CEF format:

```
config log syslog3 setting
  set format cef
end
```

All other syslog settings can be configured as required independently of the log message format including the server address and transport (UDP or TCP). You can also configure filtering for both CEF and CSV formatted log messages.

Controlled failover between wireless controllers

1+1 Wireless Controller HA

Instances of failover between FortiAP units was too long and lead to extended periods of time where WiFi users were without network connection. Because WiFi is considered a primary network connection in today's verticals (including enterprise, retail, education, warehousing, healthcare, government, and more), it is necessary for successful failover to occur as fast as possible.

Primary and secondary ACs

You can now define the role of the primary and secondary controllers on the FortiAP unit, allowing the unit to decide the order in which the FortiAP selects the FortiGate. This process was previously decided on load-based detection, but can now be defined by each unit's pre-determined priority. In addition, heartbeat intervals have been lowered to further improve FortiAP awareness and successful failover.

1+1 redundancy

1+1 HA is a form of resilience whereby a component has a backup component to take its place in the event of component failure, and successfully manage FortiAP without long failover periods.

CLI syntax

```
config wireless-controller inter-controller
  set inter-controller-mode {disable | l2-roaming | 1+1} Default is disable.
  set inter-controller-key <password>
  set inter-controller-pri {primary | secondary} Default is primary.
  set fast-failover-max [3-64] Default is 10.
  set fast-failover-wait [10-86400] Default is 10.
  config inter-controller-peer
    edit <name>
      set peer-ip <ip-address>
```

```

        set peer-port [1024-49150] Default is 5246.
        set peer-priority {primary | secondary} Default is primary.
    next
end
end

```

Multiple PSK for WPA Personal (393320)

New CLI commands have been added, under `config wireless-controller vap`, to configure multiple WiFi Protected Access Pre-Shared Keys (WPA-PSKs), as PSK is more secure without all devices having to share the same PSK.

Note that `mpsk-concurrent-clients` and the `mpsk-key` configuration method are only available when `mpsk` is set to enable.

CLI syntax

```

config wireless-controller vap
    edit <example>
        set mpsk {enable|disable}
        set mpsk-concurrent-clients [0-65535] Default is 0.
        config mpsk-key
            edit <key-name>
                set passphrase <wpa-psk>
                set concurrent-clients [0-65535] Default is empty.
                set comment <comments>
            next
        end
    end
end

```

Use the `mpsk-concurrent-clients` entry to set the maximum number of concurrent connected clients for each `mpsk` entry. Use the `mpsk-key` configuration method to configure multiple `mpsk` entries.

Hotspot 2.0 (443988) - FortiOS 5.6.3

Multiple new CLI commands have been added, under `config wireless-controller`, to configure Hotspot 2.0 Access Network Query Protocol (ANQP), a query and response protocol that defines seamless roaming services offered by an AP.

Syntax

```

config wireless-controller hotspot20 anqp-3gpp-cellular
    edit {name}
        config mcc-mnc-list
            edit {id}
                set id {integer}
                set mcc {string}
                set mnc {string}
            next
        next
    end

config wireless-controller hotspot20 anqp-ip-address-type
    edit {name}
        set ipv6-address-type {option}
        set ipv4-address-type {option}
    end

```

```
    next
end

config wireless-controller hotspot20 anqp-nai-realm
  edit {name}
    config nai-list
      edit {name}
        set encoding {enable | disable}
        set nai-realm {string}
        config eap-method
          edit {index}
            set index {integer}
            set method {option}
            config auth-param
              edit {index}
                set index {integer}
                set id {option}
                set val {option}
              next
            next
          next
        next
      next
    next
  next
end

config wireless-controller hotspot20 anqp-network-auth-type
  edit {name}
    set auth-type {option}
    set url {string}
  next
end

config wireless-controller hotspot20 anqp-roaming-consortium
  edit {name}
    config oi-list
      edit {index}
        set index {integer}
        set oi {string}
        set comment {string}
      next
    next
  next
end

config wireless-controller hotspot20 anqp-venue-name
  edit {name}

        set low
        set high
      next
    next
  end

```

VXLAN support (289354)

Virtual Extensible LAN (VXLAN) is a network virtualization technology used in large cloud computing deployments. It encapsulates OSI layer 2 Ethernet frames within layer 3 IP packets using standard destination port 4789. VXLAN endpoints that terminate VXLAN tunnels can be virtual or physical switch ports, are known as VXLAN tunnel endpoints (VTEPs). For more information about VXLAN, see [RFC 7348](#).

VTEP (VXLAN Tunnel End Point) support (289354)

Native VXLAN is now supported by FortiOS. This feature is configurable from the CLI only:

Syntax

```

config system vxlan
  edit <vxlan1> //VXLAN device name (Unique name in system.interface).
    set interface //Local outgoing interface.
    set vni //VXLAN network ID.
    set ip-version //IP version to use for VXLAN device (4 or 6).
    set dstport //VXLAN destination port, default is 4789.
    set ttl //VXLAN TTL.
    set remote-ip //Remote IP address of VXLAN.
  next
end

```

This will create a VXLAN interface:

```

show system interface vxlan1
config system interface
  edit "vxlan1"
    set vdom "root"
    set type vxlan
    set snmp-index 36
    set macaddr 8a:ee:1d:5d:ae:53
    set interface "port9"
  next
end

```

From the GUI, go to **Network > Interfaces** to verify the new VXLAN interface:

vxlan (1)			
vxlan1	0.0.0.0.0.0.0	interface_type::vxlan	0

To diagnose your VXLAN configuration, from the CLI, use the following command:

```
diagnose sys vxlan fdb list vxlan1
```

This command provides information about the VXLAN forwarding data base (fdb) associated to the vxlan1 interface. Below is a sample output:

```
-----mac=00:00:00:00:00:00 state=0x0082 flags=0x00-----
-----remote_ip=2.2.2.2 remote_port=4789-----
-----remote_vni=1 remote_ifindex=19-----
total fdb num: 1
```

VXLAN support for multiple remote IPs (398959)

VXLAN is now supported for multiple remote IPs, these remote IPs can be IPv4 unicast, IPv6 unicast, IPv4 multicast, or IPv6 multicast. This is useful in datacenter scenarios where the FortiGate can be configured with multiple tunnels to computer nodes.

CLI changes

set ip-version option can be set to the following:

ipv4-unicast//Use IPv4 unicast addressing for VXLAN.

ipv6-unicast //Use IPv6 unicast addressing for VXLAN.

ipv4-multicast//Use IPv4 multicast addressing for VXLAN.

ipv6-multicast//Use IPv6 multicast addressing for VXLAN.

When ip-version is set to ipv4-multicast or ipv6-multicast, ttl option is replaced by multicast-ttl.

New PPPoE features

PPPoE dynamic gateway support (397628)

Original design for PPPoE requires to configure a static gateway. Although it works in many scenarios, some customers require to add support for dynamic gateway for internet-service based routes.

No changes to the CLI neither to the GUI.

Support multiple PPPoE connections on a single interface (363958)

Multiple PPPoE connections on a single physical or vlan interface are now supported by the FortiGate. In addition the interface can be on demand PPPoE.

CLI

```
config system pppoe-interface
edit <name>
set dial-on-demand [enable|disable]
set ipv6 [enable|disable]
set device <interface>
set username <string>
set password <string>
set auth-type [auto|pap|chap|mschapv1|mschapv2]
set ipunnumbered <class_ip>
set pppoe-unnumbered-negotiate [enable|disable]
set idle-timeout <integer>
set disc-retry-timeout <integer>
set padt-retry-timeout <integer>
set service-name <string>
```

```

set ac-name <string>
set lcp-echo-interval <integer>
set lcp-max-echo-fails <integer>

```

- dial-on-demand - Enable/disable the dial on demand feature
- ipv6 - Enable/disable the use of IPv6.
- device - The name of the physical interface.
- username - User name for credentials
- password - Password matching the above username
- auth-type - The type of PPP authentication to be used.
 - auto - Automatic choice of authentication
 - pap - PAP authentication
 - chap - CHAP authentication
 - mschapv1 - MS-CHAPv1 authentication
 - mschapv2 - MS-CHAPv2 authentication
- ipunnumbered - PPPoE unnumbered IP.
- pppoe-unnumbered-negotiate - Enable/disable PPPoE unnumbered negotiation.
- idle-timeout - Idle time in seconds before PPPoE auto disconnects. 0 (zero) for no timeout.
- disc-retry-timeout - Timeout value in seconds for PPPoE initial discovery. 0 to 4294967295. Default = 1.
- padt-retry-timeout - Timeout value in seconds for PPPoE termination. 0 to 4294967295. Default = 1.
- service-name - PPPoE service name.)
- ac-name - PPPoE AC name.
- lcp-echo-interval - Interval in seconds allowed for PPPoE LCP echo. 0 to 4294967295. Default = 5.
- lcp-max-echo-fails - Maximum number of missed LCP echo messages before disconnect. 0 to 4294967295. Default = 3.

Adding Internet services to firewall policies (389951)

In 5.4, support was added for Internet Service objects which could be used with **FortiView**, **Logging**, **Routing** and **WAN Load Balancing**. Now they can be added to firewall policies as well.

There is an either/or relationship between Internet Service objects and destination address and service combinations in firewall policies. This means that a destination address and service can be specified in the policy OR an Internet service, not both.

CLI

The related CLI options/syntax are:

```

config firewall policy
edit 1
set internet-service 1 5 10
set internet-service-custom test
set internet-service-negate [enable|disable]
end

```

GUI

In the policy listing page you will notice that is an Internet Service object is used, it will be found in both the **Destination** and **Service** column.

In the policy editing page the **Destination Address**, now **Destination** field now has two types, **Address** and **Internet Service**.

Combining source and destination NAT in the same policy (388718)

The Service field has been added to Virtual IP objects. When `service` and `portforward` are configured, only a single mapped port can be configured. However, multiple external ports can be mapped to that single internal port.

```
config firewall vip
  edit "vip1"
    set type load-balance
    set service "HTTP-8080" "HTTP" <----- New Service field, accepts Service/Service
    group names
    set extip 20.0.0.0-20.0.255.255
    set extintf "wan1"
    set portforward enable
    set mappedip "30.0.0.1"
    set mappedport 100 <----- single port
  end
```

The reason for making this configuration possible is to allow complex scenarios where multiple sources of traffic are using multiple services to connect to a single computer, while requiring a combination of source and destination NAT and not requiring numerous VIPs bundled into VIP groups.

VIPs with different services will considered non-overlapping.

Name	Service-VIP		
Comments	0/255		
Network			
Interface	<input type="checkbox"/> any		
Type	Static NAT		
External IP Address/Range	1.1.1.1	-	1.1.1.10

Port Forwarding <input checked="" type="checkbox"/>			
Map to Port	10443		

NP6 Host Protection Engine (HPE) adds protection for DDoS attacks (363398)

NP6 processors now include HPE functionality that can protect networks from DoS attacks by categorizing incoming packets based on packet rate and processing cost and applying packet shaping to packets that can cause DoS attacks. You can use the options in the following CLI command to limit the number packets per second received for various packet types by each NP6 processor. This rate limiting is applied very efficiently because it is done in hardware by the NP6 processor.

HPE protection is disable by default. You can use the following command to enable HPE protection for the NP6_0 NP6 processor:

```
config system np6
  edit np6_0
    config hpe
      set enable-shaper enable
    end
```

HPE can be enabled and configured separately for each NP6 processor. When enabled, the default configuration is designed to provide basic DoS protection. You can use the following command to adjust the HPE settings in real time if you network is experiencing an attack. For example, the following command allows you to configure HPE settings for np6_0.

```
config system np6
  edit np6_0
    config hpe
      set tcpsyn-max
```

```
set tcp-max
set udp-max
set icmp-max
set sctp-max
set esp-max
set ip-frag-max
set ip-others-max
set arp-max
set l2-others-max
set enable-shaper {disable | enable}
end
```

Where:

`tcpsyn-max` applies shaping based on the maximum number of TCP SYN packets received per second. The range is 10,000 to 4,000,000,000 pps. The default limits the number of packets per second to 5,000,000 pps.

`tcp-max` applies shaping based on the maximum number of TCP packets received. The range is 10,000 to 4,000,000,000 pps. The default is 5,000,000 pps.

`udp-max` applies shaping based on the maximum number of UDP packets received. The range is 10,000 to 4,000,000,000 pps. The default is 5,000,000 pps.

`icmp-max` applies shaping based on the maximum number of ICMP packets received. The range is 10,000 to 4,000,000,000 pps. The default is 1,000,000 pps.

`sctp-max` applies shaping based on the maximum number of SCTP packets received. The range is 10,000 to 4,000,000,000 pps. The default is 100,000 pps.

`esp-max` NPU HPE shaping based on the maximum number of IPsec ESP packets received. The range is 10,000 to 4,000,000,000 pps. The default is 100,000 pps.

`ip-frag-max` applies shaping based on the maximum number of fragmented IP packets received. The range is 10,000 to 4,000,000,000 pps. The default is 100,000 pps.

`ip-others-max` applies shaping based on the maximum number of other IP packets received. The range is 10,000 to 4,000,000,000 pps. The default is 100,000 pps.

`arp-max` applies shaping based on the maximum number of ARP packets received. The range is 10,000 to 4,000,000,000 pps. The default is 1,000,000 pps.

`l2-others-max` applies shaping based on the maximum number of other layer 2 packets received. The range is 10,000 to 4,000,000,000 pps. The default is 100,000 pps.

New feature catalog (5.6.3, 5.6.1 and 5.6)

The following sections list all of the new features in FortiOS 5.6, 5.6.1, and 5.6.3 organized alphabetically by subject area.

Getting Started (5.6.3)

New Getting Started features added to FortiOS 5.6.3.

Administrator password changes (414927)

The existing Change Password dialog that appears in the GUI is updated to reflect the new look of the password change prompt at login.

- Added inline validation for checking password policy and password reuse
- Changed style to match new login prompt password change
- Fixed issue where fDialog would close slide out on submission failure

Support FortiOS to allow user to select domain when logging a FG into FortiCloud (452350)

Support has been added to show a list of all possible FortiCloud domains that the FortiGate can be served by.

Syntax

```
execute fortiguard-log domain
```

This command is typically used for testing purposes, and so it will not appear when entering `execute fortiguard-log ?`.

Getting Started (5.6.1)

New Getting Started features added to FortiOS 5.6.1.

VM License visibility improvement (423347)

VM License GUI items have changed as follows:

- Added VM widget to **Global > Dashboard**. Includes the following:
 - License status and type.
 - CPU allocation usage.
 - License RAM usage.
 - VMX license information (if the VM supports VMX).
 - If the VM license specifies 'unlimited' the progress bar is blank.
 - If the VM is in evaluation mode, it is yellow (warning style) and the dashboard show evaluation days used.
- Widget is shown by default in the dashboard of a FortiOS VM device.
- Removed VM information from License widget at **Global > Dashboard**.
- License info and **Upload License** button provided on page **Global > System > FortiGuard**.
- Updated 'Upload VM License' page:
 - Added license RAM usage and VMX instance usage.
 - Replaced file input component.

CLI Syntax

```
config sys admin
  edit <name>
    config gui-dashboard
      edit <1>
        set name <name>
      config widget
        edit <2>
```

```

        set type {vminfo | ...} <- new option
        set x-pos <2>
        set y-pos <1>
        set width <1>
        set height <1>
    next
end
next
end
next
end

```

FortiView Dashboard Widget (434179)

Added a new widget type to the dashboard for top level FortiView. FortiView widgets have report-by, sort-by, visualization, timeframe properties, and filters subtable in the CLI.

Supported FortiViews include Source, Destination, Application, Country, Interfaces, Policy, Wifi Client, Traffic Shaper, Endpoint Vulnerability, Cloud User, Threats, VPN, Websites, and Admin and System Events.

Bubble, table, chord chart, and country visualizations are supported in the widget.

Widgets can be saved from a filtered FortiView page on to a dashboard.

Syntax

```

config system admin
  config gui-dashboard
    config widget
      set type fortiview
      set report-by {source | destination | country | intfpair | srcintf | dstintf |
        policy | wificlient | shaper | endpoint | application | cloud | web | threat
        | system | unauth | admin | vpn}
      set timeframe {realtime | 5min | hour | day | week}
      set sort-by <string>
      set visualization {table | bubble | country | chord}
      config filters
        set key <filter_key>
        set value <filter_value>
      end
    end
  end
end
end

```

Where:

- `report-by` = Field to aggregate the data by.
- `timeframe` = Timeframe period of reported data.
- `sort-by` = Field to sort the data by.
- `visualization` = Visualization to use.

Controls added to GUI CLI console (422623)

FortiOS 5.6.1 introduces new options in the browser CLI console to export the console history. Options are now available to **Clear console**, **Download**, and **Copy to clipboard**.

FortiExplorer icon enhancement (423838)

FortiOS icons and colors are now exportable in the GUI shared project and FortiExplorer now uses these icons and colors. This change improves the icon colors only for the FortiExplorer GUI theme (seen only when accessing a web GUI page from within the FortiExplorer iOS app).

The following locations were affected: Policy List, Policy Dialogue, Address List, Address Dialogue, Virtual IP list, Virtual IP Dialogue.

Getting Started (5.6)

New Getting Started features added to FortiOS 5.6.

Change to CLI console (396225)

The CLI Console widget has been removed from FortiOS 5.6.0. It is accessed from the upper-right hand corner of the screen and is no longer a pop-out window but a sliding window.

System Information Dashboard widget WAN IP Information enhancement (401464)

WAN IP and location data are now available in the **System Information** widget. Additionally, If the WAN IP is blacklisted in the FortiGuard server, there will be a notification in the notification area, located in the upper right-hand corner of the **Dashboard**. Clicking on the notification will open the WAN IP Blacklisted slider with the relevant blacklist information.

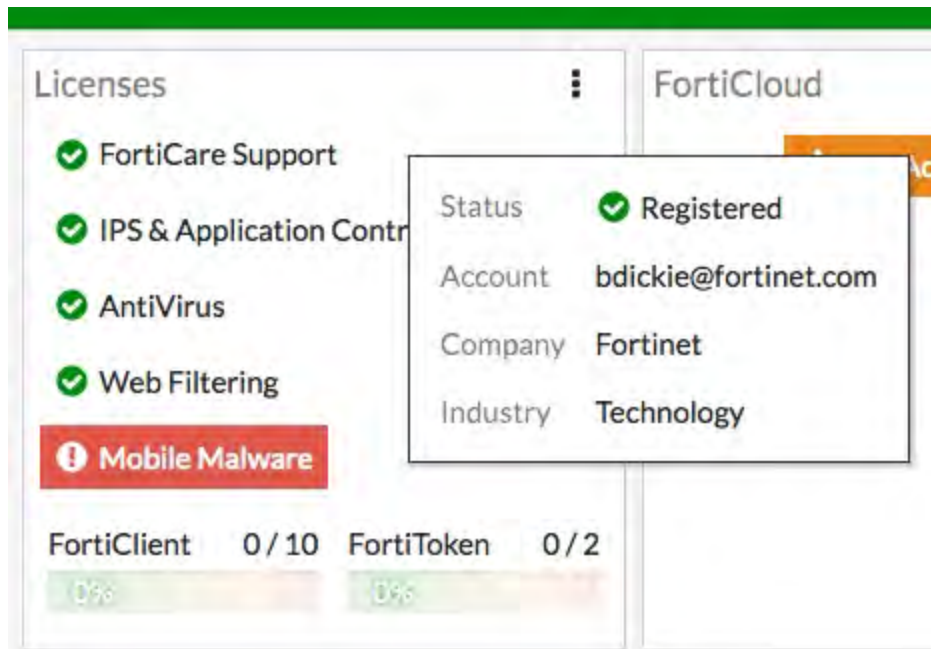

CLI and GUI changes to display FortiCare registration information (395254)

The changes pertain to industry and organization size of the FortiGate's registered owner.

GUI Changes

- Add industry and organization size to FortiCare registration page
- Add company and industry to license widget tooltip for FortiCare

When you hover over the Licenses widget in the FortiOS 5.6 dashboard, you can see the company and industry data, provided it has been entered in the FortiCare profile.

CLI Changes

Commands are added to diagnose forticare

```

dia forticare direct-registration product-registration -h
Options: a:A:y:C:c:T:eF:f:hI:i:l:O:o:p:P:z:R:r:S:s:t:v:

```

Improved GUI for Mobile Screen Size & Touch Interface (355558)

The FortiOS web GUI on mobile screens and include functionality for touch interfaces like tap to hold are improved.

Setup Wizard removed

Previously, the Setup Wizard could be launched from the web GUI by selecting the  button, located in the top right corner. This button and the wizard in question has been removed.

Authentication (5.6.3)

New authentication features added to FortiOS 5.6.3.

Certificate Import page updates (267949)

The importation of a non-CA certificate into FortiGate CA store now shows a warning message showing why the import didn't work (as expected).

Improvements to the execute fortitoken import command (401979)

The `execute fortitoken import` command has been removed and replaced by three new commands, allowing the importation of FortiToken seed files from either an FTP server, a TFTP server, or a USB drive:

- `execute fortitoken import ftp <file name> <ip>[:ftp port] <Enter> <user> <password>`
- `execute fortitoken import tftp <file name> <ip>`
- `execute fortitoken import usb <file name>`

These commands allow seed files to be imported from an external source more easily.

Improved 2FA workflow in GUI (405487, 409100, 444430, 446856, 456752)

Various improvements to the two-factor authentication workflow in the GUI which addressed the following issues:

- No email was sent after creating an administrator account with a FortiToken.
- Inconsistent view on admin and user dialog.
- Empty activation codes would be sent.
- If Norway was selected as the country code for a user, the phone number was not recognized after saving.
- Couldn't select custom SMS server when setting the phone number.
- When a FortiToken from a non-management VDOM was selected for an admin, the activation code wouldn't be sent.

Support FTM Push when FortiAuthenticator is the authentication server (408273, 438314)

FortiGate supports when the FortiAuthenticator initiates FTM Push notifications, for when users are attempting to authenticate through a VPN and/or RADIUS (with FortiAuthenticator as the RADIUS server).

Support exact match for subject and CN fields in peer user (416359)

Administrators can now specify which way a peer user authenticates, in order to avoid any unintentional admin access by a regular user. When searching for a matching certificate, use the commands below to control how to find matches in the certificate subject name (`subject-match`) or the cn attribute (`cn-match`) of the certificate subject name. This match can be any string (`substring`) or an exact match (`value`) of the cn attribute value.

Syntax

```
config vpn certificate setting
  edit <name>
    set subject-match {substring | value}
    set cn-match {substring | value}
  next
end
```

FortiToken GUI improvement (435229)

Various FortiToken import functionalities have been improved in the GUI, including the ability to import from serial number file correctly, validation of serial numbers once imported, and removing the Activate button once a token has already been activated.

Improve FTM Push notification workflow (436642, 448734)

Updated GUI and logincheck module to use a non-blocking version of the FTM Push notification procedure and periodically polls the device for any status updates from fam daemon.

FortiClient shares Social ID data with FortiOS (438610)

Support has been added to record the social ID data from FortiClient so that if an email or phone number is changed on FortiClient, the new values are updated on the FortiGate.

The data will be sent in KeepAlive messages in the following format:

```
USR_NAME|<full name for the service account>|USR_EMAIL|<email for the service account>|SERVICE|<os|custom|linkedin|google|salesforce>|
```

Wildcard certificate support/handling for SAN/CN reference identifiers (440307)

As a requirement of Network Device Collaborative Protection Profile (NDcPP), FortiOS supports and handles the use of wildcards for the following certificate reference parameters:

- Subject Alternative Name (SAN)
- Common Name (CN)

Support for FTP and TFTP to update certificates (441695)

Support has been added for FTP and TFTP servers to update the certificate bundle using a new `execute` command.

Syntax

```
execute vpn certificate ca import bundle <file-name.pkg> <ftp/tftp-server-ip>
```

Global option to enable/disable SHA1 algorithm in SSH key exchanges (444827)

Support has been added for a global option to enable/disable SHA1 algorithm in SSH key exchanges. The algorithm is enabled by default and provides administrators with the ability to disable the option for the purposes of security and compliance testing.

Syntax

```
config system global
  set ssh-kex-sha1 {enable | disable}
end
```

Support for HTTP tunnel authentication (449406)

Support has been added for an option to trigger user authentication on HTTP CONNECT request at the policy level. A new CLI entry has been added under `config firewall proxy-policy` which will trigger the

authentication process get-user, even when there is no user or group configured.

Note that, as shown below, explicit web proxy must be set.

Syntax

```
config firewall proxy-policy
  edit {policyid}
    set proxy explicit-web
    set http-tunnel-auth {enable | disable}
  next
end
```

Authentication (5.6.1)

New authentication features added to FortiOS 5.6.1.

IPv6 RADIUS Support (309235, 402437, 439773)

RADIUS authentication is supported with IPv6, allowing administrators to configure an IPv6 RADIUS server on the FortiGate for IPv6 RADIUS authentication traffic to pass between the server and FortiGate.

Note that while you can set the primary RADIUS server's IPv6 address, the source IP address for communications to the RADIUS server cannot be configured as IPv6.

Syntax

Allow IPv6 access on an interface:

```
config system interface
  edit <name>
    config ipv6
      set ip6-allowaccess {ping | https | ssh | snmp | http | telnet | fgfm | capwap}
      set ip6-address <xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx/xxx>
    next
  next
end
```

Configure the IPv6 RADIUS server:

```
config user radius
  edit <name>
    set server <xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx>
    ...
  next
end
```

Full certificate chain CRL checking (407988)

Certificate revocation/status check for peer certificates and intermediate CAs is now supported. Redesigned `fnbam_auth_cert()` API to use stack type of X509 instead of array for certificate chain. Removed obsolete `fnbam` API and parameters. Now `authd`, `sslvpn`, and `GUI` send full certificate chains to `fnbamd` for verification.

New option under user > setting to allow/forbid SSL renegotiation in firewall authentication (386595)

A new option `auth-ssl-allow-renegotiation` is now available under `config user setting` to allow/forbid renegotiation. The default value is `disable`, where a session would be terminated by `authd` once renegotiation is detected and this login would be recorded as failure. Other behavior follows regular auth settings.

Syntax

```
config user setting
    set auth-ssl-allow-renegotiation {enable | disable}
end
```

New option to allow spaces in RADIUS DN format (422978)

Previously, IKEv2 RADIUS group authentication introduced a regression because it removed spaces from ASN.1 DN peer identifier string.

Reverted default DN format to include spaces. Added a new CLI option `ike-dn-format` to allow the user to select either `with-space` or `no-space`. Customers using the `group-authentication` option can select the `ike-dn-format` setting to match the format used in their RADIUS user database.

Added LDAP filter when group-member-check is user-attr (403140)

Added LDAP filter when `group-member-check` is `user-attr`. LDAP filter is deployed when checking user attribute.

Syntax

```
config user ldap
    edit <name>
        set group-filter ?
    next
end
```

- `group-filter` is `none` by default, where the process is the same as before. When `group-filter` is set, the LDAP filter takes effect for retrieving the group information.

Added Refresh button to the LDAP browser (416649)

Previously, cached LDAP data was used even if the LDAP server configuration was updated.

In FortiOS 5.6.1, a **Refresh** button has been added in the LDAP browser. In the LDAP server dialog page, the user can delete the DN field to browse the root level tree when clicking the **Fetch DN** button.

Differentiate DN option for user authentication and membership searching (435791)

Previously, LDAP used the same DN option for user authentication and membership searching. New CLI commands are introduced to `config user ldap` to resolve this issue:

- `group-member-check user-attr`
For user attribute checking, a new attribute `group-search-base` is added, which indicates the starting point for the group search. If the `group-search-base` is not set, `binddn` is used as the search base. Removed `search-type` when `group-member-check` is `user-attr`.

- `group-member-check group-object`
For group object checking, the group names in user group match rule will be picked up as the group search base. If there are multiple matching rules, each group name will trigger the ldapsearch query once.
- `group-member-check posix-group-object`
Changed `group-object-search-base` to `group-search-base` for `posix-group-object group-member-check`.

FTM Push when FAC is auth server (408273)

This feature adds support for FortiToken Mobile (FTM) push with FortiAuthenticator server in FortiOS. It also fixes a crash when adding a node to an RB tree, by checking if the same key has already been used in the tree. If yes, remove the node using the same key before adding a new node.

Non-blocking LDAP authentication (433700)

The previous LDAP authentication in `fnbamd` used `openldap` library. OpenLDAP supports non-blocking BIND but it is not event driven.

To support non-blocking LDAP in `fnbamd`, we stopped using the `openLDAP` library in `fnbamd`, instead using only `liblber`. Instead of using `openLDAP`, `fnbamd` will create its own event-driven connection with LDAP servers over LDAP/LDAPS/STARTTLS, make it non-blocking, do CRL checking if necessary, and compose all LDAP requests using `liblber` (including bind, unbind, search, password renewal, password query, send request and receive response, and parse response). The whole process is done in one connection.

This doesn't change any `openLDAP` implementation but moves some data structure definitions and API definitions from some internal header files to public header files.

Manual certificate SCEP renewal (423997)

Added support of manual certificate SCEP renewal besides the auto-regeneration feature that already exists.

More detailed RADIUS responses shown in connectivity test (434303)

Improved on-demand test connectivity for RADIUS servers. Test results show RADIUS server reachability, NAS client rejection, and invalid User/Password. Test also shows RADIUS Attributes returned from the RADIUS server.

Example

```
FG100D3G12807101 # diagnose test authserver radius-direct
<server_name or IP> <port no(0 default port)> <secret> <user> <password>

FG100D3G12807101 # diagnose test authserver radius-direct 1.1.1.1 0 dd
RADIUS server '1.1.1.1' status is Server unreachable

FG100D3G12807101 # diagnose test authserver radius-direct 172.18.5.28 0 dd
RADIUS server '172.18.5.28' status is Secret invalid

FG100D3G12807101 # diagnose test authserver radius-direct 172.18.5.28 0 fortinet jeff1
asdfasdf
RADIUS server '172.18.5.28' status is OK
Access-Reject

FG100D3G12807101 # diagnose test authserver radius-direct 172.18.5.28 0 fortinet ychen1
asdfasdf
```

```

RADIUS server '172.18.5.28' status is OK
Access-Accept
AVP: l=6 t=Framed-Protocol(7)
  Value: 1
AVP: l=6 t=Service-Type(6)
  Value: 2

  VSA: l=6 t=MS-Link-Drop-Time-Limit(15)
    Value: 120

```

User group authentication timeout range increased to 30 days (378085)

You can now use the following command to override the default user authentication timeout for users in a user group to up to 30 days.

```

config user group
  edit <group-name>
    set authtimeout 43200
  end

```

Where `authtimeout` is the length of the timeout in minutes. An `authtimeout` of 43200 minutes is equivalent to 30 days. Set `authtimeout` to 0 to use the default authentication timeout.

Authentication (5.6)

New authentication features added to FortiOS 5.6.

FortiToken Mobile Push (397912, 408273, 399839, 404872)

FortiToken Mobile push supports two-factor authentication without requiring users to enter a four-digit code to authenticate. Instead they can just accept the authentication request from their FortiToken Mobile app.

A new command has been added under `config system ftm-push` allowing you to configure the FortiToken Mobile Push services server IP address and port number. The Push service is provided by Apple (APNS) and Google (GCM) for iPhone and Android smartphones respectively. This will help to avoid tokens becoming locked after an already enabled two-factor authentication user has been disabled.

CLI syntax

```

config system ftm-push
  set server-ip <ip-address>
  set server-port [1-65535] Default is 4433.
end

```

If an SSL VPN user authenticates with their token, then logs out and attempts to reauthenticate again within a minute, a new message will display showing "Please wait x seconds to login again." This replaces a previous error/permission denied message.

The "x" value will depend on the calculation of how much time is left in the current time step.

CLI syntax

```
config system interface
  edit <name>
    set allowaccess ftm
  next
end
```

Support V4 BIOS certificate (392960)

FortiOS now supports backwards compatibility between new BIOS version 4 and old BIOS version 3.

New BIOS V4 certificates:

- Fortinet_CA
- Fortinet_Sub_CA
- Fortinet_Factory

Old BIOS V3 certificates:

- Fortinet_CA_Backup
- Fortinet_Factory_Backup

When FortiOS connects to FortiGuard, FortiCloud, FortiManager, FortiAnalyzer, FortiSandbox as a client, the new BIOS certificate **Fortinet_Factory** will be the default client certificate. When the server returns its certificate (chain) back, FortiOS looks up the issuer of the server certificate and either keeps client certificate as is or switches to the old BIOS certificate **Fortinet_Factory_Backup**. This process occurs in one handshake.

When FortiOS connects to FortiCare, the new BIOS certificate **Fortinet_Factory** is the only client certificate and Server Name Indication (SNI) is set. There is no switchover of certificate during SSL handshake.

When FortiOS acts as a server when connected by FortiExtender, FortiSwitch, FortiAP, etc., **Fortinet_Factory** is the default server certificate. FortiOS detects SNI in client hello, and if no SNI is found or if the CN in SNI is different from the CN of **Fortinet_CA**, it switches to use the old **Fortinet_Factory_Backup**.

Support extendedKeyUsage for x.509 certificates (390393)

As per Network Device Collaborative Protection Profile (NDcPP) v1.0 requirements, server certificates used for TLS connections between FortiGate and FortiAnalyzer should have the "Server Authentication" and "Client Authentication" extendedKeyUsage fields in FIPS/CC mode.

To implement this, a new CLI command has been added under `log fortianalyzer setting` to allow you to specify the certificate used to communicate with FortiAnalyzer.

CLI syntax

```
config log fortianalyzer setting
  set certificate <name>
end
```

Administrator name added to system event log (386395)

The administrator's name now appears in the system event log when the admin issues a user quarantine ban on a source address.

Support RSA-4096 bit key-length generation (380278)

In anticipation of quantum computers, RSA-4096 bit key-length CSRs can now be imported.

New commands added to config user ldap to set UPN processing method and filter name (383561)

Added two new commands to `config user ldap` allowing you to keep or strip domain string of UPN in the token as well as the search name for this kind of UPN.

CLI syntax:

```
config user ldap
    set account-key-processing
    set account-key-name
end
```

User authentication max timeout setting change (378085)

To accommodate wireless hotspot users authenticated on the FortiGate, the user authentication max timeout setting has been extended to three days (from one day, previously).

Changes to Authentication Settings > Certificates GUI (374980)

Added new icons for certificate types and updated formatters to use these new icons.

Password for private key configurable in both GUI and CLI (374593)

FortiOS 5.4.1 introduced a feature that allowed you to export a local certificate and its private key in password protected p12, and later import them to any device. This option to set password for private key was available only in the CLI (when requesting a new certificate via SCEP or generating a CSR). This feature is now also configurable through the GUI.

The new **Password for private key** option is available under **System > Certificates** when generating a new CSR.

RADIUS password encoding (365145)

A new CLI command, under `config user radius`, has been added to allow you to configure RADIUS password encoding to use ISO-8859-1 (as per [RFC 2865](#)).

Certain RADIUS servers use ISO-8859-1 password encoding instead of others such as UTF-8. In these instances, the server will fail to authenticate the user, if the user's password is using UTF-8.

CLI syntax

```
config user radius
    edit <example>
        set password-encoding <auto | ISO-8859-1>
    end
```

This option will be skipped if the `auth-type` is neither `auto` nor `pap`.

RSSO supports Delegated-IPv6-Prefix and Framed-IPv6-Prefix (290990)

Two attributes, **Delegated-IPv6-Prefix** and **Framed-IPv6-Prefix**, have been introduced for RSSO to provide a /56 prefix for DSL customers. All devices connected from the same location (/56 per subscriber) can be mapped to the same profile without the need to create multiple /64 or smaller entries.

FortiOS Carrier (5.6.3)

New FortiOS Carrier features added to FortiOS 5.6.3.

Improved CLI attribute name under 'gtp.message-filter-v0v1' (452813)

CLI "gtp.message-filter-v0v1" had an attribute "create-aa-pdp|init-pdp-ctx", which contains a vertical pipe |. The attribute name was changed to "v0-create-aa-pdp--v1-init-pdp-ctx".

Its help text is also changed to avoid the vertical bar.

Syntax

```
config gtp message-filter-v0v1
edit <name>
set ?
.....
v0-create-aa-pdp--v1-init-pdp-ctx
```

Improved GTP performance (423332)

There are independent Receive and Transmit queues for `gtp-u` process. These queues and their associated resources are initialized when the `ftp-enhance-mode` is enabled.

CLI changes under system npu

gtp-enhance-mode

```
config system npu
set gtp-enhance-mode [enable|disable]
end
```

This configuration requires a reboot of the device to initialize the changes.

gtp-enhance-cpu-range

This is used to set the CPUs which can process the GTP-U packet inspection.

```
config system npu
set gtp-enhance-cpu-range [0|1|2]
end
```

Option	Description
0	Inspect GTPU packets by all CPUs
1	Inspect GTPU packets by Master CPUs
2	Inspect GTPU packets by Slave CPUs

New diagnose commands

```
diagnose npu np6 hbq-stats [all|np xx]
```

Used to see the GTP-U packet counter by all NP or the corresponding np.

```
diagnose npu np6 hbq-stats-clear all /np xx
```

Used to clear the GTP-U packet counter by all NP or the corresponding np.

Verifying the enhance-mode is disabled

Before execute the test or enable/disable the gtp enhance, first check the gtp-enhance-mode status as in the example below:

```
config system npu
  get
  gtp-enhance-mode: disable
  gtp-enhance-cpu-range: 0
end
```

If the gtp-enhance-mode is disable, use the command `diagnose npu np6 hbq-stats all`.

The output will be similar to below:

```
# diagnose npu np6 hbq-stats all
Total :0
```

If the gtp-enhance-mode is enable, use the command `diagnose npu np6 hbq-stats all`

The output will be similar to below:

```
# diagnose npu np6 hbq-stats all
cpu_ 0:0
cpu_ 1:0
cpu_ 2:0
cpu_ 3:0
cpu_ 4:0
cpu_ 5:0
cpu_ 6:0
cpu_ 7:0
cpu_ 8:0
cpu_ 9:0
cpu_10:0
cpu_11:0
cpu_12:0
cpu_13:0
cpu_14:0
cpu_15:0
```

```
cpu_16:0
cpu_17:0
cpu_18:0
cpu_19:0
cpu_20:0
cpu_21:0
cpu_22:0
cpu_23:0
cpu_24:0
cpu_25:0
cpu_26:0
cpu_27:0
cpu_28:0
cpu_29:0
cpu_30:0
cpu_31:0
cpu_32:0
cpu_33:0
cpu_34:0
cpu_35:0
cpu_36:0
cpu_37:0
cpu_38:0
cpu_39:0
Total :0
```

Sometimes, when loading the new configure file, and the new configure file does not match the old configure file, the `gtp-enhance-mode` status will be confused.

You can see :

```
#config system npu
#get
gtp-enhance-mode: enable
```

but you can also see that

```
diagnose npu np6 hbq-stats all
Total :0
```

This means the `gtp-enhance-mode` is actually set to `disable`.

The inverse is also possible, when you see

```
#config system npu
#get
gtp-enhance-mode: disable
```

but you also see that

```
# diagnose npu np6 hbq-stats all
cpu_ 0:0
...
cpu_39:0
Total :0
```

This means the `gtp-enhance-mode` is actually set to `enable`.

If these combinations occur, just run the command below:

```
config system npu
    set gtp-enhance-mode enable
end
```

or

```
config system npu
    set gtp-enhance-mode disable
end
```

Once this is done, reboot the device to let the 2 statuses match.

FortiOS Carrier (5.6.1)

New FortiOS Carrier features added to FortiOS 5.6.1.

GTP enhancement and GTP Performance Improvement. (423332)

The GTP changes in 5.6.1 take place in the following categories:

New GTP features and functionality enhancements.

- GTP message filter enhancements, including:
 - Unknown message white list
 - GTPv1 and GTPv2 profile separation
 - Message adoption.
- GTP IE white list.
- Global APN rate limit, including:
 - sending back REJECT message with back-off timer
 - "APN congestion" cause value
- GTP half-open, half-close configurable timer.

GTP performance improvements.

- Implemented RCU on GTP-U running path. i.e, no locking needed to look up tunnel state when processing GTP-U.

Note the RCU is only applied on GTPv1 and GTPv2 tunnels. It is not used for GTPv0 tunnels, due to the fact that (1) GTPv0 traffic is relatively minor compared with GTPv1 and GTPv2, and (2) GTPv0 tunnel indexing is totally different from GTPv1 and GTPv2. GTPv0 tunnel is indexed by [IMSI, NSAPI]. GTPv1 and GTPv2 tunnel is indexed by [IP, TEID]

- Localized CPU memory usage on GTP-U running path.
- GTP-C: changed some GTP tables from RB tree to hash table, including
 - GTP request tables, and GTPv0 tunnel tables.
 - Testing showed, when handling millions of entries adding/deleting, hash table performance was much better.
 - 2.3.2 Hash table is compatible with RCU API, so we can apply RCU on these GTP-C tables later for further performance improvements.
- GTP-C, improved GTP path management logic, so that GTP path will time out sooner when there are no tunnels linked to it

CLI Changes:**New Diagnose commands:**

```
diagnose firewall gtp
```

Option	Description
hash-stat-tunnel	GTP tunnel hash statistics.
hash-stat-v0tunnel	GTPv0 tunnel hash statistics.
hash-stat-path	GTP path hash statistics.
hash-stat-req	GTP request hash statistics.
vd-apn-shaper	APN shaper on VDOM level.
ie-white-list-v0v1	IE white list for GTPv0 or v1.
ie-white-list-v2	IE white list for GTPv2.

```
diagnose firewall gtp vd-apn-shaper
```

Option	Description
list	List

```
diagnose firewall gtp ie-white-list-v0v1
```

Option	Description
list	List

```
diagnose firewall gtp ie-white-list-v2
```

Option	Description
list	List

```
config gtp apn-shaperapn-shaper
```

Option	Description
apn	APN to match. Leave empty to match ANY. "apn" field can be empty, it matches ANY apn. when configured, it is used to set a limit for any apn which is not explicitly listed; Also, if configured, such an entry should be the last entry, as it is first-match rule.
rate-limit	Rate limit in packets/s (0 - 1000000, 0 means unlimited).
action	Action. [drop reject] There is no back-off timer in GTPv0, therefor the <code>reject</code> action is not available for V0
back-off-time	Back off time in seconds (10 - 360). <code>back-off-time</code> visible when action is "reject"

Changed commands:

Under command `firewall gtp,config message-filter` is replaced by `set message-filter-v0v1`

Example:

```
config firewall gtp
edit <name>
set message-filter-v0v1
```

New fields have been added to the `config firewall gtp` command context

Option	Description
half-open-timeout	Half-open tunnel timeout (in seconds).
half-close-timeout	Half-close tunnel timeout (in seconds).

Example:

```
config firewall gtp
edit <name>
set half-open-timeout 10
set half-close-timeout 10
```

Models affected by change

- FortiGate 3700D
- FortiGate 3700DX
- FortiGate 3800D

Device identification (5.6)

New Device Identification features added to FortiOS 5.6.

Changed default for device-identification-active-scan to disabled (380837)

It was decided that most customers would not appreciate a default setting that resulted in the FortiGate probing their systems, so active scan option is changed to disabled by default going forward, but upgrade code is added to keep the option enabled for those upgrading from 5.4.0 or 5.4.1 who were using device-identification with active scan enabled.

Diagnose command changes (5.6.1)

New diagnose features added to FortiOS 5.6.1.

crash dump improvement on i386/X86_64 (396580)

The output from the WPAD crash dump can now be in binary format as well as hexadecimal. The two commands are:

1. For dump in binary format

```
diagnose debug app wpad-dump <debug_level>
```

2. For dump in hexadecimal format

```
diagnose debug app wpad-crash-hexdump <debug_level>
```

LLDP diagnose commands easier to execute (413102)

While there is no change to the syntax of the commands, the LLDP diagnose commands are allowed to execute without switchid/portid parameters configured.

New command to monitor IPS stats (414496)

When WAD IPS scanning took place with a failed result, the message caused the IPS sensor to mistakenly record the event as something triggering the sensor. To correct this, a new command was created.

Command:

```
diagnose wad stats ips [list | clear ]
```

list	List IPS statistics
clear	Clear IPS statistics

Example

```
diagnose wad stats ips list
IPS status
unix stream counter = 0
active sess counter = 0
ips provider counter = 0
not running failure = 0
all busy failure = 0
conn close counter = 0
conn connected counter = 0
conn failure = 0
zero len failure = 0
suspended failure = 0
push failure = 0
block write counter = 0
un-block write counter = 0
```

```

un-matching failure = 0
ips action failure = 0
ips action permit = 0
ips action deny = 0
ips action bypass = 0

```

Additional information in FortiGate 30E model diagnose command (422266)

Due to additional modem features being merged into the FortiGate 30E firmware, there is more status information displayed when using the `diagnose sys lte-modem` command. There are also additional related MIB options.

New diagnose sys fips kat-error options (440186)

The command `diagnose sys fips kat-error` has added additional options, like ECDSA.

Diagnose command changes (5.6)

New diagnose features added to FortiOS 5.6.

Add missing "diag npc np6 ..." Commands (305808)

The following `diag npc np6` commands have been reintroduced into 5.6.0.

These options were available in 5.2.x but were not in 5.4.0

- `diag npc np6 gmac-stats` - Shows the GMAC MIBs counters
- `diag npc np6 gmac-stats-clear` - Clears the GMAC MIBS counters
- `diag npc np6 gige-port-stats` - Shows the GIGE PORT MIBs counters
- `diag npc np6 gige-port-stats-clear` - Clears the GIGE PORT MIBs counters

Diagnose command to show firewall service cache (355819)

A diagnostic command has been added to dump out the service name cache kept by the `miglogd` daemon for each individual VDOM.

```
diag test app miglogd 106
```

Example output:

This output has been edited down to conserve space. Only the first 5 of each grouping has been included.

```

diag test app miglogd 106
tcp
port(0), name(NONE)
port(21), name(FTP)
port(22), name(SSH)
port(23), name(TELNET)
port(25), name(SMTP)

Web Access (DNS, HTTP, HTTPS,)
Exchange Server (DCE-RPC, DNS, HTTPS,)
policies involving multiple service definitions:

```

Diagnose command to show crash history and adjust crash interval (366691)

In order to alleviate the impact logging put on resources if processes repeatedly crash, limits have been put on crash logs.

- The default limit is 10 times per 60 minutes for crash logs. This limit can be edited using the command:

```
diagnose debug crashlog interval <interval>
```

<interval> is the number of second to log crash logs for a particular process

- The `miglogd` daemon is the only one to write crash logs directly. Crash logs from other processes are done through `miglogd`.
- Crash logs for a single crash are written all at once so that the logs are easier to read if there are crashes of multiple processes at the same time.
- A `diagnose` command has been added to show crash history.

```

# diagnose debug crashlog history
# Crash log interval is 3600 seconds
# reportd crashed 2 times. The latest crash was at 2016-12-01 17:53:45

```

diagnose switch-controller commands (368197)

The following `diagnose` commands in the CLI, are designed to

- Output stats on the managed switches
- Kick the client from the managed switches

```
diagnose switch-controller dump lldp neighbors-summary <device-id> <portid>
```

```
diagnose switch-controller dump lldp neighbors-detail <device-id> <portid>
```

```
diagnose switch-controller dump lldp Stats <device-id>
diagnose switch-controller dump port-stats <device-id>
diagnose switch-controller dump trunk-state <device-id>
diagnose switch-controller kick <device-id> <vlan ID> <port ID> <MAC ID>
```

While not a diagnostic command, the following can also be run from VDOMs

```
execute replace-device fortiswitch <device-id>
```

These commands are now longer restricted to being run from the root VLAN and can be run from any VDOM

Diagnose commands for monitoring NAT sessions (376546)

We have developed the following monitoring capabilities in CLI and SNMP.

- NAT sessions per IP pool
- Total tcp sessions per IP pool
- Total udp sessions per IP pool
- Total others (non-tcp and non-udp) sessions per IP pool

FortiGate supports 4 types of NAT, which are

- Overload
- One-to-one
- Fixed-port-range
- Port-block-allocation.

diagnose firewall ippool-all

- list - lists all of the IP Pools
- stats - Statistics of the IP Pools

list

```
diagnose firewall ippool-all list
```

Example output:

```
vdom:root owns 4 ippool(s)
name:Client-IPPool
type:port-block-allocation
nat-ip-range:10.23.75.5-10.23.75.200
name:Fixed Port Range
type:fixed-port-range
nat-ip-range:20.20.20.5-20.20.20.50
name:One to One
type:one-to-one
nat-ip-range:10.10.10.5-10.10.10.50
name:Sales_Team
type:overload
nat-ip-range:10.23.56.18-10.23.56.20
```

Stats

This option has two methods of being used. By just hitting enter after stats, the output contains the stats for all of the IP Pools. By putting the name of an IP Pool after stats, the output is filtered so that only stats relating to that particular IP Pool is included in the output.

Example output #1

```
# diagnose firewall ippool-all stats
vdom:root owns 5 ippool(s)
name: Client-IPPool
type: port-block-allocation
startip: 10.23.75.5
endip: 10.23.75.200
total ses: 0
tcp ses: 0
udp ses: 0
other ses: 0
name: Fixed Port Range
type: fixed-port-range
startip: 20.20.20.5
endip: 20.20.20.50
total ses: 0
tcp ses: 0
udp ses: 0
other ses: 0
name: One to One
type: one-to-one
startip: 10.10.10.5
endip: 10.10.10.50
total ses: 0
tcp ses: 0
udp ses: 0
other ses: 0
name: Sales_Team
type: overload
startip: 10.23.56.18
endip: 10.23.56.20
total ses: 0
tcp ses: 0
udp ses: 0
other ses: 0
```

Example #2

```
# diagnose firewall ippool-all stats "Sales_Team"
name: Sales_Team
type: overload
startip: 10.23.56.18
endip: 10.23.56.20

SIP diagnose command improvements (376853)

A diagnose command has been added to the CLI that outputs VDOM data located in the voipd daemon.

```
diagnose sys sip-proxy vdom
```

Example

```
(global) # diagnose sys sip-proxy vdom
VDM list by id:
vdom 0 root (Kernel: root)
vdom 1 dmngmt-vdom (Kernel: dmngmt-vdom)
vdom 2 test2 (Kernel: test2)
vdom 3 test3 (Kernel: test3)
vdom 4 vdoma2 (Kernel: vdoma2)
vdom 5 vdomb2 (Kernel: vdomb2)
vdom 6 vdomc2 (Kernel: vdomc2)
vdom 7 vdoma (Kernel: vdoma)
vdom 8 vdomb (Kernel: vdomb)
vdom 9 vdomc (Kernel: vdomc)
VDM list by name:
vdom 1 dmngmt-vdom (Kernel: dmngmt-vdom)
vdom 0 root (Kernel: root)
vdom 2 test2 (Kernel: test2)
vdom 3 test3 (Kernel: test3)
vdom 7 vdoma (Kernel: vdoma)
vdom 4 vdoma2 (Kernel: vdoma2)
vdom 8 vdomb (Kernel: vdomb)
vdom 5 vdomb2 (Kernel: vdomb2)
vdom 9 vdomc (Kernel: vdomc)
vdom 6 vdomc2 (Kernel: vdomc2)
```

Diagnose command to get AV virus statistics (378870)

A new diagnostic command has been added for the showing of AV statistics. This can be used within each VDOM

Syntax:

```
diagnose ips av stats show
```

Example output

```
diagnose ips av stats show
AV stats:
HTTP virus detected: 0
HTTP virus blocked: 0
SMTP virus detected: 0
SMTP virus blocked: 0
POP3 virus detected: 0
POP3 virus blocked: 0
IMAP virus detected: 0
IMAP virus blocked: 0
NNTP virus detected: 0
NNTP virus blocked: 0
FTP virus detected: 0
FTP virus blocked: 0
```

```
SMB virus detected: 0
SMB virus blocked: 0
```

Diagnose command to get remote FortiSwitch trunk information (379329)

To ensure that a FortiGate and its managed FortiSwitches stay in synchronization in the event of an inadvertent trunk table change situation, there is a new CLI setting that checks for discrepancies.

The idea is to check to see if there will be a synchronization issue between the FortiGate and the FortiSwitch before applying the configuration

1. On fortilink reconnection, FGT reads trunk table of FSW using REST API GET-- Hence FGT gets all the port and its trunk membership information from FSW
2. FGT then compares its managed FSW trunk information with received FSW information
3. If there is any conflict, FGT will delete extra/conflicted trunk on FSW using REST API POST
4. At the end FGT replays all configuration to FSW as usual

This will help delete the extra trunks, conflicted trunks on the FSW and to make sure in sync

Possible reasons for losing synchronization include:

- The FortiGate reboots after a factory reset while there is still a trunk configuration in the FortiSwitch.
- The managed FortiSwitch's trunk table gets edited on the FortiGate while the FortiSwitch is offline.
- A trunk table on the FortiSwitch gets added or the existing one gets modified or deleted by a user.

New diagnose command for the CLI:

```
diagnose switch-controller dump trunk-switch-config <Managed FortiSwitch device ID>
```

help provided for diagnose debug application csfd (379675)

The syntax for the command is:

```
diagnose debug application csfd <Integer>
```

The <Integer> being the debug level. To get the integer value for the debug level, run the command without the integer. You will get the following:

```
# diagnose debug application csfd
csfd debug level is 0 (0x0)
Error 0x01
Warning 0x02
Function trace 0x04
Information 0x08
Detail 0x10
MAC packet encryption debug 0x20
MAC learning debug 0x40
FAZ configuration synchronize debugging 0x0080
FAZ configuration function trace 0x00100
Configuration tree update debug 0x00200
Configuration tree function trace 0x00400
HA Sync plugin debug 0x00800
```

Convert the value next to the debug level you want to an integer. For example, to set the debug level to Information, convert 0x08 to 8 and use it for the option at the end of the command.

```
# diagnose debug application csfd 8
```

New IPS engine diagnose commands (381371)

Periodically, when troubleshooting, an different IPS engine will need to be installed on the FortiGate but there will also be a restriction that the FortiGate can't be rebooted. Normally, a new IPS engine will not be fully recognized by the system until after a reboot. This command allows the running of new commands or new versions of commands in the IPS engine without having to reboot the FortiGate.

```
diagnose ips test cmd <command strings>
```

The command strings are separated by a semicolon such as:

```
diagnose ips test cmd command1;command2;command3
```

Examples:

- `diagnose ips test cmd "ips session status"`

This command triggers the diagnosis command in the double quotation marks: "diagnose ips session status"

- `diag ips test cmd "ips memory track; ips memory status; ips session status"`

This command triggers the diagnosis commands in the double quotation marks in order.

The results:

```
Commands[0]: ips memory track
----< execute "diagnose ips memory track" >----
Commands[1]: ips memory status
----< execute "diagnose ips memory status" >----
Commands[2]: ips session status
----< execute "diagnose ips session status" >----
```

New AV engine diagnose commands (383352)

The purpose of this diagnostic command is to display information from within the AV engine for the purposes of aiding trouble shooting and diagnostics if the AV engine crashes or times out.

The command is:

```
diagnose antivirus test
```

It's syntax can be one of the following:

```
diagnose antivirus test <command>
diagnose antivirus test <command argument1>; <argument2>; ...
```

The command is defined and interpreted by the AV engine. FortiOS just passes the CLI command into the AV engine and outputs the strings returned by AV engine.

In AV engine 5.4.239, the following command are supported.

- `get scantypes`
- `set scantypes`
- `debug`

NPU diagnose command now included HPE info in results (384692)

There is no change to the CLI but the results of the `diagnose npu np6 npu-feature` command now include results regarding HPE.

clear checksum log files (diag sys ha checksum log clear) (385905)

There is currently a command, `diag sys ha checksum log [enable | disable]` that enables a checksum debug log by saving checksum calculations to a temp file. However, the checksum calculations saved in this file can be processed by two different functions, `cmdbsvr` and the CLI.

The function `cmf_context-is-server()` now enables the determining whether the running process is `cmdbsvr` or the CLI and also a diagnose command has been added to clear the contents of the file.

```
diag sys ha checksum log clear
```

new diagnose command to delete avatars (388634)

It is now possible to delete avatars associated with FortiClient clients.

```
diagnose endpoint avatar delete <FortiClient UID>
```

or

```
diagnose endpoint avatar delete <FortiClient UID> <username>
```

- If only the FortiClient UID is used, all of the avatars, except those that are currently being used will be deleted.
- If both the FortiClient UID and the username are used, all of the avatars that belong to that combination, except those being used, will be deleted.

CID signatures have been improved for DHCP and CDP (389350, 409436)

More parameters have been added to make them more specific. This helps to reduce false positives.

- DHCP signatures:
 - A new dhcp signature file has been added 'cid.dhcp2' that allows for the class and host name to be specified in the same signature. This is for increased accuracy.
 - Relevant signatures from 'cid.dhcp' have been ported to the new signature file 'cid.dhcp2'
 - Support DHCP parameter matching in signatures.
 - Support DHCP option list matching in signatures.
- CDP mac analyzer now passes all three keys to the OS matcher.
- Tests:
 - A number of new tests (including pcaps) have been added to match existing signatures and new signatures.
 - Some tests where multiple protocols were present in a single pcap, have been modified. These are now split into multiple pcaps, each containing a single protocol. This allows FortiOS to fully test a signature, where previously a single test may have matched multiple signatures.
- CID debug statistics now use shared memory. This prevents the daemon from having to respond to CLI requests and allows for the stats to persist across daemon restarts.
 - A Change has been made to the host ip update priority. IP changes for routers that have had their type set by heuristic are not allowed to change IPs.

- If it is a Fortinet device, the change is allowed if it comes through a protocol we trust more (CDP, DHCP, LLDP, or MAC).

diagnose command to calculate socket memory usage (392655)

This diagnostic command gives the socket memory usage by individual process.

```
diagnose sys process sock-mem <pid>; <pid> ...
```

Separate arguments with a semicolon ";"

Example

Run diagnose sys top to get the pid of a few process...

```
diagnose sys top
Run Time: 1 days, 0 hours and 44 minutes
0U, 0N, 0S, 100I, 0WA, 0HI, 0SI, 0ST; 7996T, 5839F
httpd 214 S 0.1 0.2
httpd 1398 S 0.1 0.2
snmpd 173 S 0.1 0.1
```

Then use those pid with the command...

```
diagnose sys process sock-mem 214; 173
Process ID=214, sock_mem=0 (bytes)
Process ID=173, sock_mem=2 (bytes)
```

FortiGuard can determine a FortiGate's location from its public IP address (393972)

The FortiGate now shows the public IP address and the geographical location (country) in the dashboard. The FortiGate sends a ping to the FortiCare/FortiGuard network and as a response receives the local WAN IP, or if it is being NATed the public IP of the network. Using the public IP address a geo-ip Blackpool is done to determine the country.

In the same location on the Dashboard, it also shows whether or not the listed IP address is a member of the Fortinet Blacklist.

CLI

The diagnostic command to get the information is:

```
diag sys waninfo
```

Example:

```
diagnose sys waninfo
Public/WAN IP: 209.87.240.98
Location:
Latitude: 45.250100
Longitude: -75.916100
Accuracy radius: 5
Time zone: America/Toronto
City: Stittsville
Subdivisions:
0: Ontario
```

```

Country: Canada
Postal:
Code: K2S
Continent: North America
Registered country: Canada
ISP: Unknown

Failed to query whether 209.87.240.98 is in the FortiGuard IP Blacklist: ret=-1 buf_
sz=1024
Command fail. Return code 5

```

To get information about the address's inclusion as a member of the Fortinet Blacklist, the command is:

```
diag fortiguard ipblacklist [db | vr | ip | ctx]
```

- db - Get Database and Vendor/Reason List Versions.
- vr - Get Vendor/Reason List.
- ip - Get Information on Specific IP.
- ctx - Show Local Context.

If using the ip option, specify the IPv4 address after the ip option.

Example:

```
diagnose fortiguard ipblacklist ip 209.87.240.98
```

AWS bootstrapping diagnose commands (394158)

Bootstrap feature is quite similar to cloudinit in Openstack. When user launching a new instance of FGT-VM in AWS, it needs to provide some basic information of license and config stored in AWS s3 bucket via userdata. Bootstrap will download license and config from s3 bucket and apply them to FGT automatically.

CLI

Add a new cli to show the results of bootstrap config apply.

Example:

```

diagnose debug aws-bootstrap show
>> FGVM040000066475 $ config sys glo
>> FGVM040000066475 (global) $ set hostname awsondemand
>> FGVM040000066475 (global) $ end

```

Diagnose command to aid in conserve mode issues (394856)

The `diagnose hardware sys conserve` command provides memory information about the system that is useful in diagnosing conserve mode issues.

Example

```

diagnose hardware sys conserve
memory conserve mode: off
total RAM: 7996 MB
memory used: 2040 MB 25% of total RAM
memory used threshold extreme: 7597 MB 95% of total RAM
memory used threshold red: 7037 MB 88% of total RAM
memory used threshold green: 6557 MB 82% of total RAM

```

Diagnose commands to display FortiCare registration information (395254)

The Dashboard License widget can display information about the registered company owner and industry. There are some diagnostic commands that can do that in the CLI.

```
diagnose forticare protocol [HTTP | HTTPS]
diagnose forticare server < server IP>
diagnose forticare cnreg-code-list - List of known ISO 3166-1 numeric country/region
codes.
diagnose forticare direct-registration reseller-list <cnreg-code>
diagnose forticare direct-registration country-data <cnreg-code>
diagnose forticare direct-registration organization-list
diagnose forticare direct-registration product-registration <arguments>
```

Options/arguments for product registration:

- a = account_id
- A = address
- y = city
- C = company
- c = contract_number
- T = country_code
- e = existing_account
- F = fax
- f = first_name
- h = help
- I = industry
- i = industry_id
- l = last_name
- O = orgsize
- o = orgsize_id
- p = password
- P = phone
- z = postal_code
- R = reseller
- r = reseller_id
- S = state
- s = state_code
- t = title
- v = version

new diag test app csfd options (395302)

Two additional test levels have been added to the `diag test app csfd` command in order to dump some additional information about timers, file handlers status and received MAC addresses to the HA master.

```
diag test app csfd 11
diag test app csfd 40
```

new 'AND' and 'OR' filter capabilities for debug flow addr (398985)

In order to make a more flexible filter for the debug flow address command, the Boolean arguments of 'AND' and 'OR' have been added to the command parser. This will work regardless of whether or not the source or destination address is being filtered.

Syntax:

```
diagnose debug flow filter address <IP1|from IP> <IP2|to IP> <ENTER|and/or>
```

Improve wad debug trace and crash log information (400454)

Previously, when filtering on a wad debug trace or crash log information, the information may not have been as targeted as necessary. A new setting has been added to target a specific policy.

```
diagnose wad filter firewall-policy <index>
diagnose wad filter explicit-policy <index>
```

These commands will target the firewall or explicit proxy policies. Using a "-1" as the value will index of that particular policy type.

diagnose hardware test added to additional models (403571)

The diagnose hardware test that was previously on FortiGate E Series models, and the FortiGate 300/500D models, has been expanded to include:

- Multiple low range models
- Multiple mid range models
- FortiGate 3800D model

This diagnostic feature replaces much of the functionality of the HQIP test that requires the installation of a separate firmware image.

diag sys sip-proxy config profile --> diag sys sip-proxy config profiles (404874)

Diagnose command has been changed to make it more consistent with other similar commands.

```
diagnose sys sip-proxy config profile
```

has been changed to

```
diagnose sys sip-proxy config profiles
```

diag debug flow changes (405348)

For crash and console logs, the logs are no longer parsed before being sent to their destination. Now they are dumped directly to the destination.

In addition the following options have been removed from the diagnose command list:

```
diag debug flow show console
diag debug flow show console enable
diag debug flow show console disable
```

improve wad memory diagnose process (408236)

The WAD SSL memory dump functions have been moved to migbase so they can be shared by both WAD and CLI.

CLI additions

- `diagnose wad memory` - WAD memory diagnostics
- `diagnose wad memory general` - List of WAD memory blocks.
- `diagnose wad memory bucket` List suspicious WAD memory buckets.
- `diagnose wad memory ssl` List SSL memory statistics

New daemon watchdog framework in forticron (409243)

A new feature has been added to dump userspace's process stacks.

CLI additions:

```
diagnose sys process pstack <pid>
```

<pid> - Process ID, such as those displayed when using `diagnose sys top`

Output from diagnose wad debug command filterable(410069)

The output from the command was so verbose that there was some concern that the information that was being looked for could get lost in all of the extraneous data so some parameters were added that allow the information to be filtered by both severity level and the category of the information.

The command has a few settings

```
diagnose wad debug [enable|disable|show|clear|display]
```

- `enable` - Enable the level or category debug setting.
- `disable` - Disable debug setting.
- `show` - Show the current debug setting.
- `clear` - Clear the exiting debug setting.
- `display` - Changes to the Display setting.
 - `diag wad debug display pid enable` - enables the display of PID values in the output.

Syntax to set the level

```
diagnose wad debug enable level <level>
```

Where the <level> is one of:

- `error` - error
- `warn` - warning
- `info` - information
- `verbose` - verbose

Syntax to set the category

```
diag wad debug enable category <category>
```

Where <category> is one of the following:

- `connection` - connection
- `session` - session
- `protocol` - protocol
- `io` - I/O
- `packet` - packet
- `db` - cache database
- `cifs` - CIFS
- `ssl` - SSL
- `webcache` - webcache
- `policy` - policy matching
- `auth` - authentication
- `scan` - UTM scan
- `cache` - wanopt cache
- `tunnel` - wanopt tunnel
- `bank` - bank
- `stats` - stats
- `disk` - cache disk
- `video` - cache video
- `rplmsg` - replacement message
- `ipc` - IPC
- `bar` - Fortinet top bar
- `waf` - WAF
- `memblk` - memory block
- `all` - all category

DNS log improvements (410132)

DNS logs have been improved to make the presentation of the data clearer. These changes involve a reorganization of the DNS log subtypes.

These changes include:

- Change `dns-subtype` to `dns-response`
- Remove `status` field and add Pass/Block/Redirect to `action` field
- Change the `msg` field display DNS filter rating results
- All error messages now to the `error` field
- Change `urlfilteridx` to `domainfilteridx`
- Change `urlfilterlist` to `domainfilterlist`
- Add a query type value field.

Explicit web proxy (5.6)

New explicit web proxy features added to FortiOS 5.6.

Explicit proxy supports multiple incoming ports and port ranges (402775, 398687)

Explicit proxy can now be configured to listen on multiple ports on the same IP as well as listen for HTTP and HTTPS on those same (or different) ports.

Define the IP ranges using a hyphen (-). As shown below, `port_high` is not necessary to specify if `port_low` is equal to `port_high`.

CLI syntax

```
config web-proxy explicit
  set http-incoming-port <port_low> [-<port_high>]
end
```

Explicit proxy supports IP pools (402221)

Added a new command, `poolname`, to `config firewall proxy-policy`. When setting the IP pool name with this command, the outgoing IP will be selected.

CLI syntax

```
config firewall proxy-policy
  edit <example>
    set poolname <name>
end
```

Option to remove unsupported encoding from HTTP headers (392908)

Added a new command to `config web-proxy profile` that, when enabled, allows the FortiGate to strip out unsupported encoding from request headers, and correctly block banned words. This is to resolve issues when attempting to successfully block content using Google Chrome.

CLI syntax:

```
config web-proxy profile
  edit <example>
    set strip-encoding {enable | disable}
end
```

New authentication process for explicit web proxying (386474, 404355)

While in Proxy inspection mode, explicit proxy options can be set under **Network > Explicit Proxy**. These settings will affect what options are available for creating proxy policies under **Policy & Objects > Proxy Policy**. From here you may create new policies with **Proxy Type** set to either **Explicit Web**, **Transparent Web**, or **FTP**.

Authentication will be triggered differently when configuring a transparent HTTP policy. Before such a policy can be configured, you must enable **HTTP Policy Redirect** under **Security Profiles > Proxy Options**.

Added Internet services to explicit proxy policies (386182)

Added two new commands to `config firewall proxy-policy`. FortiOS can use the Internet Service Database (introduced in 5.4.1) as the web-proxy policy matching factor.

CLI syntax:

```
config firewall proxy-policy
edit <example>
set internet-service <application-id>
set internet-service-custom <application-name>
```

Virtual WAN link in an explicit proxy firewall policy (385849, 396780)

Virtual WAN link (VWL) interfaces may now be set as the destination interface in an explicit proxy policy, routing traffic properly using basic virtual WAN link load balance settings. This is now configurable through both the CLI under `firewall proxy-policy` and the GUI.

Added application ID and category setting on the explicit proxy enabled service (379330)

This feature introduces support for application ID/category in the service of explicit proxy as one policy selection factor. The intent is to identify the application type based on the HTTP request with IPS application type detection function. It is similar to the current firewall explicit address, but it is implemented as a service type, and you can select the application ID/ category to define explicit service. Of course, now it must be an HTTP-based application.

CLI syntax

```
config firewall service custom
edit "name"
set app-service-type [disable|app-id|app-category]
next
end
```

Explicit Proxy - populate pac-file-url in transparent mode (373977)

You can now use `manageip` to populate `pac-file-url` in transparent opmode. Previously, in the CLI, when displaying `pac-file-url`, the code only tries to get interface IP to populate `pac-file-url`.

CLI syntax

```
config vdom
edit root
config system settings
set opmode transparent
set manageip 192.168.0.34/24
end
config web-proxy explicit
set pac-file-server-status enable
get pac-file-url [url.pac]
end
```

SSL deep inspection OCSP support for Explicit Proxy (365843)

OCSP support for SSL deep inspection added for Explicit Proxy.

CLI syntax

```
config vpn certificate setting
  set ssl-ocsp-status [enable|disable]
  set ssl-ocsp-option [certificate|server]
end
```

Timed out authentication requests are now logged (357098)**CLI syntax**

```
config web-proxy explicit
  set trace-auth-no-rsp [enable|disable]
end
```

Firewall (5.6.3)

New firewall features added to FortiOS 5.6.3.

Multi-port support for Explicit Proxy (402775)

Support has been added for the use of multiple ports and port range in the explicit FTP or Web proxies. These changes have been added in both CLI and GUI.

CLI changes:

```
set http-incoming-port <port_low>[-<port_high>]
```

Where:

- `port_low` - the low value of the port
- `port_high` - the high value of the port

The `port_high` value can be omitted if `port_low` and `port_high` are the same.

Nturbo support CAPWAP traffic and fix IPsec IPv6 firewall policy code typo (290708) (423323)

NTurbo is used for IPSEC+IPS case. The IPSEC SA info is passed to NTURBO as part of VTAG for control packet and will be used for the xmit.

If the packets need to go through IPSEC interface, the traffic will be always offloaded to Nturbo. But for the case that SA has not been installed to NP6 because of hardware limitation or SA offload disable, the packets will be sent out through raw socket by IPS instead of Nturbo, since the software encryption is needed in this case.

CLI Changes:

Previously, NTurbo could only be enabled or disabled globally. The setting of `np-acceleration` has been added to the firewall policy context instead of just the global context.

Add: Added a CLI command in the firewall policy to enable/disable NTurbo acceleration.

```
config firewall policy
edit 1
set np-acceleration [enable|disable]
end
```

When IPS is enabled for VPN IPsec traffic, the data can be accelerated by NTurbo now.

Toggling SNAT in Central SNAT policies (434981)

The central NAT feature is not enabled by default. When `central-nat` is enabled, `nat` option under IPv4 policies is skipped and SNAT must be done via `central-snat-map`.

- Info messages and redirection links have been added to IPv4 policy list and dialog to indicate the above
- If NGFW mode is policy-based, then it is assumed that `central-nat` (specifically SNAT) is enabled implicitly
- The option to toggle NAT in `central-snat-map` policies has been added (previously it was only shown in NGFW policy-based mode).

- In central-snat policy dialog, the port-mapping fields for the original port have been updated to accept ranges.
- Nat will be skipped in firewall policy if per vdom central nat is enabled.

Example scenarios to show changes in how CLI treats central-nat

Change: make nat available regardless of NGFW mode.

```
config firewall central-snat-map
edit 1
set orig-addr "192-86-1-86"
set srcintf "port23"
set dst-addr "192-96-1-96"
set dstintf "port22"
set nat-ippool "pool1"
set protocol 17
set orig-port 2896-2897
set nat enable
end
```

Change: hide nat-port if nat-ippool is not set or NAT is disabled.

```
config firewall central-snat-map
edit 1
set orig-addr "192-86-1-86"
set srcintf "port23"
set dst-addr "192-96-1-96"
set dstintf "port22"
set nat-ippool "pool1"
set protocol 17
set orig-port 2896-2897
set nat disable
end
```

Change: change orig-port to accept range

```
config firewall central-snat-map
edit 1
set orig-addr "192-86-1-86"
set srcintf "port23"
set dst-addr "192-96-1-96"
set dstintf "port22"
set nat-ippool "pool1"
set protocol 17
set orig-port 2896-2897 (help text changed to: Original port or port range).
set nat-port 35804-35805
end
```

Improved wildcard support for firewall fqdn (444646)

The following wildcard character instances are now supported in wildcard FQDN addresses:

- "?" character
- "*" character in the middle of a phrase
- The "?*" combination

Policy Matching based on Referrer Headers and Query Strings (446257)

Web proxy policies support creating web proxy addresses to match referrer headers and query strings.

Matching referrer headers

For example, to create a web proxy address to match the referrer header to block access to the following YouTube URL <http://youtube.com/user/test321>. The http request will have the following format:

```
GET /user/test321 HTTP/1.1
Host: www.youtube.com
User-Agent: curl/7.52.1
Accept: */*
```

Create the following web proxy addresses to match this page:

```
config firewall proxy-address
edit youtube
set type host-regex
set host-regex ".*youtube.com"
next
edit test321
set host "youtube"
set path "/user/test321"
set referrer enable
end
```

Then create two proxy policies, one that allows access to all traffic and a second one that blocks access to the page that matches the referrer header:

```
config firewall proxy-policy
edit 1
set uuid 92273e4e-8c53-51e7-a7bd-f26e6e15fc98
set proxy explicit-web
set dstintf "wan2"
set srcaddr "all"
set dstaddr "all"
set service "webproxy-connect"
set action accept
set schedule "always"
set utm-status enable
set profile-protocol-options "test"
set ssl-ssh-profile "test"
next
edit 2
set uuid d35ad06a-8c53-51e7-8511-17200f682a4a
set proxy explicit-web
set dstintf "wan2"
set srcaddr "all"
set dstaddr "test321"
set service "webproxy"
set action accept
set schedule "always"
set utm-status enable
set av-profile "default"
set profile-protocol-options "test"
set ssl-ssh-profile "test"
end
```

Matching query strings

To match the video with URL `youtube.com/watch?v=XXXXXXXXXX`, (where `XXXXXXXXXX` is an example YouTube query string) you need to match an HTTP request with the following format:

```
GET /user/watch?v=GLCHldlwQsg HTTP/1.1
Host: www.youtube.com
User-Agent: curl/7.52.1
Accept: */*
```

Create the following web proxy addresses to match this video or query string:

```
config firewall proxy-address
edit "youtube"
set uuid 4ad63880-971e-51e7-7b2e-c69423ac6314
set type host-regex
set host-regex ".*youtube.com"
next
edit "query-string"
set uuid 7687a8c0-9727-51e7-5063-05edda03abbf
set host "youtube"
set path "/watch"
set query "v=XXXXXXXXXX"
end
```

Then create two proxy policies, one that allows access to all traffic and a second one that blocks access to the page that matches the query string

```
config firewall proxy-policy
edit 1
set uuid 92273e4e-8c53-51e7-a7bd-f26e6e15fc98
set proxy explicit-web
set dstintf "wan2"
set srcaddr "all"
set dstaddr "all"
set service "webproxy-connect"
set action accept
set schedule "always"
set utm-status enable
set profile-protocol-options "test"
set ssl-ssh-profile "test"
next
edit 2
set uuid d35ad06a-8c53-51e7-8511-17200f682a4a
set proxy explicit-web
set dstintf "wan2"
set srcaddr "all"
set dstaddr "query-string"
set service "webproxy"
set action accept
set schedule "always"
set utm-status enable
set av-profile "default"
set profile-protocol-options "test"
set ssl-ssh-profile "test"
next
end
```

Firewall (5.6.1)

New firewall features added to FortiOS 5.6.1.

Improvement to NAT column in Policy List Display (305575)

The NAT column in the listing of Policy can provide more information than before.

Previously the field for the policy in the column only showed whether NAT was **Enabled** or **Disabled**.

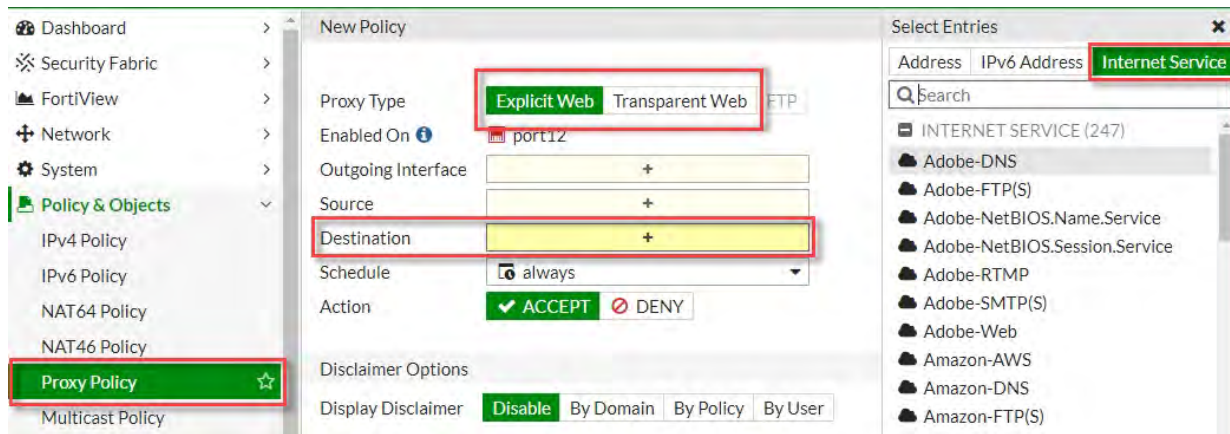

With the new improvements, not only does the field show the name of the Dynamic Pool, if one is being used, but the tool-tip feature is engaged if you hover the cursor over the icon in the field and provides even more specific information.

GUI support for adding Internet-services to proxy-policies (405509)

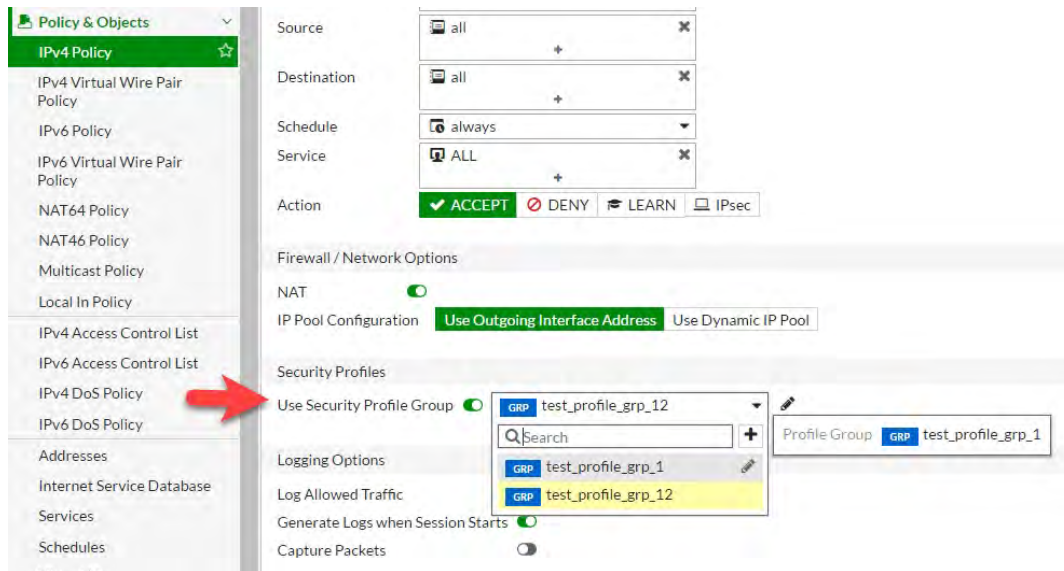

There is now GUI support for the configuration of adding Internet services to proxy policies. When choosing a destination address for a Proxy Policy, the Internet Service tab is visible and the listed objects can be selected.

By choosing an **Internet Service** object as the **Destination**, this sets `internet-service` to enable and specifying either an **Address** or **IPv6 Address** object will set `internet-service` to disable.

Inline editing of profile groups on policy (409485)

There can now be editing to the profile groups within the policy list display window. Before, you had to go into the edit window of the policy, such as in the image below:

However, now the editing can be done from the list display of policies and clicking on the GRP icon. Right clicking on the icon will slide a window out from the left and left clicking will give you a drop-down menu.

Rename "action" to "nat" in firewall.central-snat-map (412427)

The `action` field option in the context of `firewall central-snat-map` in the CLI was considered by some to be a little ambiguous, so it has been renamed to `nat`, an option that can either be `enabled` or `disabled`.

Explicit proxy supports session-based Kerberos authentication (0437054)

- Explicit proxy supports session-based Kerberos authentication
- Transparent proxy will create an anonymous user if the an attempt to create a NTLM connection fails.
- When FSSO authentication fails for the explicit FTP proxy, the FortiGate responses with the error message "match policy failed".

Firewall (5.6)

New firewall features added to FortiOS 5.6.

Optimization of the firewall Service cache (355819)

In order to improve the efficiency and performance of the firewall Service cache, the following improvements have been made:

- The logic behind the structure of the cache has been simplified. Instead of storing ranges of port numbers, we store each individual port number in the cache
- Separate caches are created for each VDOM so that cache searches are faster.
- The performance of more frequently used cases has been increased
- Hash tables are used to improve the performance of complex cases. These could include such instances as:
 - service names tied to specific IP Ranges
 - redefinition (one port number with multiple service names)

New CLI option to prevent packet order problems for sessions offloaded to NP4 or NP6 (365497)

In order to prevent the issue of a packet, on FortiGate processing a heavy load of traffic, from being processed out of order, a new setting has been added to better control the timing of pushing the packets being sent to NP units.

The new option, `delay-tcp-npc-session`, has been added into the context of config firewall policy within the CLI

```
config firewall policy
  edit <Integer for policy ID>
    set delay-tcp-npc-session
  end
```

Policy may not be available on units not using NP units.

GUI changes to Central NAT (371516)

The Central NAT configuration interface prevents the accidental occurrence of being able to select "all" and "none" as two objects for the same field. It only allows the selecting of a single IP pool, though it is still possible to

select multiple IP pools within the CLI.

Max value for Firewall User authentication changed (378085)

Previously, the maximum time that a member of a firewall user group could remain authenticated without any activity was 24 hours (1440 minutes). The maximum value for this setting has been changed to 72 hours (4320 minutes). This allow someone to log in but not be kicked off the system due to inactivity over the course of a weekend.

The syntax in the CLI for configuring this setting is:

```
config user group
  edit <name of user group>
    set authtimeout 4320
  end
```

Changes to default SSL inspection configuration (380736)

SSL is such a big part of normal traffic that SSL certificate inspection is no longer disabled by default. SSL inspection is now mandatory in firewall policies whenever a policy includes a security profile. The default setting is the Certificate Inspection level. As a result there have been a few changes within the CLI and the GUI.

CLI

The setting SSL-SSH-Profile, is a required option, with the default value being "certificate-inspection", when it is applicable in the following tables:

- firewall.profile-group
- firewall.policy
- firewall.policy6,
- firewall.proxy-policy

The following default profiles are read-only:

- certificate-inspection
- deep-ssl-inspection

GUI

IPv4/IPv6 Policy and Explicit Proxy Policy edit window

- The configuration and display set up for SSL/SSH Inspection is now similar to "profile-protocol-option" option
- The disable/enable toggle button is no longer available for the Profile Protocol Option
- The default profile is set to "certificate-inspection"

IPv4/IPv6 Policy, Explicit Proxy Policy list page

- There is validation for SSL-SSH-Profile when configuring UTM profiles

SSL/SSH Inspection list page

- There is no delete menu on GUI for default ssl profiles
- The "Edit" menu has been changed to "View" for default SSL profiles
- The default SSL profile entries are considered an implicit class and are grayed out

SSL/SSH Inspection edit window

- The only input for default SSL profiles is now download/view trusted certificate links
- To return to the List page from default SSL profiles, the name of the button is now "Return"

Profile Group edit window

- There is no check box for SSL-SSH-Profile. It is always required.

Name change conventions due to upgrade

Starting in 5.6, the profiles "certificate-inspection" and "deep-inspection" are set up by the firmware as default read-only profiles. If you have profiles with these names that were configured in a previous version of FortiOS, rather than overwrite the firmware's default profile, profiles with these names will be upgraded to reflect the configuration conventions of the new firmware but the profile names will be changed by adding a prefix of "_upg_".

Add firewall policy comment field content to log messages (387865)

There has been a need by some customer to have some information in the logs that includes specific information about the traffic that produced the log. The rather elegant solution is that when the log-policy-comment option is enabled, the comment field from the policy will be included in the log. In order to make the logs more useful regarding the traffic just include a customized comment in the policy and enable this setting.

Syntax

```
config system settings
    set log-policy-comment [enable | disable]
end
```

- This setting is for all traffic and security logs.
- It can be select on a per VDOM basis

Learning mode changes profile type to single (387999)

The Learning mode does not function properly when it is applied to a policy that has a UTM profile group applied to it. The logging that should be taking place from the Learning Mode profiles does not occur as intended, and the

Automatically switching the profile type to single on a policy with Learning mode enabled prevents it from being affected by the UTM policy groups.

MAC address authentication in firewall policies and captive portals (391739)

When enabled, a MAC authentication request will be sent to `fnbamd` on any traffic. If the authentication receives a positive response, login becomes available. If the response is negative the normal authentication process takes over.

CLI

New option in the firewall policy setting

```
config firewall policy
    edit <policy ID>
        set radius-mac-auth-bypass [enable |disable]
    end
```

New option in the interface setting

```
config system interface
edit <interface>
set security-mode captive-portal
set security-mac-auth-bypass
end
```

Display resolved IP addresses for FQDN in policy list (393927)

If a FQDN address object is used in a policy, hovering the cursor over the icon for that object will show a tool tip that lists the parameters of the address object. This tool tip now includes the IP address that the FQDN resolves to.

Added comment for acl-policy, interface-policy and DoS-policy (396569)

A comment field has been added to the following policy types:

- acl-policy
- interface-policy
- DoS-policy

Comments of up to 1023 characters can be added through the CLI.

Examples:

DoS policy

```
config firewall DoS-policy
edit 1
set comment "you can put a comment here(Max 1023)."
```

Interface policy

```
config firewall interface-policy
edit 1
set comment "you can put a comment here(max 1023)."
```

Firewall ACL

```
config firewall acl
edit 1
set status disable
set comment "you can put a comment here(max 1023)."
```

```
set interface "port5"
set srcaddr "all"
set dstaddr "all"
set service "ALL"
end
```

Internet service settings moved to more logical place in CLI (397029)

The following settings have moved from the application context of the CLI to the firewall context:

- `internet-service`
- `internet-service-custom`

Example of `internet-service`

```
config firewall internet-service 1245324
set name "Fortinet-FortiGuard"
set reputation 5
set icon-id 140
set offset 1602565
config entry
edit 1
set protocol 6
set port 443
set ip-range-number 27
set ip-number 80
next
edit 2
set protocol 6
set port 8890
set ip-range-number 27
set ip-number 80
next
edit 3
set protocol 17
set port 53
set ip-range-number 18
set ip-number 31
next
edit 4
set protocol 17
set port 8888
set ip-range-number 18
set ip-number 31
next
end
```

Example of `internet-service-custom`

```
config firewall internet-service-custom
edit "custom1"
set comment "custom1"
config entry
edit 1
set protocol 6
config port-range
edit 1
set start-port 30
```

```

        set end-port 33
      next
    end
    set dst "google-drive" "icloud"
  next
end
next
end

```

Example of get command:

```

get firewall internet-service-summary
Version: 00004.00002
Timestamp: 201611291203
Number of Entries: 1349

```

Certificate key size selection (397883)

FortiOS will now support different SSL certificate key lengths from the HTTPS server. FortiOS will select a key size from the two options of 1024 and 2048, to match the key size (as close as possible, rounding up) on the HTTPS server. If the size of the key from the server is 512 or 1024 the proxy will select a 1024 key size. If the key size from the servers is over 1024, the proxy will select a key size of 2048.

CLI changes:

In `ssl-ssh-profile` remove:

- `certname-rsa`
- `certname-dsa`
- `certname-ecdsa`

In `vpn certificate` setting, add the following options :

- `certname-rsa1024`
- `certname-rsa2048`
- `certname-dsa1024`
- `certname-dsa2048`
- `certname-ecdsa256`
- `certname-ecdsa384`

AWS API integration for dynamic firewall address object (400265)

Some new settings have been added to the CLI that will support instance information being retrieved directly from the AWS server. The IP address of a newly launched instance can be automatically added to a certain firewall address group if it meets specific requirements. The new address type is: `ADDR_TYPE_AWS`

New CLI configuration settings:**The AWS settings**

```

config aws
  set access-key
  set secret-key
  set region

```

```
set vpc-id
set update-interval
```

- access-key - AWS access key.
- secret-key - AWS secret key.
- region - AWS region name.
- vpc-id - AWS VPC ID.
- update-interval - AWS service update interval (60 - 600 sec, default = 60).

The AWS address:

```
config firewall address
edit <address name>
set type aws
set filter <filter values>
```

The filter can be a combination of any number of conditions, as long as the total length of filter is less than 2048 bytes. The syntax for the filter is:

```
<key1=value1> [& <key2=value2>] [| <key3=value3>]
```

For each condition, it includes a key and value, the supported keys are:

1. instanceId, (e.g. instanceId=i-12345678)
2. instanceType, (e.g. instanceType=t2.micro)
3. imageId, (e.g. imageId=ami-123456)
4. keyName, (e.g. keyName=aws-key-name)
5. architecture, (e.g. architecture=x86)
6. subnetId, (e.g. subnetId=sub-123456)
7. placement.availabilityzone, (e.g. placement.availabilityzone=us-east-1a)
8. placement.groupname, (e.g. placement.groupname=group-name)
9. placement.tenancy, (e.g. placement.tenancy=tenancy-name)
10. privateDnsName, (e.g. privateDnsName=ip-172-31-10-211.us-west-2.compute.internal)
11. publicDnsName, (e.g. publicDnsName=ec2-54-202-168-254.us-west-2.compute.amazonaws.com)
12. AWS instance tag, each tag includes a key and value, the format of tag set is: tag.Name=Value, maximum of 8 tags are supported.

Internet service configuration (405518)

To make the CLI configuration of Internet service configuration more intuitive, the settings for Internet service in Explicit Web proxy are closer to those in the Firewall police. An Internet service enable switch has been added to the Explicit Web proxy with the same text description as the Firewall policy.

CLI:

The relevant options in the firewall policy are:

```
config firewall policy
edit 1
set internet-service enable
set internet-service-id 327681 1572864 917519 393225 1572888 1572877 917505
```

```
next
end
```

The Explicit Web proxy is now has these options:

```
config firewall proxy-policy
edit 1
set uuid f68e0426-dda8-51e6-ac04-37fc3f92cadf
set proxy explicit-web
set dstintf "port9"
set srcaddr "all"
set internet-service 2686980
set action accept
set schedule "always"
set logtraffic all
next
end
```

Changes to SSL abbreviate handshake (407544)

The SSL handshake process has changed to make troubleshooting easier.

- In order to better identify which clients have caused SSL errors, the WAD SSL log will use the original source address rather than the source address of packets.
- The return value of `wad_ssl_set_cipher` is checked.
- The `wad_ssl_session_match` has been removed because it will add the connection into bypass cache and bypass further inspection.
- DSA and ECDSA certificates are filtered for `admin-server-cert`
- `cert-inspect` is reset after a WAD match to a Layer 7 policy
- An option to disable the use of SSL abbreviate handshake has been added

CLI addition

```
config firewall ssl setting
set abbreviate-handshake [enable|disable]
```

NGFW mode in the VDOM - NAT & SSL Inspection considerations (407547)

Due to how the NGFW Policy mode works, it can get complicated in the two areas of NAT and SSL Deep Inspection. To match an application against a policy, some traffic has to pass through the FortiGate in order to be properly identified. Once that happens may end up getting mapped to a different policy, where the new policy will be appropriately enforced.

NAT

In the case of NAT being used, the first policy that is triggered to identify the traffic might require NAT enabled for it to work correctly. i.e., without NAT enabled it may never be identified, and thus not fall through. Let's use a very simple example:

Policy 1: Block Youtube

Policy 2: Allow everything else (with NAT enabled)

Any new session established will never be identified immediately as Youtube, so it'll match policy #1 and let some traffic go to try and identify it. Without NAT enabled to the Internet, the session will never be setup and thus stuck here.

Solution:

- NAT for NGFW policies must be done via Central SNAT Map
- Central SNAT Map entries now have options for 'srcintf', 'dstintf' and 'action'.
- If no IP-pools are specified in the Central SNAT entry, then the outgoing interface address will be used.
- NGFW policies now must use a single default ssl-ssh-profile. The default ssl-ssh-profile can be configured under the system settings table.

SSL

In the case of SSL inspection, the issue is a bit simpler. For each policy there are 3 choices:

1. No SSL,
2. Certificate Only
3. Deep Inspection.

For 1. and 2. there is no conflict and the user could enable them inter-changeably and allow policy fallthrough.

The issue happens when:

- The first policy matched, uses **Certificate Only**
- After the application is detected, it re-maps the session to a new policy which has **Deep Inspection** enabled

This switching of behavior is the main cause of the issue.

Solution:

- Multiple SSL profiles have been replaced with a single page of settings
- The user can setup exemptions for destination web category, source IP or etc.

CLI**Changes**

```
config system settings
  set inspection-mode flow
  set policy-mode [standard | ngfw]
```

Has been changed to:

```
config system settings
  set inspection-mode flow
  set ngfw-mode [profile-based | policy-based]
```

- ngfw-mode - Next Generation Firewall mode.
- profile-based - Application and web-filtering is configured using profiles applied to policy entries.
- policy-based - Application and web-filtering is configured as policy match conditions.

Additions

Setting the vdom default ssl-ssh-profile

```
config system settings
  set inspection-mode flow
  set ngfw-mode policy-based
  set ssl-ssh-profile <profile>
```

ssl-ssh-profile - VDOM SSL SSH profile.

Setting srcintf, dstintf, action on the central-snat policy

```
config firewall central-snat-map
  edit <id>
    set srcintf <names or any>
    set dstintf <names or any>
    set action (permit | deny)
```

- `srcintf` - Source interface name.
- `dstintf` - Destination interface name.
- `action` - Action of central SNAT policy.

GUI

System settings, VDOM settings list/dialog:

- A field has been added to show the default `ssl-ssh-profile`

IPv4/v6 Policy list and dialogs:

- In NGFW policy-based mode, there are added tool tips under NAT columns/fields to indicate that NAT must be configured via Central SNAT Map. Additionally, links to redirect to Central SNAT list were added.
- Default `ssl-ssh-profile` is shown in the policy list and dialog for any policies doing NGFW (`application, application-categories, url-categories`) or UTM (`av-profile etc.`) inspection.
 - Default `ssl-ssh-profile` is disabled from editing in policy list dialog

Central SNAT Policy list and dialogs:

- In both `profile-based` & `policy-based ngfw-mode`, fields for `srcintf`, `dstintf` were added to Central SNAT policies entries.
- In `policy-based` mode only, a toggle-switch for **NAT Action** was added in Central SNAT policy dialog. The action is also configurable from the **Action** column in Central SNAT policy list.

SSL/SSH Inspection list:

- In policy-based mode only, the navigation bar link to **SSL/SSH Inspection** redirects to the profiles list
- In policy-based mode only, the **SSL/SSH Inspection** list table indicates which profile is the current VDOM default. Additionally, options are provided in the list menu and context menu to change the current VDOM default.

Support HTTP policy for flow-based inspection (411666)

It is possible to implement an HTTP-policy in a VDOM that is using the Flow-based inspection mode. Enabling the HTTP-policy causes the traffic to be redirected to WAD so that the traffic can be properly matched and processed.

Support for CA chain downloading to improve certificate verification (369270)

During certificate verification, if the certificate chain is not complete and CA issuer information exists in the certificate, FortiOS attempts to download intermediate/root CAs from the HTTP server and attempts to perform chain verification. The downloaded CAs are saved in a cache (max 256) to be re-used for future certificate validation. CAs are removed from the cache if they are inactive or not needed for more than 1 hour.

CA chain downloading is used to improve verification results for certificates that are difficult to verify. The CAs are kept in the cache to improve performance.

Managed FortiSwitch OS 3.6.0 (FortiOS 5.6.3)

New managed FortiSwitch features added to FortiOS 5.6.3 if the FortiSwitch is running FortiSwitch OS 3.6.0.

Firewall policy now required for RADIUS traffic (434470)

In FortiLink mode, you must manually create a firewall policy to allow RADIUS traffic for 802.1x authentication from the FortiSwitch (for example, from the FortiLink interface) to the RADIUS server through the FortiGate.

STP root guard (376015)

Enable root guard on all ports that should not be root bridges. Do not enable root guard on the root port. You must have STP enabled to be able to use root guard.

Using the FortiGate GUI

1. Go to **WiFi & Switch Controller > Managed FortiSwitch**.
2. Right-click on a port.
3. Select **Enable** or **Disable**.

Using the FortiGate CLI

```
config switch-controller managed-switch
  edit <switch-id>
    config ports
      edit <port name>
        set stp-root-guard {enabled | disabled}
      end
    end
  end
```

STP BPDU guard (406182)

When BPDU guard is enabled on STP edge ports, any BPDUs received cause the ports to go down for a specified number of minutes. The BPDUs are not forwarded, and the network edge is enforced.

There are two prerequisites for using BPDU guard:

- You must define the port as an edge port with the `set edge-port enable` command.
- You must enable STP on the switch interface with the `set stp-state enabled` command.

Using the FortiGate GUI

1. Go to **WiFi & Switch Controller > Managed FortiSwitch**.
2. Right-click on a port.
3. Select **Enable** or **Disable**.

Using the FortiGate CLI

```
config switch-controller managed-switch
  edit <switch-id>
    config ports
      edit <port name>
        set stp-bpdu-guard {enabled | disabled}
        set stp-bpdu-guard-time <0-120>
      end
    end
  end
```

FortiSwitch log message changes (438738)

More details are now provided in exported FortiSwitch logs, for example:

- New Switch-Controller user field and daemon-name ui fields.
- Removed Switch-Controller keyword from the msg field
- Changed UpdSwConf keyword in msg field to FortiSwitch in flcfgd logs
- Removed the VDOM keyword from the msg field in flcfgd logs
- Removed the Fortiswitch keyword before SN in the msg field
- Changed syslog to have switch SN first followed by a space and then the first word following with a capital (in the msg field)

Use the following CLI commands to enable the export of FortiSwitch logs and to set the level of logging included. The system logs all messages at and above the logging severity level you select. For example, if you select `error`, the system logs `error`, `critical`, `alert`, and `emergency` level messages.

```
config switch-controller switch-log
  set status (*enable | disable)
  set severity [emergency | alert | critical | error | warning | notification |
    *information | debug]
end
```

Support FSW BPDU Guard (442921) (442922)

With standard STP, a device that sends BPDU(s) to any switch port becomes a member of that switch's STP network topology. In order to enforce a network edge, the access ports on the switch can be configured with BPDU guard. With BPDU guard enabled, the port does not forward BPDUs upstream (toward its root bridge). Instead, when a BPDU guard enabled port receives any BPDU, it immediately puts the port into a blocking state and alerts the user.

This prevents the access port from accepting the downstream device, removing it from the receiving switch's STP calculations. In order to unblock the port after bpdu guard has triggered, the user must execute a reset command.

After the port is reset, it will resume normal operation and return to a blocking state only if another BPDU is received.

BPDU guard is typically used in conjunction with Root Guard to enforce a specific network topology.

Syntax

```
config switch-controller managed-switch
  edit <switch SN>
    config ports
      edit <port>
        set stp-bpdu-guard <enable | *disable>
        set stp-bpdu-guard-timeout <time> (0-120 in minutes)
      next
    end
  next
end

config switch-controller managed-switch
  edit <switch SN>
    config ports
      edit <port>
        set stp-root-guard <enable | *disable>
      next
    end
  next
end

diagnose switch-controller dump stp <switch SN> <instance>
diagnose switch-controller bpdu-guard-status <switch SN>
```

Managed switch CLI features added to GUI (448722)

Added new optional columns "Edge Port", "LLDP Profile", "QoS Policy", "STP BPDU Guard", "STP Root Guard" in **WiFi & Switch Controller > FortiSwitch Ports**.

This would allow administrators to make changes to the features above to multiple switch ports at the same time.

Added unit in help-text when setting max-rate/min-rate under switch-controller qos queue-policy (449487) (449869)

Modified the CLI help-text on the FortiGate to show priority under strict schedule when setting max-rate/min-rate under switch-controller qos queue-policy.

Syntax

```
set priority-0
  queue-0 COS queue 0. (lowest priority)
  queue-1 COS queue 1.
  queue-2 COS queue 2.
  queue-3 COS queue 3.
  queue-4 COS queue 4.
  queue-5 COS queue 5.
  queue-6 COS queue 6.
  queue-7 COS queue 7. (highest priority)
```

Added FortiSwitch factory-reset functionality to the FortiOS GUI (393205)

Added a **Factory Reset** button to the **WiFi & Switch Controller > Managed FortiSwitch** page when a FortiSwitch document is selected.

Syntax

```
execute switch-controller factory-rest <switch sn>
```

Managed FortiSwitch OS 3.6.0 (FortiOS 5.6.1)

New managed FortiSwitch features added to FortiOS 5.6.1 if the FortiSwitch is running FortiSwitch OS 3.6.0.

Simplified method to convert a FortiSwitch to standalone mode (393205)

There is an easier way to convert a FortiSwitch from FortiLink mode to standalone mode so that it will no longer be managed by a FortiGate:

- `execute switch-controller factory-reset <switch-id>`
This command returns the FortiSwitch to the factory defaults and then reboots the FortiSwitch. If the FortiSwitch is configured for FortiLink auto-discovery, FortiGate can detect and automatically authorize the FortiSwitch.
- `execute switch-controller set-standalone <switch-id>`
This command returns the FortiSwitch to the factory defaults, reboots the FortiSwitch, and prevents the FortiGate from automatically detecting and authorizing the FortiSwitch.

You can disable FortiLink auto-discovery on multiple FortiSwitches using the following commands:

```
config switch-controller global
  set disable-discovery <switch-id>
end
```

You can also add or remove entries from the list of FortiSwitches that have FortiLink auto-discovery disabled using the following commands:

```
config switch-controller global
  append disable-discovery <switch-id>
  unselect disable-discovery <switch-id>
end
```

Quarantines (410828)

Quarantined MAC addresses are blocked on the connected FortiSwitches from the network and the LAN.

NOTE: You must enable the quarantine feature in the FortiGate CLI using the `set quarantine enable` command. You can add MAC addresses to the quarantine list before enabling the quarantine feature, but the quarantine does not go into effect until enabled.

Quarantining a MAC address

Using the FortiGate GUI

1. Select the host to quarantine.
 - Go to **Security Fabric > Physical Topology**, right-click on a host, and select **Quarantine Host on FortiSwitch**.

- Go to **Security Fabric > Logical Topology**, right-click on a host, and select **Quarantine Host on FortiSwitch**.
- Go to **FortiView > Sources**, right-click on an entry in the Source column, and select **Quarantine Host on FortiSwitch**.

2. Click **OK** to confirm that you want to quarantine the host.

Using the FortiGate CLI

```
config switch-controller quarantine
  set quarantine enable
  edit <MAC_address>
    set description <string>
    set tags <tag1 tag2 tag3 ...>
  next
next
end
```

Option	Description
MAC_address	A layer-2 MAC address in the following format: 12:34:56:aa:bb:cc
string	Optional. A description of the MAC address being quarantined.
tag1 tag2 tag3 ...	Optional. A list of arbitrary strings.

Viewing quarantine entries

Quarantine entries are created on the FortiGate that is managing the FortiSwitch.

Using the FortiGate GUI

1. Go to **Monitor > Quarantine Monitor**.
2. Click **Quarantined on FortiSwitch**.

Using the FortiGate CLI

Use the following command to view the quarantine list of MAC addresses:

```
show switch-controller quarantine
```

When the quarantine feature is enabled on the FortiGate, it creates a quarantine VLAN (qtn.<FortiLink_port_name>) on the virtual domain. The quarantine VLAN is applied to the allowed and untagged VLANs on all connected FortiSwitch ports.

Use the following command to view the quarantine VLAN:

```
show system interface qtn.<FortiLink_port_name>
```

Use the following command to view how the quarantine VLAN is applied to the allowed and untagged VLANs on all connected FortiSwitch ports:

```
show switch-controller managed-switch
```

Releasing MAC addresses from quarantine

Using the FortiGate GUI

1. Go to **Monitor > Quarantine Monitor**.
2. Click **Quarantined on FortiSwitch**.
3. Right-click on one of the entries and select **Delete** or **Remove All**.
4. Click **OK** to confirm your choice.

Using the FortiGate CLI

Use the following commands to delete a quarantined MAC address:

```
config switch-controller quarantine
config targets
    delete <MAC_address>
end
```

When the quarantine feature is disabled, all quarantined MAC addresses are released from quarantine. Use the following commands to disable the quarantine feature:

```
config switch-controller quarantine
    set quarantine disable
end
```

Assign untagged VLANs to a managed FortiSwitch port (410828)

Use the following commands to assign untagged VLANs to a managed FortiSwitch port:

```
config switch-controller managed-switch
    edit <managed-switch>
        config ports
            edit <port>
                set untagged-vlans <VLAN-name>
            next
        end
    next
end
```

View, create, and assign multiple 802.1X policy definitions (408389 and 403901)

Previously, you could create one 802.1X policy for all managed FortiSwitches in a virtual domain. Now, you can create multiple 802.1X policies and assign a different 802.1X policy to each managed FortiSwitch port.

View security policies for managed FortiSwitches

You can view security policies for managed FortiSwitches in two places:

- Go to **WiFi & Switch Controller > FortiSwitch Security Policies**.
- Go to **WiFi & Switch Controller > FortiSwitch Ports** and click the **+** next to a FortiSwitch. The security policy for each port is listed in the Security Policy column.

Create and assign multiple 802.1X policy definitions for managed FortiSwitches

Previously, you could create one 802.1X policy for all managed FortiSwitches in a virtual domain. Now, you can create multiple 802.1X policies and assign a different 802.1X policy to each managed FortiSwitch port.

To create an 802.1X security policy:

1. Go to **WiFi & Switch Controller > FortiSwitch Security Policies**.
2. Click **Create New**.
3. Enter a name for the new FortiSwitch security policy.
4. For the security mode, select **Port-based** or **MAC-based**.
5. Click **+** to select which user groups will have access.
6. Enable or disable guest VLANs on this interface to allow restricted access for some users.
7. Enter the number of seconds for authentication delay for guest VLANs. The range is 60-900 seconds.
8. Enable or disable authentication fail VLAN on this interface to allow restricted access for users who fail to access the guest VLAN.
9. Enable or disable MAC authentication bypass (MAB) on this interface.
10. Enable or disable EAP pass-through mode on this interface.
11. Enable or disable whether the session timeout for the RADIUS server will overwrite the local timeout.
12. Click **OK**.

To apply an 802.1X security policy to a managed FortiSwitch port:

1. Go to **WiFi & Switch Controller > FortiSwitch Ports**.
2. Click the **+** next to a FortiSwitch.
3. In the Security Policy column for a port, click **+** to select a security policy.
4. Click **OK** to apply the security policy to that port.

Override 802.1X settings

To override the 802.1X settings for a virtual domain:

1. Go to **WiFi & Switch Controller > Managed FortiSwitch**.
2. Click on a FortiSwitch faceplate and click **Edit**.
3. In the Edit Managed FortiSwitch page, move the **Override 802-1X settings** slider to the right.
4. In the Reauthentication Interval field, enter the number of minutes before reauthentication is required. The maximum interval is 1,440 minutes. Setting the value to 0 minutes disables reauthentication.
5. In the Max Reauthentication Attempts field, enter the maximum times that reauthentication is attempted. The maximum number of attempts is 15. Setting the value to 0 disables reauthentication.
6. Select **Deauthenticate** or **None** for the link down action. Selecting **Deauthenticate** sets the interface to unauthenticated when a link is down, and reauthentication is needed. Selecting **None** means that the interface does not need to be reauthenticated when a link is down.
7. Click **OK**.

Enable and disable switch-controller access VLANs through FortiGate (406718)

Access VLANs are VLANs that aggregate client traffic solely to the FortiGate. This prevents direct client-to-client traffic visibility at the layer-2 VLAN layer. Clients can only communicate with the FortiGate. After the client traffic

reaches the FortiGate, the FortiGate can then determine whether to allow various levels of access to the client by shifting the client's network VLAN as appropriate.

Use `enable` to allow traffic only to and from the FortiGate and to block FortiSwitch port-to-port traffic on the specified VLAN. Use `disable` to allow normal traffic on the specified VLAN.

```
config system interface
  edit <VLAN name>
    set switch-controller-access-vlan {enable | disable}
  next
end
```

Override the admin password for all managed FortiSwitches (416261)

By default, each FortiSwitch has an admin account without a password. To replace the admin passwords for all FortiSwitches managed by a FortiGate, use the following commands:

```
config switch-controller switch-profile
  edit default
    set login-passwd-override {enable | disable}
    set login-passwd <password>
  next
end
```

If you had already applied a profile with the override enabled and the password set and then decide to remove the admin password, you need to apply a profile with the override enabled and use the `unset login-passwd` command; otherwise, your previously set password will remain in the FortiSwitch.

Configure an MCLAG with managed FortiSwitches (366617)

To configure a multichassis LAG (MCLAG) with managed FortiSwitches:

1. For each MCLAG peer switch, log into the FortiSwitch to create a LAG:

```
config switch trunk
  edit "LAG-member"
    set mode lacp-active
    set mclag-icl enable
    set members "<port>" "<port>"
  next
```

2. Enable the MCLAG on each managed FortiSwitch:

```
config switch-controller managed-switch
  edit "<switch-id>"
    config ports
      edit "<trunk name>"
        set type trunk
        set mode {static | lacp-passive | lacp-active}
        set bundle {enable | disable}
        set members "<port>,<port>"
        set mclag {enable | disable}
      next
    end
  next
end
```

3. Log into each managed FortiSwitch to check the MCLAG configuration:

```
diagnose switch mclag
```

After the FortiSwitches are configured as MCLAG peer switches, any port that supports advanced features on the FortiSwitch can become a LAG port. When `mclag` is enabled and the LAG port names match, an MCLAG peer set is automatically formed. The member ports for each FortiSwitch in the MCLAG do not need to be identical to the member ports on the peer FortiSwitch.

Configure QoS with managed FortiSwitches (373581)

Quality of Service (QoS) provides the ability to set particular priorities for different applications, users, or data flows. **NOTE:** FortiGate does not support QoS for hard or soft switch ports.

To configure the QoS for managed FortiSwitches:

1. Configure a Dot1p map.

```
config switch-controller qos dot1p-map
  edit <Dot1p map name>
    set description <text>
    set priority-0 <queue number>
    set priority-1 <queue number>
    set priority-2 <queue number>
    set priority-3 <queue number>
    set priority-4 <queue number>
    set priority-5 <queue number>
    set priority-6 <queue number>
    set priority-7 <queue number>
  next
end
```

2. Configure a DSCP map.

```
config switch-controller qos ip-dscp-map
  edit <DSCP map name>
    set description <text>
    configure map <map_name>
      edit <entry name>
        set cos-queue <COS queue number>
      next
    end
  next
end
```

```

        set diffserv {CS0 | CS1 | AF11 | AF12 | AF13 | CS2 | AF21 | AF22 | AF23
          | CS3 | AF31 | AF32 | AF33 | CS4 | AF41 | AF42 | AF43 | CS5 | EF |
          CS6 | CS7}
        set ip-precedence {network-control | internetwork-control | critic-ecp
          | flashoverride | flash | immediate | priority | routine}
        set value <DSCP raw value>
      next
    end
  end
end

```

3. Configure the egress QoS policy.

```

config switch-controller qos queue-policy
  edit <QoS egress policy name>
    set schedule {strict | round-robin | weighted}
    config cos-queue
      edit [queue-<number>]
        set description <text>
        set min-rate <rate in kbps>
        set max-rate <rate in kbps>
        set drop-policy {taildrop | random-early-detection}
        set weight <weight value>
      next
    end
  next
end

```

4. Configure the overall policy that will be applied to the switch ports.

```

config switch-controller qos qos-policy
  edit <QoS egress policy name>
    set default-cos <default CoS value 0-7>
    set trust-dot1p-map <Dot1p map name>
    set trust-ip-dscp-map <DSCP map name>
    set queue-policy <queue policy name>
  next
end

```

5. Configure each switch port.

```

config switch-controller managed-switch
  edit <switch-id>
    config ports
      edit <port>
        set qos-policy <CoS policy>
      next
    end
  next
end

```

Reset PoE-enabled ports from the GUI (387417)

If you need to reset PoE-enabled ports, go to **WiFi & Switch Control > FortiSwitch Ports**, right-click on one or more PoE-enabled ports and select **Reset PoE** from the context menu.

You can also go to **WiFi & Switch Control > Managed FortiSwitch** and click on a port icon for the FortiSwitch of interest. In the FortiSwitch Ports page, right-click on one or more PoE-enabled ports and select **Reset PoE** from the context menu.

Adding preauthorized FortiSwitches (382774)

After you preauthorize a FortiSwitch, you can assign the FortiSwitch ports to a VLAN.

To preauthorize a FortiSwitch:

1. Go to **WiFi & Switch Controller > Managed FortiSwitch**.
2. Click **Create New**.
3. In the New Managed FortiSwitch page, enter the serial number, model name, and description of the FortiSwitch.
4. Move the **Authorized** slider to the right.
5. Click **OK**.

The Managed FortiSwitch page shows a FortiSwitch faceplate for the preauthorized switch.

Managed FortiSwitch OS 3.6.0 (FortiOS 5.6)

New managed FortiSwitch features added to FortiOS 5.6 if the FortiSwitch is running FortiSwitch OS 3.6.0.

IGMP snooping (387515)

The GUI and CLI support the ability to configure IGMP snooping for managed switch ports.

To enable IGMP snooping from the GUI, go to **WiFi & Switch Controller > FortiSwitch VLANs**, edit a VLAN and turn on **IGMP Snooping** under **Networked Devices**.

From the CLI, start by enabling IGMP snooping on the FortiGate:

```
config switch-controller igmp-snooping
  set aging-time <int>
  set flood-unknown-multicast (enable | disable)
end
```

Then enable IGMP snooping on a VLAN:

```
config system interface
  edit <vlan>
    set switch-controller-igmp-snooping (enable | disable)
  end
```

Use the following command to enable IGMP snooping on switch ports, and to override the global parameters for a specific switch.

```
config switch-controller managed-switch
  edit <switch>
    config ports
      edit port <number>
        set igmp-snooping (enable | disable)
        set igmps-flood-reports (enable | disable)
      next
    config igmp-snooping globals
      set aging-time <int>
      set flood-unknown-multicast (enable | disable)
    end
  next
```

end

User-port link aggregation groups (378470)

The GUI now supports the ability to configure user port LAGs on managed FortiSwitches.

To create a link aggregation group for FortiSwitch user ports:

1. Go to **WiFi & Switch Controller > FortiSwitch Ports**
2. Click **Create New > Trunk**.
3. In the New Trunk Group page:
 - a. Enter a name for the trunk group
 - b. Select two or more physical ports to add to the trunk group
 - c. Select the mode: Static, Passive LACP, or Active LACP
4. Click **OK**.

DHCP blocking, STP, and loop guard on managed FortiSwitch ports (375860)

The managed FortiSwitch GUI now supports the ability to enable/disable DHCP blocking, STP and loop guard for FortiSwitch user ports.

Go to **WiFi & Switch Controller > FortiSwitch Ports**. For any port you can select DHCP Blocking, STP, or Loop Guard. STP is enabled on all ports by default. Loop guard is disabled by default on all ports.

Switch profile enhancements (387398)

Default switch profiles are bound to every switch discovered by the FortiGate. This means that an administrator can establish a password for this profile or create a new profile and bind that profile to any switch. Consequently, the password provided shall be configured on the FortiSwitch against the default "admin" account already present.

Number of switches per FortiGate based on model (388024)

The maximum number of supported FortiSwitches depends on the FortiGate model:

FortiGate Model Range	Number of FortiSwitches Supported
Up to FortiGate-98 and FortiGate-VM01	8
FortiGate-100 to 280 and FortiGate-VM02	24
FortiGate-300 to 5xx	48
FortiGate-600 to 900 and FortiGate-VM04	64
FortiGate-1000 and up	128
FortiGate-3xxx and up, and FortiGate-VM08 and up	256

Miscellaneous configuration option changes

- The default value of `dhcp-snooping` (also called DHCP-blocking) is changed from `trusted` in FortiOS 5.4 to `untrusted` in FortiOS 5.6.

- The default value of `edge-port` is changed from `disabled` in FortiOS 5.4 to `enabled` in FortiOS 5.6.0.
- The default value for DHCP snooping on the FortiLink VLAN (system interface) is changed from “enabled” in FortiOS 5.6.2 and earlier to “disabled” in FortiOS 5.6.3 and later. Note that, in the GUI, DHCP snooping is automatically changed to “enable” when the DHCP server is enabled on the interface.

Additional GUI support

- Link aggregation of FortiSwitch ports
- DHCP trusted/untrusted, loop guard, and STP for FortiSwitch ports
- Connect to CLI support for FortiSwitch

FortiView (5.6.3)

New FortiView features added to FortiOS 5.6.3.

Support learning reports and FortiAnalyzer (415806)

Both backend and GUI have been updated to support learning reports from FortiAnalyzer.

Backend updates the query configure list; GUI updates learning report to use log display device setting.

Added support to FortiView to sort by application risk and browsing time (249666)

Added ability to sort applications by threat level and by browsing time so that admin can quickly see and prioritize the riskier applications at the top of the list.

FortiView (5.6.1)

New FortiView features added to FortiOS 5.6.1.

FortiView Dashboard Widget (434179)

A new widget type has been added to the FortiGate Dashboard, that displays compact FortiView data. Supported FortiViews include Source, Destination, Application, Country, Interfaces, Policy, Wifi Client, Traffic Shaper, Endpoint Vulnerability, Cloud User, Threats, VPN, Websites, Admin, and System. All usual visualizations are supported.

Widgets can be saved directly to the Dashboard from a filtered page in FortiView, or configured in the CLI.

Interface Categories (`srcintfrole`, etc) added to log data (434188)

In 5.6, logs and FortiView both sort log traffic into two interface categories: "Traffic from LAN/DMZ", and "Traffic from WAN." For greater compatibility and troubleshooting of FortiAnalyzer and FortiCloud setups, interface category fields that expose this information have been added to general log data in 5.6.1: `srcintfrole` and `dstintfrole` for better backend control and monitoring.

FortiView (5.6)

New FortiView features added to FortiOS 5.6.

Added Vulnerability score topology view (303786)

In **Physical Topology** and **Logical Topology** pages, there are two new views added: **Vulnerability**, and **Threat**. Drill-downs in these menus will now include Vulnerability/Threat information. In Vulnerability view, device bubbles are colored based on maximum vulnerability level, and bubble size is the vulnerability score. In Threat view, device bubbles are colored based on maximum threat level, and bubble size is the threat score.

FortiView VPN tunnel map feature (382767)

The FortiView VPN page now displays VPN tunnel connections between devices, and offers more information about tunnels and devices on drill-down.

Updated FortiView CSF topology pages (384188)

The FortiView **Physical Topology** and **Logical Topology** pages have been updated in 5.6.0 to reorganize and clarify larger deployments with servers and multi-directional traffic.

Historical FortiView includes FortiAnalyzer (387423)

Data from associated FortiAnalyzer devices can now be selected as a log display option for Historical FortiView.

FortiView menu reorganization (399713)

The order of FortiView pages has been reorganized in 5.6.0 based on the source interface of data being displayed:

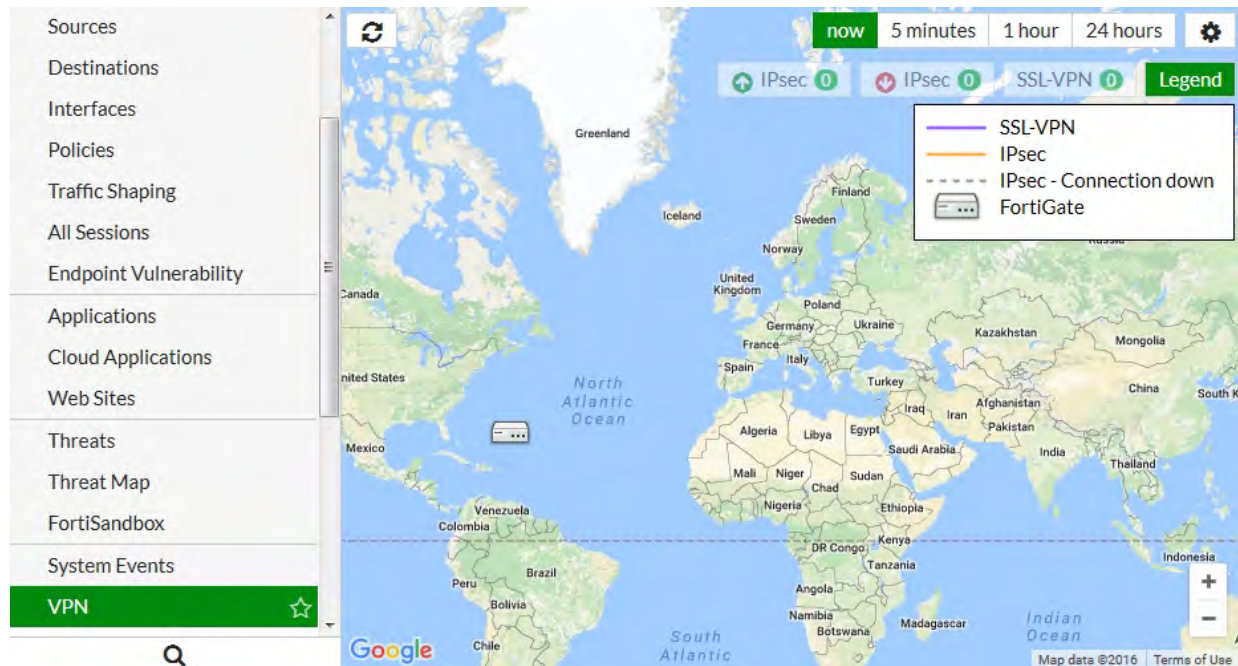

- Topology
- Traffic from LAN/DMZ
- Traffic from WAN
- All Segments

Data Exchange with FortiAnalyzer (393891)

Rather than sending all CSF information via log messages, FortiGate and FortiAnalyzer will now directly pass CSF information (tree, interface roles, user devices, HA members), if the FAZ responds to notices that are sent when the data has changed.

Google Maps Integration

FortiView now uses Google Maps to display location-related information. In this release the first view to use Google maps this component is the FortView VPN page. All current VPNs can be viewed on a fully scalable Google world map.

FortiView usability and organization updates (306247)

Several organization changes have been made to make the FortiView menu order less cluttered, and more intuitive.

- **WiFi Client Monitor** is now in FortiView, but is hidden when there is no managed FortiAP or WiFi Radio.
- **Country** view has been merged into **Destinations** view.
- **Failed Authentication** and **Admin Login** views have been merged into **System Events** view.

FortiGate VM enhancements for AWS, Azure, Google, SDN connectors and more (5.6.3)

The realm of virtual computing has become mainstream and not only does this mean that security appliances can also be virtual, there is also a requirement for security appliances in a virtual environment. These environments can be the publicly available platforms such as Amazon Web Services, Azure and Google Cloud Platform or they can be Software Defined Networks (SDN) such as those made by Cisco, HP, Nuage and OpenStack. For that reason, not only is the number of Virtual FortiOS variations growing along with what they can do, a number of the new features being introduced deal with integrating FortiOS into these environments.

In some cases the new feature isn't even part of the FortiOS code but a separate piece of software that not only allows the FortiOS-VM to be part of the virtual environment but allows the management software of the environment to manage the FortiOS-VM. Previously, these connectors to SDNs have been treated separately as specialized products with their own documentation. Because they are so integral to FortiOS in a world where virtual computing is becoming normal, this documentation is going to become more integrated into the normal FortiOS documentation.

Recipes are now being published for the cloud-based and SDN environments on the Fortinet Cookbook website.

- <http://cookbook.fortinet.com/amazon-web-services-aws/>
- <http://cookbook.fortinet.com/cisco-aci/>
- <http://cookbook.fortinet.com/microsoft-azure/>
- <http://cookbook.fortinet.com/nuage-vsp/>

FGT_VM64_AZURE and FGT_VM64_AZUREONDEMAND platforms (356702)

FortiOS runs in the Azure Cloud and supports the Azure Security Center NGFW feature. The `waagent` daemon is used to configure the VM to communicate with the Azure Cloud fabric.

- The kernel UDF filesystem is needed to mount the cdrom disc on first boot.
- `libmxml` is upgraded from v2.9 to v2.10

CLI Changes:

Added: `azure-security-center` logging destination

```
config log [azure-security-center | azure-security-center2]
  config filter
    set status [enable | disable]
    set appliance-id
    set policy-saskey
    set policy-name
    set eventhub-name
    set servicebus-namespace
  config setting
    set severity (see below)
    set forward-traffic [enable | disable]
    set local-traffic [enable | disable]
    set multicast-traffic [enable | disable]
    set sniffer-traffic [enable | disable]
    set anomaly [enable | disable]
    set voip [enable | disable]
    set gtp [enable | disable]
    set dns [enable | disable]
    set filter (see below)
```

```
set filter-type [include | exclude]
```

`severity` option includes the following levels of severity notifications:

- emergency
- alert
- critical
- error
- warning
- notification
- information
- debug

The `filter` option is set by included the logid list and/or its level as filters. Possibilities include:

- logid(...)
- traffic-level(...)
- event-level(...)
- virus-level(...)
- webfilter-level(...)
- ips-level(...)
- emailfilter-level(...)
- anomaly-level(...)
- voip-level(...)
- dlp-level(...)
- app-ctrl-level(...)
- waf-level(...)
- gtp-level(...)
- dns-level(...)

Example 1

```
config log azure-security-center
config setting
set filter "logid(40704,32042)"
```

Example 2

```
config log azure-security-center
config setting
set filter "event-level(information)"
```

The available levels are as the following: emergency, alert, critical, error, warning, notice, information, debugdebug

SDN Connector (404907)

FortiOS-VM is now supported in a Cisco ACI environment through the use of a SDN connector. The software can be found on the [Fortinet Service and Support site](#).

FortiGate-VM performance improvements and optimization (416548)

Performance has been improved for FortiOS VM platforms by implementing new features to improve efficiency and resource utilization. As well, you can now configure interrupt affinity and packet distribution to optimize performance for your VM environment. Interrupt affinity allows you to align interrupts from interfaces to specific CPUs. Packet distribution allows you to configure FortiGate-VM to distribute processing to multiple CPUs.

Configuring interrupt affinity

Use the following commands to configure interrupt affinity for two 10G interfaces (port2 and port3).

Interrupts from first interface are assigned to core #0 and those from the second interface are assigned to core #1.

```
config system affinity-interrupt
  edit 1
    set interrupt "port2-TxRx-0"
    set affinity-cpumask "0x1"
  next
  edit 2
    set interrupt "port2-TxRx-1"
    set affinity-cpumask "0x1"
  next
  edit 3
    set interrupt "port3-TxRx-0"
    set affinity-cpumask "0x2"
  next
  edit 4
    set interrupt "port3-TxRx-1"
    set affinity-cpumask "0x2"
end
```

Configuring packet distribution

Use the following commands to configure packet redistribution to redistribute packets from core #0 and #1 to all other cores.

The example is based on VM08:

```
config system affinity-packet-redistribution
  edit 1
    set interface "port2"
    set affinity-cpumask "0xFC"
  next
  edit 2
    set interface "port3"
    set affinity-cpumask "0xFC"
end
```

FortiGate-VM Models available for Google Cloud Platform (GCP) (422209)

The following FortiGate-VM models will be supported on Google Cloud Platform:

- FG-VM01
- FG-VM02

- FG-VM04
- FG-VM08

FG-WM00 is not supported.

Since GCP use netmask 32, static route must be configured on GCP VPC, instead of FGT.

Licenses will be interchangeable between platforms. A FG-VM04 license that functions in a VMware or Citrix environment can be also used in the GCP environment as well.

While an .out file will be necessary for upgrading, full downloadable images will not be needed for initial installation of the solution. GCP consists of pre-existing images that can be checked out of their library and deployed instantly. A difference between this environment and enterprise virtualization platforms is that machine size can never change. An n1-standard-4 has exactly 15 GB of RAM and 4 vCPUs. This can never be changed or edited by the end user or administrator.

The currently available GCP instances we are looking to support are as follows (these will/could change as vNIC values reveal themselves):

FG-VM	Equates to Instance Type	vCPU	RAM	Disks
FG-VM01-GC	n1-standard-1	1	3.75GB	16 (32 in Beta)
FG-VM02-GC	n1-standard-2	2	7.50 GB	16 (64 in Beta)
FG-VM04-GC	n1-standard-4	4	15 GB	16 (64 in Beta)
FG-VM08-GC	n1-standard-8	8	30 GB	16 (128 in Beta)
FG-VM16-GC	n1-standard-16	16	60 GB	16 (128 in Beta)
FG-VM32-GC	n1-standard-32	32	88 GB	16 (128 in Beta)
FG-VMUL-GC	any of the above and any new that could be created.			

Additional information from GCP: <https://cloud.google.com/compute/docs/images/building-custom-os>.

NPU KVM image for FortiHypervisor (435326)

Currently, there are 2 separate images of FortiOS that can run on FortiHypervisor:

1. Standard KVM image -- this is the one all customers have access to via the Fortinet Support site and FortiGuard
2. NPU support image -- this is a special branch, not available on support site or FortiGuard.

When FHV tries to deploy a VM that it gets from FortiGuard, it can only retrieve #1 but not #2. NPU versions are now supported by and available for FortiHypervisor.

FGT-VM AWS HA support (445721)

FortiGate-VMs in an Amazon Web Services environment support the use of HA.

This includes two parts:

1. HA with unicast heartbeat traffic.
2. AWS API supports to move secondary IPs and update routing tables.

CLI Changes:

Add: Unicast HA config

```
config system ha
    unicast-hb [enable|disable]
    unicast-hb-peerip <Unicast Heartbeat Peer IP>
end
```

Closed-Network FGT-VM (451872) (455174)

FortiGate-VM is not part of the FortiGuard Network for the purpose of upgrades.

Logging enhancements on FG-VMX (452701)

An event log is created when the Service Manager loses connectivity to a VMX instance. A unique serial number should be used for each VMX instance so that users can identify from the log which VMX instance is described.

SDN Connector - AWS (454233)

Improvements have been made in the support of FortiGate-VM integrating into the AWS environment.

1. `config aws setting` has been moved to the context of `config system sdn-connector`.

```
config system sdn-connector
    edit <string>
        set access-key <AWS access key ID>
        set secret-key <AWS secret access key>
        set region <AWS region name>
        set vpc-id <AWS VPC ID>
    end
```
2. Update to the GUI SDN connector edit page that supports allowing configuration of the following fields:
 - AWS access key ID
 - AWS secret access key
 - AWS region name
 - AWS VPC ID
 - Update Interval
3. Change to address edit page to allow configuration of the **Filter** field for Dynamic AWS address.
4. Update to the dynamic address monitor API to get resolved address list for dynamic AWS addresses.

NSX Connector Upgrade Support (454674) (458180)

Support for NSX connector upgrade to SDN connectors.

Change to `config system sdn-connector`:

```
config nsx setting
```

Change to `config firewall address`:

```
set type nsx

set type dynamic
    set sdn nsx
```

When using the sdn nsx setting, the user should also use the nsx rest-api password.

GUI fixes for the SDN Connector (458183) (459079) (459081)

- Update address list and policy list to show icon/tooltip of the dynamic address, the same way as FQDN address does.

Updates to SDN connector page

- Add back the **Enable Service** button from SVM Settings page (SVM only)
- Add back **VMX Statistics** list from SVM Settings page (SVM only)
- Add back api monitor for nsx service (SVM only)
- Remove **SVM Settings** page

Updates to Address List page

- Disable clone context menu for dynamic sdn address
- Add dynamic address details in colored labels
- Add tool-tip to name column; show invalid icon for unresolved dynamic address (the same way as FQDN address)

Update Policy List page

- add tool-tip to name column; show invalid icon for unresolved dynamic address (the same way as FQDN address)

FortiGate VM (5.6.0)

New Virtual FortiOS features added to FortiOS 5.6.0.

FGT-VM vCPUs (308297)

Fortinet has now launched licensing for FortiGate VMs that support larger than 8 vCPUs. The new models/licenses include:

- Support for up to 16 vCPU - FortiGate-VM16
- Support for up to 32 vCPU - FortiGate-VM32
- Support for unlimited vCPU - FortiGate-VMUL

Each of these models should be able to support up to 500 VDOMs.

Improvements to License page (382128)

The page has been rewritten with some minor improvements such as:

- An indicator to show when a VM is waiting for authentication or starting up
- Shows VM status when license is valid
- Shows CLI console window when VM is waiting too long for remote registration of server

Citrix XenServer tools support for XenServer VMs (387984)

This support allows users, with Citrix XenServer tools to read performance statistics from XenServer clients and do Xenmotion with servers in the same cluster

Since FortiGates don't support hardware hotplugging, the ability to do network interface of disk changes is not supported at this time.

There are no changes to the GUI, but there are some changes to the CLI.

A setting has been edited to control the debug level of the XenServer tools daemon

```
diag debug application xstoolsd <integer>
```

Integer = Debug level

An additional update has been added to set the update frequency for XenServer tools

```
config system global
  set xstools-update-frequency Xenserver <integer>
end
```

Enter an integer value from 30 to 300 (default = 60).

FOS VM supports more interfaces (393068)

The number of virtual interfaces that the VM version of FortiOS supports has been raised from 3 to 10.

NSX security group importing (403975)

A feature has been added to allow the importation of security group information from VMware's NSX firewall.

CLI Changes:

nsx group list

This is used to list NSX security Groups

Syntax:

```
execute nsx group list <name of the filter>
```

nsx group import

This is used to import NSX security groups.

Syntax:

```
execute nsx group import <vdom> <name of the filter>
```

nsx group delete

This is used to delete NSX security Groups

Syntax:

```
execute nsx group delete <vdom> <name of the filter>
```

nsx.setting.update-period

This is used to set the update period for the NSX security group

Syntax:

```
config.nsx.setting.update-period <0 - 3600 in seconds>
```

0 means disabled

Default value: 0

Non-vdom VM models FGVM1V/FGVM2V/FGVM4V (405549)

New models of the FortiGate-VM have been introduced. These match up with the existing FortiGate-VM models of FG-VM01, FG-VM02 and FG-VM04. The difference being that the new models don't support VDOMs.

Original FortiGate-VM	New FortiGate-VM without VDOM support
FG-VM01	FG-VM01v
FG-VM02	FG-VM02v
FG-VM04	FG-VM04v

Hardware acceleration (5.6.3)

New hardware acceleration features added to FortiOS 5.6.3.

Bandwidth control between the ISF and NP6 XAUI ports (437911)

In some cases, the Internal Switch Fabric (ISF) buffer size may be larger than the buffer size of an NP6 XAUI port that receives traffic from the ISF. If this happens, burst traffic from the ISF may exceed the capacity of an XAUI port and sessions may be dropped.

You can use the following command to configure bandwidth control between the ISF and XAUI ports. Enabling bandwidth control can smooth burst traffic and keep the XAUI ports from getting overwhelmed and dropping sessions.

Use the following command to enable bandwidth control:

```
config system npu
  set sw-np-bandwidth {0G | 2G | 4G | 5G | 6G}
end
```

The default setting is 0G which means no bandwidth control. The other options limit the bandwidth to 2Gbps, 4Gbps and so on.

SNMP/CLI monitoring capabilities of NP6 session table and session drift (441532)

In some cases sessions processed by NP6 processors may fail to be deleted leading to a large number of idle sessions. This is called session drift. New monitoring capabilities have been added to allow you to use SNMP to be alerted when the number of idle sessions becomes high. The SNMP fields allow you to see which NP6 processor has the abnormal number of idle sessions and you can use a diagnose command to delete them.

You can use the following diagnose command to determine if drift is occurring:

```
diagnose npu np6 sse-drift-summary
NPU    drv-drift
-----
np6_0  0
np6_1  0
-----
Sum    0
-----
```

The command output shows a drift summary for all the NP6 processors in the system, and shows the total drift. Normally the sum is 0. The previous command output, from a FortiGate-1500D, shows that the 1500D's two NP6 processors are not experiencing any drift.

If the sum is not zero, then extra idle sessions may be accumulating. You can use the following command to delete those sessions:

```
diagnose npu np6 sse-purge-drift <np6_id> [<time>]
```

Where <np6_id> is the number (starting with NP6_0 with a np6_id of 0) of the NP6 processor for which to delete idle sessions. <time> is the age in seconds of the idle sessions to be deleted. All idle sessions this age and older are deleted. The default time is 300 seconds.

The `diagnose npu np6 sse-stats <np6_id>` command output also includes a `drv-drift` field that shows the total drift for one NP6 processor.

For SNMP monitoring, the following MIB fields have been added. These fields allow you to use SNMP to monitor more session table information for NP6 processors including drift for each NP6 processor.

```
FORTINET-FORTIGATE-MIB::fgNPUNumber.0 = INTEGER: 2
FORTINET-FORTIGATE-MIB::fgNPUName.0 = STRING: NP6
FORTINET-FORTIGATE-MIB::fgNPUDrvDriftSum.0 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fgNPUIIndex.0 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fgNPUIIndex.1 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fgNPUSessionTblSize.0 = Gauge32: 33554432
FORTINET-FORTIGATE-MIB::fgNPUSessionTblSize.1 = Gauge32: 33554432
FORTINET-FORTIGATE-MIB::fgNPUSessionCount.0 = Gauge32: 0
FORTINET-FORTIGATE-MIB::fgNPUSessionCount.1 = Gauge32: 0
FORTINET-FORTIGATE-MIB::fgNPUDrvDrift.0 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fgNPUDrvDrift.1 = INTEGER: 0
```

Hardware acceleration (5.6.1)

New hardware acceleration features added to FortiOS 5.6.1.

Optionally disable NP6 offloading of traffic passing between 10Gbps and 1Gbps interfaces (392436)

Due to NP6 internal packet buffer limitations, some offloaded packets received at a 10Gbps interface and destined for a 1Gbps interface can be dropped, reducing performance for TCP and IP tunnel traffic. If you experience this performance reduction, you can use the following command to disable offloading sessions passing from 10Gbps interfaces to 1Gbps interfaces:

```
config system npu
    set host-shortcut-mode host-shortcut
end
```

Select `host-shortcut` to stop offloading TCP and IP tunnel packets passing from 10Gbps interfaces to 1Gbps interfaces. TCP and IP tunnel packets passing from 1Gbps interfaces to 10Gbps interfaces are still offloaded as normal.

If `host-shortcut` is set to the default `bi-directional` setting, packets in both directions are offloaded.

Hardware acceleration (5.6)

New hardware acceleration features added to FortiOS 5.6.

Improved visibility of SPU and nTurbo hardware acceleration (389711)

All hardware acceleration hardware has been renamed Security Processing Units (SPUs). This includes NPx and CPx processors.

SPU and nTurbo data is now visible in a number of places on the GUI. For example, the Active Sessions column pop-up in the firewall policy list and the Sessions dashboard widget.

The following example shows the Sessions dashboard widget tracking SPU and nTurbo sessions. **Current sessions** shows the total number of sessions, **SPU** shows the percentage of these sessions that are SPU sessions and **Nturbo** shows the percentage that are nTurbo sessions.

You can also add SPU filters to many FortiView pages.

NP4Lite option to disable offloading ICMP traffic in IPsec tunnels (383939)

In some cases ICMP traffic in IPsec VPN tunnels may be dropped by the NP4Lite processor due to a bug with the NP4Lite firmware. You can use the following command to avoid this problem by preventing the NP4Lite processor from offloading ICMP sessions in IPsec VPN tunnels. This command is only available on FortiGate models with NP4Lite processors, such as the FortiGate/FortiWiFi-60D.

```
config system npu
    set process-icmp-by-host {disable | enable}
end
```

The option is disabled by default and all ICMP traffic in IPsec VPN tunnels is offloaded where possible. If you are noticing that ICMP packets in IPsec VPN tunnels are being dropped you can disable this option and have all ICMP traffic processed by the CPU and not offloaded to the NP4Lite.

NP6 IPv4 invalid checksum anomaly checking (387675)

The following new options have been added to NP6 processors to check for IPv4 checksum errors in IPv4, TCP, UDP, and ICMP packets.

```
config system np6
    edit {np6_0 | np6_1 | ...}
        config fp-anomaly
            set ipv4-csum-err {drop | trap-to-host}
            set tcp-csum-err {drop | trap-to-host}
            set udp-csum-err {drop | trap-to-host}
            set icmp-csum-err {drop | trap-to-host}
        end
    end
```

You can use the new options to either drop packets with checksum errors (the default) or send them to the CPU for processing. Normally you would want to drop these packets.

As well, note that when configuring NP6 anomaly protection, the separate options `config fp-anomaly-v4` and `config fp-anomaly-v6` have been combined under `config fp-anomaly`.

Stripping clear text padding and IPsec session ESP padding (416950)

In some situations, when clear text or ESP packets in IPsec sessions may have large amounts of layer 2 padding, the NP6 IPsec engine may not be able to process them and the session may be blocked.

If you notice dropped IPsec sessions, you could try using the following CLI options to cause the NP6 processor to strip clear text padding and ESP padding before sending the packets to the IPsec engine. With padding stripped, the session can be processed normally by the IPsec engine.

Use the following command to strip ESP padding:

```
config system npu
  set strip-esp-padding enable
  set strip-clear-text-padding enable
end
```

Stripping clear text and ESP padding are both disabled by default.

High Availability (5.6.1)

New High Availability features added to FortiOS 5.6.1.

HA cluster Uptime on HA Status dashboard widget (412089)

The HA Status dashboard widget now displays how long the cluster has been operating (Uptime) and the time since the last failover occurred (State Changed). You can hover over the State Changed time to see the event that caused the state change.

You can also click on the HA Status dashboard widget to configure HA settings or to get a listing of the most recent HA events recorded by the cluster.

FGSP with static (non-dialup) IPsec VPN tunnels and controlling IKE routing advertisement (402295)

Until FortiOS 5.6.1, the FortiGate Session Life Support Protocol (FGSP) only supported IPsec tunnel synchronization for dialup (or dynamic) IPsec VPN tunnels. FortiOS 5.6.1 now also supports IPsec tunnel synchronization for static IPsec VPN tunnels. No special FGSP or IPsec VPN configuration is required. You can configure static IPsec VPN tunnels normally and create a normal FGSP configuration.

An additional feature has been added to support some FGSP configurations that include IPsec VPNs. A new CLI option allows you to control whether IKE routes are synchronized to all units in the FGSP cluster.

```
config system cluster-sync
  edit 0
    set slave-add-ike-routes {enable | disable}
  end
```

Enable to synchronize IKE routes, disable if you do not need to synchronize IKE routes. Enabling routing synchronization is optional but doing so increases synchronization overhead and bandwidth usage. If you have problems with IPsec VPN tunnel synchronization you may want to enable synchronizing routes otherwise you could leave it disabled to improve performance and save bandwidth.

VRRP support for synchronizing firewall VIPs and IP Pools (0397824)

FortiOS VRRP HA now supports failover of firewall VIPs and IP Pools when the status of a virtual router (VR) changes. This feature introduces a new proxy ARP setting to map VIP and IP Pool address ranges to each VR's Virtual MAC (VMAC). After failover, the IP Ranges added to the new primary VR will be routed to the new primary VR's VMAC.

Use the following command to add a proxy ARP address range and a single IP address to a VR added to a FortiGate's port5 interface. The address range and single IP address should match the address range or single IP for VIPs or IP Pools added to the port5 interface:

```
config system interface
  edit port5
    config vrrp
      edit 1
        config proxy-arp
          edit 1
            set ip 192.168.62.100-192.168.62.200
          next
          edit 2
            set ip 192.168.62.225
          end
        end
      end
    end
  end
```

High Availability (5.6)

New High Availability features added to FortiOS 5.6.

Multicast session failover (293751)

FGCP HA multicast session synchronization supports multicast session failover. To configure multicast session failover, use the following command to change the multicast TTL timer to a smaller value than the default. The recommended setting to support multicast session failover is 120 seconds (2 minutes). The default setting is 600 seconds (10 minutes).

```
config system ha
  set multicast-ttl 120
end
```

The multicast TTL timer controls how long to keep synchronized multicast routes on the backup unit (so they are present on the backup unit when it becomes the new primary unit after a failover). If you set the multicast TTL lower the multicast routes on the backup unit are refreshed more often so are more likely to be accurate. Reducing this time causes route synchronization to happen more often and could affect performance.

Performance improvement when shutting down or rebooting the primary unit (380279)

In previous versions of FortiOS, if you entered the `execute reboot` or `execute shutdown` command on the primary unit, a split brain configuration could develop for a few seconds while the primary unit was shutting down. This would happen because the heartbeat packets would stop being sent by the primary unit, while it was still able to forward traffic. When the heartbeat packets stop the backup unit becomes the primary unit. The result was a split brain configuration with two primary units both capable of forwarding traffic.

This wouldn't happen all the time, but when it did network traffic would be delayed until the primary unit shut down completely. To resolve this issue, in FortiOS 5.6 when you run the `execute reboot` or `execute shutdown` command on the primary unit, the primary unit first becomes the backup unit before shutting down

allowing the backup unit to become the new primary unit and avoiding the split brain scenario. This behavior only happens when you manually run the `execute reboot` or `execute shutdown` command from the primary unit.

VRRP failover process change (390938)

In a FortiOS 5.6 VRRP configuration, when the master cannot reach its next hop router (vrdst) it sends packets to the configured backup router(s). These packets set the priority of the master to be lower than the backup router(s). So a backup router now becomes the new master and takes over processing traffic.

Use the `vrdst-priority` option to set the lower priority that the master sends to the backup routers. The following CLI syntax resets the master's priority to 10 if it can no longer connect to its next hop router.

```
config system interface
edit port10
config vrrp
set vrip 10.31.101.200
set priority 255
set vrdst 10.10.10.1
set vrdst-priority 10
end
```

Display cluster up time and history (get system ha status command changes)(394745)

The `get system HA status` command now displays cluster uptime and history:

```
get system status
Version: FortiGate-5001D v5.6.0,build1413,170121 (interim)
...
Current HA mode: a-p, master
Cluster uptime: 3 days, 4 hours, 3 minutes, 46 seconds
...
```

In-band HA management Interface (401378)

You can use the following command to add a management interface to an individual cluster unit interface that is also connected to a network and processing traffic. The in-band management interface is an alternative to the reserved HA management interface feature and does not require reserving an interface just for management access.

```
config system interface
edit port1
set management-ip 172.20.121.155/24
end
```

The management IP address is accessible from the network that the cluster interface is connected to. This setting is not synchronized so each cluster unit can have their own management IP addresses. You can add a management IP address to each cluster unit interface. You can use the `execute ha manage` command to connect to individual cluster units.

The `management-ip` can be on the same subnet as the interface you are adding it to but cannot be on the same subnet as other cluster unit interfaces.

Up to four dedicated HA management interfaces supported (378127)

You can now add up to four dedicated HA management interfaces. Just like all FortiGate interfaces, these management interfaces must be on a different subnet from any other FortiGate interface. You can also configure

a separate default gateway for each interface.

Use the following command to add two dedicated HA management interfaces:

```
config system ha
  set ha-mgmt-status enable
  config ha-mgmt-interfaces
    edit 1
      set interface port4
      set gateway 10.10.10.1
    next
    edit 2
      set interface port5
      set gateway 4.5.6.7
    end
```

FGSP support for automatic session sync after peer reboot (365851)

New options allow you to configure your FGSP cluster to resume sessions more smoothly after a failed FortiGate rejoins the cluster. In some cases when a failed FortiGate in the cluster comes back up it may begin processing sessions before the session table has been synchronized to it from the other FortiGate in the cluster. When this happens, the FortiGate may drop packets until the session synchronization is complete.

Shutting down interfaces during session synchronization

This new feature allows you to shut some interfaces down on the failed FortiGate when it is starting up so that it will not accept packets until session synchronization is complete. Then the interfaces are brought up and traffic can flow. While the interfaces are down, the FortiGate that had not failed keeps processing traffic.

Use the following command to select the interfaces to shutdown while waiting for session synchronization to complete:

```
config system cluster-sync
  edit 1
    set down-intfs-before-sess-sync port1 port2
  end
```

Heartbeat monitoring

If the FortiGate that was running fails before session synchronization is complete, the FortiGate that is restarting would not be able to complete session synchronization and would not turn on its shutdown interfaces. To prevent this from happening FGSP now includes heartbeat monitoring. Using heartbeat monitoring the FortiGate that is waiting for session synchronization to finish can detect that the other FortiGate is down and turn on its interfaces even if session synchronization is not complete. You can use the following command to change the heartbeat interval (hb-interval) and lost heartbeat threshold (hp-lost-threshold) to change heartbeat monitoring timing.

```
config system cluster-sync
  edit 1
    set hb-interval 2
    set hb-lost-threshold 3
  end
```

NTP over Dedicated HA management interfaces (397889)

If you set up dedicated management interfaces on each cluster unit, if NTP is enabled, the primary unit contacts an NTP server using the dedicated management interface. System time is then synchronized to the backup units through the HA heartbeat.

Example CLI:

```
config system interface
  edit port5
    set ip 172.16.79.46 255.255.255.0
  end

config system ha
  set group-name FGT-HA
  set mode a-p
  set ha-mgmt-status enable
  config ha-mgmt-interfaces
    edit 1
      set interface port5
      set gateway 172.16.79.1
    end
  set ha-direct enable
end

config system ntp
  set ntpsync enable
  set syncinterval 5
end
```

IPsec VPN (5.6.3)

New IPsec VPN features added to FortiOS 5.6.3.

IPsec performance improvements for VM (439030)

In IPsec AES-GCM and AES-CBC-SHA mode, this feature leverages Intel AES-NI instructions to accelerate cipher and GCM operations, and uses Intel SSSE3 instructions to accelerate SHA1/SHA256 HMAC operations.

New entries to call Intel aesni directly:

- supported algorithms include: aesni, aesni-gcm, sha1/256/384/512-ssse3/avx/avx2
- some necessary additions, such as aes-gcm generic functions for non-aesni uses

This feature removes the old aes-gcm implementation using Linux Crypto API so that all the software crypto algorithms are under the Crypto_ftnt umbrella.

Two new diagnose commands have been introduced in this feature:

```
diagnose vpn ipsec driver    (shows software crypto drivers in use)
diagnose vpn ipsec cpu      (shows crypto CPU distribution)
```

Improved support for dynamic routing over dynamic IPsec interfaces (435152) (446498) (447569)

Solutions have been introduced to resolve the following issues:

- IPv6 RIP does not successfully exchange routes over ADVPN if the hub has 'set net-device disable'.
- BGP over an IPsec tunnel established by an IKE mode-cfg client connected to IKE mode-cfg server with 'set net-device disable' cannot establish.
- Multicast traffic does not flow over a 'set type dynamic' IPsec interface with 'set net-device disable'.

For 'set type dynamic' + 'set net-device disable' + 'set mode-cfg enable' + 'set add-route disable' then do `_not_` allocate a /30 (/126 for IPv6) as is done when 'set net-device enable', instead allocate a single IP address to the peer.

When the 'set type dynamic' tunnel negotiates, then add an IPsec peer route with the peer's allocated IP address pointing at the newly negotiated tunnel. Note this is an IPsec peer route not a regular route. A regular route is *not* added (unlike the case of 'set net-device enable').

'Config router static' / 'set device xxx' can now refer to a 'set type dynamic' IPsec interface. This allows the admin to define a static route covering the address range of the pool from which peer IP addresses will be allocated.

BMRK IPsec UDP performance for AES256GCM drops after AES-NI checked in (452164)

This new feature fixes the aesni-cbc errors and precomputed the per-SA constant elements for aesni-gcm.

1. aesni-cbc

When ECO 106922 was checked in, there was a known issue that the aesni-cbc driver wasn't working. The solution at that time was aesni plus generic cbc.

With this ECO, we fixed the errors in Intel's aesni-cbc driver so that we can fully leverage the aesni-cbc benefits. The aesni-cbc is faster than aesni plus generic cbc because:

- a. it can do cbc in one go with its 128-bits xmm registers.
- b. it can decrypt 4 blocks at the same time instead of one. It uses alternating AESDEC(Intel's aes instruction) on different blocks to speed up the calculations.

QA's tests show that with this, we can boost aes-cbc-sha1's throughput by 10+%.

2. AES fall-back function changed to Intel's x86_64 assembly from C generic function

When fpu is not available, aesni can't be used and must fall back to a generic function. The assembly aes function should be slightly faster than the C generic one.

This would also slight boost aes throughput for those that don't have aesni but have a x86_64 cpus.

3. aesni-gcm pre-computations

There are some elements in the aesni-gcm algo that maintain constant per-SA. This ECO moves these calculations to the prepare() function so that these calculations are only done once per-SA instead of per-packet.

QA's tests show that this helps to stabilize the 1500D aesni-gcm throughput and make it maintain above 1Gbps (packet size 1360).

4. Added counter reset function for diagnose commands:

```
diagnose vpn ipsec driver clear
diagnose vpn ipsec cpu clear
```

IPsec dial-up interface sharing (379973)

This feature makes it possible to use a single interface for all instances that spawn via a given phase1. Instead of creating an interface per instance, all traffic will run over the single interface and any routes that need creating will be created on that single interface.

A new CLI option "net-device [enable|disable]" is added in the phase1-interface command sets. The default is "disable" so that the new feature kicks in for all the new configurations. An upgrade feature will add a "set net-device enable" for all the existing configurations so that they will keep the old behavior. Please see the CLI Syntax section below for more details.

Under the new single-interface scheme, instead of relying on routing to guide traffic to the specific instance as currently happens, all traffic will flow to the specific device and IPsec will need to take care of locating the correct instance for outbound traffic. For this purpose, another new CLI option "tunnel-search" is created. The option is only available when the above "net-device" option is "disable".

There are two options for "tunnel-search", corresponding to the two ways to select the tunnel for outbound traffic. One is "selectors", meaning selecting a peer using the IPSec selectors (proxy-ids). The other is "nexthop" where all the peers use the same default selectors (0/0) while using some routing protocols such as BGP, OSPF, RIPng, etc to resolve the routing. The default for "tunnel-search" is "selectors".

Syntax

```
config vpn ipsec phase1-interface
  edit xxx
    set net-device [enable|disable] Enable to create a kernel device for every dialup instance
  next
end
config vpn ipsec phase1-interface
  edit xxx
    set net-device disable
    set tunnel-search [selectors|nexthop] Search for tunnel in selectors or using nexthops
```

```

    next
end

```

IPsec VPN (5.6.1)

New IPsec VPN features added to FortiOS 5.6.1.

Support for Brainpool curves specified in RFC 6954 for IKE (412795)

Added support for Brainpool curves specified in [RFC 6954](#) (originally RFC 5639) for IKE. Four new values are added for VPN phase1 and phase2 DH groups.

The allocated transform IDs are 27, 28, 29, 30:

- 27 - Brainpool 224-Bit Curve
- 28 - Brainpool 256-Bit Curve
- 29 - Brainpool 384-Bit Curve
- 30 - Brainpool 512-Bit Curve

Syntax

```

config vpn ipsec phase1/phase1-interface
    edit <name>
        set dhgrp {1 | 2 | 5 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 27 | 28 | 29 | 30}
    next
end
config vpn ipsec phase2/phase2-interface
    edit <name>
        set dhgrp {1 | 2 | 5 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 27 | 28 | 29 | 30}
    next
end

```

Removed "exchange-interface-ip" option from "vpn ipsec phase1" (411981)

The command `exchange-interface-ip` only works for interface-based IPsec VPN (`vpn ipsec phase1-interface`), and so it has been removed from policy-based IPsec VPN (`vpn ipsec phase1`).

IKEv2 ancillary RADIUS group authentication (406497)

This feature provides for the IDi information to be extracted from the IKEv2 AUTH exchange and sent to a RADIUS server, along with a fixed password configurable via CLI, to perform an additional group authentication step prior to tunnel establishment. The RADIUS server may return framed-IP-address, framed-ip-netmask, and dns-server attributes, which are then applied to the tunnel.

It should be noted, unlike Xauth or EAP, this feature does not perform individual user authentication, but rather treats all users on the gateway as a single group, and authenticates that group with RADIUS using a fixed password. This feature also works with RADIUS accounting, including the `phase1 acct-verify` option.

Syntax

```

config vpn ipsec phase1-interface
    edit <name>
        set mode-cfg enable
        set type dynamic
        set ike-version 2
    end
end

```

```

    set group-authentication {enable | disable}
    set group-authentication-secret <password>
  next
end

```

IPsec mode-cfg can assign IPs from firewall address and sharing IP pools (393331)

This feature adds the ability for users to configure assign-IPs from firewall addresses/groups.

Previously, different policies accessing the same network needed to ensure that non-overlapping IP-ranges were assigned to policies to avoid the same IP address being assigned to multiple clients. With this feature, the address `name` is used to identify an IP pool and different policies can refer to the same IP pool to check for available IPs, thus simplifying the task of avoiding IP conflicts.

Syntax

```

config vpn ipsec phase1-interface
  edit <name>
    set mode-cfg enable
    set type dynamic
    set assign-ip-from {range | dhcp | name}
    set ipv4-name <name>
    set ipv6-name <name>
  next
end

```

Improve interface-based dynamic IPsec up/down time (379937)

This feature makes it possible to use a single interface for all instances that spawn via a given phase1. Instead of creating an interface per instance, all traffic will run over the single interface and any routes that need creating will be created on that single interface.

A new CLI option `net-device` is added in the `phase1-interface` command sets. The default is `disable` so that the new feature kicks in for all the new configurations. An upgrade feature will add a `set net-device enable` for all the existing configurations so that they will keep the old behavior.

Under the new single-interface scheme, instead of relying on routing to guide traffic to the specific instance, all traffic will flow to the specific device and IPsec will need to take care of locating the correct instance for outbound traffic. For this purpose, another new CLI option `tunnel-search` is created. The option is only available when the above `net-device` option is set to `disable`.

There are two options for `tunnel-search`, corresponding to the two ways to select the tunnel for outbound traffic. One is `selectors`, meaning selecting a peer using the IPsec selectors (proxy-ids). The other is `nexthop` where all the peers use the same default selectors (0/0) while using some routing protocols such as BGP, OSPF, RIPng, etc. to resolve the routing. The default for `tunnel-search` is `selectors`.

Syntax

```

config vpn ipsec phase1-interface
  edit <name>
    set net-device {enable | disable}
    set tunnel-search {selectors | nexthop}
  next
end

```

Hide psksecret option when peertype is dialup (415480)

In aggressive mode and IKEv2, when peertype is dialup, pre-shared key is per-user based. There is no need to configure the psksecret in the phase1 setup. Previously, if left unconfigured, CLI would output psksecret error and fail to create the phase1 profile.

To prevent psksecret length check running on the configuration end, the psksecret option will be hidden. Prior to Mantis 397712, the length check passed because it was incorrectly checking the length of encrypted password which is always 204 length long.

Peertype dialup option removed for main mode.

New enforce-ipsec option added to L2TP config (423988)

A new `enforce-ipsec` option is added in L2TP configuration to force the FortiGate L2TP server to accept only IPsec encrypted connections.

Syntax

```
config vpn l2tp
    set eip 50.0.0.100
    set sip 50.0.0.1
    set status enable
    set enforce-ipsec-interface {disable | enable}    (default = disable)
    set usrgrp <group_name>
end
```

IPsec VPN Wizard improvements (368069)

Previously, when using wan-load-balance (WLB) feature, and when configuring an IPsec tunnel with the wizard, the setting 'incoming interface' list does not contain the wan-load-balance nor the wan2 interface. Disabling the WLB permits the configuration.

The solution in 5.6.1 is as follows:

- (368069) The IPsec VPN wizard now allows users to select members of virtual-wan-link (VWL) as IPsec phase1-interface. Before saving, if the phase1 interface is a VWL member, then the Wizard automatically sets the virtual-wan-link as the destination interface in the L2TP policy.
- (246552) List VPN tunnels for VWL members if VWL is set as the destination interface in policy-based IPsec VPN.

IPsec manual key support removed from GUI (436041)

The majority of customers are not using policy-based IPsec today, and beyond that, very few are using manual key VPN. As a result, the IPsec manual key feature is removed from the GUI; the feature store option is removed as well.

Added GUI support for local-gw when configuring custom IPsec tunnels (423786)

Previously, the `local-gw` option was not available on the GUI when configuring a custom IPsec tunnel. This feature adds the `local-gw` setting to the IPsec VPN Edit dialog. The user is able to choose the primary or secondary IP address from the currently selected interface, or specify an ip address manually. Both `local-gw` and `local-gw6` are supported.

Moved the dn-format CLI option from phase1 config to vdom settings (435542)

Previous fix for `dn-format` didn't take into account that, at the time `isakmp_set_peer_identifier` is used, we don't have a connection and haven't matched our gateway yet, so we can't use that to determine the `dn-format` configuration setting.

The solution was to move the `dn-format` CLI option from phase1 config to vdom settings. It is renamed to `ike-dn-format`.

FGT IKE incorrect NAT detection causes ADVPN hub behind VIP to not generate shortcuts (416786)

When ADVPN NAT support was added, only spokes behind NAT was considered. No thought was given to a hub behind a VIP or the problems that occurred due to the way that FortiOS clients behind NAT enable NAT-T even when it is not required.

The solution in 5.6.1 is as follows:

- Moved shortcut determination out of the kernel and up to IKE. The shortcut message now contains the ID of both tunnels so that IKE can check the NAT condition of both.
- Added IKE debug to cover sending the initial shortcut query. The lack of this previously meant it could be awkward to determine if the offer had been converted into a query correctly.
- Added "nat:" output in `diag vpn ike gateway list` output to indicate whether this device or the peer is behind NAT.
- Tweaked the `diag vpn tunnel list` output so that the auto-discovery information now includes symbolic as well as numeric values, which makes it easier to see what type of auto-discovery was enabled.

IPsec VPN (5.6)

New IPsec VPN features added to FortiOS 5.6.

Improvement to stats crypto command output (403995)

The CLI command `get vpn ipsec stats crypto` now has a better format for the information it shows in differentiating between NP6 lite and SOC3 (CP). To further avoid confusion, all engine's encryption (encrypted/decrypted) and integrity (generated/validated) information is shown under the same heading, not separate headings.

Improved certificate key size control commands (397883)

Proxy will choose the same SSL key size as the HTTPS server. If the key size from the server is 512, the proxy will choose 1024. If the key size is bigger than 1024, the proxy will choose 2048.

As a result, the `firewall ssl-ssh-profile` commands `certname-rsa`, `certname-dsa`, and `certname-ecdsa` have been replaced with more specific key size control commands under `vpn certificate` setting.

CLI syntax

```
config vpn certificate setting
  set certname-rsa1024 <name>
  set certname-rsa2048 <name>
  set certname-dsa1024 <name>
```

```
set certname-dsa2048 <name>
set certname-ecdsa256 <name>
set certname-ecdsa384 <name>
end
```

Support bit-based keys in IKE (397712)

As per FIPS-CC required standards, as well as [RFC 4306](#), IKE supports pre-shared secrets to be entered as both ASCII string values and as hexadecimal encoded values. This feature parses hex encoded input (indicated by the leading characters **0x**) and converts the input into binary data for storage.

With this change, the `psksecret` and `psksecret-remote` entries under the IPsec VPN CLI command `config vpn ipsec phase1-interface` have been amended to differentiate user input as either ASCII string or hex encoded values.

IKEv2 asymmetric authentication (393073)

Support added for IKEv2 asymmetric authentication, allowing both sides of an authentication exchange to use different authentication methods, for example the initiator may be using a shared key, while the responder may have a public signature key and certificate.

A new command, `authmethod-remote`, has been added to `config vpn ipsec phase1-interface`.

For more detailed information on authentication of the IKE SA, see [RFC 5996 - Internet Key Exchange Protocol Version 2 \(IKEv2\)](#).

Allow mode-cfg with childless IKEv2 (391567)

An issue that prevented `childless-ike` from being enabled at the same time as `mode-cfg` has been resolved. Both options can now be enabled at once under `config vpn ipsec phase1-interface`.

IKEv2 Digital Signature Authentication support (389001)

FortiOS supports the use of Digital Signature authentication, which changes the format of the Authentication Data payload in order to support different signature methods.

Instead of just containing a raw signature value calculated as defined in the original IKE RFCs, the Auth Data now includes an ASN.1 formatted object that provides details on how the signature was calculated, such as the signature type, hash algorithm, and signature padding method.

For more detailed information on IKEv2 Digital Signature authentication, see [RFC 7427 - Signature Authentication in the Internet Key Exchange Version 2 \(IKEv2\)](#).

Passive static IPsec VPN (387913)

New commands have been added to `config vpn ipsec phase1-interface` to prevent initiating VPN connection. Static IPsec VPNs can be configured in tunnel mode, without initiating tunnel negotiation or rekey.

To allow a finer configuration of the tunnel, the `rekey` option is removed from `config system global` and added to `config vpn ipsec phase1-interface`.

CLI syntax

```
config vpn ipsec phase1-interface
edit <example>
```

```

set rekey {enable | disable}
set passive-mode {enable | disable}
set passive-tunnel-interface {enable | disable}
end

```

Phase 2 wizard simplified (387725)

Previously, for a site-to-site VPN, phase 2 selectors had their static routes created in the IPsec VPN wizard by adding IP addresses in string format. Now, since addresses and address groups are already created for these addresses, the address group can be used in the route directly. This means that the route can be modified simply by modifying the address/groups that were created when the VPN was initially created.

With this change, the VPN wizard will create less objects internally, and reduce complexity.

In addition, a blackhole route will be created by default with a higher distance-weight set than the default route. This is to prevent traffic from flowing out of another route if the VPN interface goes down. In these instances, the traffic will instead be silently discarded.

Unique IKE ID enforcement (383296)

All IPsec VPN peers now connect with unique IKE identifiers. To implement this, a new `phase1` CLI command has been added (`enforce-unique-id`) which, when enabled, requires all IPsec VPN clients to use a unique identifier when connecting.

CLI syntax

```

config vpn ipsec phase1
edit <name>
    set enforce-unique-id {keep-new | keep-old | disable} Default is disable.
next
end

```

Use `keep-new` to replace the old connection if an ID collision is detected on the gateway.

Use `keep-old` to reject the new connection if an ID collision is detected.

FortiView VPN tunnel map feature (382767)

A geospatial map has been added to FortiView to help visualize IPsec and SSL VPN connections to a FortiGate using Google Maps. Adds geographical-IP API service for resolving spatial locations from IP addresses.

This feature can be found under **FortiView > VPN**.

Childless IKEv2 initiation (381650)

As documented in [RFC 6023](#), when both sides support the feature, no child IPsec SA is brought up during the initial AUTH of the IKEv2 negotiation. Support for this mode is not actually negotiated, but the responder indicates support for it by including a `CHILDLESS_IKEV2_SUPPORTED` Notify in the initial `SA_INIT` reply. The initiator is then free to send its AUTH without any SA or TS payloads if it also supports this extension.

CLI syntax

```

config vpn ipsec phase1-interface
edit ike
    set ike-version 2
    set childless-ike enable
next
end

```

Due to the way configuration payloads (IKEV2_PAYLOAD_CONFIG) are handled in the current code base, mode-cfg and childless-ike aren't allowed to be enabled at the same time. Processing config payloads for mode-cfg requires a child ph2handle to be created, but with childless-ike we completely avoid creating the child ph2 in the first place which makes the two features incompatible. It may be possible to support both in the future, but a deeper rework of the config payload handling is required.

Allow peertype dialup for IKEv2 pre-shared key dynamic phase1 (378714)

Restored `peertype dialup` that was removed in a previous build (when IKEv2 PSK gateway re-validation was not yet supported).

If `peertype` is `dialup`, IKEv2 AUTH verify uses user password in the user group "usrgrp" of phase1. The "psksecret" in phase1 is ignored.

CLI syntax

```
config vpn ipsec phase1-interface
  edit "name"
    set type dynamic
    set interface "wan1"
    set ike-version 2
    set peertype dialup
    set usrgrp "local-group"
  next
end
```

IPsec default phase1/phase1-interface peertype changed from 'any' to 'peer' (376340)

Previously, when `authmethod` was changed to `signature`, `peertype` automatically changed to `peer` and required a peer to be set. This change was done to try to provide a more secure initial configuration, while allowing the admin to set `peertype` back to `any` if that's what they really wanted. The default value was kept at `any` in the CLI. However, this caused problems with copy/pasting configurations and with FMG because if `peertype any` wasn't explicitly provided, the CLI was switched to `peertype peer`.

This patch changes the default `peertype` to `peer` now; `peertype any` is considered non-default and will be printed out on any config listing. Upgrade code has been written to ensure that any older build that was implicitly using `set peertype any` has this setting preserved.

IPsec GUI bug fixes (374326)

Accept type "Any peer ID" is available when creating IPsec tunnel with `authmethod`, pre-shared key, `ikev1` main mode/aggressive mode, and `ikev2`.

Support for IKEv2 Message Fragmentation (371241)

Added support for IKEv2 Message Fragmentation, as described in [RFC 7383](#).

Previously, when sending and IKE packets with IKEv1, the whole packet is sent once, and it is only fragmented if there is a retransmission. With IKEv2, because [RFC 7383](#) requires each fragment to be individually encrypted and authenticated, we would have to keep a copy of the unencrypted payloads around for each outgoing packet, in case the original single packet was never answered and we wanted to retry with fragments. So with this

implementation, if the IKE payloads are greater than a configured threshold, the IKE packets are preemptively fragmented and encrypted.

CLI syntax

```
config vpn ipsec phase1-interface
  edit ike
    set ike-version 2
    set fragmentation [enable|disable]
    set fragmentation-mtu [500-16000]
  next
end
```

IPsec monitoring pages now based on phase 1 proposals not phase 2 (304246)

The IPsec monitor, found under **Monitor > IPsec Monitor**, was in some instances showing random uptimes even if the tunnel was in fact down.

Tunnels are considered as "up" if at least one phase 2 selector is active. To avoid confusion, when a tunnel is down, **IPsec Monitor** will keep the **Phase 2 Selectors** column, but hide it by default and be replaced with **Phase 1** status column.

IPv6 (5.6.3)

New IPv6 features added to FortiOS 5.6.3.

IPv6 RADIUS support (402437, 439773)

Added support for IPv6 RADIUS authentication. When configuring the FortiGate interface and the RADIUS server (under `config system interface` and `config user radius` respectively), the server IP address can be set as IPv6.

Added support for IPv6 Fortisandbox (424290) (447153)

FortiOS can now communicate with a FortiSandbox if the FortiSandbox has an IPv6 IP address.

IPv6 captive portal support (435435)

Captive portal now supports IPv6 addresses; works with remote RADIUS authentication and WiFi interfaces.

IPv6 (5.6)

New IPv6 features added to FortiOS 5.6.

FortiGate can reply to an anycast probe from the interface's unicast address (308872)

A new setting has been added within the CLI that can enable the FortiGate to reply to an anycast probe from the FortiGate's unicast IP address.

```
config system global
  set ipv6-allow-anycast-probe [enable|disable]
end
```

Enable: Enable probing of IPv6 address space through Anycast, by responding from the unicast IP address

Disable: Disable probing of IPv6 address space through Anycast

Secure Neighbor Discovery (355946)

Additional settings have been added to the configuration for interfaces with IPv6 so that they comply more closely to the parameters of RFC 3971

The context of the new settings is

```
config system interface
  edit <interface>
  config ipv6
```

The new options with IPv6 are:

ndmode

Neighbor discovery mode

```
set ndmode [basic | SEND]
```

Basic: Does not support SEND.

SEND-compatible: Supports SEND.

nd-cert

Neighbor discovery certificate

```
set nd-cert <string of Name of certificate to be used>
```

Example string: "Fortinet_Factory local"

n-security-level

Neighbor discovery security level

```
set nd-security-level <integer>
```

- Integer values from 0 - 7
- 0 = least secure
- 7 = most secure
- default = 0

nd-timestamp-delta -

Neighbor discovery timestamp delta value

```
set nd-timestamp-delta <integer of time in seconds>
```

- Range: 1 - 3600 sec
- default = 300

nd-timestamp-fuzz

Neighbor discovery timestamp fuzz factor

```
set nd-timestamp-fuzz <integer of time in seconds>
```

- Range: 1 - 60 sec
- default = 1

Additional related technical information

Kerenl

- Redirects ICMPv6 packets to user space if they require SEND options verification or build.

Radvd

- Verifies NS/RS SEND options including CGA, RSA, Timestamp, NONCE, etc. Daemon also creates neighbor cache for future timestamp checking, any entry gets flushed in 4 hours.
- Helps kernel build NA/RA SEND options including CGA, RSA, Timestamp, NONCE, etc. CGA parameters are kept in cache for each interface. CGA modifier is kept in CMDB.

Diagnose command for radvd

```
diag test application radvd
```

- Shows statistics
- Toggles message dump

Add multicast-PMTU to allow FGT to send ICMPv6 Too Big Message (373396)

New multicast-PMTU feature added to better comply with RFC 4443.

Normally, a “Packet Too Big” icmp6 message is sent by a routing device in response to a packet that it cannot forward because the packet is larger than the MTU of the outgoing link. For security reasons, these message may be disabled because attackers can use the information about a victim's ip address as the source address to do IP address spoofing.

In FortiOS's implementation of this function, a setting in the CLI, has been added to make this behavior optional on the FortiGate.

The syntax for the option is:

```
config router multicast6
  set multicast-PMTU [enable|disable]
end
```

Logging and Reporting (5.6.3)

New logging and reporting features added to FortiOS 5.6.3.

Improve FortiAnalyzer storage usage on Log Settings page (409658)

This feature improves FortiAnalyzer storage usage information in log settings to include more detailed per-ADOM information as follows:

- (1) FAZ ADOM (Name)
Size / Used
- (2) Indexed Logs
Used / Available
Data Policy Days Configured / Actual
- (3) Compressed Logs
Used / Available
Data Policy Days Configured / Actual

Range change for maximum log age (440633)

The value range for "maximum-log-age" under "config log disk setting" has been limited to 0-3650.

New connect and disconnect event logs for FSSO server status change (446263)

Connect and disconnect event logs for FSSO server status changes have been added according to the following:

- When FSSO server status changes from disconnected to connected, record one connected event.
- When FSSO server status changes from connected to disconnected, record one disconnected event and send one FSSO server disconnected alert email when set.

These logs must be enabled in the CLI.

Syntax

```
config alertemail setting
  set FSSO-disconnect-logs
```

Security Fabric audit result logging to FortiGuard (452588)

The CLI now includes an option for the user to enable (by default) or disable FortiGuard security fabric audit result submission.

If enabled, every time a user runs the Security Fabric audit test on the FortiGate, the audit result will be sent to FortiGuard. When disabled, no audit data is sent to FortiGuard.

Security Audit categories have been reorganized and renamed to reflect the categories as they are in the security audit matrix.

Syntax

```
config system global
  set fortiguard-audit-result-submission [enable | disable]
end
```

Config log disk uploadtime units change (400999)

Instructions for upload time under "config log disk setting" has been clarified by adding the phrase 'daily upload' and mentioning that this is the Hour. The help text also now includes the acceptable range for more clarity.

Log field extension policy-name and meta-field (455441)

An option to include the policy name field has been added to traffic logs (log-policy-name). Likewise, an option to add a meta-field tag to all logs has also been added (custom-field and custom-log-fields; see below). This meta-field could be used for identifying the fortigate sending the logs, for example.

These options can only be enabled in the CLI.

Syntax

```
config log setting
    set log-policy-name [enable | disable]
end
config log custom-field
    edit "aaa"
        set name "fieldda"
        set value "111"
    next
end
config log setting
    set custom-log-fields "aaa"
end
```

Rename logtime to eventtime (454445)

The "logtime" field in logs has been renamed to "eventtime" to avoid confusion. The logtime is the timestamp that miglogd receives the message.

Logging and Reporting (5.6.1)

New logging and reporting features added to FortiOS 5.6.1.

Usability Updates to Reports Page (383684)

The **Reports** page has been updated in 5.6.1, to include both FortiCloud and Local Reports in a single location. Configuring of report schedules is also available on this page. The page will display whichever format is enabled, or allow switching between both if both Local and FortiCloud are in use.

Interface Categories (srcintfrole, etc) added to log data (434188)

In 5.6, logs and FortiView both sort log traffic into two interface categories: "Traffic from LAN/DMZ", and "Traffic from WAN." For greater compatibility and troubleshooting of FortiAnalyzer and FortiCloud setups, interface category fields that expose this information have been added to general log data in 5.6.1: srcintfrole and dstintfrole for better backend control and monitoring.

Logging and Reporting (5.6)

New logging and reporting features added to FortiOS 5.6.

All string values in log messages are enclosed in double quotes (399871)

In previous versions, some string log fields have double quotes and some do not. FortiOS 5.6 adds double-quotes to all string fields in all log messages.

Some example log messages:

```
date=2017-01-27 time=10:46:26 logid="0001000014" type="traffic"
subtype="local" level="notice" vd="vd1" srcip=172.16.200.1 srcport=17856
srcintf=unknown-0 dstip=192.168.100.206 dstport=53 dstintf="port1"
sessionid=1461 proto=17 action="accept" policyid=0 dstcountry="Reserved"
srccountry="Reserved" trandisp="noop" service="DNS" app="DNS" duration=180
sentbyte=92 rcvdbyte=0 sentpkt=1 rcvdpkt=0 appcat="unscanned"

date=2017-01-27 time=10:36:34 logid="0107045071" type="event"
subtype="endpoint" level="notice" vd="vd1" logdesc="FortiClient Vulnerability
Scan" scantime=1467851105 fctuid="A8BA0B12DA694E47BA4ADF24F8358E2F"
user="test-user" srcip=192.168.25.26 srcname="test-pc"
srcmac="01:02:03:04:05:06" devtype="Windows PC" vulnid=25894
vulnname="Security Vulnerability CVE-2016-0636 in Oracle JDK"
vulncat="Applications" severity="critical" cveid="CVE-2016-0636"
vendorurl="http://www.oracle.com/technetwork/topics/security/alert-cve-2016-
0636-2949497.html" msg="Endpoint Vulnerability Scan."
```

Client and server certificates included in Application control log messages (406203)

When SSL/TLS traffic triggers an application control signature, the application control log messages now include information about the signatures used by the session. This includes the client certificate issuer, the name in the server certificate, and the server certificate issuer.

DNS Logging (401757)

FortiOS logging now includes the Detailed DNS log message type. DNS events were previously recorded as event logs. In FortiOS 5.6 DNS log messages are a new category that also includes more DNS log messages to provide additional detail about DNS activity through the FortiGate. You can enable DNS logging from the CLI using the following command (shown in this example for memory logging):

```
config log memory filter
    set dns enable
end
```

DNS log messages include details of each DNS query and response. DNS log messages are recorded for all DNS traffic though the FortiGate and originated by the FortiGate.

The detailed DNS logs can be used for low-impact security investigation. Most network activity involves DNS activity of some kinds. Analyzing DNS logs can provide a lot of details about the activity on your network without using flow or proxy-based resource intensive techniques.

Added Policy Comment logging option (387865)

As an alternative to custom log fields, the functionality has been added to log a policy's comment field in all traffic log files that use that policy, in order to sort/isolate logs effectively with larger deployments and VDOMs. The feature is disabled by default.

```
config log setting
    set log policy comment [enable/disable]
```

FortiAnalyzer encryption option name change (399191)

For clarity, and because the default options for `config log fortianalyzer setting` have now changed, the option `default` has now been changed to `high-medium` in the following CLI commands:

```
config log fortianalyzer setting
    set enc-algorithm [high/high-medium/low]
config log fortianalyzer override-setting
    set enc-algorithm [high/high-medium/low]
config log fortiguard setting
    set enc-algorithm [high/high-medium/low]
config log fortiguard override-setting
    set enc-algorithm [high/high-medium/low]
```

Maximum values changes

Maximum values changes in FortiOS 5.6.3:

- Merged FGT 90E/91E into trunk (386658).
- Merged FGT 3960E/3980E into 5.6 and trunk (435854).

Maximum values changes in FortiOS 5.6.1:

- The maximum number of SSIDs (CLI command `config wireless-controller vap`) for FortiGate models 600C, 600D, 800C, 800D, and 900D increased from 356 to 512 (414202).
- The maximum number DLP sensors (CLI command `config dlp sensor / config filter`) for models 1000C, 1000D, 1200D, 1500D, 1500DT, 3240C, and 3600C decreased from 10,000 to 3,000. (371270)
- The maximum number DLP sensors (CLI command `config dlp sensor / config filter`) for models 3000D, 3100D, 3200D, 3700D, 3700DX, 3800D, 3810D, 3815D, 5001C, and 5001D decreased from 50,000 to 4,000. (371270)

Maximum values changes in FortiOS 5.6:

- The maximum number of wireless controller QoS Profiles is per VDOM (388070).

Modem (5.6.1)

New modem features added to FortiOS 5.6.1.

New modem features (422266)

New FortiOS 5.6.1 modem features include:

- The ability to edit wireless profiles stored on EM7x modems from FortiOS.
- GPS support.
- MIB for internal LTE modems.
- Syslog messages for internal LTE modems.
- More status information displayed by the `diagnose sys lte-modem` command
- New modem-related MIB entities.

`config system lte-modem` command changes

The `mode`, `interface`, and `holddown-timer` options of the `config system lte-modem` command have been removed. These options are no longer needed. Instead, use SD-WAN for redundant interfaces.

The `config system lte-modem` command includes the following options

`status` Enable/disable USB LTE/WIMAX device.

`extra-init` Extra initialization string to USB LTE/WIMAX device.

`manual-handover` Enable/Disable manual handover from 3G to LTE network. If enabled, the FortiGate switches the modem firmware to LTE mode if the modem itself fails to do so after 5 loops.

`force-wireless-profile` Force the modem to use the configured wireless profile index (1 - 16), 0 if don't force. If your FortiGate includes an LTE modem or if an LTE modem is connected to it you can use the `execute`

`lte-modem` command to list the LTE modem profiles. Use this command to select one of these wireless profiles.

Wireless profiles contain detailed LTE modem data session settings. In each modem, a maximum of 16 wireless profiles can be stored, any data connections are initiated using settings from one of the stored wireless profiles. To make a data connection, at least one profile must be defined. Here is a sample wireless profile table stored in one of the internal modems:

```
FG30EN3U15000025 # execute lte-modem wireless-profile list
```

ID	Type	Name	APN	PDP_Type	Authen	Username
*1	0	profile1	vzwims	3	0	
2	0	profile2	vzwadmin	3	0	
3	0	profile3	VZWINTERNET	3	0	
4	0	profile4	vzwapp	3	0	
5	0	profile5	vzw800	3	0	
9	0	profile9	vzwims	2	0	
10	0	profile10	vzwadmin	0	0	
11	0	profile11	VZWINTERNET	0	0	
12	0	profile12	vzwapp	3	0	
13	0	profile13		0	0	

Profile Type:

```
0 ==> QMI_WDS_PROFILE_TYPE_3GPP
1 ==> QMI_WDS_PROFILE_TYPE_3GPP2
* ==> Default 3GPP Profile, # ==> Default 3GPP2 Profile
```

Profile PDP Type:

```
0 ==> QMI_WDS_PDP_TYPE_IPV4
1 ==> QMI_WDS_PDP_TYPE_PPP
2 ==> QMI_WDS_PDP_TYPE_IPV6
3 ==> QMI_WDS_PDP_TYPE_IPV4_OR_IPV6
```

Authentication:

```
0 ==> QMI_WDS_AUTHENTICATION_NONE
1 ==> QMI_WDS_AUTHENTICATION_PAP
2 ==> QMI_WDS_AUTHENTICATION_CHAP
3 ==> QMI_WDS_AUTHENTICATION_PAP|QMI_WDS_AUTHENTICATION_CHAP
```

`authtype` Authentication type for PDP-IP packet data calls.

`apn` Log in APN string for PDP-IP packet data calls.

`modem-port` Modem port index (0 - 20).

`network-type` Set wireless network.

`auto-connect` Enable/disable Modem auto connect.

`gpsd-enabled` Enable/disable GPS daemon.

`data-usage-tracking` Enable/disable data usage tracking.

`gps-port` Modem port index (0 - 20). Specify the index for GPS port, by default it is set to 255 which means to use the system default.

execute lte-modem command changes

The following options are available for the `execute lte-modem` command:

`cold-reboot` Cold reboot LTE Modem, which means power off the internal modem and power it on again after 1 second.

`get-modem-firmware` get-modem-firmware

`get-pri-firmware` get-pri-firmware

`power-off` Power off LTE Modem.

`power-on` Power on LTE Modem.

`purge-billing-data` Purge all existing LTE Modem billing data.

`reboot` Warm reboot LTE Modem.

`set-operation-mode` Set LTE Modem operation mode to online or offline.

`wireless-profile` wireless-profile

`cold-reboot`, `power-off`, `power-on`, `set-operation-mode`, and `wireless-profile` are new in FortiOS 5.6.1.

New execute lte-modem wireless-profile command

The following options are available for the `execute lte-modem wireless-profile` command:

`create` Create a wireless profile. You use the `create` command to create an LTE modem profile by providing a name and supplying settings for the profile. The command syntax is:

```
execute lte-modem wireless-profile create <name> <type> <pdp-type> <apn-name> <auth-type>
    [<user> <password>]
```

`<name>` Wireless profile name of 1 to 16 characters.

`<type>` Wireless profile type:

- 0 for 3GPP profiles.
- 1 for 3GPP2 profiles.

`<pdp-type>` Wireless profile PDP type.

- 0 for IPv4
- 1 for PPP
- 2 for IPv6
- 3 for IPv4v6

`<apn-name>` Wireless profile APN name, 0 to 32 characters.

`<auth-type>` Wireless profile authentication type.

- 0 for no authentication.
- 1 for PAP
- 2 for CHAP
- 3 for PAP and CHAP

[<user> <password>] Wireless profile user name and password (1 to 32 characters each). Not required if <auth-type> is 0.

For example, use the following command to create an LTE modem 3GPP IPv4 profile named myprofile6. This profile uses the APN profile named p6apn that uses PAP and CHAP authentication.

```
execute lte-modem wireless-profile create myprofile 0 0 myapn 3 myname mypasswd
```

delete <profile-number> Delete a wireless profile from the Modem. Specify profile ID of the profile to delete.

list List all the wireless profiles stored in the Modem. If the modem is busy the list may not display. If this happens just repeat the command. It may take a few attempts.

modify Modify a wireless profile using the same settings as the create command except the first option is the profile ID. You can find the profile ID for each profile by listing the profiles using the `execute lte-modem wireless-profile list` command. For example, to modify the profile created above to change it to an IPv4v6 profile, change the APN profile to yourapn, and set the authentication type to PAP enter the following command (assuming the profile ID is 6):

```
execute lte-modem wireless-profile modify 6 myprofile 0 3 yourapn 1 myname mypasswd
```

test Test wireless profiles.

Static mode for wwan interface removed (440865)

When configuring the wireless modem wwan interface from the CLI the `mode` can only be set to DHCP. Static addressing for the wwan interface is not supported so the `static` option has been removed.

Networking (5.6.3)

New networking features added to FortiOS 5.6.3.

Static Route GUI page updates (268344)

Updates have been made to the **New Static Route/Edit Static Route** page (under **Network > Static Routes**) so as to avoid the device interface being selected first before the gateway. The admin can now specify the gateway first, then the device interface will populate automatically based on the gateway. In addition, if the gateway is not in the same subnet as the selected interface, a warning message will appear.

Advanced Routing GUI updates (413433, 445075)

Fixed an issue where an interface was not able to be deleted in the GUI under **Network > Multicast > Multicast Routing**.

VXLAN interfaces can be attached to loopback interfaces (436773)

Support has been added for VXLAN unicast devices to be "binded" to the loopback interface as its underlying interface:

- The IP address of the loopback interface would be taken as the source IP for its outgoing VXLAN packets, so that the peer knows where to reply.
- Among parameters passing to kernel, the ifindex of the loopback interface is not actually passed down to kernel, so that the kernel can freely choose the physical outgoing interface.

VXLAN traffic can be routed across multiple physical links, providing resistance to single points of failure.

New option to configure DHCP renew time (440923)

Support has been added to allow you to set a minimum DHCP renew time in seconds (under `config system interface`). Note that this entry is only available when `mode` is set to `dhcp`.

Syntax

```
config system interface
  edit {name}
    set dhcp-renew-time <seconds>
  next
end
```

Set the DHCP renew time range between 300-604800 (or five minutes to seven days). You can use the renew time provided by the server by setting this entry to 0.

Show/add IPv6 address for CLI "get" under interface and CLI "fnsysctl/sysctl ifconfig interface_id" (442988, 230480)

Client IPv6 DHCP addresses were only available to view in the CLI by using `diagnose ipv6 address list`, but are also now available by entering `get` in the interface (under `config system interface`).

Similarly, static IPv6 addresses were available to view under `diagnose ipv6 address list` and by entering `get` under the interface, but are also now available by entering `fnsysctl/sysctl ifconfig interface_id`.

DHCP Option 82 on Fortigate DHCP relay - RFC3046 (451456)

Support has been added to enable or disable DHCP relay option 82 (under config system interface), as referenced in [RFC3046](#): "Overall adding of the DHCP relay agent option SHOULD be configurable, and SHOULD be disabled by default".

Syntax

```
config system interface
  edit {name}
    set dhcp-relay-agent-option {enable | disable}
  next
end
```

Networking (5.6.1)

New networking features added to FortiOS 5.6.1.

IPv6 Router Advertisement options for DNS enhanced with recursive DNS server option (399406)

This feature is based on [RFC 6106](#) and it adds the ability to obtain DNS search list options from upstream DHCPv6 servers and the ability to send them out through either Router Advertisement or FortiGate's DHCP server.

FortiOS 5.6 supported the following:

To get the information from the upstream ISP server:

```
config system interface
  edit wan1
    config ipv6
      set dhcp6-prefix-delegation enable
    next
  next
end
```

To use Routing Advertisement to send the DNS search list:

```
config system interface
  edit port 1
    config IPv6
      set ip6-address 2001:10::/64
      set ip6-mode static
      set ip6-send-adv enable
      config ip6-delegated-prefix-list
      edit 1
        set upstream-interface WAN
        set subnet 0:0:0:11::/64
        set autonomous-flag enable
        set onlink-flag enable
      next
    next
  end
end
```

To use DHCPv6 server to send DNS search list:

```
config system dhcp6 server
  edit 1
    set interface port2
    set upstream-interface WAN
    set ip-mode delegated
    set dns-service delegated
    set dns-search-list delegated // this is a new command
    set subnet 0:0:0:12::/64
  next
end
```

In FortiOS 5.6.1 this feature has been enhanced to include the recursive DNS server option that sends the IPv6 recursive DNS server option to downstream clients with static prefix RA.

The new options include `rdnss` and `dnssl` in the following syntax:

```
config system interface
  edit port1
    config ipv6
      config ip6-prefix-list
        edit 2001:db8::/64
          set autonomous-flag enable
          set onlink-flag enable
          set rdnss 2001:1470:8000::66 2001:1470:8000::72
          set dnssl fortinet.com fortinet.ca
        end
      end
    end
  end
```

Temporarily mask interface failure (435426)

In some situations during normal operation, attached network equipment may cause a FortiGate interface to appear to have disconnected from the network. And in some cases you may not want the FortiGate interface to detect and respond to the apparent interruption. For example, when Lawful Intercept (LI) devices are inserted/removed from the network path using a switch mechanism the signal is entirely interrupted. That interruption is seen by the FortiGate as an interface failure.

When the network path is interrupted, the FortiGate normally declares that the interface is down. All services using the interface are notified and act accordingly.

This new feature allows the FortiGate interface to temporarily delay detecting that the interface is down. If the connection is restored during the delay period, the FortiGate ignores the interface down condition and services using the interface resume without apparent interruption.

Use the following command to enable and configure the down time for a FortiGate interface:

```
config system interface
  edit port1
    set disconnect-threshold <delay>
  end
```

`<delay>` is the time to wait before sending a notification that this interface is down or disconnected (0 - 1000 ms, default = 0).

Policy Routes now appear on the routing monitor (411841)

You can go to **Monitor > Routing Monitor** and select Policy to view the active policy routes on your FortiGate.

Refresh		Edit Route		Static & Dynamic		Policy	
IP Version	From	Source	To	Destination	Gateway IP	Protocol	Action
4	 mgmt1	10.10.10.0/255.255.255.0	Any	0.0.0.0/0.0.0.0	172.20.121.2	Any	✓ Route

Control how the system behaves during a routing change (408971)

FortiOS allows you to dynamically make routing changes while the FortiGate unit is processing traffic. Routing changes that affect the routing used for current sessions may affect how the FortiGate continues to process the session after the routing change has been made.

Using the following command you can control whether FortiOS keeps (preserves) the routing for the sessions that are using the route or causes the changed routing table to be applied to active sessions, possibly causing their destinations to change.

```
config system interface
  edit port2
    set preserve-session-route {enable | disable}
  end
```

If enabled, all sessions passing through port2 are allowed to finish without being affected by the routing changes. If disabled (the default), when a route changes the new routing table is applied to the active sessions through port2 which may cause their destinations to change.

Networking (5.6)

New networking features added to FortiOS 5.6.

New command to get transceiver signal strength (205138)

On most FortiGate models with SFP/SFP+ interfaces you can use the following command to display information about the status of the transceivers installed in the SFP/SFP+ interfaces of the FortiGate.

The command output lists all of SFP/SFP+ interfaces and if they include a transceiver the output displays information about it. The command output also includes details about transceiver operation that can be used to diagnose transmission problems.

```
get system interface transceiver
```

```
...
```

```
Interface port14 - Transceiver is not detected.
```

```
Interface port15 - SFP/SFP+
```

```
Vendor Name   : FIBERXON INC.
Part No.      : FTM-8012C-SLG
Serial No.    : 101680071708917
```

```
Interface port16 - SFP/SFP+
```

```
Vendor Name   : FINISAR CORP.
Part No.      : FCLF-8521-3
Serial No.    : PS62ENQ
```

SFP/SFP+	Temperature	Voltage	Optical	Optical	Optical
Interface	(Celsius)	(Volts)	Tx Bias	Tx Power	Rx Power
			(mA)	(dBm)	(dBm)

```
-----
port15      N/A      N/A      N/A      N/A      N/A
port16      N/A      N/A      N/A      N/A      N/A
++ : high alarm, + : high warning, - : low warning, -- : low alarm, ? : suspect.
```

New BGP local-AS support (307530)

Use the following command to configure BGP local-AS support:

```
config router bgp
  config neighbor
    edit "neighbor"
      ...
      set local-as 300
      set local-as-no-prepend disable|enable
      set local-as-replace-as disable|enable
    end
```

Enable `local-as-no-prepend` if you do not want to prepend local-as to incoming updates.

Enable `local-as-replace-as` to replace a real AS with local AS in outgoing updates.

Interface setting removed from SNMP community (310665)

The SNMP GUI has been cleaned up by removing the **Interface** setting.

RPF checks can be removed from the state evaluation process (311005)

You can remove stateful firewall RPF state checks without fully enabling asymmetric routing. State checks can be disabled on specific interfaces. The following command shows how to disable state checks for traffic received by the wan1 interface.

Disabling state checks makes a FortiGate unit less secure and should only be done with caution.

```
config system interface
  edit wan1
    set src-check disable
  end
```

BGP graceful-restart-end-on-timer, stale-route, and linkdown-failover options (374140)

If `graceful-end-on-timer` is enabled, the BGP graceful restart process will be stopped upon expiration of the restart timer only.

If `linkdown-failover` is enabled for a BGP neighbor, the neighbor will be down when the outgoing interface is down.

If `stale-route` is enabled for a BGP neighbor, the route learned from the neighbor will be kept for the `graceful-stalepath-time` after the neighbor is down due to hold timer expiration or TCP connection failure.

```
config router bgp
  set graceful-end-on-timer disable|enable
  config neighbor
    edit 192.168.1.1
```

```

        set linkdown-failover disable|enable
        set stale-route disable|enable
graceful-end-on-timer stops BGP graceful restart process on timer only.

```

`linkdown-failover` and `stale-route` are options to bring down BGP neighbors upon link down and to keep routes for a period after the neighbor is down.

FQDNs can be destination addresses in static routes (376200)

FQDN firewall addresses can now be used as destination addresses in a static route.

From the GUI, to add a FQDN firewall address (or any other supported type of firewall address) to a static route in the firewall address configuration you must enable the **Static Route Configuration** option. Then when configuring the static route set **Destination** to **Named Address**.

From the CLI, first configure the firewall FQDN address:

```

config firewall address
  edit 'Fortinet-Documentation-Website'
    set type fqdn
    set fqdn docs.fortinet.com
    set allow-routing enable
  end

```

Then add the FQDN address to a static route.

```

config router static
  edit 0
    set dstaddr Fortinet-Documentation-Website
    ...
  end

```

Priority for Blackhole routes (378232)

You can now add a priority to a blackhole route to change its position relative to kernel routes in the routing table. Use the following command to add a blackhole route with a priority:

```

config router static
  edit 23
    set blackhole enable
    set priority 200
  end

```

New DDNS refresh interval (383994)

A new DDNS option has been added to configure the FortiGate to refresh DDNS IP addresses by periodically checking the configured DDNS server.

```

config system ddns
  edit 1
    set ddns-server FortiGuardDDNS
    set use-public-ip enable
    set update-interval seconds
  end

```

The default `update-interval` is 300 seconds and the range is 60 to 2592000 seconds.

Support IPv6 blackhole routes on GUI (388599)

IPv6 blackhole routes are now supported from GUI, go to **Network > Static Routes** and select **Create New > IPv6 Route**.

Choose **Blackhole** for **Device** field.

SSL-VPN can use a WAN link load balancing interface (396236)

Virtual-wan-link interface can now be set as a destination interface in SSLVPN policy.

Also SSL-VPN interface can now be set as a source interface for WAN LLB.

DDNS support for noip.com (399126)

Noip.com, and provider for Dynamic DNS has been added as a supported option for a `ddns-server`.

CLI

```
config system ddns
  edit <ddns_ip>
    set ddns-server
      [dyndns.org|dyns.net|ods.org|tzo.com|vavic.com|dipdns.net|now.net.cn||dhs.org|ea
      sydns.com|genericDDNS|FortiGuardDDNS|noip.com]
```

IPv6 Router Advertisement options for DNS (399406)

This feature is based on [RFC 6106](#) and it adds the ability to obtain DNS search list options from upstream DHCPv6 servers and the ability to send them out through either Router Advertisement or FortiGate's DHCP server.

Configuration example:

To get the information from the upstream ISP server:

```
config system interface
  edit wan1
    config ipv6
      set dhcp6-prefix-delegation enable
    next
```

```
next
end
```

To use Routing Advertisement to send the DNS search list:

```
config system interface
  edit port 1
    config IPv6
      set ip6-address 2001:10::/64
      set ip6-mode static
      set ip6-send-adv enable
      config ip6-delegated-prefix-list
        edit 1
          set upstream-interface WAN
          set subnet 0:0:0:11::/64
          set autonomous-flag enable
          set onlink-flag enable
        next
      next
    end
  end
end
```

To use DHCPv6 server to send DNS search list:

```
config system dhcp6 server
  edit 1
    set interface port2
    set upstream-interface WAN
    set ip-mode delegated
    set dns-service delegated
    set dns-search-list delegated // this is a new command
    set subnet 0:0:0:12::/64
  next
end
```

WAN LLB to SD-WAN on GUI (403102)

To be more consistent with current terminology, the term **WAN LLB** has been changed in the GUI to the more recognizable **SD-WAN**.

New RFCs

The following RFCs are now supported by FortiOS 5.6.3 or the support for these RFCs has been enhanced in FortiOS 5.6.3:

- [RFC 7627](#) Transport Layer Security (TLS) Session Hash and Extended Master Secret Extension (443870)

The following RFCs are now supported by FortiOS 5.6.1 or the support for these RFCs has been enhanced in FortiOS 5.6.1:

- [RFC 6954](#) Using the Elliptic Curve Cryptography (ECC) Brainpool Curves for the Internet Key Exchange Protocol Version 2 (IKEv2) (412795)
- [RFC 6106](#) IPv6 Router Advertisement Options for DNS Configuration (399406)
- [RFC 4787](#) Network Address Translation (NAT) Behavioral Requirements for Unicast UDP (408875)
- Improved enforced secure-renegotiation checks support for [RFC 5746](#) Transport Layer Security (TLS) Renegotiation Indication Extension (422133)
- [RFC 7627](#) Transport Layer Security (TLS) Session Hash and Extended Master Secret Extension (422133)

The following RFCs are now supported by FortiOS 5.6 or the support for these RFCs has been enhanced in FortiOS 5.6:

- [RFC 7427](#) Signature Authentication in the Internet Key Exchange Version 2 (IKEv2) (389001)
- [RFC 7348](#) Virtual eXtensible Local Area Network (VXLAN) or VTEP (289354)
- [RFC 5996 \(section 2.15\)](#) IKEv2 asymmetric authentication (393073)
- [RFC 6106](#) IPv6 Router Advertisement Options for DNS (399406)
- [RFC 7383](#) Internet Key Exchange Protocol Version 2 (IKEv2) Message Fragmentation (371241)
- [RFC 3971](#) IPv6 Secure Neighbor Discovery (SEND) (355946)
- [RFC 6023](#) Childless IKEv2 Initiation (381650)

Sandbox Integration (5.6.1)

New sandbox integration features added to FortiOS 5.6.1.

New file extension lists for determining which file types to send to FortiSandbox (379326)

This feature introduces two new file extension lists:

- File extensions to submit to FortiSandbox even though the AV engine says they are unsupported.
- File extensions to exclude from submitting to FortiSandbox even though the AV engine says they are supported.

These lists are configured on the FortiSandbox, not the FortiGate, and are dynamically loaded on the FortiGate via quarantine.

These lists are only file extensions and not file types detected by the AV engine using magic bytes. Pattern matching is done on the extension of the filename only.

Syntax

```
diag sys scanunit reload-fsa-ext
```

FortiSandbox integration with AntiVirus in quick mode (436380)

FortiSandbox options in an AntiVirus Security Profile in quick scanning mode can now be enabled with CLI commands.

CLI syntax

```
config antivirus profile
  edit default
    set ftgd-analytics disable/everything
    set analytics-max-upload 10
    set analytics-wl-filetype 0
    set analytics-bl-filetype 0
    set analytics-db enable/disable
    set scan-mode quick
  end
```

Security Fabric (5.6.3)

New Security Fabric features added to FortiOS 5.6.3.

Security Profiles (5.6.3)

New security profile features added to FortiOS 5.6.3.

Added multiple ports and port range support in the explicit ftp/web proxy (402775)

Added multiple ports and port range support in the explicit ftp/web proxy:

- added new monitor api endpoint for checking whether a list of TCP port ranges is being used, sample usage:
/api/v2/monitor/system/check-port-availability?port_ranges=[{"start":8080,"end":8080},{"start":400,"end":600}, {"start":1,"end":200}]&service=webproxy
- added GUI support for port ranges in web-proxy and ftp-proxy settings

Block access to unsupported FortiClient endpoints (457695)

You can use the following command to deny registration of unsupported FortiClients endpoints. An unsupported FortiClient endpoint means the endpoint is running FortiClient but for some reason not all of the criteria are available to identify the endpoint, or the endpoint may be running an unsupported version of FortiClient. Information required that is not available could include the endpoint's IP address or MAC address is not visible.

```
config endpoint-control setting
    set forticlient-dereg-unsupported-client {enable | disable}
end
```

Exempt list fix (381762)

The FortiClient Monitor page now shows exempt device types, as opposed to just the device category. FortiOS can now differentiate the three cases both from backend and GUI.

Backend changes

Differentiate the three cases:

- exempt by custom device
- exempt by device category
- exempt by device group

GUI changes

1. **Monitor > FortiClient Monitor** page:
 - show device exempt reasons as any combination of device, device category, device group, source address.
2. Update REST monitor api
 - (URI: /api/v2/monitor/user/device/select?compliance_visibility=true)
 - update "exempt_reason" field from string to array of strings in json result

Security Profiles (5.6.1)

New security profile features added to FortiOS 5.6.1.

FortiGuard WAN IP blacklist service is now online (404859)

The FortiGuard WAN IP blacklist service was not online in FortiOS 5.6.0. In FortiOS 5.6.1, a notification appears on the **Dashboard** when WAN IP is blacklisted. Clicking on the notification brings up the blacklist details.

Application Control GUI improvements (279956)

An **All Categories** button on the **Security Profiles > Application Control** page makes it easier to apply an action (Monitor, Allow, Block, Quarantine) to all categories at once.

Note that the **All Categories** selector goes blank when any of the actions to be applied to individual categories is manually changed to something different than what was selected for all the categories. The **Unknown Application** action will match the **All Categories** action unless that action is Quarantine, which is unsupported for unknown applications.

Industrial Application Control signatures (434592)

The application control category Industrial is now controlled by a FortiGuard license and the default disable mask is no longer needed. The special category is also no longer used.

GUI updates to reflect package and license changes for IPS, Application Control and Industrial signatures (397010)

The following changes have been made to the GUI to reflect changes in the signature databases:

- Application Control signature database information is displayed under on the **System > FortiGuard** page in the FortiCare section.
- The IPS package version and license status are shown in a separate section in **System > FortiGuard** page. A link to manually upload the IPS database signatures has been added.
- The Industrial package version and license status are shown in a separate section in **System > FortiGuard** page. A link to manually upload the Industrial database signatures is available. Access to the Industrial database is provided with the purchase of the FortiGuard Industrial Security Service. The row item for this license will not appear if you are not subscribed.
- Botnet category is no longer available when searching the Application Signatures list.

Improved FortiClient monitor display (378288)

The GUI for the **Monitor > FortiClient Monitor** page has been revised.

- new dropdown option: **Online Only** or **Include Offline**. The default is **Online Only**.
- new dropdown option
 - **Sending FortiTelemetry Only** (default)
 - **Include All FortiTelemetry States**
 - **Not Sending FortiTelemetry Only**
- update: **Compliance** status for offline device is **N/A**
- update: offline status indicator to grey
- new compliance status text after the icon in **Compliance** column
- Moved **Compliance** column after **Status** column
- Combined unregistered endpoint devices with not registered devices

FortiSandbox integration with AntiVirus in quick mode (436380)

FortiSandbox options in an AntiVirus Security Profile in quick scanning mode can now be enabled with CLI commands.

CLI syntax

```
config antivirus profile
edit default
set ftgd-analytics disable/everything
set analytics-max-upload 10
set analytics-wl-filetype 0
set analytics-bl-filetype 0
set analytics-db enable/disable
set scan-mode quick
end
```

Pre-configured parental controls for web filtering (399715)

Pre-configured filters based on the Motion Picture Association of America (MPAA) ratings can now be added to the Web Filter Security Profile. This feature is already available on FortiCloud and uses the same ratings categories.

Anti-Spam GUI updates (300423)

Changes made to the Anti-Spam profile update the GUI to reflect FortiOS 5.6 style.

Security Profiles (5.6)

New security profile features added to FortiOS 5.6.

New FortiGuard Web Filter categories (407574)

New categories added to FortiGuard Web Filter sub-categories:

- Under Security Risk:
 - Newly Observed Domain (5.90)
 - Newly Registered Domain (5.91)
- Under General Interest - Business
 - Charitable Organizations (7.92)
 - Remote Access (7.93)
 - Web Analytics (7.94)
 - Online Meeting (7.95)

Newly observed domain (NOD) applies to URLs whose domain name is not rated and were observed for the first time in the past 30 minutes.

Newly registered domain (NRD) applies to URLs whose domain name was registered in the previous 10 days.

Overall improvement to SSL inspection performance (405224)

The enabling / disabling of proxy cipher / kxp hardware acceleration in CP8/CP9 required restarting of the WAD daemon for the change to take effect; this bug has been repaired.

New CLI commands

The FortiGate will use the `ssl-queue-threshold` command to determine the maximum queue size of the CP SSL queue. In other words, if the SSL encryption/decryption task queue size is larger than the threshold, the FortiGate will switch to use CPU rather than CP. If less, it will employ CP.

```
config firewall ssl setting
    set ssl-queue-threshold <integer>
end
```

The integer represents the maximum length of the CP SSL queue. Once the queue is full, the proxy switches cipher functions to the main CPU. The range is 0 - 512 and the default is 32.

FortiClient Endpoint license updates (401721)

FortiClient endpoint licenses for FortiOS 5.6.0 can be purchased in multiples of 100. There is a maximum client limit based on the FortiGate's model. FortiCare enforces the maximum limits when the customer is applying the license to a model.

If you are using the ten free licenses for FortiClient, support is provided on the Fortinet Forum (forum.fortinet.com). Phone support is only available for paid licenses.

Model(s)	Maximum client limit
VM00	200
FGT/FWF 30 to 90 series	200
FGT 100 to 400 series	600
FGT 500 to 900 series, VM01, VM02	2,000
FGT 1000 to 2900 series	20,000
FGT 3000 to 3600 series, VM04	50,000
FGT 3700D and above, VM08 and above	100,000

Older FortiClient SKUs will still be valid and can be applied to FortiOS 5.4 and 5.6.

If you are using the ten free licenses for FortiClient, support is provided on the Fortinet Forum (forum.fortinet.com). Phone support is only available for paid licenses.

FortiClient Vulnerability Exemption Setting (407230)

A new CLI command provides a manual override for client computers with vulnerabilities that cannot be fixed.

CLI Syntax

New command to enable/disable compliance exemption for vulnerabilities that cannot be auto patched. Default is `disable`.

```

config endpoint-control profile
  edit <profile-name>
    config forticlient-winmac-setting
      set forticlient-vuln-scan enable
      set forticlient-vuln-scan-exempt [enable|disable]
    end
  next
end

```

DNS profile supports safe search (403275)

Users can take advantage of pre-defined DNS doctor rules to edit DNS profiles and provide safe search for Google, Bing, and YouTube.

To add safe search to a DNS profile - GUI

1. Go to **Security Profiles > DNS Filter**.
2. Edit the default filter or create a new one.
3. Enable **Enforce 'Safe Search on Google, Bing, YouTube**.
4. Select **Strict** or **Moderate** level of restriction for **YouTube Access**.

To add safe search to a DNS profile - CLI

```

config dnsfilter profile
  edit "default"
    set safe-search enable
    set youtube-restrict {strict | moderate} (only available is safe-search enabled)
  next
end

```

Application control and Industrial signatures separate from IPS signatures (382053)

IPS, Application control and industrial signatures have been separated. The get system status command shows the versions of each signature database:

```

get system status
Version: FortiGate-5001D v5.6.0,build1413,170121 (interim)
Virus-DB: 42.00330(2017-01-23 01:16)
Extended DB: 1.00000(2012-10-17 15:46)
Extreme DB: 1.00000(2012-10-17 15:47)
IPS-DB: 6.00741(2015-12-01 02:30)
IPS-ETDB: 0.00000(2001-01-01 00:00)
APP-DB: 6.00741(2015-12-01 02:30)

```

Changes to default SSL inspection configuration (380736)

SSL inspection is mandatory in the CLI and GUI and is enabled by default.

GUI Changes

- Updated edit dialogues for IPv4/IPv6 Policy and Explicit Proxy Policy
 - SSL/SSH inspection data displayed in muted palette
 - disabled the toggle button for this option

- set the default profile as "certificate-inspection"
- Updated list pages for IPv4/IPv6 Policy and Explicit Proxy Policy
 - Add validation for "ssl-ssh-profile" when configuring UTM profiles
- Updated SSL/SSH Inspection list page
 - disabled delete menu on GUI for default ssl profiles
 - changed "Edit" menu to "View" menu for default ssl profiles
 - added implicit class (grayed) the default ssl profile entries
- Updated SSL/SSH Inspection edit dialog
 - disabled all the inputs for default ssl profiles except download/view trusted certificate links
 - changed button to "Return" for default ssl profiles to return the list page
- Updated Profile Group edit dialog
 - removed checkbox for "ssl-ssh-profile" option, make it always required.

CLI changes

1. `ssl-ssh-profile` default value is `certificate-inspection` when applicable in table `firewall.profile-group`, `firewall.policy`, `firewall.policy6`, `firewall.explicit-proxy-policy`
2. make default profiles "certificate-inspection", "deep-ssl-inspection" read only in table `firewall.ssl-ssh-profile`

Block Google QUIC protocol in default Application Control configuration (385190)

QUIC is an experimental protocol from Google. With recent Google Chrome versions (52 and above), and updated Google services, more than half of connections to Google servers are now in QUIC. This affects the accuracy of Application Control. The default configuration for Application control blocks QUIC.

Users may enable QUIC with CLI commands.

CLI Syntax

```
config application list
edit <profile-name>
set options allow-quic
end
```

Botnet database changes (390756)

Starting in FortiOS 5.6, FortiGate units and FortiGuard Distribution Servers (FDS) will use object IDs IBDB and DBDB to download and update the Botnet database. Botnet protection will be part of the AntiVirus contract.

FortiOS 5.4 uses object IDs IRDB and BDDb.

Fortinet Security Fabric audit check for endpoint vulnerability and unauthorized FAP and FSW (401462)

The new Security Fabric Audit feature allows for the display of endpoint vulnerability status in real-time. Users can see:

- FortiClient devices that have critical vulnerabilities detected.
- Discovered FortiSwitches that have not yet been authorized.
- Discovered FortiAPs that have not yet been authorized.

Change to CLI commands for configuring custom Internet services (397029)

Custom internet services are no longer configured through use of the commands `config application internet-service` and `config application internet-service-custom` in the CLI.

These commands are replaced by `config firewall internet-service` and `config firewall internet-service-custom`.

CLI Syntax - examples

```
config firewall internet-service 1245324
  set name "Fortinet-FortiGuard"
  set reputation 5
  set icon-id 140
  set offset 1602565
  config entry
    edit 1
      set protocol 6
      set port 443
      set ip-range-number 27
      set ip-number 80
    next
    edit 2
      set protocol 6
      set port 8890
      set ip-range-number 27
      set ip-number 80
    next
    edit 3
      set protocol 17
      set port 53
      set ip-range-number 18
      set ip-number 31
    next
    edit 4
      set protocol 17
      set port 8888
      set ip-range-number 18
      set ip-number 31
    next
  end
end
```

```
config firewall internet-service-custom
  edit "custom1"
    set comment "custom1"
    config entry
      edit 1
        set protocol 6
        config port-range
          edit 1
            set start-port 30
            set end-port 33
          next
        next
      next
    end
  end
```

```

        end
        set dst "google-drive" "icloud"
    next
end
next
end

```

Enable "sync-session-ttl" in "config ips global" CLI by default (399737)

`sync-session-ttl` is now set to `enable` by default in order to:

- enhance detection of P2P traffic. Efficient detection of P2P is important on hardware accelerated platforms
- ensure that IPS and the kernel use the same ttl
- ensure that IPS sessions time out sooner

CASI functionality moved into application control (385183, 372103)

Cloud Access Security Inspection (CASI) is merged with Application Control resulting in changes to the GUI and the CLI.

GUI Changes

- Toggle option added to quickly filter CASI signatures in the Application Signatures list.
- Application Overrides table now shows any parent-child hierarchy using the `--parent` metadata on signatures. Deleting a parent app also deletes its child apps. And conversely, adding a child app will add all its parent apps but with implicit filter action.
- A policy breakdown is shown on existing application control profiles for policies using the profile. The breakdown indicates which policies are using a deep inspection.
- A breakdown is shown for application categories and filter overrides to indicate the number of CASI and non-CASI signatures. A lock icon is shown for applications requiring deep inspection.

CLI Changes

Commands removed:

- `config application casi profile`
- `casi profile in config firewall policy`
- `casi profile in config firewall policy6`
- `casi-profile-status and casi-profile under config firewall sniffer`
- `casi-profile-status and casi-profile under config firewall interface-policy`

New diagnose command to delete avatars (388634)

Commands to delete avatars by FortiClient UID or avatar name have been added to the CLI.

the two following commands has been added to diagnose endpoint avatar:

- `diagnose endpoint avatar delete <ftcl_uid>`
- `diagnose endpoint avatar delete <ftcl_uid> <username>`

The attribute `delete` did not exist before. The values `<fctl_uid>` and `<user_name>` describe a set of avatars. If only `<fctl_uid>` is defined, all avatars belonging to this FortiClient UID that are not being used will be removed. If both values are defined, the avatar belonging to them will be removed unless they are being used in which case this call will cause an error to user.

Fortinet bar option disabled in profile protocol options when VDOM is in flow-based inspection mode (384953)

In order to prevent the Fortinet Bar from being enabled and redirecting traffic to proxy (WAD) when a VDOM is in flow-based mode, the Fortinet Bar option is disabled in profile protocol options.

SSL/SSH profile certificate handling changes (373835)

In order to support DSA and ECDSA key exchange (in addition to RSA) in SSL resign and replace mode, CLI commands for `deep-inspection` have changed. The `certname` command in `ssl-ssh-profile` has been removed.

To select from the list of available certificates in the system, use the CLI below.

```
edit deep-inspection
  set server-cert-mode re-sign
  set certname-{rsa | dsa | ecdsa}
```

Restricting access to YouTube (replacement for the YouTube Education filter feature) (378277)

Previous versions of FortiOS supported YouTube for Schools (YTfS). As of July 1, 2016 this feature is no longer supported by YouTube. Instead you can use the information in the YouTube support article [Restrict YouTube content on your network or managed devices](#) to achieve the same result. FortiOS supports applying **Strict** or **Moderate** restrictions using HTTP headers as described in this article.

In FortiOS 5.6 with inspection mode set to proxy-based, in a Web Filter profile under **Search Engines** you can select **Restrict YouTube Access** and select either **Strict** or **Moderate**.

Enhancements to IPS Signatures page (285543)

The IPS signatures list page now shows which IPS package is currently deployed. Users can also change their IPS package by linking directly to the FortiGate's **System > FortiGuard** page from the IPS Signatures list page.

DLP sensor GUI changes (307225)

The DLP sensor for file size has been corrected to indicate that the file size has to be greater than the number of KB entered. Previously, the GUI incorrectly showed that the files size could be greater than or equal to the number of KB entered.

Web Filter profile page GUI updates (309012)

The GUI for the **Web Filter** security profile and **Web Profile Overrides** pages are changed.

Web Filter profile page

- removed multilist for override user group and profile
- replaced FortiGuard categories actions icons with font icons
- added tooltip for **Allow users to override blocked categories** to explain the policy group dependency

Web Profile Overrides page

- removed multilist of user, user group, original profile, new profile
- duplicate profile for new profile (for bug #284239)

Web Filter Quota traffic can no longer be set to 0 (374380)

To fix a bug in older major release, the CLI has been changed so that minimum traffic quota does not allow 0 as an entry. The value entered must be in the range of 1 - 4,294,967,295; if 0 is entered, then an error message will be returned.

CLI Commands:

```
config webfilter profile
  edit default
    config ftgd-wf
      config quota
        edit 1
          set type traffic
          set value {a number in the range of 1 - 4,294,967,295}
```

Webcache-https and SSL deep inspection profile configuration changes (381101)

In older releases, the CLI blocked the configuration of the SSL deep inspection profile when webcache-https was enabled. This bug is fixed in FortiOS 5.6.0.

FortiGate conserve mode changes (242562, 386503)

The following changes were made to rework **conserve mode** and facilitate its implementation:

- Implemented CLI commands to configure **extreme**, **red**, and **green** memory usage thresholds in percentages of total RAM. Memory used is the criteria for these thresholds, and set at 95% (extreme), 88% (red) and 82% (green).
- Removed structure `av_conserve_mode`, other changes in kernel to obtain and set memory usage thresholds from the kernel
- Added conserve mode diagnostic command `diag hardware sysinfo conserve`, which displays information about memory conserve mode.
- Fixed conserve mode logs in the kernel
- Added conserve mode stats to the proxy daemon through command `diag sys proxy stats all | grep conserve_mode`

New custom IPS and Application Control Signatures list (280954)

You can now create IPS and Application control custom signatures by going to **Security Profiles > Custom Signatures**. From here you can create and edit all custom IPS and Application Control signatures.

Default inspection mode set to flow-based (377392)

In FortiOS 5.6.0, the following changes were made to inspection mode:

- factory default sets the FortiGate to flow-based inspection with VDOM disabled
- whenever a VDOM is created, the default inspection mode is flow-based

You must use the CLI to set the FortiGate to proxy-based inspection. To change the inspection mode back to flow-based inspection, you may use the GUI or the CLI.

```
config system settings
    edit <name_str>
        set inspection-mode {proxy | flow}
    end
```

Server Load balancing (5.6.1)

New load balancing features added to FortiOS 5.6.1.

Add server load balancing real servers on the Virtual Server GUI page (416709)

In previous versions of the FortiOS GUI, after adding a Virtual Server you would go to **Policy & Objects > Real Servers** to add real servers and associate each real server with a virtual server.

In FortiOS 5.6.1 you now go to **Policy & Objects > Virtual Servers**, configure a virtual server and then from the same GUI page add real servers to the virtual server. In addition, on the Virtual Server GUI page the option **Outgoing Interface** is renamed **Interface** and the load balancing method **Source IP Hash** has been renamed **Static**.

Server Load balancing (5.6)

New load balancing features added to FortiOS 5.6.

IPv6, 6to4, and 4to6 server load balancing (280073)

Sever load balancing is supported for:

- IPv6 VIPs (`config firewall vip6`)
- IPv6 to IPv4 (6to4) VIPs (`config firewall vip64`)
- IPv4 to IPv6 (4to6) VIPs (`config firewall vip46`)

Configuration is the same as IPv4 VIPs, except support for advanced HTTP and SSL related features is not available. IPv6 server load balancing supports all the same server types as IPv4 server load balancing (HTTP, HTTPS, IMAPS, POP3S, SMTPS, SSL, TCP, UDP, and IP). IPv4 to IPv6 and IPv6 to IPv4 server load balancing supports fewer server types (HTTP, TCP, UDP, and IP).

Improved Server load balancing GUI pages (404169)

Server load balancing GUI pages have been updated and now include more functionality and input verification.

Session-aware Load Balancing (SLBC) (5.6.1)

New SLBC features added to FortiOS 5.6.1.

FortiController-5000 series independent port splitting (42333)

FortiOS 5.6.1 supports splitting some 40G FortiController front panel fiber channel front panel interfaces in to 10G ports. In previous versions of FortiOS this configuration was not supported and all FortiController fiber channel front panel interfaces had to operate at the same speed.

SSL VPN (5.6.3)

New SSL VPN features added to FortiOS 5.6.3.

Virtual desktop option no longer supported (442044)

The SSL VPN web portal no longer supports the virtual desktop and its option has been removed from the interface.

Option to disable FortiClient download in web portal (439736)

You can use the following commands to enable or disable allowing SSL VPN users to download FortiClient from the SSL VPN web portal. If `forticlient-download` is enabled, you can select the download method (`direct` or over the `ssl_vpn`). You can also optionally specify a custom URL for downloading the Windows and Mac OS versions of FortiClient.

Syntax

```
config vpn ssl web portal
  edit <portal name>
    set forticlient-download {enable | disable}
    set forticlient-download-method {direct | ssl-vpn}
    set customize-forticlient-download-url {enable | disable}
    set windows-forticlient-download-url <url>
    set macos-forticlient-download-url <url>
  end
```

Upgraded OpenSSL to 1.1.x (412033) (...)

OpenSSL has been upgraded to 1.1 to provide more cryptographic algorithms. All 3rd-party libraries that depend on OpenSSL have also been updated. OpenLDAP has been upgraded to 2.4.45 to be compatible with OpenSSL 1.1. Furthermore, the `ssl_v3` attribute has been removed from `vpn.ssl.settings` and `global.admin-https-ssl-version`.

SSL VPN (5.6.1)

New SSL VPN features added to FortiOS 5.6.1.

Added a button to send Ctrl-Alt-Delete to the remote host for VNC and RDP desktop connections (401807)

Previously, users were unable to send **Ctrl-Alt-Delete** to the host machine in an SSL VPN remote desktop connection.

FortiOS 5.6.1 adds a new button that allows users to send **Ctrl-Alt-Delete** in remote desktop tools (also fixes 412456, preserving the SSL VPN realm after session timeout prompts a logout).

Improved SSL VPN Realms page (0392184)

Implemented minor functional changes to the dialog on the **SSL VPN > Realms** page:

- URL preview uses info message similar to that seen on the SSL VPN settings dialog.
- Virtual-Host input is now visible when set in the CLI.

- Added help tooltip describing what the virtual-host property does.

Customizable FortiClient Download URL in SSL VPN Web Portal (437883)

A new attribute, `customize-forticlient-download-url`, is added to `vpn.ssl.web.portal`.

The added attribute indicates whether to support a customizable download URI for FortiClient. This attribute is disabled by default. If enabled, two other attributes, `windows-forticlient-download-url` and `macos-forticlient-download-url`, will appear through which the user can customize the download URL for FortiClient.

Syntax

```
config vpn ssl web portal
  edit <portal>
    set customize-forticlient-download-url {enable | disable}
    set windows-forticlient-download-url <custom URL for Windows>
    set macos-forticlient-download-url <custom URL for Mac OS>
  next
end
```

SSL VPN SSO Support for HTML5 RDP (417248)

This feature adds support for SSO from the SSL VPN portal to an RDP bookmark. If SSO is used, then the credentials used to login to SSL VPN will be automatically used when connecting to a remote RDP server.

Syntax

```
conf vpn ssl web user-bookmark
  edit <name>
    config bookmarks
      edit <name>
        set apptype rdp
        set host "x.x.x.x"
        set port <value>
        set sso [disable | auto]
      next
    end
  next
end
```

SSL VPN (5.6)

New SSL VPN features added to FortiOS 5.6.

Remote desktop configuration changes (410648)

If NLA security is chosen when creating an RDP bookmark, a username and password must be provided. However there may be instances where the user might want to use a blank password, despite being highly unrecommended. If a username is provided but the password is empty, the CLI will display a warning. See example CLI below, where the warning appears as a caution before finishing the command:

```
config vpn ssl web user-group-bookmark
  edit <group-name>
    config bookmarks
      edit <bookmark-name>
```

```

        set apptype rdp
        set host 172.16.200.121
        set security nla
        set port 3389
        set logon-user <username>
    next
end

```

Warning: password is empty. It might fail user authentication and remote desktop connection would be failed.

```

end

```

If no username (logon-user) is specified, the following warning message will appear:

```

Please enter user name for RDP security method NLA. object set operator error, -2010
discard the setting Command fail. Return code -2010

```

SSL VPN supports WAN link load balancing interface (396236)

This new feature allows you to set `virtual-wan-link` as the destination interface in a firewall policy (when SSL VPN is the source interface) for WAN link load balancing in the GUI and in the CLI. This lets you log into a FortiGate via SSL VPN for traffic inspection and then have outbound traffic load balanced by WAN link load balancing.

Syntax

```

config firewall policy
    edit <example>
        set dstintf virtual-wan-link
    end

```

SSL VPN login timeout to support high latency (394583)

With long network latency, the FortiGate can timeout the client before it can finish negotiation processes, such as DNS lookup and time to enter a token. Two new CLI commands under `config vpn ssl settings` have been added that allow the login timeout to be configured, replacing the previous hard timeout value. The second command can be used to set the SSL VPN maximum DTLS hello timeout.

Syntax

```

config vpn ssl settings
    edit <example>
        set login-timeout [10-180] Default is 30 seconds.
        set dtls-hello-timeout [10-60] Default is 10 seconds.
    end

```

SSL VPN supports Windows 10 OS check (387276)

A new CLI field has been added to the `os-check-list` under `config vpn ssl web portal` to allow OS checking for Windows 10.

Syntax

```

config vpn ssl web portal
    edit <example>
        set os-check enable
        config os-check-list windows-10
            set action {deny | allow | check-up-to-date}
        end
    end

```

```
end
end
```

SSL VPN DNS suffix per portal and number of portals (383754)

A new CLI command under `config vpn ssl web portal` to implement a DNS suffix per SSL VPN portal. Each suffix setting for each specific portal will override the `dns-suffix` setting under `config vpn ssl settings`.

This feature also raises bookmark limits and the number of portals that can be supported, depending on what FortiGate series model is used:

- 650 portals on 1000D series
- 1300 portals on 2000E series
- 2600 portals on 3000D series

The previous limit for 1000D series models, for example, was 256 portals.

Syntax

```
config vpn ssl web portal
edit <example>
set dns-suffix <string>
end
```

New SSL VPN timeout settings (379870)

New SSL VPN timeout settings have been introduced to counter 'Slowloris' and 'R-U-Dead-Yet' vulnerabilities that allow remote attackers to cause a denial of service via partial HTTP requests.

The FortiGate solution is to add two attributes (`http-request-header-timeout` and `http-request-body-timeout`).

Syntax

```
config vpn ssl settings
set http-request-header-timeout [1-60] (seconds)
set http-request-body-timeout [1-60] (seconds)
end
```

Personal bookmark improvements (377500)

You can now move and clone personal bookmarks in the GUI and CLI.

Syntax

```
config vpn ssl web user-bookmark
edit 'name'
config bookmarks
move bookmark1 after/before
clone bookmark1 to
next
end
```

New controls for SSL VPN client login limits (376983)

Removed the limitation of SSL VPN user login failure time, by linking SSL VPN user setting with `config user settings` and provided a new option to remove SSL VPN login attempts limitation. New CLI allows the administrator to configure the number of times wrong credentials are allowed before SSL VPN server blocks an IP address, and also how long the block would last.

Syntax

```
config vpn ssl settings
  set login-attempt-limit [0-10] Default is 2.
  set login-block-time [0-86400] Default is 60 seconds.
end
```

Unrated category removed from ssl-exempt (356428)

The "Unrated" category has been removed from the SSL Exempt/Web Category list.

Clipboard support for SSL VPN remote desktop connections (307465)

A remote desktop clipboard viewer pane has been added which allows user to copy, interact with and overwrite remote desktop clipboard contents.

System (5.6.3)

New system administration features added to FortiOS 5.6.3.

System (5.6.1)

New system administration features added to FortiOS 5.6.1.

Use self-sign as default GUI certificate if BIOS cert is using SHA-1 (403152)

For increased security, SHA-1 certificate has been replaced by self-sign certificate as the default GUI certificate, if the BIOS certificate is using SHA-1.

Administrator timeout override per access profile (413543)

The GUI is often used for central monitoring. To do this requires the inactivity timeout to be increased, to avoid an admin having to constantly log in over again. This new feature allows the **admintimeout** value, under `config system accprofile`, to be overridden per access profile.

Note that this can be achieved on a per-profile basis, to avoid the option from being unintentionally set globally.

CLI Syntax - Configure admin timeout

```
config system accprofile
  edit <name>
    set admintimeout-override {enable | disable}
    set admintimeout <0-480> - (default = 10, 0 = unlimited)
  next
end
```

New execute script command (423159)

A new `execute` command has been introduced to merge arbitrary configlets into the running configuration from script. The command's authentication can be carried out using either username and password or with a certificate. This command supports FTP/TFTP and SCP.

An important benefit of this feature is that if the configuration in the script fails (i.e. a syntax error), the system will revert back to running configurations without interrupting the network.

CLI Syntax - Load script from FTP/TFTP/SCP server to firewall

```
execute restore scripts <ftp | tftp |
  scp> <dir / filename in server> <server ip> <username> <password>
```

System (5.6)

New system administration features added to FortiOS 5.6.

Remove CLI commands from 1-CPU platforms (405321)

Two CLI commands that set CPU affinity have been removed from 1-CPU platforms since they do not have any impact on these platforms. The commands are `config system global > set miglog-affinity` and `config system global > set av-affinity <string>`.

New SNMP trap for bypass events (307329)

When bypass mode is enabled or disabled on FortiGate units that are equipped with bypass interfaces and support AMC modules, a new SNMP trap is generated and logs bypass events.

Implement SNMP support for NAT Session monitoring which includes new SNMP OIDs (383661)

FortiOS 5.6 implements a new feature providing SNMP support for NAT session monitoring. The resulting new SNMP object identifier (OID) is:

FORTINET-FORTIGATE-

MIB:fortinet.fnFortiGateMib.fgFirewall.fgFwIppools.fgFwIppTables.fgFwIppStatsTable.fgFwIppStatsEntry
1.3.6.1.4.1.12356.101.5.3.2.1.1

Additionally, there are eight new items:

- .fgFwIppStatsName .1
- .fgFwIppStatsType .2
- .fgFwIppStatsStartIp .3
- .fgFwIppStatsEndIp .4
- .fgFwIppStatsTotalSessions .5
- .fgFwIppStatsTcpSessions .6
- .fgFwIppStatsUdpSessions .7
- .fgFwIppStatsOtherSessions .8

New extended database version OIDs for AV and IPS (402162)

New extended database version OIDs ensure accurate display of the AntiVirus and IPS databases in use when you go to **System > FortiGuard**.

Administrator password encryption hash upgraded from SHA1 to SHA256 (391576)

The encryption for administrator passwords is upgraded from SHA1 to SHA256.

Downgrades from FortiOS 5.6->5.4->5.2->5.0 will keep the administrator password usable. If you need to downgrade to FortiOS 4.3, remove the password before the downgrade, then login after the downgrade and re-set password.

Allow multiple FortiManager addresses when configuring central management (388083)

Central management configuration can now support multiple FortiManager addresses. This feature is mainly to help the case where the FortiGate unit is behind NAT.

FortiGuard can determine a FortiGate's location from its public IP address (393972)

A new CLI command allows users to determine a FortiGate's location from its public IP address through FortiGuard.

The new CLI command is `diagnose sys waninfo`.

Deletion of multiple saved configurations supported (308936)

The FortiGate will save multiple configurations and images when `revision-backup-on-logout` and `revision-image-auto-backup` are enabled in `config system global`.

The deletion of multiple saved configurations is now possible due to changes in the CLI command `execute revision delete config <revision ID>`. Where the command only allowed for one revision ID at a time, it now allows almost ten.

New CLI option to limit script output size (388221)

The new CLI command `set output-size` limits the size of an auto script in megabytes and prevents the memory from being used up by the script's output.

CLI Syntax

```
config system auto-script
  edit <script name>
    set output-size <integer>
  next
end
```

Enter an integer value from 10 to 1024. Default is 10.

Enable / disable logging of SSL connection events (375582)

New CLI commands are added to give the user the option to enable or disable logging of SSL connection events.

CLI Syntax

```
config system global
  set log-ssl-connection {enable | disable}
end
```

Default is `disable`.

Enabling or disabling static key ciphers (379616)

There is a new option in `system global` to enable or disable static key ciphers in SSL/TLS connections (e.g., AES128-SHA, AES256-SHA, AES128-SHA256, AES256-SHA256). The default is `enable`.

CLI Syntax

```
config system global
  set ssl-static-key-ciphers {enable | disable}
end
```

Enhancements to IPS Signatures page (285543)

The IPS signatures list page now shows which IPS package is currently deployed. You can also change the IPS package by hovering over the information icon next to the IPS package name. Text appears that links directly to the FortiGate's **System > FortiGuard** page from the IPS Signatures list page.

Combine multiple commands into a CLI alias (308921)

You can add one or more CLI command to a CLI alias, then use the `alias` command to run the alias that you have created to execute the stored commands. For example, create the following `alias` to run the `get system status` command:

```
config system alias
  edit "version"
    set command "get system status"
  end
```

Then you can use the following command to run the alias:

```
alias version
```

You can use command abbreviations (for example: `g sys stat` instead of `get system status`). Use quotes around the syntax if there are spaces (there usually are).

You can enter `alias` followed by a `?` to view the aliases that you have added.

You can add multiple commands to an alias by pressing **Ctrl-Enter** after the first line. Press enter at the end of subsequent lines. And the end of the last line add second quote and press Enter to end the command.

```
config system alias
  edit "debug_flow"
    set command "diag debug enable"
    diag debug flow show console enable"
  end
```

You can include config commands in an alias as well, for example, create the following alias to bring the port1 and port2 interfaces down:

```
config system alias
  edit port12down
    set command "config system interface
    edit port1
    set status down
    next
    edit port2
    set status down
    end"
  end
```

You can combine `config`, `execute`, `get`, and `diagnose` commands in the same alias, for example:

```
config system alias
  edit "show-info"
    set command "show full-configuration alertemail setting
    get sys status
    dia sys top"
  end
```

Traffic shaping (5.6.3)

Support schedule on traffic shaping policy (450337)

In FortiOS 5.6, a new traffic "shaping-policy" feature was added, but it lacked the ability to apply different shaping profiles at different times. This feature addresses this issue by adding a "schedule" attribute to the shaping policy.

This feature is currently only available via the CLI, and you can use this feature to apply a reoccurring schedule to your traffic shaping policies. The default recurring schedule options available are **always** or **none**. You can also create new schedules or schedule groups under **Policy & Objects > Schedules**. This allows you to create custom recurring or one-time schedules that can then be applied to your traffic shaping policies using the commands below.

Syntax

```
config firewall shaping-policy
  edit <shaping policy ID>
    set schedule {always | none}
  end
```

VDOMs (5.6.0)

This section describes new VDOM features added to FortiOS 5.6

Dashboard changes

The option to enable VDOMs is no longer part of the **System Information** widget. To enable VDOMs, you must now go to **System > Settings**.

Firewall Service Cache improvement

The Firewall Service Cache will now have separate caches for each VDOM, to improve the speed of cache searches.

VoIP/SIP (5.6)

This chapter describes new VoIP and SIP features added to FortiOS 5.6.

SIP strict-register enabled by default in VoIP Profiles (380830)

If `strict-register` is disabled, when REGISTER is received by a FortiGate, the source address (usually the IP address of PBX) and ports (usually port 5060) are translated by NAT to the external address of the FortiGate and port 65476. Pinholes are then opened for SIP and RTP. This tells the SIP provider to send incoming SIP traffic to the external address of the FortiGate on port 65476.

This creates a security hole since the port is open regardless of the source IP address so an attacker who scans all the ports by sending REGISTER messages to the external IP of the FortiGate will eventually have one register go through.

When `strict-register` is enabled (the new default) the pinhole is smaller because it will only accept packets from the SIP server.

Enabling `strict-register` can cause problems when the SIP registrar and SIP proxy server are separate entities with separate IP addresses.

SIP diagnose command improvements (376853)

A diagnose command has been added to the CLI that outputs VDOM data located in the voipd daemon.

```
diagnose sys sip-proxy vdom
```

Example

```
(global) # diagnose sys sip-proxy vdom
VDOM list by id:
vdom 0 root (Kernel: root)
vdom 1 dmngmt-vdom (Kernel: dmngmt-vdom)
vdom 2 test2 (Kernel: test2)
vdom 3 test3 (Kernel: test3)
vdom 4 vdoma2 (Kernel: vdoma2)
vdom 5 vdomb2 (Kernel: vdomb2)
vdom 6 vdomc2 (Kernel: vdomc2)
vdom 7 vdoma (Kernel: vdoma)
vdom 8 vdomb (Kernel: vdomb)
vdom 9 vdomc (Kernel: vdomc)
```

```
VDOM list by name:
vdom 1 dmngmt-vdom (Kernel: dmngmt-vdom)
vdom 0 root (Kernel: root)
vdom 2 test2 (Kernel: test2)
vdom 3 test3 (Kernel: test3)
vdom 7 vdoma (Kernel: vdoma)
vdom 4 vdoma2 (Kernel: vdoma2)
vdom 8 vdomb (Kernel: vdomb)
vdom 5 vdomb2 (Kernel: vdomb2)
vdom 9 vdomc (Kernel: vdomc)
vdom 6 vdomc2 (Kernel: vdomc2)
```

WiFi (5.6.3)

New WiFi features added to FortiOS 5.6.3.

Allow admin with write permission to see plain text WiFi password (249787, 434513, 452834, 458211, 458285)

Add support for admins with write permission to read plain text password. Admins can view these plain text passwords (captive-portal-radius-secret and passphrase) under `config wireless-controller vap`. Note that security must be set as a WPA-personal setting.

WiFi Health Monitor page updates (392574, 392585, 404341, 417039, 434141, 440709)

The **WiFi Health Monitor** page list of active clients now shows their MAC address entries (similar to the **WiFi Client Monitor** page), making client information easier to view when opening the **Active Client** widget.

FortiAP LED Schedules (436227)

Support has been added for WTP profile LED schedules.

Use the command below (`led-schedule`) to assign recurring firewall schedules for illuminating LEDs on the FortiAP. This entry is only available when `led-state` is enabled, at which point LEDs will be visible when at least one of the schedules is valid.

Separate multiple schedule names with a space, as configured under `config firewall schedule group` and `config firewall schedule recurring`.

Syntax

```
config wireless-controller wtp-profile
  edit {name}
    set led-state {enable | disable}
    set led-schedules <name>
  next
end
```

Sharing Tunnel SSIDs within a single managed AP between VDOMs as a Virtual AP for multi-tenancy (439751)

Support has been added for the ability to move a tunnel mode VAP into a VDOM, similar to an interface/VLAN in VDOMs.

FortiAP is registered into the root VDOM. Within a customer VDOM, customer VAPs can be created/added. In the root VDOM, the customer VAP can be added to the registered FortiAP. Any necessary firewall rules and interfaces can be configured between the two VDOMs.

Syntax

```
config wireless-controller global
  set wtp-share {enable | disable}
end
```

30D/30E models support two normal-mode FAPs (446122)

Fixed an issue that blocked FortiGate 30D and 30E models from supporting two normal-mode FortiAPs.

MAC Bypass for Captive Portal (448296)

Support has been added to provide a MAC address bypass for authenticated clients. Previously, when clients were authenticated with bridged SSID and their MAC addresses were known, they were not redirected to the External Captive Portal.

A new portal type has been added, under `config wireless-controller vap`, to provide successful MAC authentication Captive Portal functionality.

Syntax

```
config wireless-controller vap
  edit {name}
    set portal-type {cmcc-macauth}
  next
end
```

WiFi Health Monitor fixes (449341)

An issue has been addressed where the **Client Count** widget (under **WiFi Health Monitor**) showed wrong options for the timeline selection.

The fixes include:

- Fixed timeline selection options to correct values.
- Updated time filter parameters with correct arguments in the **Login Failures** widget.
- Added local radio to **AP Status** widget details.
- Fixed **Login Failures** widget, where the SSID name was improperly formatted if it contained HTML characters.

Various bug fixes (452975, 455218, 453161, 405117, 453533, 453535, 184384)

Various fixes have been implemented to address a variety of issues:

The fixes include:

- Removed code to avoid repeated printing "parse dhcp options" after upgrade or reboot.
- Removed code that supported FAP-C221E, C226E, and C21D, as their product names changed.
- Changed the text for incorrect WiFi CLI help descriptions.
- Fixed background scan settings for FAP 222C, 223C, 321C, C220C, C225C, C23JD, and C24JE.
- Set WTP entry with "discovered" state to built-in in order to skip them, as only managed FAPs can be counted toward FAP capacity.

Configure how a FortiWiFi WiFi interface in client mode selects a WiFi band (455305)

For an FortiWiFi WiFi interface operating in client mode, you can use the following option to configure the WiFi band that the interface can connect to. You can configure the interface to connect to any band, just to the 5G band or to prefer connecting to the 5G band.

Syntax

```
config system interface
  edit {name}
    set wifi-ap-band {any | 5g-preferred | 5g-only}
  next
end
```

WiFi (5.6.1)

New WiFi features added to FortiOS 5.6.1.

Support for various FortiAP models (416177) (435638) (424483)

FortiAP units FAP-U321EV, FAP-U323EV, FAP-S221E, FAP-S223E, FAP-222E, FAP-221E, and FAP-223E are supported by FortiOS 5.6.1.

As part of this support, new CLI attributes have been added under `config wireless-controller wtp-profile` to manage their profiles.

CLI syntax

```
config wireless-controller wtp-profile
  edit <model>
    config platform
      set type <model>
    end
    set ap-country <code>
    config radio-1
      set band 802.11n
    end
    config radio-2
      set band 802.11ac
    end
  next
end
```

New Managed AP Groups and Dynamic VLAN Assignment (436267)

The FortiGate can create FortiAP Groups, under **WiFi & Switch Controller > Managed Devices > Managed FortiAPs** by selecting **Create New > Managed AP Group**, where multiple APs can be managed. AP grouping allows specific profile settings to be applied to many APs all at once that belong to a certain AP group, simplifying the administrative workload.

Note that each AP can only belong to one group.

In addition, VLANs can be assigned dynamically based on the group which an AP belongs. When defining an SSID, under **WiFi & Switch Controller > SSID**, a setting called **VLAN Pooling** can be enabled where you can either assign the VLAN ID of the AP group the device is connected to, to each device as it is detected, or to always assign the same VLAN ID to a specific device. Dynamic VLAN assignment allows the same SSID to be deployed to many APs, avoiding the need to produce multiple SSIDs.

GUI support for configuring multiple pre-shared keys for SSID interfaces (406321)

Multiple pre-shared keys can be created per SSID. When creating a new SSID, enable **Multiple Pre-shared Keys** under **WiFi Settings**.

FortiAP Bluetooth Low Energy (BLE) Scan (438274)

The FortiGate can configure FortiAP Bluetooth Low Energy (BLE) scan, incorporating Google's BLE beacon profile known as Eddystone, used to identify groups of devices and individual devices.

Currently, only the FAP-S221E, FAP-S223E, and FAP-222E models support this feature.

As part of this support, new CLI attributes have been added under `config wireless-controller timers` and `config wireless-controller wtp-profile`, including a new CLI command, `config wireless-controller ble-profile`.

CLI syntax - Configure BLE profiles

```
config wireless-controller ble-profile
  edit <name>
    set comment <comment>
    set advertising {ibeacon | eddystone-uid | eddystone-url}
    set ibeacon-uuid <uuid>
    set major-id <0 - 65535> - (default = 1000)
    set minor-id <0 - 65535> - (default = 1000)
    set eddystone-namespace <10-byte namespace>
    set eddystone-instance <device id>
    set eddystone-url <url>
    set txpower <0 - 12> - (default = 0)
    set beacon-interval <40 - 3500> - (default = 100)
    set ble-scanning {enable | disable} - (default = disable)
  next
end
```

Note that `txpower` determines the transmit power level on a scale of 0-12:

0: -21 dBm	1: -18 dBm	2: -15 dBm	3: -12 dBm	4: -9 dBm
5: -6 dBm	6: -3 dBm	7: 0 dBm	8: 1 dBm	9: 2 dBm
10: 3 dBm	11: 4 dBm	12: 5 dBm		

CLI syntax - Configure BLE report intervals

```
config wireless-controller timers
  set ble-scan-report-intv - (default = 30 sec)
end
```

CLI syntax - Assign BLE profiles to WTP profiles

```
config wireless-controller wtp-profile
```

```

edit <name>
    set ble-profile <name>
next
end

```

WiFi client monitor page search enhanced (440709)

WiFi Client Monitor page (**Monitor > WiFi Client Monitor**) now supports search function.

WiFi (5.6)

New WiFi features added to FortiOS 5.6.

Captive Portal Authentication with FortiAP in Bridge Mode (408915)

The FortiGate can operate as a web captive portal server to serve the captive portal local bridge mode.

A new CLI command has been added under `config wireless-controller vap` to set the captive portal type to CMCC, a wireless cipher.

CLI syntax

```

config wireless-controller vap
edit <name>
    set portal-type { ... | cmcc }
next
end

```

802.11kv(r) support (405498, 395037)

New CLI commands have been added under `config wireless-controller vap` to set various 802.11kv settings, or Voice Enterprise (802.11kv) and Fast Basic Service Set (BSS) Transition (802.11r), to provide faster and more intelligent roaming for the client.

CLI syntax

```

config wireless-controller vap
edit <name>
    set voice-enterprise {enable | disable}
    set fast-bss-transition {enable | disable}
    set ft-mobility-domain
    set ft-r0-key-lifetime [1-65535]
    set ft-over-ds {enable | disable}
next
end

```

External Captive Portal authentication with FortiAP in Bridge Mode (403115, 384872)

New CLI commands have been added under `config wireless-controller vap` to set various options for external captive portal with FortiAP in Bridge Mode. The commands set the standalone captive portal server category, the server's domain name or IP address, secret key to access the RADIUS server, and the standalone captive portal Access Controller (AC) name.

Note that these commands are only available when **local-standalone** is set to **enable** and **security** is set to **captive-portal**.

CLI syntax

```
config wireless-controller vap
  edit <name>
    set captive-portal-category {FortiCloud | CMCC} Default is FortiCloud.
    set captive-portal-radius-server <server>
    set captive-portal-radius-secret <password>
    set captive-portal-ac-name <name>
  next
end
```

Japan DFS support for FAP-421E/423E/S421E/S423E (402287, 401434)

Korea and Japan Dynamic Frequency Selection (DFS) certification has been added for FAP-421E/423E/S421E/S423E. DFS is a mechanism that allows WLANs to select a frequency that does not interfere with certain radar systems while operating in the 5 GHz band.

802.3az support on WAVE2 WiFi APs (400558)

A new CLI command has been added under `config wireless-controller wtp-profile` to enable or disable use of Energy-Efficient Ethernet (EEE) on WTP, allowing for less power consumption during periods of low data activity.

CLI syntax

```
config wireless-controller wtp-profile
  edit <profile-name>
    set energy-efficient-ethernet {enable|disable}
  end
```

CLI command update made in wids-profile (400263)

The CLI command `rogue-scan` under `config wireless-controller wids-profile` has been changed to `sensor-mode` and allows easier configuration of radio sensor mode. Note that while `foreign` enables radio sensor mode on foreign channels only, `both` enables the feature on foreign and home channels.

CLI syntax

```
config wireless-controller wids-profile
  edit <example>
    set sensor-mode {disable|foreign|both}
  end
```

Channel utilization, FortiPresence support on AP mode, QoS enhancement for voice (399134, 377562)

A new CLI command has been added, `config wireless-controller qos-profile`, to configure quality of service (QoS) profiles where you can add WiFi multi-media (WMM) control and Differentiated Services Code Point (DSCP) mapping.

Note that:

- `call-capacity` and `bandwidth-admission-control` are only available when `call-admission-control` is set to enable.

- bandwidth-capacity is only available when bandwidth-admission-control is set to enable.
- All DSCP mapping options are only available when dscp-wmm-mapping is set to enable.
- wmm is already set to enable by default. If wmm is set to disable, the following entries are *not* available: wmm-uapsd, call-admission-control, and dscp-wmm-mapping.

CLI syntax

```
config wireless-controller qos-profile
edit <example>
    set comment <comment>
    set uplink [0-2097152] Default is 0 Kbps.
    set downlink [0-2097152] Default is 0 Kbps.
    set uplink-sta [0-2097152] Default is 0 Kbps.
    set downlink-sta [0-2097152] Default is 0 Kbps.
    set burst {enable|disable} Default is disable.
    set wmm {enable|disable} Default is enable.
    set wmm-uapsd {enable|disable} Default is enable.
    set call-admission-control {enable|disable} Default is disable.
    set call-capacity [0-60] Default is 10 phones.
    set bandwidth-admission-control {enable|disable} Default is disable.
    set bandwidth-capacity [1-600000] Default is 2000 Kbps.
    set dscp-wmm-mapping {enable|disable} Default is disable.
    set dscp-wmm-vo [0-63] Default is 48 56.
    set dscp-wmm-vi [0-63] Default is 32 40.
    set dscp-wmm-be [0-63] Default is 0 24.
    set dscp-wmm-bk [0-63] Default is 8 16.
```

QoS profiles can be assigned under the `config wireless-controller vap` command using `qos-profile`.

FortiCloud managed APs can now be applied a bandwidth restriction or rate limitation based on SSID. For instance if guest and employee SSIDs are available, you can rate limit guest access to a certain rate to accommodate for employees. This feature also applies a rate limit based on the application in use, as APs are application aware.

FAP-U421E and FAP-U423E support (397900)

Two Universal FortiAP models support FortiOS 5.6. Their default profiles are added under `config wireless-controller wtp-profiles`, as shown below:

CLI syntax

```
config wireless-controller wtp-profile
edit "FAPU421E-default"
    config platform
        set type U421E
    end
    set ap-country US
    config radio-1
        set band 802.11n
    end
    config radio-2
        set band 802.11ac
    end
next
end
```

```

config wireless-controller wtp-profile
  edit "FAPU423E-default"
    config platform
      set type U423E
    end
    set ap-country US
    config radio-1
      set band 802.11n
    end
    config radio-2
      set band 802.11ac
    end
  next
end

```

Minor reorganization of WiFi GUI entries (396497)

WiFi & Switch Controller GUI entries **Managed FortiAPs**, **SSID**, **FortiAP Profiles**, and **WIDS Profiles** have been reorganized.

Multiple PSK support for WPA personal (393320, 264744)

New CLI commands have been added, under `config wireless-controller vap`, to configure multiple WiFi Protected Access Pre-Shared Keys (WPA-PSKs), as PSK is more secure without all devices having to share the same PSK.

Note that, for the following multiple PSK related commands to become available, `vdom`, `ssid`, and `passphrase` all have to be set first.

CLI syntax

```

config wireless-controller vap
  edit <example>
    set mpsk {enable|disable}
    set mpsk-concurrent-clients [0-65535] Default is 0.
    config mpsk-key
      edit key-name <example>
        set passphrase <wpa-psk>
        set concurrent-clients [0-65535] Default is empty.
        set comment <comments>
      next
    end
  next
end

```

Use the `mps-k-concurrent-clients` entry to set the maximum number of concurrent connected clients for each `mps-k` entry. Use the `mps-k-key` configuration method to configure multiple `mps-k` entries.

Table size of qos-profile has VDOM limit (388070)

The command `config wireless-controller qos-profile` now has VDOM table limit; there is no longer an unlimited number of entries within each VDOM.

Add "dhcp-lease-time" setting to local-standalone-nat VAP (384229)

When a Virtual Access Point (VAP) has been configured for a FortiAP, a DHCP server is automatically configured on the FortiAP side with a hard lease time. A new CLI command under `config wireless-controller vap` has been added to customize the DHCP lease time for NAT IP address. This is to solve issues where the DHCP IP pool was exhausted when the number of clients grew too large for the lease time span.

Note that the new command, `dhcp-lease-time`, is only available when `local-standalone` is set to `enable`, then setting `local-standalone-nat` to `enable`.

CLI syntax

```
config wireless-controller vap
  edit <example>
    set local-standalone {enable|disable}
    set local-standalone-nat {enable|disable}
    set dhcp-lease-time [300-8640000] Default is 2400 seconds.
  end
```

New CLI command to configure LDPC for FortiAP (383864)

Previously, LDPC value on FortiAP could only be changed on FortiAP local CLI. Syntax has been added in FortiOS CLI under the 'wireless-controller.vap' entry to configure the LDPC value on FortiAP.

CLI Syntax

```
configure wireless-controller vap
  edit 1
    set ldpc [enable|rx|tx|disable]
  end
```

New region code/SKU for Indonesia (382926)

A new country region code, F, has been added to meet Indonesia's WiFi channel requirements. Indonesia previously belonged to region code W.

FortiAP RMA support added (381936)

New CLI command `fortiap` added under `exe replace-device` to replace an old FortiAP's serial number with a new one.

CLI Syntax

```
execute replace-device fortiap <old-fortiap-id> <new-fortiap-id>
```

Support fixed-length 64-hex digit for WPA-Personal passphrase (381030)

WPA-Personal passphrase now supports a fixed-length of 64 hexadecimal digits.

Allow FortiGates to manage cloud-based FortiAPs (380150)

FortiGates can now manage cloud-based FortiAPs using the new `fapc-compatibility` command under `wireless-controller` setting.

If enabled, default FAP-C wtp-profiles will be added. If disabled, FAP-C related CMDDB configurations will be removed: wtp-group in vap's vlan-pool, wtp-group, ws, wtp, wtp-profile.

CLI syntax

```
config wireless-controller setting
  set country CN
  set fapc-compatibility [enable|disable]
end
```

You will receive an error message when trying to change `country` while `fapc-compatibility` is enabled. You need to disable `fapc-compatibility` before changing to an FAPC unsupported country.

Use IPsec instead of DTLS to protect CAPWAP tunnels (379502)

This feature is to utilize FortiAP hardware to improve the throughput of tunneled data traffic by using IPsec when data security is enabled.

"AES-256-CBC & SHA256" algorithm and "dh_group 15" are used for both CAPWAP IPsec phase1 and phase 2.

FAP320B will not support this feature due to its limited capacity of free flash.

New option added to support only one IP per one endpoint association (378207)

When users change configuration, the radiusd will reset all configurations and refresh all logons in the kernel. All these actions are done in the one loop. A CLI option has been added to enable/disable replacement of an old IP address with a new IP address for the same endpoint on RADIUS accounting start.

CLI Syntax

```
configure user radius
  edit radius-root
    set rsso-ep-one-ip-only [enable|disable]
  next
end
```

FAP-222C-K DFS support (377795)

Dynamic Frequency Selection (DFS) bands can now be configured for FortiAP 222C-K.

Note that this FortiAP model has the Korean region code (K), but `ap-country` under `config wireless-controller wtp-profile` still needs to be set to KR.

CLI syntax

```
config wireless-controller wtp-profile
  edit <K-FAP222C>
    config platform
      set type <222C>
    end
    set ap-country KR
    config radio-2
      set band <802.11ac>
      set vap-all <disable>
```

```

        set vaps "vap-vd-07"
        set channel "52" "56" "60" "64" "100" "104" "108" "112" "116" "120" "124" "128"
            "132" "136" "140"
    end
next
end

```

Dynamic VLAN support in standalone mode (377298)

Dynamic VLAN is now supported in standalone mode. Previously, dynamic VLAN only worked in local bridge mode.

CLI-only features added to GUI (376891)

Previously CLI-only features have been added to the GUI under **FortiAP Profiles**, **Managed FortiAPs**, and **SSID**. Also fixed issue where the correct value is displayed when viewing the **WIDS Profile** notification icon under **FortiAP Profiles**.

Managed AP GUI update (375376)

Upgraded Managed FortiAPs dialog page to a newer style, including icons for SSID and LAN port.

Bonjour gateway support (373659)

Bonjour gateway now supported for WiFi networks.

Syntax

```

config wireless-controller bonjour-profile
  edit 0
    set comment "comment"
    config policy-list
      edit 1
        set description "description"
        set from-vlan [0-4094] Default is 0 .
        set to-vlan [0-4094|all] Default is all .
        set services [all|airplay|afp|bit-
          torrent|ftp|ichat|itunes|printers|samba|scanners|ssh|chromecast]
      next
    end
  next
end

```

FAP421E/423E wave2 support (371374)

Previously removed wave2 FAP421E and FAP423E models have been reinstated and are now supported again. The models are available again through the CLI and GUI. These models are listed under the **Platform** dropdown menu when creating a new FortiAP Profile under **WiFi & Switch Controller > FortiAP Profiles**.

CLI syntax

```

config wireless-controller wtp-profile
  edit <example>
    config platform
      set type <...|421E|423E>
    end
  end
end

```

WiFi Health Monitor GUI changes (308317)

The Wifi Health Monitor page has been improved, including the following changes:

- Flowchart used for diagrams
- Chart used for interference and AP clients
- Removed spectrum analysis
- Added functionality to upgrade FortiAP firmware
- Added option to view both 2.4GHz and 5GHz data simultaneously

AP Profile GUI page updates (298266)

The AP Profile GUI page has been upgraded to a new style including AngularJS code.

1+1 Wireless Controller HA (294656)

Instances of failover between FortiAP units was too long and lead to extended periods of time where WiFi users were without network connection. Because WiFi is considered a primary network connection in today's verticals (including enterprise, retail, education, warehousing, healthcare, government, and more), it is necessary for successful failover to occur as fast as possible.

You can now define the role of the primary and secondary controllers on the FortiAP unit, allowing the unit to decide the order in which the FortiAP selects the FortiGate. This process was previously decided on load-based detection, but can now be defined by each unit's pre-determined priority. In addition, heartbeat intervals have been lowered to further improve FortiAP awareness and successful failover.

Syntax

```
config wireless-controller inter-controller
  set inter-controller-mode {disable | l2-roaming | 1+1} Default is disable.
  set inter-controller-key <password>
  set inter-controller-pri {primary | secondary} Default is primary.
  set fast-failover-max [3-64] Default is 10.
  set fast-failover-wait [10-86400] Default is 10.
  config inter-controller-peer
    edit <name>
      set peer-ip <ip-address>
      set peer-port [1024-49150] Default is 5246.
      set peer-priority {primary | secondary} Default is primary.
    next
  end
end
```

Support for duplicate SSID names on tunnel and bridge mode interfaces (278955)

When `duplicate-ssid` is enabled in the CLI, this feature allows VAPs to use the same SSID name in the same VDOM. When disabled, all SSIDs in WLAN interface will be checked—if duplicate SSIDs exist, an error message will be displayed. When `duplicate-ssid` is enabled in the CLI, duplicate SSID check is removed in "Edit SSID" GUI page.

Syntax

```
config wireless-controller setting
  set duplicate-ssid [enable|disable]
```

```
next  
end
```

Controlled failover between wireless controllers (249515)

Instances of failover between FortiAP units was too long and lead to extended periods of time where WiFi users were without network connection. Because WiFi is considered a primary network connection in today's verticals (including enterprise, retail, education, warehousing, healthcare, government, and more), it is necessary for successful failover to occur as fast as possible.

Administrators can now define the role of the primary and secondary controllers on the FortiAP unit, allowing the unit to decide the order in which the FortiAP selects the FortiGate. This process was decided on load-based detection, but can now be defined by each unit's pre-determined priority. In addition, heartbeat intervals have been lowered to further improve FortiAP awareness and successful failover.

Chapter 2 - Getting Started

Getting started

This guide explains how to get started with a FortiGate, and examines basic configuration tasks and best practices in these sections:

- [Installation](#) discusses installing a FortiGate in your network.
- [Using the GUI](#) highlights features of the graphical user interface (GUI).
- [Using the CLI](#) provides a high level overview of the command line interface (CLI) for FortiOS.
- [FortiExplorer for iOS](#) provides instructions for connecting to a FortiGate using the FortiExplorer for iOS app.
- [FortiGate Inspection Mode](#) summarizes proxy-based and flow-based inspection modes.
- [FortiGate LED Specifications](#) presents a short guide to LED status indicators.
- [Basic Administration](#) explains basic tasks for setting up a new FortiGate and for updating firmware.
- [Resources](#) provides a list of documents to help you with more advanced FortiGate configurations.

Differences between Models

Before you get started, note that not all FortiGate models have the same features. This is especially true of the desktop or entry-level models: FortiGate / FortiWiFi models 30 to 90. If you are using one of these FortiGate models, you may have some difficulties accessing certain features.

Preliminary information on [entry-level models](#) is available below:

The entry-level, or desktop, models can connect to the internet in two simple steps. They also have a number of features that are only available using the CLI, rather than appearing in the GUI.

- [Quick installation using DHCP](#)
- [CLI-only features](#)

Consult your model's Quick Start Guide, [hardware manual](#), or the [Feature / Platform Matrix](#) for further information about features that vary by model.

Fortinet's Cookbook site has a section on [hardware](#) that provides how-to recipes and articles on features that are unique to certain models.

FortiGate models differ principally by the names used and the features available:

- Naming conventions may vary between FortiGate models. For example, on some models the hardware switch interface used for the local area network is called **lan**, while on other units it is called **internal**.
- Certain features are not available on all models. Additionally, a particular feature may be available only through the CLI on some models, while that same feature may be viewed in the GUI on other models.

If you believe your FortiGate model supports a feature that does not appear in the GUI, go to **System > Feature Visibility** and confirm that the feature is enabled. For more information, see [Feature Visibility on page 300](#).

What's New in FortiOS 5.6

This chapter describes new features added to FortiOS 5.6.0, 5.6.1, and 5.6.3.

FortiOS 5.6.3

These features first appeared in FortiOS 5.6.3.

Administrator password changes (414927)

The existing Change Password dialog that appears in the GUI is updated to reflect the new look of the password change prompt at login.

- Added inline validation for checking password policy and password reuse
- Changed style to match new login prompt password change
- Fixed issue where fDialog would close slide out on submission failure

Support FortiOS to allow user to select domain when logging a FG into FortiCloud (452350)

Support has been added to show a list of all possible FortiCloud domains that the FortiGate can be served by.

Syntax

```
execute fortiguard-log domain
```

This command is typically used for testing purposes, and so it will not appear when entering `execute fortiguard-log ?`.

FortiOS 5.6.1

These features first appeared in FortiOS 5.6.1.

VM License visibility improvement (423347)

VM License GUI items have changed as follows:

- Added VM widget to **Global > Dashboard**. Includes the following:
 - License status and type.
 - CPU allocation usage.
 - License RAM usage.
 - VMX license information (if the VM supports VMX).
 - If the VM license specifies 'unlimited' the progress bar is blank.
 - If the VM is in evaluation mode, it is yellow (warning style) and the dashboard show evaluation days used.
- Widget is shown by default in the dashboard of a FortiOS VM device.
- Removed VM information from License widget at **Global > Dashboard**.
- License info and **Upload License** button provided on page **Global > System > FortiGuard**.
- Updated 'Upload VM License' page:

- Added license RAM usage and VMX instance usage.
- Replaced file input component.

CLI Syntax

```
config sys admin
  edit <name>
    config gui-dashboard
      edit <1>
        set name <name>
        config widget
          edit <2>
            set type {vminfo | ...} <- new option
            set x-pos <2>
            set y-pos <1>
            set width <1>
            set height <1>
          next
        end
      next
    end
  next
end
```

FortiView Dashboard Widget (434179)

Added a new widget type to the dashboard for top level FortiView. FortiView widgets have report-by, sort-by, visualization, timeframe properties, and filters subtable in the CLI.

Supported FortiViews include Source, Destination, Application, Country, Interfaces, Policy, Wifi Client, Traffic Shaper, Endpoint Vulnerability, Cloud User, Threats, VPN, Websites, and Admin and System Events.

Bubble, table, chord chart, and country visualizations are supported in the widget.

Widgets can be saved from a filtered FortiView page on to a dashboard.

Syntax

```
config system admin
  config gui-dashboard
    config widget
      set type fortiview
      set report-by {source | destination | country | intfpair | srcintf | dstintf |
        policy | wificlient | shaper | endpoint | application | cloud | web | threat
        | system | unauth | admin | vpn}
      set timeframe {realtime | 5min | hour | day | week}
      set sort-by <string>
      set visualization {table | bubble | country | chord}
      config filters
        set key <filter_key>
        set value <filter_value>
      end
    end
  end
end
end
```

Where:

- `report-by` = Field to aggregate the data by.
- `timeframe` = Timeframe period of reported data.
- `sort-by` = Field to sort the data by.
- `visualization` = Visualization to use.

Controls added to GUI CLI console (422623)

FortiOS 5.6.1 introduces new options in the browser CLI console to export the console history. Options are now available to **Clear console**, **Download**, and **Copy to clipboard**.

FortiExplorer icon enhancement (423838)

FortiOS icons and colors are now exportable in the GUI shared project and FortiExplorer now uses these icons and colors. This change improves the icon colors only for the FortiExplorer GUI theme (seen only when accessing a web GUI page from within the FortiExplorer iOS app).

The following locations were affected: Policy List, Policy Dialogue, Address List, Address Dialogue, Virtual IP list, Virtual IP Dialogue.

FortiOS 5.6

These features first appeared in FortiOS 5.6.

The FortiOS 5.6 **Dashboard** has a new layout with a Network Operations Center (NOC) view with a focus on alerts. Widgets are interactive; by clicking or hovering over most widgets, the user can get additional information or follow links to other pages.

Enhancements to the GUI dashboard and its widgets are:

- Multiple dashboard support.
- VDOM and global dashboards.
- Updated resize control for widgets.
- Notifications moved to the top header bar (moved existing dashboard notifications to the header and added additional ones).
- Reorganization of **Add Widget** dialog.
- New **Host Scan Summary** widget.
- New **Vulnerabilities Summary** widget that displays endpoint vulnerability information much like the FortiClient Enterprise Management Server (EMS) summary.
- Multiple bug fixes.

Features that were only visible through old dashboard widgets have been placed elsewhere in the GUI:

- Restore configuration.
- Configuration revisions.
- Firmware management.
- Enabling / disabling VDOMs.
- Changing inspection mode.
- Changing operation mode.
- Shutdown / restart device.
- Changing hostname.
- Changing system time.

The following **widgets** are displayed by default:

- [System Information](#)
- [Licenses](#)
- [FortiCloud](#)
- [Security Fabric](#)
- [Administrators](#)
- [CPU](#)
- [Memory](#)
- [Sessions](#)
- [Bandwidth](#)
- [Virtual Machine](#) (on VMs and new to FortiOS 5.6.1)

The following **optional** widgets are available:

- [Interface Bandwidth](#)
- [Disk Usage](#)

- Security Fabric Risk
- Advanced Threat Protection Statistics
- Log Rate
- Session Rate
- Sensor Information
- HA Status
- Host Scan Summary
- Vulnerabilities Summary
- FortiView (new to FortiOS 5.6.1)

The following widgets have been **removed**:

- CLI Console
- Unit Operation
- Alert Message Console

System Information

System Information	
Hostname	FG100D3G15818864
Serial Number	FG100D3G15818864
Firmware	v5.6.0 build1435
Mode	NAT (Proxy-based)
System Time	2017/03/22 14:05:04
Uptime	00:00:31:34
WAN IP	209.87.240.98 (🇨🇦 Kanata, Ontario, Canada)

Only appears when you click on the widget. Click on the System page you want to go to.

FortiGuard WAN IP blacklist service is now online

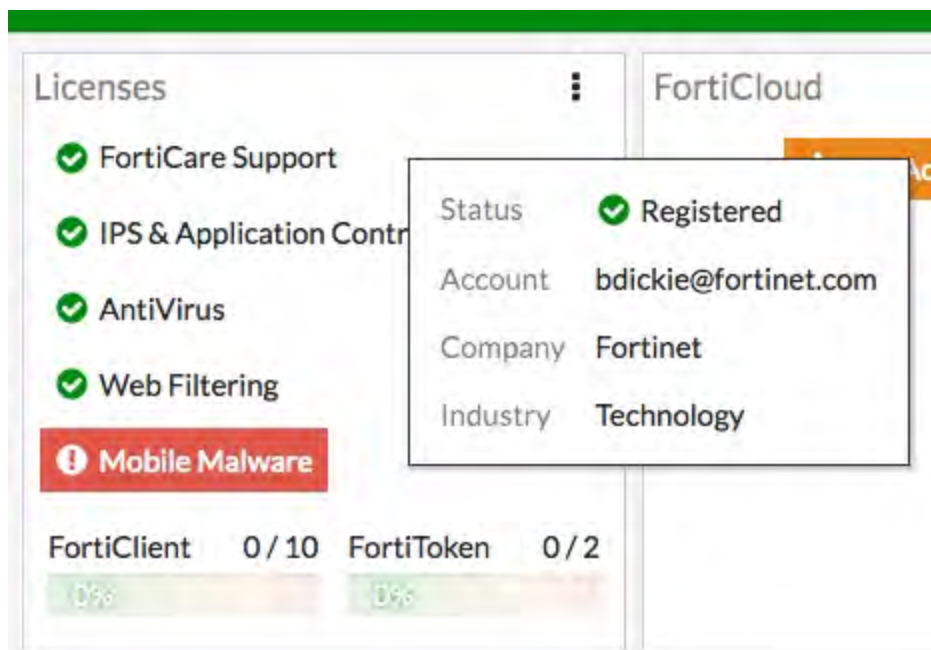

The FortiGuard WAN IP blacklist service was not online in FortiOS 5.6.0. In FortiOS 5.6.1, a notification appears on the **Dashboard** when WAN IP is blacklisted. Clicking on the notification (bell icon) brings up the blacklist details.

Licenses

Hovering over the **Licenses** widget will cause status information (and, where applicable, database information) on the licenses to be displayed for **FortiCare Support**, **IPS & Application Control**, **AntiVirus**, **Web Filtering**, **Mobile Malware**, and **FortiClient**. The image below shows **FortiCare Support** information along with the registrant's company name and industry.

Clicking in the **Licenses** widget will provide you with links to other pages, such as **System > FortiGuard** or contract renewal pages.

FortiCloud

This widget displays FortiCloud status and provides a link to activate FortiCloud.

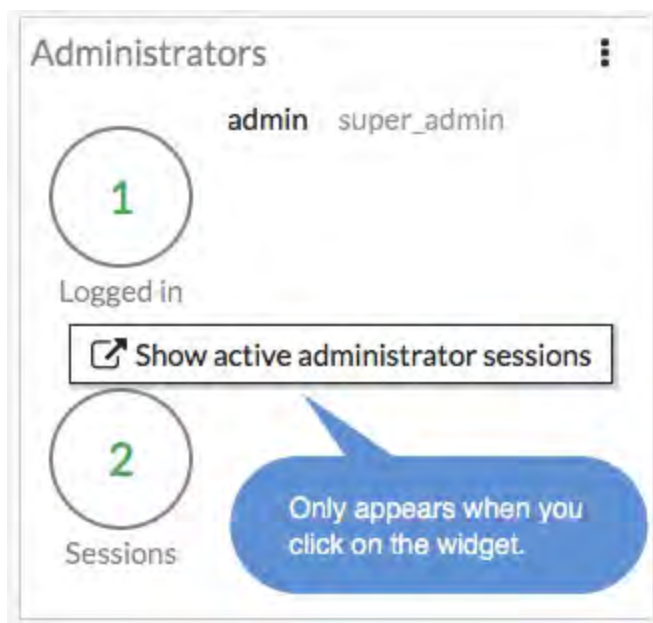

Fortinet Security Fabric

The **Security Fabric** widget is documented in the [Security Fabric](#) section of the **What's New** document.

Administrators

This widget allows you to view which administrators are logged in and how many sessions are active. The link directs you to a page displaying active administrator sessions.

CPU

The real-time CPU usage is displayed for different timeframes.

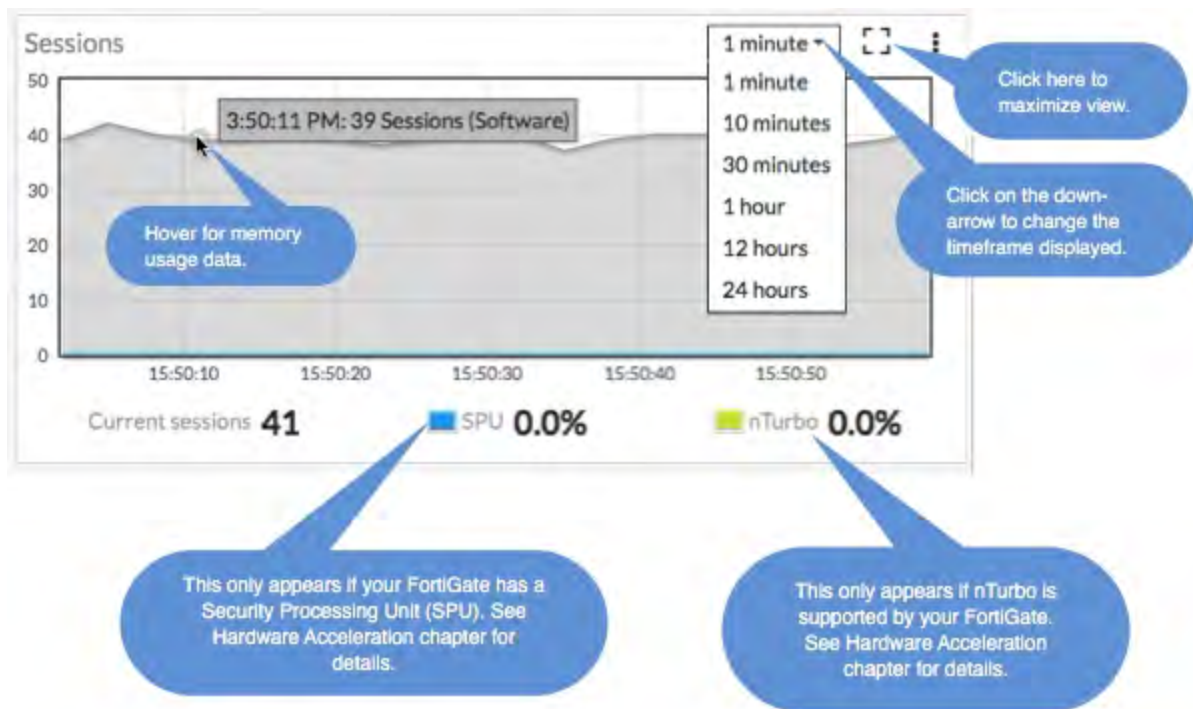

Memory

Real-time memory usage is displayed for different time frames. Hovering over any point on the graph displays percentage of memory used along with a timestamp.

Sessions

Bandwidth

Virtual Machine

FortiOS 5.6.1 introduces a VM widget with these features:

- License status and type.
- CPU allocation usage.
- License RAM usage.
- VMX license information (if the VM supports VMX).
- If the VM license specifies 'unlimited' the progress bar is blank.
- If the VM is in evaluation mode, it is yellow (warning style) and the dashboard show evaluation days used.
- Widget is shown by default in the dashboard of a FortiOS VM device.
- Removed VM information from License widget at **Global > Dashboard**.
- License info and **Upload License** button provided on page **Global > System > FortiGuard**.
- Updated 'Upload VM License' page:
 - Added license RAM usage and VMX instance usage.
 - Replaced file input component.

Changing inspection modes (flow-based or proxy-based)

To change inspection modes, go to **System > Settings** and scroll down to **Inspection Mode**. You can select Flow-based to operate in Flow mode or Proxy to operate in Proxy mode. Flow-based inspection is the default inspection mode for FortiOS 5.6.

Transparent Web proxy mode

In proxy mode, FortiOS 5.6 functions just like FortiOS 5.4 with the addition of the new Transparent Web Proxy mode. See [Transparent web proxy \(386474\)](#) on page 88.

NGFW profile-based and NGFW policy-based modes

When you use **Flow-based** as the **Inspection Mode**, you have the option in FortiOS 5.6 to select an **NGFW Mode**. **Profile-based** mode works the same as flow-based mode did in FortiOS 5.4

Flow-based inspection with profile-based **NGFW mode** is the default in FortiOS 5.6.

In the new **NGFW Policy-based** mode, you add applications and web filtering profiles directly to a policy without having to first create and configure Application Control or Web Filtering profiles. When selecting NGFW policy-based mode you can also select the SSL/SSH Inspection mode that is applied to all policies. See [NGFW Policy Mode \(397035\)](#) on page 96.

When you use flow-based inspection, all proxy mode profiles are converted to flow mode, removing any proxy settings. And proxy-mode only features (for example, Web Application Profile) are removed from the GUI.

If your FortiGate has multiple VDOMs, you can set the inspection mode independently for each VDOM. Go to **System > VDOM**. Click **Edit** for the VDOM you wish to change and select the **Inspection Mode**.

CLI syntax

The following CLI commands can be used to configure inspection and policy modes:

```
config system settings
  set inspection-mode {proxy | flow}
  set policy-mode {standard | ngfw}
end
```

Change to CLI console (396225)

The CLI Console widget has been removed from FortiOS 5.6.0. It is accessed from the upper-right hand corner of the screen and is no longer a pop-out window but a sliding window.

System Information Dashboard widget WAN IP Information enhancement (401464)

WAN IP and location data are now available in the **System Information** widget. Additionally, If the WAN IP is blacklisted in the FortiGuard server, there will be a notification in the notification area, located in the upper right-hand corner of the **Dashboard**. Clicking on the notification will open the WAN IP Blacklisted slider with the relevant blacklist information.

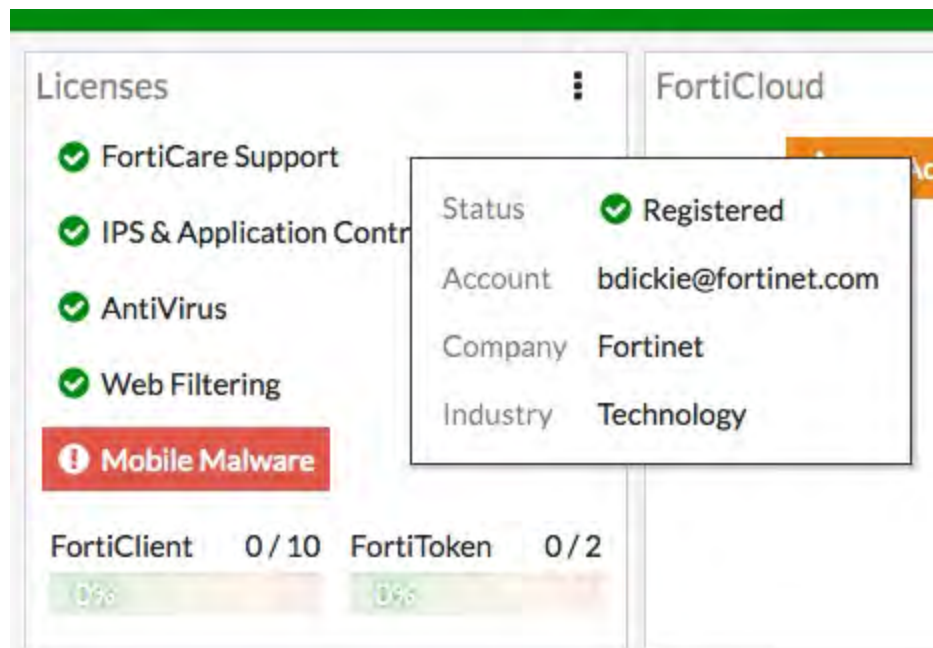

CLI and GUI changes to display FortiCare registration information (395254)

The changes pertain to industry and organization size of the FortiGate's registered owner.

GUI Changes

- Add industry and organization size to FortiCare registration page
- Add company and industry to license widget tooltip for FortiCare

When you hover over the Licenses widget in the FortiOS 5.6 dashboard, you can see the company and industry data, provided it has been entered in the FortiCare profile.

CLI Changes

Commands are added to diagnose forticare

```
dia forticare direct-registration product-registration -h
Options: a:A:y:C:c:T:eF:f:hI:i:l:O:o:p:P:z:R:r:S:s:t:v:

```

Improved GUI for Mobile Screen Size & Touch Interface (355558)

The FortiOS web GUI on mobile screens and include functionality for touch interfaces like tap to hold are improved.

Setup Wizard removed

Previously, the Setup Wizard could be launched from the web GUI by selecting the  button, located in the top right corner. This button and the wizard in question has been removed.

Installation

This section discusses how to install your FortiGate and use it in your network, after completion of the initial setup outlined in the FortiGate model's Quick Start Guide.

The following topics are included in this section:

- [Quick installation using DHCP](#)
- [Installing a FortiGate in NAT mode](#)
- [Using a Virtual Wire Pair](#)

Quick installation using DHCP

Most of the FortiGate desktop models have a default configuration that includes a DHCP server on the **lan** (or **internal**) interface and a security policy that securely allows all sessions from the internal network to reach the Internet. Because of this, you can connect your desktop FortiGate to the Internet in two simple steps:

Note that, in order to use this installation method, your ISP must provide connectivity with DHCP and accept DHCP requests without authentication. You must also use IPv4 to connect your FortiGate to the Internet.

1. Connect the FortiGate's **wan** interface to your ISP-supplied equipment, and connect the internal network to the FortiGate's default **lan** interface. Turn on the ISP's equipment, the FortiGate, and the computers on the internal network.
2. For computers on the internal network:
 - a. **Windows Vista/7/8/10 users:**
 - i. Go to **Network and Sharing Center** and select **Change adapter settings**.
 - ii. Open the **Local Area Connection** (Ethernet or Wi-Fi, whichever applies) and select **Properties**.
 - iii. Select **Internet Protocol Version 4 (TCP/IPv4)** and then select **Properties**.
 - iv. Select **Obtain an IP address automatically** and **Obtain DNS server address automatically**.
 - v. Click **OK**.
 - b. **Mac OS X users:**
 - i. Go to **System Preferences > Network** and select your Ethernet connection.
 - ii. Set **Configure IPv4** to **Using DHCP**.

Results

From any computer on the internal network, open a web browser and browse to any website to confirm successful Internet connectivity.

Installing a FortiGate in NAT mode

There are two main ways to install a FortiGate using network address translation (NAT)/Route mode: [Standard installation in NAT mode](#), where Internet access is provided by a single Internet service provider (ISP), and [Redundant Internet installation](#), where two ISPs are used.

NAT mode vs. Transparent mode

A FortiGate can operate in one of two modes: NAT or Transparent.

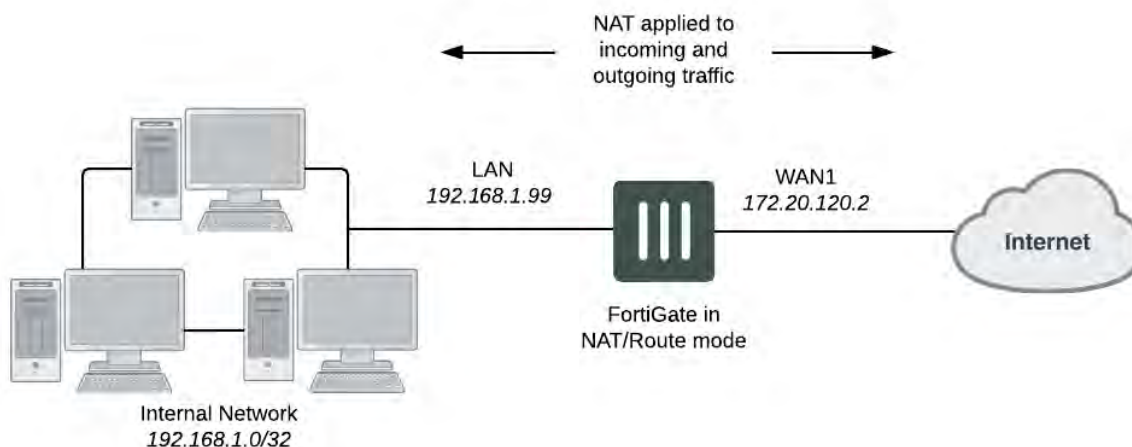

The most common of the two operating modes is NAT mode, where a FortiGate is installed as a gateway or router between two networks. In most cases, it is used between a private network and the Internet. This allows the FortiGate to hide the IP addresses of the private network using NAT. NAT mode is also used when two or more ISPs provide the FortiGate with redundant Internet connections.

A FortiGate in Transparent mode is installed between the internal network and the router. In this mode, the FortiGate does not make any changes to IP addresses and only applies security scanning to traffic. When a FortiGate is added to a network in Transparent mode, no network changes are required, except to provide the FortiGate with a management IP address. Transparent mode is used primarily when there is a need to increase network protection but changing the configuration of the network itself is impractical.

For more information about Transparent Mode, see the [Transparent Mode](#) handbook.

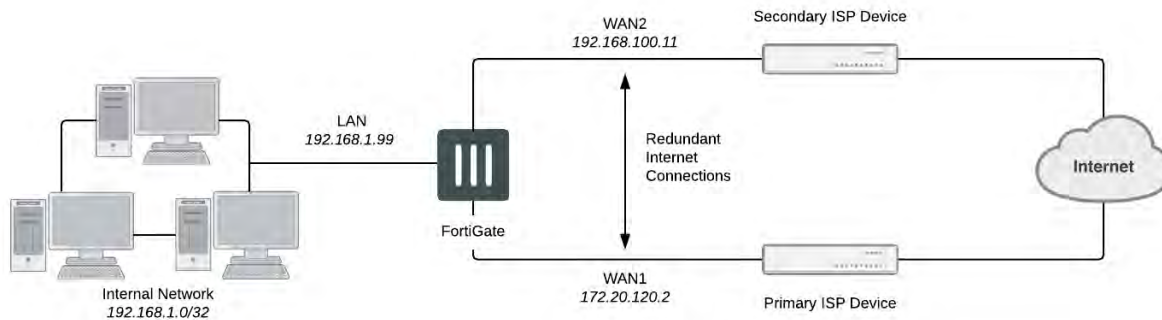

Standard installation in NAT mode

In this configuration, a FortiGate is installed as a gateway or router between a private network and the Internet. By using NAT, the FortiGate is able to hide the IP addresses of the private network.

Redundant Internet installation

In this configuration, a WAN link interface is created that provides the FortiGate with redundant Internet connections from two ISPs. The WAN link interface combines these two connections, allowing the FortiGate to treat them as a single interface.

Installing a FortiGate with Redundant Internet

If you have previously configured your FortiGate using the standard installation, you will have to delete all routes and policies referring to an interface that will be used to provide redundant Internet. This includes the default Internet access policy that is included on many FortiGate models.

1. Connect your ISP devices to your FortiGate's Internet-facing interfaces (typically WAN1 and WAN2).
2. Go to **Network > SD-WAN** to create a WAN link interface, which is used to group multiple Internet connections together so that the FortiGate can treat them as a single interface.
3. Set the interface's **Status** to **Enable**.
4. Under **Interface**, select **Create New**. Add WAN1 and enter the Gateway IP provided by your primary ISP. Do the same for WAN2, but use the Gateway IP provided by your secondary ISP.
5. Select an appropriate method for the **SD-WAN Usage** from the following options, and **Apply** your changes when finished:
 - **Bandwidth** - A bandwidth cap is defined for active members of the SD WAN link.
 - **Volume** - A volume ratio is set for each active member.
 - **Sessions** - A sessions ratio is set for each active member.
6. Go to **Network > Static Routes** and create a new default route. Set **Interface** to the SD-WAN link.
7. Go to **Policy & Objects > IPv4 Policy** and select **Create New** to add a security policy that allows users on the private network to access the Internet.

Using a Virtual Wire Pair

A virtual wire pair consists of two interfaces that do not have IP addressing and are treated similar to a transparent mode VDOM. All traffic received by one interface in the virtual wire pair can only be forwarded out the other interface, provided that a virtual wire pair firewall policy allows this traffic. Traffic from other interfaces cannot be routed to the interfaces in a virtual wire pair.

Virtual wire pairs are useful for atypical topologies where MAC addresses do not behave normally. For example, port pairing can be used in a Direct Server Return (DSR) topology where the response MAC address pair may not match the request's MAC address pair.

Virtual wire pairing replaces the port pairing feature available in earlier firmware versions. Unlike port pairing, virtual wire pairing can be used for FortiGates in both NAT and Transparent modes.

In the example configuration below, a virtual wire pair (consisting of port3 and port4) makes it easier to protect a web server that is behind a FortiGate operating as an Internal Segmentation Firewall (ISFW). Users on the internal network will access the web server through the ISFW over the virtual wire pair.

Adding a virtual wire pair and virtual wire pair policy

Interfaces used in a virtual wire pair cannot be used to access the ISFW FortiGate. Before creating a virtual wire pair, make sure you have a different port configured to allow admin access using your preferred protocol.

1. Go to **Network > Interfaces** and select **Create New > Virtual Wire Pair**.
2. Select the interfaces to add to the virtual wire pair. These interfaces cannot be part of a switch, such as the default **lan/internal** interface.
3. (Optional) If desired, enable **Wildcard VLAN**.
4. Select **OK**.
5. Go to **Policy & Objects > IPv4 Virtual Wire Pair Policy**, select the virtual wire pair, and select **Create New**.
6. Select the direction that traffic is allowed to flow.
7. Configure the other firewall options as desired.
8. Select **OK**.
9. If necessary, create a second virtual wire pair policy to allow traffic to flow in the opposite direction.

If you have a USB-wan interface, it will not be included in the interface list when building a wired-pair.

Results

Traffic can now flow through the FortiGate using the virtual wire pair.

Using the GUI

This section presents an introduction to the FortiGate's graphical user interface (GUI), also called the web-based manager.

The following topics are included in this section:

- [Connecting to the GUI using a web browser](#)
- [Menus](#)
- [Dashboard](#)
- [Feature Visibility](#)
- [Tables](#)
- [Text Strings](#)

Connecting to the GUI using a web browser

The graphical user interface is best displayed using a 1280 x 1024 resolution. Check the [FortiOS Release Notes](#) for information about browser compatibility.

In order to connect to the GUI using a web browser, an interface must be configured to allow administrative access over HTTPS or over both HTTPS and HTTP. By default, an interface has already been set up that allows HTTPS access, with the IP address 192.168.1.99.

Browse to <https://192.168.1.99> and enter your username and password. If you have not changed the admin account's password, use the default user name, `admin`, and leave the password field blank.

The GUI will now be displayed in your browser.

If you wish to use a different interface to access the GUI, do the following:

1. Go to **Network > Interfaces** and edit the interface you wish to use for access. Take note of its assigned IP address.
2. Beside **Administrative Access**, select **HTTPS**, and any other protocol you require. You can also select **HTTP**, although this is not recommended as the connection will be less secure.
3. Select **OK**.
4. Browse to the IP address using your chosen protocol.

Results

The GUI will now be displayed in your browser.

Menus

If you believe your FortiGate model supports a menu that does not appear in the GUI as expected, go to **System > Feature Visibility** and ensure the feature is enabled. For more information, see ["Feature Visibility" on page 300](#).

The GUI contains the following main menus, which provide access to configuration options for most FortiOS features:

Dashboard	<p>The dashboard displays various widgets that display important system information and allow you to configure some system options.</p> <p>For more information, see "Dashboard" on page 297.</p>
Security Fabric	<p>Access the physical topology, logical topology, audit, and settings features of the Fortinet Security Fabric.</p> <p>For more information, see the Fortinet Security Fabric guide.</p>
FortiView	<p>A collection of dashboards and logs that give insight into network traffic, showing which users are creating the most traffic, what sort of traffic it is, when the traffic occurs, and what kind of threat the traffic may pose to the network.</p> <p>For more information, see the FortiView handbook.</p>
Network	<p>Options for networking, including configuring system interfaces and routing options.</p> <p>For more information, see the Networking handbook.</p>
System	<p>Configure system settings, such as administrators, FortiGuard, and certificates.</p> <p>For more information, see the System Administration handbook.</p>
Policy & Objects	<p>Configure firewall policies, protocol options, and supporting content for policies, including schedules, firewall addresses, and traffic shapers.</p> <p>For more information, see the Networking handbook.</p>
Security Profiles	<p>Configure your FortiGate's security features, including AntiVirus, Web Filtering, and Application Control.</p> <p>For more information, see the Security Profiles handbook.</p>
VPN	<p>Configure options for IPsec and SSL virtual private networks (VPNs).</p> <p>For more information, see the IPsec VPN and SSL VPN handbooks.</p>

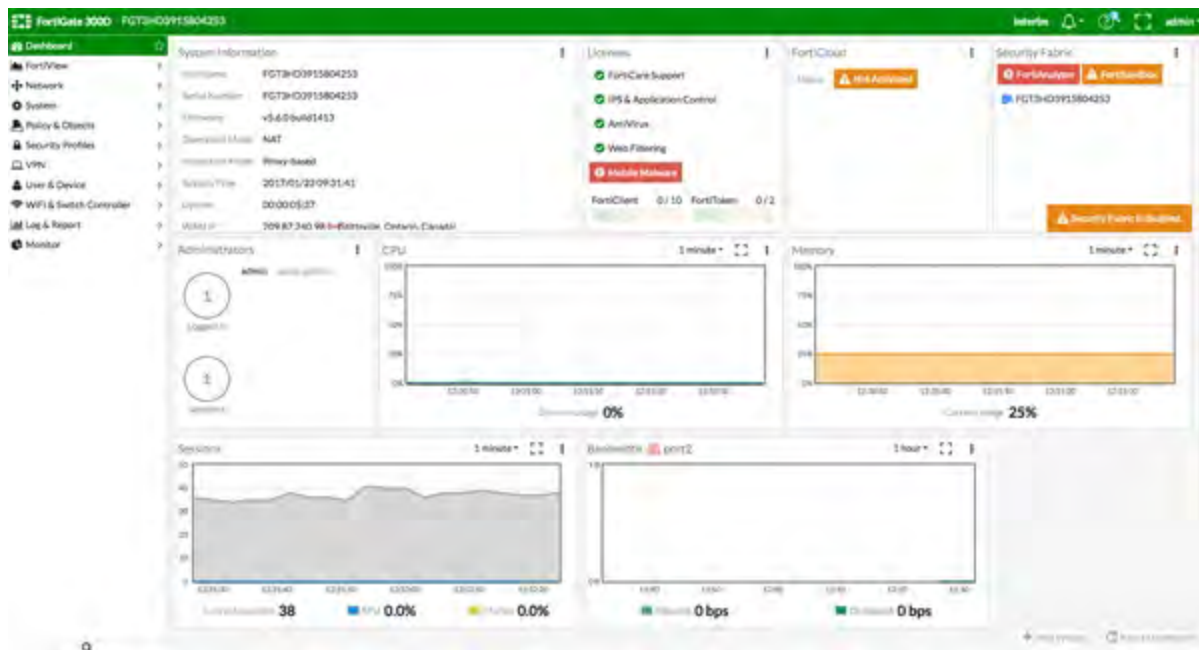

User & Device	Configure user accounts, groups, and authentication methods, including external authentication and single sign-on (SSO).
WiFi & Switch Controller	<p>Configure the unit to act as a wireless network controller, managing the wireless Access Point (AP) functionality of FortiWiFi and FortiAP units.</p> <p>On certain FortiGate models, this menu has additional features allowing for FortiSwitch units to be managed by the FortiGate.</p> <p>For more information, see the FortiWiFi and FortiAP Configuration Guide handbook.</p>
Log & Report	<p>Configure logging and alert email as well as reports.</p> <p>For more information, see the Logging and Reporting handbook.</p>
Monitor	View a variety of monitors, including the Routing Monitor, VPN monitors for both IPsec and SSL, monitors relating to wireless networking, and more.

Dashboard

The FortiOS **Dashboard** consists of a network operations center (NOC) view with a focus on alerts. Widgets are interactive; by clicking or hovering over most widgets, the user can get additional information or follow links to other pages.

The dashboard and its widgets include:

- Multiple dashboard support.
- VDOM and global dashboards.
- Widget resize control.
- Notifications on the top header bar.

The following widgets are displayed by default:

Widget	Description
System Information	The System Information widget lists information relevant to the FortiGate system, including Hostname, Serial Number, and Firmware.
Security Fabric	The Security Fabric widget is documented in the Fortinet Security Fabric guide.
CPU	The real-time CPU usage is displayed for different time frames.

Widget	Description
License Status	<p>Hovering over the Licenses widget will display status information (and, where applicable, database information) on the licenses for FortiCare Support, IPS & Application Control, AntiVirus, Web Filtering, Mobile Malware, and FortiClient.</p> <p>Clicking in the Licenses widget will provide you with links to other pages, such as System > FortiGuard or contract renewal pages.</p>
FortiCloud	This widget displays FortiCloud status and provides a link to activate FortiCloud.
Administrators	This widget allows you to view which administrators are logged in and how many sessions are active. The link directs you to a page displaying active administrator sessions.
Memory	Real-time memory usage is displayed for different time frames. Hovering over any point on the graph displays percentage of memory used along with a timestamp.
Sessions	<p>Hovering over the Sessions widget allows you to view memory usage data over time. Click on the down-arrow to change the timeframe displayed.</p> <p>SPU (Security Processing Unit) percentage is displayed if your FortiGate includes an SPU. Likewise, nTurbo percentage is displayed if supported by your FortiGate. See the Hardware Acceleration chapter for details.</p>
Bandwidth	<p>Hover over the Bandwidth widget to display bandwidth usage data over time. Click on the down-arrow to change the timeframe displayed.</p> <p>Bandwidth is displayed for both incoming and outgoing traffic.</p>
Virtual Machine	<p>The VM widget (shown by default in the dashboard of a FortiOS VM device) includes:</p> <ul style="list-style-type: none"> • License status and type • CPU allocation usage • License RAM usage • VMX license information (if the VM supports VMX) <p>If the VM license specifies 'unlimited' the progress bar is blank. If the VM is in evaluation mode, it is yellow (warning style) and the dashboard show evaluation days used.</p>

The following optional widgets are also available:

- FortiView
- Host Scan Summary
- Vulnerabilities Summary
- Botnet Activity
- HA Status
- Log Rate

- Session Rate
- Security Fabric Score
- Advanced Threat Protection Statistics
- Interface Bandwidth

Feature Visibility

Feature Visibility is used to control which features are visible in the GUI. This allows you to hide features that are not being used. Some features are also disabled by default and must be enabled in order to configure them through the GUI.

Feature Visibility only alters the visibility of these features, rather than their functionality. For example, disabling web filtering on the **Feature Visibility** page does not remove web filtering from the FortiGate, but removes the option of configuring web filtering from the GUI. Configuration options will still be available using the CLI.

Enabling/disabling features

Feature Visibility can be found at **System > Feature Visibility**. Ensure that all features you wish to configure in the GUI are turned on, and that features you wish to hide are turned off. When you have finished, select **Apply**.

Security Features Presets

The main Security Features can be toggled individually, however six system presets (or **Feature Sets**) are available:

- **NGFW** should be chosen for networks that require application control and protection from external attacks.
- **ATP** should be chosen for networks that require protection from viruses and other external threats.
- **WF** should be chosen for networks that require web filtering.
- **NGFW + ATP** should be chosen for networks that require protection from external threats and attacks.
- **UTM** should be chosen for networks that require protection from external threats and wish to use security features that control network usage. This is the default setting.
- **Custom** should be chosen for networks that require customization of available features (including the ability to select all features).

Tables

Many of the GUI pages contain tables of information that you can filter to display specific information. Administrators with read and write access can define the filters.

Navigation

Some tables contain information and lists that span multiple pages. Navigation controls appear at the bottom of the page.

Filters

Filters are used to locate a specific set of information or content within multiple pages. These are especially useful in locating specific log entries. The specific filtering options vary, depending on the type of information in the log.

To create a filter, select **Add Filter** at the top of the page. A list of the available fields for filtering will be shown.

Column settings

Column settings are used to select the types of information displayed on a certain page. Some pages have large amounts of information available and not all content can be displayed on a single screen. Some pages may even contain content that is irrelevant to you. Using column settings, you can choose to display only relevant content.

To view configure column settings, right-click the header of a column and select the columns you wish to view and de-select any you wish to hide. After you have finished making your selections, click **Apply** (you may need to scroll down the list to do so).

Any changes that you make to the column settings are stored in the unit's configuration. To return columns to the default state for any given page, right-click any header and select **Reset Table**.

Copying objects

In tables containing configuration objects, such as the policy table found at **Policy & Objects > IPv4 Policy**, you have the option to copy an object. This allows you to create a copy of that object, which you can then configure as needed. You can also reverse copy a policy to change the direction of the traffic impacted by that policy.

To copy an object:

1. Select that object, then right-click to make a menu appear and select the **Copy** option.
2. Right-click the row in the table that is either above or below where you want the copied object to be placed, select the **Paste** option and indicate **Above** or **Below**.

Reverse cloning works much the same way. Instead of selecting **Copy**, you will select **Clone Reverse**.

Once the policy is copied, you must give it a name, configure as needed, and enable it.

Editing objects

Some tables allow you to edit parts of the configuration directly on the table itself. For example, security features can be added to an existing firewall policy from the policy list by clicking on the plus sign in the **Security Profiles** column and selecting the desired profiles.

If this option is not immediately available, check to see that the column is not hidden (see [Column settings](#)). Otherwise, you must select the object and open the policy by selecting the **Edit** option found at the top of the page.

Text Strings

The configuration of a FortiGate is stored in the FortiOS configuration database. To change the configuration, you can use the GUI or CLI to add, delete, or change configuration settings. These changes are stored in the database as you make them. Individual settings in the configuration database can be text strings, numeric values, selections from a list of allowed options, or on/off (enable/disable) settings.

Entering text strings (names)

Text strings are used to name entities in the configuration. For example, the name of a firewall address, the name of an administrative user, and so on. You can enter any character in a FortiGate configuration text string, except the following characters that present Cross-Site Scripting (XSS) vulnerabilities:

- “ (double quote)
- & (ampersand)
- ' (single quote)
- < (less than)
- > (greater than)

Most GUI text string fields make it easy to add an acceptable number of characters and prevent you from adding the XSS vulnerability characters.

There is a different character limitation for VDOM names and hostnames. The only valid characters are numbers (0-9), letters (a-z, A-Z), and special characters - (dash) and _ (underscore).

From the CLI, you can also use the `tree` command to view the number of characters that are allowed in a name field. For example, firewall address names can contain up to 64 characters. When you add a firewall address to the GUI, you are limited to entering 64 characters in the firewall address name field. From the CLI you can enter the following `tree` command to confirm that the firewall address `name` field allows 64 characters.

```
config firewall address
  tree
  -- [address] --*name (64)
  |- uuid
  |- subnet
  |- type
  |- start-ip
  |- end-ip
  |- fqdn (256)
  |- country (3)
  |- cache-ttl (0,86400)
  |- wildcard
  |- comment
  |- visibility
  |- associated-interface (36)
  |- color (0,32)
  |- [tags] --*name (65)
  +- allow-routing
```

The `tree` command output also shows the number of characters allowed for other firewall address name settings. For example, the fully qualified domain name (`fqdn`) field can contain up to 256 characters.

Entering numeric values

Numeric values set various sizes, rates, addresses, and other numeric values (e.g. a static routing priority of 10, a port number of 8080, an IP address of 10.10.10.1). Numeric values can be entered as a series of digits without spaces or commas (for example, 10 or 64400), in dotted decimal format (for example the IP address 10.10.10.1) or, as in the case of MAC or IPv6 addresses, separated by colons (e.g. the MAC address 00:09:0F:B7:37:00). Most numeric values are standard base-10 numbers, but some fields - again, such as MAC addresses - require hexadecimal numbers.

Most GUI numeric value fields make it easy to add the acceptable number of digits within the allowed range. CLI help text includes information about allowed numeric value ranges. Both the GUI and the CLI prevent you from entering invalid numbers.

Using the CLI

The command line interface (CLI) is an alternative configuration tool to the GUI or web-based manager. While the configuration of the GUI uses a point-and-click method, the CLI requires typing commands or uploading batches of commands from a text file, like a configuration script.

This section explains common CLI tasks that an administrator does on a regular basis and includes the topics:

- [Connecting to the CLI](#)
- [Command syntax](#)
- [Sub-commands](#)
- [Permissions](#)
- [Tips](#)

Connecting to the CLI

You can access the CLI in three ways:

- [Locally with a console cable](#) — Connect your computer directly to the FortiGate unit's console port. Local access is required in some cases:
 - If you are installing your FortiGate unit for the first time and it is not yet configured to connect to your network, you may only be able to connect to the CLI using a local serial console connection, unless you reconfigure your computer's network settings for a peer connection.
 - Restoring the firmware utilizes a boot interrupt. Network access to the CLI is not available until after the boot process has completed, making local CLI access the only viable option.
- [Through the network](#) — Connect your computer through any network attached to one of the FortiGate unit's network ports. The network interface must have enabled Telnet or SSH administrative access if you connect using an SSH/Telnet client, or HTTP/HTTPS administrative access if you connect by accessing the **CLI Console** in the GUI. The CLI console can be accessed from the upper-right hand corner of the screen and appears as a slide-out window.
- [Locally with FortiExplorer for iOS](#) — Use the FortiExplorer app on your iOS device to configure, manage, and monitor your FortiGate.

Connecting to the CLI using a local console

Local console connections to the CLI are formed by directly connecting your management computer or console to the FortiGate unit, using its DB-9 or RJ-45 console port. To connect to the local console you need:

- A computer with an available serial communications (COM) port.
- The RJ-45-to-DB-9 or null modem cable included in your FortiGate package.
- Terminal emulation software such as HyperTerminal for Microsoft Windows.

The following procedure describes the connection using Microsoft HyperTerminal software; steps may vary with other terminal emulators.

To connect to the CLI using a local serial console connection

1. Using the null modem or RJ-45-to-DB-9 cable, connect the FortiGate unit's console port to the serial communications (COM) port on your management computer.

2. On your management computer, start HyperTerminal.
3. For the **Connection Description**, enter a **Name** for the connection, and select **OK**.
4. On the **Connect using** drop-down, select the communications (COM) port on your management computer you are using to connect to the FortiGate unit.
5. Select **OK**.
6. Select the following **Port** settings and select **OK**.

Bits per second	9600
Data bits	8
Parity	None
Stop bits	1
Flow control	None

7. Press **Enter** or **Return** on your keyboard to connect to the CLI.
8. Type a valid administrator account name (such as `admin`) and press **Enter**.
9. Type the password for that administrator account and press **Enter**. (In its default state, there is no password for the `admin` account.)

The CLI displays the following text:

```
Welcome!
Type ? to list available commands.
```

You can now enter CLI commands, including configuring access to the CLI through SSH or Telnet.

Enabling access to the CLI through the network (SSH or Telnet)

SSH or Telnet access to the CLI is accomplished by connecting your computer to the FortiGate unit using one of its RJ-45 network ports. You can either connect directly, using a peer connection between the two, or through any intermediary network.

If you do not want to use an SSH/Telnet client and you have access to the web-based manager, you can alternatively access the CLI through the network using the **CLI Console** widget in the web-based manager.

You must enable SSH and/or Telnet on the network interface associated with that physical network port. If your computer is not connected directly or through a switch, you must also configure the FortiGate unit with a static route to a router that can forward packets from the FortiGate unit to your computer. You can do this using either a local console connection or the web-based manager.

Requirements

- A computer with an available serial communications (COM) port and RJ-45 port
- Terminal emulation software such as HyperTerminal for Microsoft Windows
- The RJ-45-to-DB-9 or null modem cable included in your FortiGate package
- A network cable
- Prior configuration of the operating mode, network interface, and static route.

To enable SSH or Telnet access to the CLI using a local console connection

1. Using the network cable, connect the FortiGate unit's network port either directly to your computer's network port, or to a network through which your computer can reach the FortiGate unit.
2. Note the number of the physical network port.
3. Using a local console connection, connect and log into the CLI.
4. Enter the following command:

```
config system interface
  edit <interface_str>
    set allowaccess <protocols_list>
  end
```

where:

- <interface_str> is the name of the network interface associated with the physical network port and containing its number, such as `port1`.
- <protocols_list> is the complete, space-delimited list of permitted administrative access protocols, such as `https ssh telnet`.

For example, to exclude HTTP, HTTPS, SNMP, and PING, and allow only SSH and Telnet administrative access on `port1`, enter the following:

```
config system interface
  edit port1
    set allowaccess ssh telnet
  end
```

5. To confirm the configuration, enter the command to display the network interface's settings.

```
show system interface <interface_str>
```

The CLI displays the settings, including the allowed administrative access protocols, for the network interfaces.

Connecting to the CLI using SSH

Once the FortiGate unit is configured to accept SSH connections, you can use an SSH client on your management computer to connect to the CLI.

Secure Shell (SSH) provides both secure authentication and secure communications to the CLI. FortiGate units support 3DES and Blowfish encryption algorithms for SSH.

Before you can connect to the CLI using SSH, you must first configure a network interface to accept SSH connections. The following procedure uses PuTTY. Steps may vary with other SSH clients.

To connect to the CLI using SSH

1. On your management computer, start an SSH client.
2. In **Host Name (or IP address)**, enter the IP address of a network interface on which you have enabled SSH administrative access.
3. Set a **Port** of 22.
4. For the **Connection type**, select **SSH**.
5. Select **Open**.

The SSH client connects to the FortiGate unit.

The SSH client may display a warning if this is the first time you are connecting to the FortiGate unit and its SSH key is not yet recognized by your SSH client, or if you have previously connected to the FortiGate unit but used a different IP address or SSH key. This is normal if your management computer is directly connected to the FortiGate unit with no network hosts between them.

6. Click **Yes** to verify the fingerprint and accept the FortiGate unit's SSH key. You will not be able to log in until you have accepted the key.
7. The CLI displays a login prompt.
8. Type a valid administrator account name (such as `admin`) and press **Enter**.
9. Type the password for this administrator account and press **Enter**.
The FortiGate unit displays a command prompt (its hostname followed by a #). You can now enter CLI commands.

If three incorrect login or password attempts occur in a row, you will be disconnected. If this occurs, wait one minute, then reconnect to attempt the login again.

Connecting to the CLI using Telnet

Once the FortiGate unit is configured to accept Telnet connections, you can use a Telnet client on your management computer to connect to the CLI.

Telnet is not a secure access method. SSH should be used to access the CLI from the Internet or any other untrusted network.

Before you can connect to the CLI using Telnet, you must first configure a network interface to accept Telnet connections.

To connect to the CLI using Telnet

1. On your management computer, start a Telnet client.
2. Connect to a FortiGate network interface on which you have enabled Telnet.
3. Type a valid administrator account name (such as `admin`) and press **Enter**.
4. Type the password for this administrator account and press **Enter**.
The FortiGate unit displays a command prompt (its hostname followed by a #). You can now enter CLI commands.

If three incorrect login or password attempts occur in a row, you will be disconnected. If this occurs, wait one minute, then reconnect to attempt the login again.

CLI-only features

As you can see in the [Feature / Platform Matrix](#), the entry level models have a number of features that are only available using the CLI, rather than appearing in the GUI.

You can open the CLI console so that it automatically opens to the object you wish to configure. For example, to edit a firewall policy, right-click on the policy in the policy list (**Policy & Objects > IPv4 Policy**) and select **Edit in CLI**. The CLI console will appear, with the commands to access this part of the configuration added automatically.

Once you have access to the CLI, you can enter instructions for specific tasks that can be found throughout the FortiOS Handbook. Options are also available at the top of the CLI Console to **Clear console**, **Download**, and **Copy to clipboard**.

Refer to the [CLI Reference](#) for a list of the available commands.

Command syntax

When entering a command, the CLI console requires that you use valid syntax and conform to expected input constraints. It will reject invalid commands.

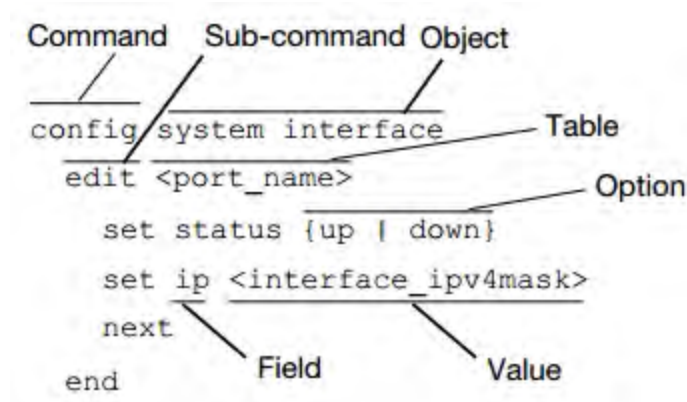

Fortinet documentation uses the conventions below to describe valid command syntax.

Terminology

Each command line consists of a command word that is usually followed by configuration data or other specific item that the command uses or affects.

To describe the function of each word in the command line, especially if that nature has changed between firmware versions, Fortinet uses terms with the following definitions.

Command syntax terminology

- **Command** — A word that begins the command line and indicates an action that the FortiGate unit should perform on a part of the configuration or host on the network, such as `config` or `execute`. Together with other words, such as fields or values, that end when you press the **Enter** key, it forms a command line. Exceptions include multi-line command lines, which can be entered using an escape sequence. Valid command lines must be unambiguous if abbreviated. Optional words or other command line permutations are indicated by syntax notation.
- **Sub-command** — A kind of command that is available only when nested within the scope of another command. After entering a command, its applicable sub-commands are available to you until you exit the scope of the command, or until you descend an additional level into another sub-command. Indentation is used to indicate levels of nested commands. Not all top-level commands have sub-commands. Available sub-commands vary by their containing scope.
- **Object** — A part of the configuration that contains tables and /or fields. Valid command lines must be specific enough to indicate an individual object.
- **Table** — A set of fields that is one of possibly multiple similar sets which each have a name or number, such as an administrator account, policy, or network interface. These named or numbered sets are sometimes referenced by other parts of the configuration that use them.
- **Field** — The name of a setting, such as `ip` or `hostname`. Fields in some tables must be configured with values. Failure to configure a required field will result in an invalid object configuration error message, and the FortiGate unit will discard the invalid table.

- **Value** — A number, letter, IP address, or other type of input that is usually your configuration setting held by a field. Some commands, however, require multiple input values which may not be named but are simply entered in sequential order in the same command line. Valid input types are indicated by constraint notation.
- **Option** — A kind of value that must be one or more words from of a fixed set of options.

Indentation

Indentation indicates levels of nested commands, which indicate what other sub-commands are available from within the scope. For example, the `edit` sub-command is available only within a command that affects tables, and the `next` sub-command is available only from within the `edit` sub-command:

```
config system interface
  edit port1
    set status up
  next
end
```

Notation

Brackets, braces, and pipes are used to denote valid permutations of the syntax. Constraint notations, such as `<address_ipv4>`, indicate which data types or string patterns are acceptable value input.

Command syntax notation

Convention	Description
Square brackets []	<p>An optional word or series of words. For example:</p> <pre>[verbose {1 2 3}]</pre> <p>indicates that you may either omit or type both the <code>verbose</code> word and its accompanying option, such as <code>verbose 3</code>.</p>
Curly braces { }	<p>A word or series of words that is constrained to a set of options delimited by either vertical bars or spaces. You must enter at least one of the options, unless the set of options is surrounded by square brackets [].</p>
Options delimited by vertical bars	<p>Mutually exclusive options. For example:</p> <pre>{enable disable}</pre> <p>indicates that you must enter either <code>enable</code> or <code>disable</code>, but must not enter both.</p>

Convention	Description
Angle brackets < >	<p>A word constrained by data type. The angled brackets contain a descriptive name followed by an underscore (_) and suffix that indicates the valid data type. For example, <retries_int>, indicates that you should enter a number of retries as an integer.</p> <p>Data types include:</p> <ul style="list-style-type: none"> • <xxx_name>: A name referring to another part of the configuration, such as policy_A. • <xxx_index>: An index number referring to another part of the configuration, such as 0 for the first static route. • <xxx_pattern>: A regular expression or word with wild cards that matches possible variations, such as *@example.com to match all email addresses ending in @example.com. • <xxx_fqdn>: A fully qualified domain name (FQDN), such as mail.example.com. • <xxx_email>: An email address, such as admin@example.com. • <xxx_ipv4>: An IPv4 address, such as 192.168.1.99. • <xxx_v4mask>: A dotted decimal IPv4 netmask, such as 255.255.255.0. • <xxx_ipv4mask>: A dotted decimal IPv4 address and netmask separated by a space, such as 192.168.1.99 255.255.255.0. • <xxx_ipv4/mask>: A dotted decimal IPv4 address and CIDR-notation netmask separated by a slash, such as 192.168.1.1/24 • <xxx_ipv4range> : A hyphen (-)-delimited inclusive range of IPv4 addresses, such as 192.168.1.1-192.168.1.255. • <xxx_ipv6>: A colon (:)-delimited hexadecimal IPv6 address, such as 3f2e:6a8b:78a3:0d82:1725:6a2f:0370:6234. • <xxx_v6mask>: An IPv6 netmask, such as /96. • <xxx_ipv6mask>: A dotted decimal IPv6 address and netmask separated by a space. • <xxx_str>: A string of characters that is not another data type, such as P@ssw0rd. Strings containing spaces or special characters must be surrounded in quotes or use escape sequences. • <xxx_int>: An integer number that is not another data type, such as 15 for the number of minutes.
Options delimited by spaces	<p>Non-mutually exclusive options. For example:</p> <pre>{http https ping snmp ssh telnet}</pre> <p>indicates that you may enter all or a subset of those options, in any order, in a space-delimited list, such as:</p> <pre>ping https ssh</pre>

Sub-commands

Each command line consists of a command word that is usually followed by configuration data or other specific item that the command uses or affects:

```
get system admin
```

Sub-commands are available from within the scope of some commands. When you enter a sub-command level, the command prompt changes to indicate the name of the current command scope. For example, after entering:

```
config system admin
```

the command prompt becomes:

```
(admin) #
```

Applicable sub-commands are available to you until you exit the scope of the command, or until you descend an additional level into another sub-command.

For example, the `edit` sub-command is available only within a command that affects tables; the `next` sub-command is available only from within the `edit` sub-command:

```
config system interface
  edit port1
    set status up
  next
end
```

Sub-command scope is indicated by indentation.

Available sub-commands vary by command. From a command prompt within `config`, two types of sub-commands might become available:

- commands affecting fields
- commands affecting tables

Commands for tables

clone <table>

Clone (or make a copy of) a table from the current object.

For example, in `config firewall policy`, you could enter the following command to clone security policy 27 to create security policy 30:

```
clone 27 to 30
```

In `config antivirus profile`, you could enter the following command to clone an antivirus profile named `av_pro_1` to create a new antivirus profile named `av_pro_2`:

```
clone av_pro_1 to av_pro_2
```

`clone` may not be available for all tables.

delete <table>

Remove a table from the current object.

For example, in `config system admin`, you could delete an administrator account named `newadmin` by typing `delete newadmin` and pressing Enter. This deletes `newadmin` and all its fields, such as `newadmin's first-name` and `email-address`.

`delete` is only available within objects containing tables.

edit <table>

Create or edit a table in the current object.

For example, in `config system admin`:

- edit the settings for the default `admin` administrator account by typing `edit admin`.
- add a new administrator account with the name `newadmin` and edit `newadmin's` settings by typing `edit newadmin`.

`edit` is an interactive sub-command: further sub-commands are available from within `edit`.

`edit` changes the prompt to reflect the table you are currently editing.

`edit` is only available within objects containing tables.

In objects such as security policies, `<table>` is a sequence number. To create a new entry without the risk of overwriting an existing one, enter `edit 0`. The CLI initially confirms the creation of entry 0, but assigns the next unused number after you finish editing and enter `end`.

end

Save the changes to the current object and exit the `config` command. This returns you to the top-level command prompt.

get

List the configuration of the current object or table.

- In objects, `get` lists the table names (if present), or fields and their values.
- In a table, `get` lists the fields and their values.

purge	<p>Remove all tables in the current object.</p> <p>For example, in <code>config user local</code>, you could type <code>get</code> to see the list of user names, then type <code>purge</code> and then <code>y</code> to confirm that you want to delete all users.</p> <p><code>purge</code> is only available for objects containing tables.</p> <p>Caution: Back up the FortiGate before performing a <code>purge</code>. <code>purge</code> cannot be undone. To restore purged tables, the configuration must be restored from a backup.</p> <p>Caution: Do not purge <code>system interface</code> or <code>system admin</code> tables. <code>purge</code> does not provide default tables. This can result in being unable to connect or log in, requiring the FortiGate unit to be formatted and restored.</p>
rename <table> to <table>	<p>Rename a table.</p> <p>For example, in <code>config system admin</code>, you could rename <code>admin3</code> to <code>fwadmin</code> by typing <code>rename admin3 to fwadmin</code>.</p> <p><code>rename</code> is only available within objects containing tables.</p>
show	<p>Display changes to the default configuration. Changes are listed in the form of configuration commands.</p>

Example of table commands

From within the `system admin` object, you might enter:

```
edit admin_1
```

The CLI acknowledges the new table, and changes the command prompt to show that you are now within the `admin_1` table:

```
new entry 'admin_1' added
(admin_1)#
```

Commands for fields

abort	Exit both the <code>edit</code> and/or <code>config</code> commands without saving the fields.
append	Add an option to an existing list.
end	Save the changes made to the current table or object fields, and exit the <code>config</code> command (to exit without saving, use <code>abort</code> instead).
get	<p>List the configuration of the current object or table.</p> <ul style="list-style-type: none"> • In objects, <code>get</code> lists the table names (if present), or fields and their values. • In a table, <code>get</code> lists the fields and their values.

move	Move an object within a list, when list order is important. For example, rearranging security policies within the policy list.
next	<p>Save the changes you have made in the current table's fields, and exit the <code>edit</code> command to the object prompt (to save and exit completely to the root prompt, use <code>end</code> instead).</p> <p><code>next</code> is useful when you want to create or edit several tables in the same object, without leaving and re-entering the <code>config</code> command each time.</p> <p><code>next</code> is only available from a table prompt; it is not available from an object prompt.</p>
select	<p>Clear all options except for those specified.</p> <p>For example, if a group contains members A, B, C, and D and you remove all users except for B, use the command <code>select member B</code>.</p>
set <field> <value>	<p>Set a field's value.</p> <p>For example, in <code>config system admin</code>, after typing <code>edit admin</code>, you could type <code>set password newpass</code> to change the password of the <code>admin</code> administrator to <code>newpass</code>.</p> <p>Note: When using <code>set</code> to change a field containing a space-delimited list, type the whole new list. For example, <code>set <field> <new-value></code> will replace the list with the <code><new-value></code> rather than appending <code><new-value></code> to the list.</p>
show	Display changes to the default configuration. Changes are listed in the form of configuration commands.
unselect	Remove an option from an existing list.
unset <field>	<p>Reset the table or object's fields to default values.</p> <p>For example, in <code>config system admin</code>, after typing <code>edit admin</code>, typing <code>unset password</code> resets the password of the <code>admin</code> administrator account to the default (in this case, no password).</p>

Example of field commands

From within the `admin_1` table, you might enter:

```
set password my1stExamplePassword
```

to assign the value `my1stExamplePassword` to the `password` field. You might then enter the `next` command to save the changes and edit the next administrator's table.

Permissions

Access profiles control which CLI commands an administrator account can access. Access profiles assign either read, write, or no access to each area of FortiOS. To view configurations, you must have read access. To make changes, you must have write access. So, depending on the account used to log in to the FortiGate, you may not have complete access to all CLI commands. For complete access to all commands, you must log in with an administrator account that has the `super_admin` access profile. By default the `admin` administrator account has the `super_admin` access profile.

Administrator accounts, with the `super_admin` access profile are similar to a root administrator account that always has full permission to view and change all FortiGate configuration options, including viewing and changing all other administrator accounts and including changing other administrator account passwords.

Increasing the security of administrator accounts

Set strong passwords for all administrator accounts (including the `admin` account) and change passwords regularly.

For more information about increasing the security of administrator accounts, see:

- [Hardening your FortiGate](#)

Tips

Basic features and characteristics of the CLI environment provide support and ease of use for many CLI tasks.

Help

To display brief help during command entry, press the question mark (?) key.

- Press the question mark (?) key at the command prompt to display a list of the commands available and a description of each command.
- Type a word or part of a word, then press the question mark (?) key to display a list of valid word completions or subsequent words, and to display a description of each.

Shortcuts and key commands

Keys	Action
?	List valid word completions or subsequent words. If multiple words could complete your entry, display all possible completions with helpful descriptions of each.
Tab	Complete the word with the next available match. Press the Tab key multiple times to cycle through available matches.
Up arrow, or Ctrl + P	Recall the previous command. Command memory is limited to the current session.
Down arrow, or Ctrl + N	Recall the next command.
Left or Right arrow	Move the cursor left or right within the command line.
Ctrl + A	Move the cursor to the beginning of the command line.
Ctrl + E	Move the cursor to the end of the command line.
Ctrl + B	Move the cursor backwards one word.
Ctrl + F	Move the cursor forwards one word.
Ctrl + D	Delete the current character.

Keys	Action
Ctrl + C	<p>Abort current interactive commands, such as when entering multiple lines.</p> <p>If you are not currently within an interactive command such as <code>config</code> or <code>edit</code>, this closes the CLI connection.</p>
\ then Enter	<p>Continue typing a command on the next line for a multi-line command.</p> <p>For each line that you want to continue, terminate it with a backslash (\). To complete the command line, terminate it by pressing the spacebar and then the Enter key, without an immediately preceding backslash.</p>

Command abbreviation

You can abbreviate words in the command line to their smallest number of non-ambiguous characters.

For example, the command `get system status` could be abbreviated to `g sy stat`.

Adding and removing options from lists

When adding options to a list, such as a user group, using the `set` command will remove the previous configuration. For example, if you wish to add user D to a user group that already contains members A, B, and C, the command would need to be `set member A B C D`. If only `set member D` was used, then all former members would be removed from the group.

However, there are additional commands which can be used instead of `set` for changing options in a list.

Additional commands for lists

append	<p>Add an option to an existing list.</p> <p>For example, <code>append member</code> would add user D to a user group while all previous group members are retained</p>
select	<p>Clear all options except for those specified.</p> <p>For example, if a group contains members A, B, C, and D and you remove all users except for B, use the command <code>select member B</code>.</p>
unselect	<p>Remove an option from an existing list.</p> <p>For example, <code>unselect member A</code> would remove member A from a group will all previous group members are retained.</p>

Environment variables

The CLI supports the following environment variables. Variable names are case-sensitive.

Environment variables

\$USERFROM	The management access type (<code>ssh</code> , <code>telnet</code> , <code>jsconsole</code> for the CLI Console widget in the web-based manager, and so on) and the IP address of the administrator that configured the item.
\$USERNAME	The account name of the administrator that configured the item.
\$SerialNum	The serial number of the FortiGate unit.

For example, the FortiGate unit's host name can be set to its serial number:

```
config system global
    set hostname $SerialNum
end
```

Special characters

The following special characters, also known as reserved characters, are not permitted in most CLI fields:

< > () # ' “

You may be able to enter special characters as part of a string's value by using a special command, enclosing it in quotes, or preceding it with an escape sequence — in this case, a backslash (\) character.

In other cases, different keystrokes are required to input a special character. If you need to enter **?** as part of config, you first need to input **CTRL-V**. If you enter **?** without first using **CTRL-V**, the question mark has a different meaning in the CLI; it will show available command options in that section.

For example, if you enter **?** without **CTRL-V**:

```
edit "*.xe
token line: Unmatched double quote.
```

If you enter **?** with **CTRL-V**:

```
edit "*.xe?"
new entry '*.xe?' added
```

Entering special characters

Character	Keys
?	Ctrl + V then ?
Tab	Ctrl + V then Tab

Character	Keys
Space (to be interpreted as part of a string value, not to end the string)	Enclose the string in quotation marks: "Security Administrator". Enclose the string in single quotes: 'Security Administrator'. Precede the space with a backslash: Security\ Administrator.
'	\'
(to be interpreted as part of a string value, not to end the string)	
"	\"
(to be interpreted as part of a string value, not to end the string)	
\	\\

Using grep to filter get and show command output

In many cases, the `get` and `show` (and `diagnose`) commands may produce a large amount of output. If you are looking for specific information in a large `get` or `show` command output, you can use the `grep` command to filter the output to only display what you are looking for. The `grep` command is based on the standard UNIX `grep`, used for searching text output based on regular expressions.

Use the following command to display the MAC address of the FortiGate unit internal interface:

```
get hardware nic internal | grep Current_HWaddr
Current_HWaddr          00:09:0f:cb:c2:75
```

Use the following command to display all TCP sessions in the session list and include the session list line number in the output:

```
get system session list | grep -n tcp
```

Use the following command to display all lines in HTTP replacement message commands that contain URL (upper or lower case):

```
show system replacemsg http | grep -i url
```

There are three additional options that can be applied to `grep`:

```
-A <num> After
-B <num> Before
-C <num> Context
```

The option `-f` is also available to support contextual output, in order to show the complete configuration. The following example shows the difference in output when `-f` option is used versus when it is not.

Using -f:

```
show | grep -f ldap-group1
config user group
  edit "ldap-group1"
    set member "pc40-LDAP"
  next
end
config firewall policy
  edit 2
    set srcintf "port31"
    set dstintf "port32"
    set srcaddr "all"
    set action accept
    set identity-based enable
    set nat enable
    config identity-based-policy
      edit 1
        set schedule "always"
        set groups "ldap-group1"
        set dstaddr "all"
        set service "ALL"
      next
    end
  next
end
```

Without using -f:

```
show | grep ldap-group1
edit "ldap-group1"
  set groups "ldap-group1"
```

Language support and regular expressions

Characters such as ñ, é, symbols, and ideographs are sometimes acceptable input. Support varies by the nature of the item being configured. CLI commands, objects, field names, and options must use their exact ASCII characters, but some items with arbitrary names or values may be input using your language of choice. To use other languages in those cases, you must use the correct encoding.

Input is stored using Unicode UTF-8 encoding but is not normalized from other encodings into UTF-8 before it is stored. If your input method encodes some characters differently than in UTF-8, your configured items may not display or operate as expected.

Regular expressions are especially impacted. Matching uses the UTF-8 character values. If you enter a regular expression using another encoding, or if an HTTP client sends a request in an encoding other than UTF-8, matches may not be what you expect.

For example, with Shift-JIS, backslashes (\) could be inadvertently interpreted as the symbol for the Japanese yen (¥) and vice versa. A regular expression intended to match HTTP requests containing money values with a yen symbol therefore may not work if the symbol is entered using the wrong encoding.

For best results, you should:

- use UTF-8 encoding, or
- use only the characters whose numerically encoded values are the same in UTF-8, such as the US-ASCII characters that are also encoded using the same values in ISO 8859-1, Windows code page 1252, Shift-JIS and other encodings, or
- for regular expressions that must match HTTP requests, use the same encoding as your HTTP clients.

HTTP clients may send requests in encodings other than UTF-8. Encodings usually vary by the client's operating system or input language. If you cannot predict the client's encoding, you may only be able to match any parts of the request that are in English, because regardless of the encoding, the values for English characters tend to be encoded identically. For example, English words may be legible regardless of interpreting a web page as either ISO 8859-1 or as GB2312, whereas simplified Chinese characters might only be legible if the page is interpreted as GB2312.

If you configure your FortiGate unit using other encodings, you may need to switch language settings on your management computer, including for your web browser or Telnet/SSH client. For instructions on how to configure your management computer's operating system language, locale, or input method, see its documentation.

If you choose to configure parts of the FortiGate unit using non-ASCII characters, verify that all systems interacting with the FortiGate unit also support the same encodings. You should also use the same encoding throughout the configuration if possible in order to avoid needing to switch the language settings of the web-based manager and your web browser or Telnet/SSH client while you work.

Similarly to input, your web browser or CLI client should normally interpret display output as encoded using UTF-8. If it does not, your configured items may not display correctly in the GUI or CLI. Exceptions include items such as regular expressions that you may have configured using other encodings in order to match the encoding of HTTP requests that the FortiGate unit receives.

To enter non-ASCII characters in the CLI Console:

1. On your management computer, start your web browser and go to the URL for the FortiGate unit's GUI.
2. Configure your web browser to interpret the page as UTF-8 encoded.
3. Log in to the FortiGate unit.
4. Open the CLI Console from the upper right-hand corner.
5. In the title bar of the **CLI Console** widget, click **Edit** (the pencil icon).
6. Enable **Use external command input box** and select **OK**.
7. The **Command** field appears below the usual input and display area of the **CLI Console**.
8. Type a command in this field and press **Enter**.

In the display area, the **CLI Console** widget displays your previous command interpreted into its character code equivalent, such as:

```
edit \743\601\613\743\601\652
```

and the command's output.

To enter non-ASCII characters in a Telnet/SSH client

1. On your management computer, start your Telnet or SSH client.
2. Configure your Telnet or SSH client to send and receive characters using UTF-8 encoding.
Support for sending and receiving international characters varies by each Telnet/SSH client. Consult the documentation for your Telnet/SSH client.

3. Log in to the FortiGate unit.
4. At the command prompt, type your command and press **Enter**.

You may need to surround words that use encoded characters with single quotes (').

Depending on your Telnet/SSH client's support for your language's input methods and for sending international characters, you may need to interpret them into character codes before pressing Enter.

For example, you might need to enter:

```
edit '\743\601\613\743\601\652'
```

5. The CLI displays your previous command and its output.

Screen paging

You can configure the CLI to pause after displaying each page's worth of text when displaying multiple pages of output. When the display pauses, the last line displays `--More--`. You can then either:

- press the **spacebar** to display the next page.
- type **q** to truncate the output and return to the command prompt.

This may be useful when displaying lengthy output, such as the list of possible matching commands for command completion, or a long list of settings. Rather than scrolling through or possibly exceeding the buffer of your terminal emulator, you can simply display one page at a time.

To configure the CLI Console to pause display when the screen is full:

```
config system console
  set output more
end
```

Baud rate

You can change the default baud rate of the local console connection.

To change the baud rate enter the following commands:

```
config system console
  set baudrate {9600 | 19200 | 38400 | 57600 | 115200}
end
```

Editing the configuration file on an external host

You can edit the FortiGate configuration on an external host by first backing up the configuration file to a TFTP server. Then edit the configuration file and restore it to the FortiGate unit.

Editing the configuration on an external host can be timesaving if you have many changes to make, especially if your plain text editor provides advanced features such as batch changes.

To edit the configuration on your computer:

1. Use `execute backup` to download the configuration file to a TFTP server, such as your management computer.
2. Edit the configuration file using a plain text editor that supports Unix-style line endings.

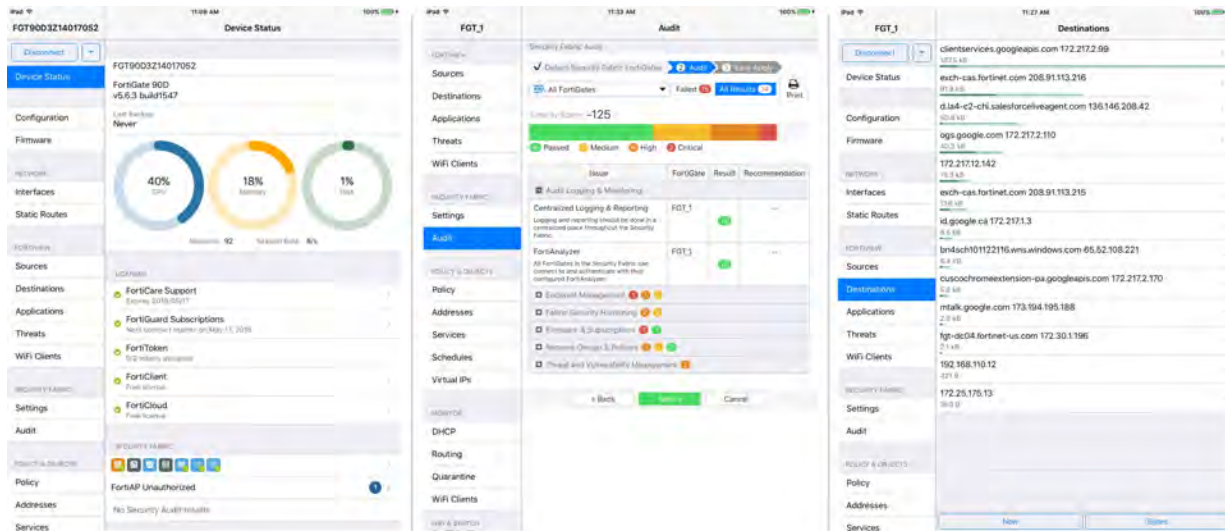

Do not edit the first line. The first line(s) of the configuration file (preceded by a # character) contains information about the firmware version and FortiGate model. If you change the model number, the FortiGate unit will reject the configuration file when you attempt to restore it.

3. Use `execute restore` to upload the modified configuration file back to the FortiGate unit.

The FortiGate unit downloads the configuration file and checks that the model information is correct. If it is correct, the FortiGate unit loads the configuration file and checks each command for errors. If a command is invalid, the FortiGate unit ignores the command. If the configuration file is valid, the FortiGate unit restarts and loads the new configuration.

FortiExplorer for iOS

FortiExplorer for iOS is a user-friendly application that helps you to quickly and easily configure, manage, and monitor FortiGate appliances using an iOS device. FortiExplorer lets you rapidly provision, deploy, and monitor Security Fabric components including FortiGate, FortiWiFi, and FortiAP devices.

FortiExplorer for iOS requires iOS 9.3 or later and is compatible with iPhone, iPad, and iPod Touch. It is supported by FortiOS 5.6+ and is [only available on the App Store](#) for iOS devices.

Advanced features are available with the purchase of FortiExplorer Pro. Paid features include the ability to add more than two devices and the ability to download firmware images from FortiCare.

Up to six members can use this app with 'Family Sharing' enabled in the App Store.

Getting started with FortiExplorer

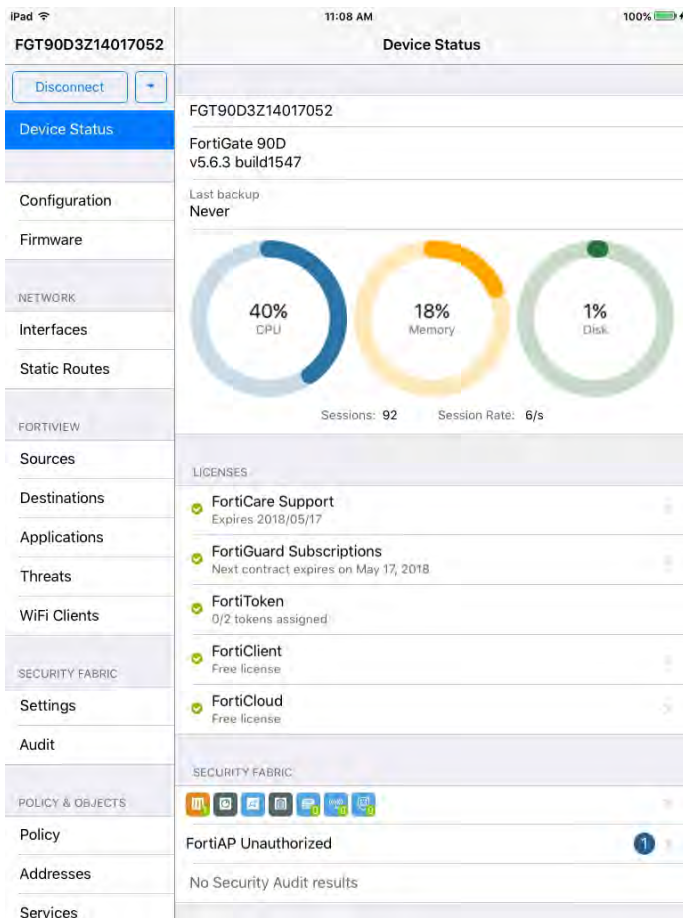

If your FortiGate is accessible on the wireless network, you can connect to it using FortiExplorer provided that your iOS device is on the same network (see [Connecting FortiExplorer to a FortiGate via WiFi](#)). Otherwise, you will need to physically connect your iOS device to the FortiGate using a USB cable (see below).

Connecting FortiExplorer to a FortiGate via USB

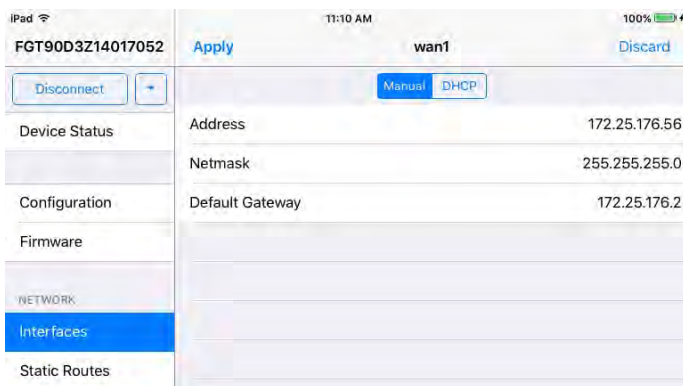

For the purpose of this document, we assume that you are just getting started; you do not have access to the FortiGate over the wireless network, and the FortiGate is in its factory configuration.

1. Connect your iOS device to your FortiGate's USB management port.
If prompted on your iOS device, **Trust** this 'computer'.
2. Open the FortiExplorer app and select your FortiGate from the list under **USB Attached Device**.
3. On the **Login** screen, select **USB**.
4. Enter the default **Username** (**admin**) and leave the **Password** field blank.
5. You can opt to **Remember Password**. Tap **Done** when you are ready.

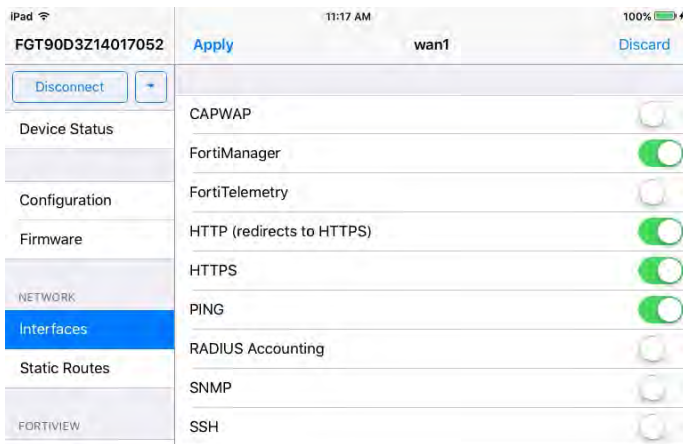

FortiExplorer opens the FortiGate management interface to the **Device Status** page:

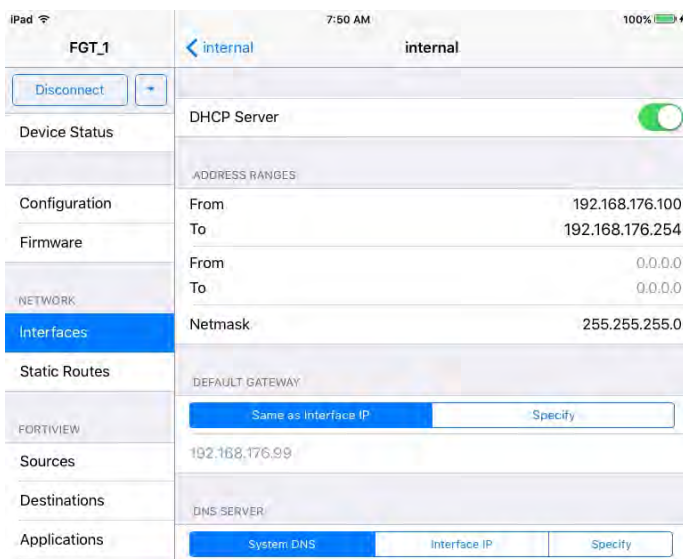

6. Go to **Network > Interfaces** and configure the WAN interface(s).
In the example, the **wan1** interface **Address** mode is set to **DHCP** by default. Set it to **Manual** and enter its **Address**, **Netmask**, and **Default Gateway**, and then **Apply** your changes.

7. (Optional) Configure **Administrative Access** to allow **HTTP** and **HTTPS** access.
This will allow administrators to access the FortiGate web-based manager using a web browser.

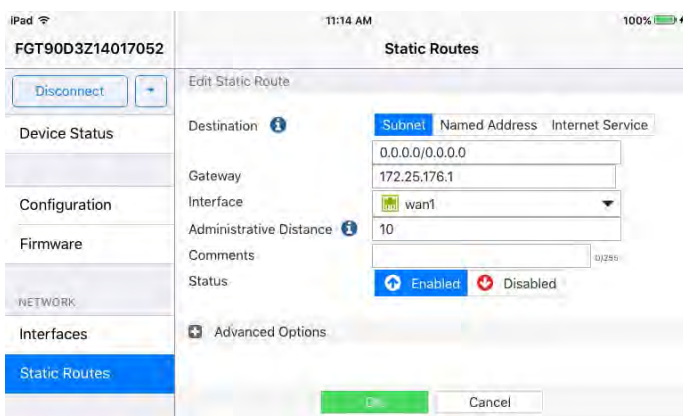

8. Go to **Network > Interfaces** and configure the local network (internal) interface. Set the **Address** mode as before and configure **Administrative Access** if desired.
9. Configure a **DHCP Server** for the internal network subnet.

Return to the internal interface using the  button at the top of the screen.

10. Go to **Network > Static Routes** and configure the static route to the gateway.

11. Go to **Policy & Objects > Policy** and edit the Internet access policy. As a best practice, provide a **Name** for the policy, enable the desired **Security Profiles**, and configure **Logging Options**. Select **OK** to finalize.

The screenshot displays the 'Edit Policy' interface in the FortiGate iOS app. The left sidebar contains a navigation menu with categories like NETWORK, FORTIVIEW, SECURITY FABRIC, and POLICY & OBJECTS. The 'Policy' option is currently selected. The main content area is titled 'Edit Policy' and includes several configuration sections:

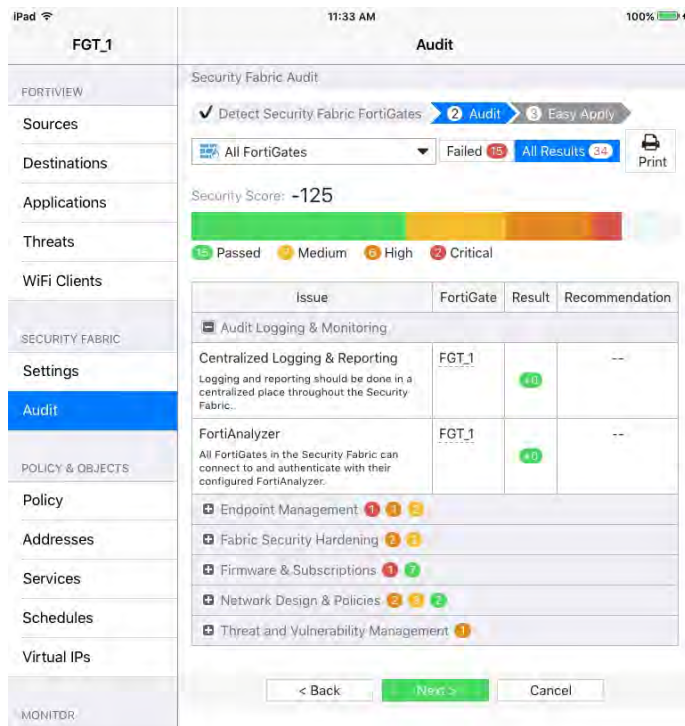

- Basic Policy Settings:** Fields for Name, Incoming Interface (set to 'internal'), Outgoing Interface (set to 'wan1'), Source (set to 'all'), Destination (set to 'all'), Schedule (set to 'always'), and Service (set to 'ALL'). The Action is configured to 'ACCEPT'.
- Firewall / Network Options:** Includes NAT and IP Pool Configuration (with options for 'Use Outgoing Interface Address' and 'Use Dynamic IP Pool').
- Security Profiles:** A list of profiles with toggle switches for AntiVirus, Web Filter, DNS Filter, Application Control, and SSL Inspection.
- Logging Options:** Includes 'Log Allowed Traffic' (with tabs for 'Security Events' and 'All Sessions') and 'Capture Packets'.
- Comments:** A text field for adding remarks, currently showing 'Write a comment...'.
- Enable this policy:** A toggle switch at the bottom.

 At the very bottom, there are 'OK' and 'Cancel' buttons to save or discard changes.

Running a Security Fabric Audit

The FortiGate is now configured in a very basic state. Once you've configured the other potential elements of your network, such as other **Interfaces**, **Schedules**, or **Managed FortiAPs**, it is recommended that you run a **Security Fabric Audit** to identify potential vulnerabilities and highlight best practices that could be used to improve your network's overall security and performance.

Follow the steps of the Security Fabric Audit (under **Security Fabric > Audit**) to determine a **Security Score** for the selected device(s). The results should identify issues ranging from Medium to Critical importance, and may provide recommended actions where possible.

Connecting FortiExplorer to a FortiGate via WiFi

If your FortiGate is accessible on the wireless network, you can connect to it using FortiExplorer provided that your iOS device is on the same network. Assuming this is the case:

1. Open the FortiExplorer app and select **Add** from the **Devices** page.
2. Enter the **Host** information and appropriate **Username** and **Password** credentials. If necessary, change the default **Port** number, and opt to **Remember Password**.

3. If the FortiGate device identity cannot be verified, click **Connect** at the prompt.
FortiExplorer opens the FortiGate management interface to the **Device Status** page.

Upgrading to FortiExplorer Pro

Paid features provided with the purchase of FortiExplorer Pro include the ability to add more than two devices and the ability to download firmware images from FortiCare.

- To upgrade to FortiExplorer Pro, open the FortiExplorer app, go to **Settings** and select **Upgrade to FortiExplorer Pro**. Follow the on-screen prompts.

LED Specifications

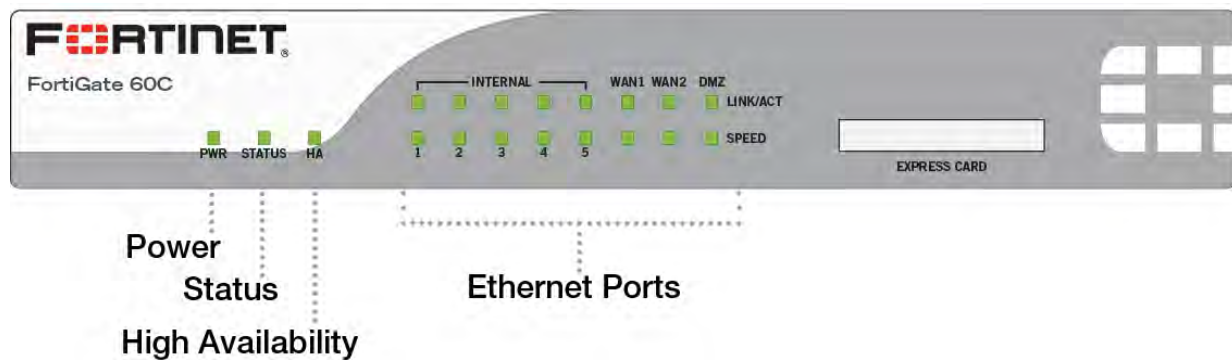

The following section includes information regarding FortiGate LED status indicators.

- [Sample FortiGate faceplates](#)
- [LED status codes](#)
- [About alarm levels](#)
- [LED status codes for ports](#)

Sample FortiGate faceplates

The faceplates indicate where the LEDs are typically found on desktop and mid-range FortiGate models.

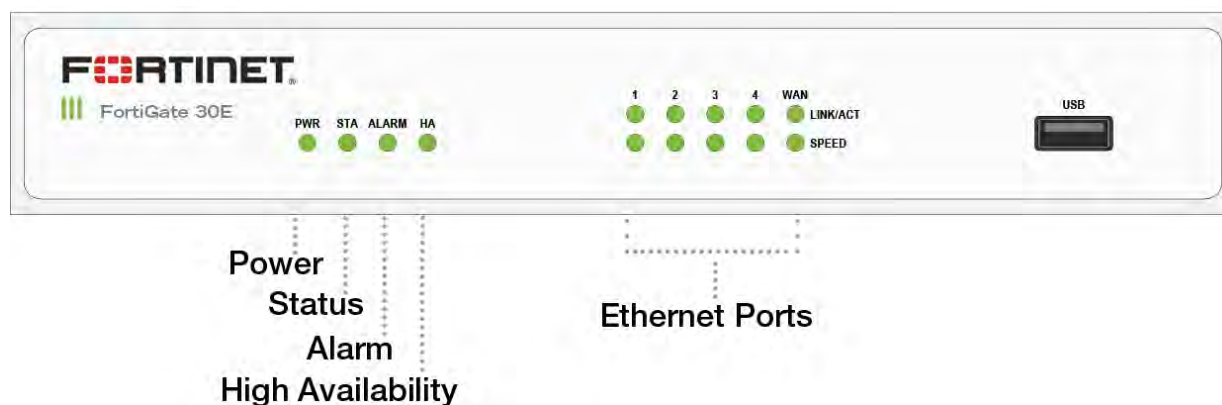

FortiGate 60C

FortiGate 100D

FortiGate 30E

LED status codes

LABEL	STATE	MEANING
PWR	Green	Power is On.
	Off	Power is Off.
STA	Green	Normal status.
	Flashing Green	Booting Up. If the FortiGate has a reset button, Flashing Green also means that the reset button was used.
	Red	The FortiGate has a critical alarm (see About Alarm Levels).
ALARM	Off	No alarms or the FortiGate has a minor alarm.
	Amber	The FortiGate has a major alarm.
	Red	The FortiGate has a critical alarm. The status LED will also be red.
		More information at About Alarm Levels .
HA	Green	The FortiGate is operating in an FGCP HA cluster.
	Red	A failover has occurred. This usually means that one of the FortiGates in an HA cluster has failed or that HA heartbeat communication between the FortiGates in the HA cluster has failed or been interrupted.
	Off	HA not configured.
		Failover operation feature not available in all units.

LABEL	STATE	MEANING
WIFI	Green	Wireless port is active.
	Flashing Green	Wireless interface is transmitting and receiving data.
	Off	Wireless interface is down.

About alarm levels

Minor, major, and critical alarms are defined based on IPMI, ATCA, and Telco standards for naming alarms.

- A minor alarm (also called an IPMI non-critical (NC) alarm) indicates a temperature or a power level outside of the normal operating range that is not considered a problem. In the case of a minor temperature alarm, the system could respond by increasing fan speed. A non-critical threshold can be an upper non-critical (UNC) threshold (for example, a high temperature or a high power level) or a lower non-critical (LNC) threshold (for example, a low power level). The LEDs do not indicate minor alarms since user intervention is not required.
- A major alarm (also called an IPMI critical or critical recoverable (CR) alarm) indicates that the system itself cannot correct the cause for the alarm and that intervention is required. For example, the cooling system cannot provide enough cooling to reduce the temperature. It could also mean that conditions (e.g. temperature) are approaching the outside limit of the allowed operating range. A critical threshold can also be an upper critical (UC) threshold (e.g. a high temperature or a high power level) or a lower critical (LC) threshold (e.g. a low power level).
- A critical alarm (also called an IPMI non-recoverable (NR) alarm) indicates detection of a temperature or power level that is outside of the allowed operating range and could potentially cause physical damage.

LED status codes for ports

TYPE OF PORT	STATE	MEANING
Ethernet Ports Link / Activity	Green	Connected.
	Flashing Green	Transmitting and receiving data.
	Off	No link established.
		On FortiGate models with front-facing ports, this LED is to the left of the port. On FortiGate models with ports at the back of the device, this LED is in the upper row.
SFP Ports	Green	Connected.
	Flashing Green	Transmitting and receiving data.
	Off	No link established.

TYPE OF PORT	STATE	MEANING
Ethernet Ports Speed	Green	Connected at 1Gbps.
	Amber	Connected at 100Mbps.
	Off	Not connected or connected at 10Mbps.
		On FortiGate models with front-facing ports, this LED is to the right of the port. On FortiGate models with ports at the back of the device, this LED is in the lower row.

Inspection Mode

To control your FortiGate's security profile inspection mode in FortiOS 5.6, you can select **Flow-based** or **Proxy** inspection modes from **System > Settings**. Having control over flow and proxy mode is helpful if you want to ensure that only flow inspection mode is used.

In most cases proxy mode is preferred because more security profile features are available along with more configuration options for these individual features. Some implementations, however, may require all security profile scanning to only use flow mode. In this case, you can set your FortiGate to flow mode knowing that proxy mode inspection will not be used.

Setting up the FortiGate to operate in these new modes (or to operate in the other available operating modes) involves going to **System > Settings** and changing the **Inspection Mode** and **NGFW Mode**.

NGFW mode simplifies applying application control and web filtering to traffic by allowing you to add applications and web filtering profiles directly to policies.

Transparent proxy allows you to apply web authentication to HTTP traffic without using the explicit proxy.

Changing inspection and policy modes

To change inspection modes, go to **System > Settings**. You can select **Flow-based** to operate in flow mode or **Proxy** to operate in proxy mode.

NGFW policy mode

When you select **Flow-based** as the **Inspection Mode**, you have the option to select an **NGFW Mode**. **Profile-based** mode works the same as flow-based mode did in FortiOS 5.4.

In **Policy-based** mode, you add applications and web filtering profiles directly to a policy without having to first create and configure Application Control or Web Filtering profiles.

When you change to **Flow-based** inspection, all proxy mode profiles are converted to flow mode, removing any proxy settings. In addition, proxy-mode only features (for example, Web Application Profile) are removed from the GUI.

If your FortiGate has multiple VDOMs, you can set the inspection mode independently for each VDOM. Go to **System > VDOM**. Click **Edit** for the VDOM you wish to change and select the **Inspection Mode**.

CLI syntax

The following CLI command can be used to configure inspection and policy modes:

```
config system settings
    set inspection-mode {proxy | flow}
    set policy-mode {standard | ngfw}
end
```

Security profile features mapped to inspection mode

The table below lists FortiOS security profile features and shows whether they are available in flow-based or proxy-based inspection modes.

Security Profile Feature	Flow-based inspection	Proxy-based inspection
AntiVirus	x	x
Web Filter	x	x
DNS Filter	x	x
Application Control	x	x
Intrusion Protection	x	x
Anti-Spam		x
Data Leak Protection		x
VoIP		x
ICAP		x
Web Application Firewall		x
FortiClient Profiles	x	x
Proxy Options	x	x
SSL Inspection	x	x
SSH Inspection		x
Web Rating Overrides	x	x
Web Profile Overrides		x

From the GUI, you can only configure antivirus and web filter security profiles in proxy mode. From the CLI, you can configure flow-based antivirus profiles, web filter profiles, and DLP profiles and they will appear on the GUI and include their inspection mode setting. Flow-based profiles created when in flow mode are still available when you switch to proxy mode.

In flow mode, antivirus and web filter profiles only include flow-mode features. Web filtering and virus scanning is still done with the same engines and to the same accuracy, but some inspection options are limited or not available in flow mode. Application control, intrusion protection, and FortiClient profiles are not affected when switching between flow and proxy mode.

Even though VoIP profiles are not available from the GUI in flow mode, the FortiGate can process VoIP traffic. In this case the appropriate session helper is used (for example, the SIP session helper).

Setting flow or proxy mode doesn't change the settings available from the CLI. However, when in flow mode you can't save security profiles that are set to proxy mode.

You can also add proxy-only security profiles to firewall policies from the CLI. So, for example, you can add a VoIP profile to a security policy that accepts VoIP traffic. This practice isn't recommended because the setting will not be visible from the GUI.

Proxy mode and flow mode antivirus and web filter profile options

The following tables list the antivirus and web filter profile options available in proxy and flow modes.

Antivirus features in proxy and flow mode

Feature	Proxy	Flow
Scan Mode (Quick or Full)		x
Detect viruses (Block or Monitor)	x	x
Inspected protocols	x	(all relevant protocols are inspected)
Inspection Options	x	x (not available for quick scan mode)
Treat Windows Executables in Email Attachments as Viruses	x	x
Send Files to FortiSandbox Appliance for Inspection	x	x
Use FortiSandbox Database	x	x
Include Mobile Malware Protection	x	x

Web Filter features in proxy and flow mode

Feature	Proxy	Flow
FortiGuard category based filter	x	x (show, allow, monitor, block)
Category Usage Quota	x	
Allow users to override blocked categories (on some models)	x	
Search Engines	x	

Feature		Proxy Flow	
	Enforce 'Safe Search' on Google, Yahoo!, Bing, Yandex	x	
	Restrict YouTube Access	x	
	Log all search keywords	x	
Static URL Filter		x	x
	Block invalid URLs	x	
	URL Filter	x	x
	Block malicious URLs discovered by FortiSandbox	x	x
	Web Content Filter	x	x
Rating Options		x	x
	Allow websites when a rating error occurs	x	x
	Rate URLs by domain and IP Address	x	x
	Block HTTP redirects by rating	x	
	Rate images by URL	x	
Proxy Options		x	
	Restrict Google account usage to specific domains	x	
	Provide details for blocked HTTP 4xx and 5xx errors	x	
	HTTP POST Action	x	
	Remove Java Applets	x	
	Remove ActiveX	x	
	Remove Cookies	x	
	Filter Per-User Black/White List	x	

Basic Administration

This section contains information about basic FortiGate administration that can be done after you have installed the unit in your network.

While this section mainly focuses on accomplishing tasks with the GUI, some tasks include instructions to use the CLI. You can access the CLI using the GUI or FortiExplorer, or via SSH or Telnet connection. For more information about the CLI, see [Using the CLI](#).

Registration

In order to have full access to Fortinet Support and FortiGuard Services, you must register your FortiGate.

Registering your FortiGate:

1. Go to the **Dashboard** and locate the **Licenses** widget.
2. Click on **FortiCare Support** to display a pop-up window and **Register**.
3. In the pop-up window, either use an existing Fortinet Support account or create a new one. Select your **Country** and **Reseller**.
4. Select **OK**.

FortiGate platforms do not impose any limitations on the number or type of customers, users, devices, IP addresses, or number of VPN clients being served by the platform. Such factors are limited solely by the hardware capacity of each given model.

System Settings

There are several system settings that should be configured once your FortiGate is installed:

- [Default administrator password](#)
- [Settings](#)
 - [Changing the host name](#)
 - [Central Management](#)
 - [System Time](#)
 - [Administration Settings](#)
 - [Password Policy](#)
 - [View Settings](#)
- [Administrator password retries and lockout time](#)

Default administrator password

By default, your FortiGate has an administrator account set up with the username `admin` and no password. In order to prevent unauthorized access to the FortiGate, it is highly recommended that you add a password to this account.

To change the default password:

1. Go to **System > Administrators**.
2. Edit the **admin** account.
3. Select **Change Password**.
4. Enter the **New Password** and re-enter the password for confirmation.
5. Select **OK**.

For details on selecting a password and password best practices, see the section on [Passwords](#).

It is also recommended to change the user name of this account; however, since you cannot change the user name of an account that is currently in use, a second administrator account will need to be created in order to do this. For more information about creating and using administrator accounts, see the Administrators section of the [System Administration](#) chapter.

Settings

Settings can be accessed by going to **System > Settings**. On this page, you can change the **Host name**, designate the centralized security management for your FortiGate in **Central Management**, set the system time and identify time zone in **System Time**, configure HTTP, HTTPS, SSH, and Telnet ports as well as idle timeout in **Administration Settings**, designate the **Password Policy**, and manage display options and designate inspection mode in **View Settings**.

Changing the host name

The host name of your FortiGate appears in the **Hostname** row in the **System Information** widget on the Dashboard. The host name also appears at the CLI prompt when you are logged in to the CLI, and as the SNMP system name.

To change the host name on the FortiGate

Go to **System > Settings** and type in the new name in the **Host name** row. The only administrators that can change a FortiGate's host name are administrators whose admin profiles permit system configuration write access. If the FortiGate is part of an HA cluster, you should use a unique host name to distinguish the FortiGate from others in the cluster.

Central Management

You can manage any size Fortinet security infrastructure, from a few devices to thousands of appliances, by using FortiManager or FortiCloud. You can configure your FortiGate for either of these centralized security management services through Central Management. Be sure that you have registered your device with the FortiManager appliance or FortiCloud host. For more information on configuring your FortiGate for Central Management, see [Adding a FortiGate to FortiManager](#) or [FortiCloud](#).

System Time

For effective scheduling and logging, the FortiGate system time and date should be accurate. You can either manually set the system time and date or configure the FortiGate to automatically synchronize with a Network Time Protocol (NTP) server.

NTP enables you to keep the FortiGate time synchronized with other network systems. By enabling NTP on the FortiGate, FortiOS will check with the NTP server you select at the configured intervals. This will also ensure that logs and other time-sensitive settings on the FortiGate are correct.

The FortiGate maintains its internal clock using a built-in battery. At start up, the time reported by the FortiGate will indicate the hardware clock time, which may not be accurate. When using NTP, the system time might change after the FortiGate has successfully obtained the time from a configured NTP server.

By default, FortiOS has the daylight savings time configuration enabled. The system time must be manually adjusted after daylight saving time ends. To disable DST, enter the following commands in the CLI:

```
config system global
  set dst disable
end
```

To set the date and time

1. Go to the **System > Settings**.
2. Under **System Time**, select your **Time Zone** by using the drop-down menu.
3. **Set Time** by either selecting **Synchronize with NTP Server** or **Manual settings**. If you select synchronization, you can either use the default FortiGuard servers or specify a custom server. You can also set the **Sync interval**.
4. If you use an NTP server, you can identify a specific interface for this self-originating traffic by enabling **Setup device as local NTP server**.
5. Select **Apply**.

Administration Settings

In order to improve security, you can change the default port configurations for administrative connections to the FortiGate. When connecting to the FortiGate when the port has changed, the port must be included, such as `https://<ip_address>:<port>`. For example, if you are connecting to the FortiGate using port 99, the URL would be `https://192.168.1.99:99`.

To configure the port settings:

1. Go to **System > Settings**.
2. Under **Administration Settings**, change the port numbers for HTTP, HTTPS, SSH, and/or Telnet as needed. You can also select **Redirect to HTTPS** in order to avoid HTTP being used for the administrators.
3. Select **Apply**.

When you change the default port number for HTTP, HTTPS, SSH, or Telnet, ensure that the port number is unique. If a conflict exists with a particular port, a warning message will appear.

By default, the GUI disconnects administrative sessions if no activity occurs for five minutes. This prevents someone from using the GUI if the management PC is left unattended.

To change the idle timeout

1. Go to **System > Settings**.
2. In the **Administration Settings** section, enter the time in minutes in the **Idle timeout** field.
3. Select **Apply**.

Password Policy

The FortiGate includes the ability to create a password policy for administrators and IPsec pre-shared keys. With this policy, you can enforce regular changes and specific criteria for a password including:

- minimum length between 8 and 64 characters.
- if the password must contain uppercase (A, B, C) and/or lowercase (a, b, c) characters.
- if the password must contain numbers (1, 2, 3).
- if the password must contain special or non-alphanumeric characters (!, @, #, \$, %, ^, &, *, (, and)).
- where the password applies (admin or IPsec or both).
- the duration of the password before a new one must be specified.

To create a password policy - GUI

1. Go to **System > Settings**.
2. Configure **Password Policy** settings as required.
3. Click **Apply**.

If you add a password policy or change the requirements on an existing policy, the next time that administrator logs into the FortiGate, they are prompted to update their password to meet the new requirements before proceeding to log in.

For information about recovering a lost password and enhancements to the process, see: [Resetting a lost Admin password](#) on the Fortinet Cookbook site.

View Settings

Three settings can change the presentation of information in the GUI: **Language**, **Lines per page**, and **Theme**.

To change the language, go to **System > Settings**. Select the language you want from the **Language** drop-down list: English (the default), French, Spanish, Portuguese, Japanese, Traditional Chinese, Simplified Chinese, or Korean. For best results, you should select the language that is used by the management computer.

To change the number of lines per page displayed in the GUI tables, set **Lines per page** to a value between 20 and 1,000. The default is 50 lines per page.

Five color themes are currently available: Green (the default), Red, Blue, Melongene, and Mariner. To change your theme, select the color from the **Theme** drop-down list.

This is also where you select either **Flow-based** or **Proxy Inspection Mode**. If you select Flow-based mode, then you need to specify if it is **NGFW Profile-based** or **NGFW Policy-based** inspection.

Administrator password retries and lockout time

By default, the FortiGate sets the number of password retries at three, allowing the administrator a maximum of three attempts to log into their account before locking the account for a set amount of time.

Both the number of attempts (`admin-lockout-threshold`) and the wait time before the administrator can try to enter a password again (`admin-lockout-duration`) can be configured within the CLI.

To configure the lockout options:

```
config system global
    set admin-lockout-threshold <failed_attempts>
```

```
set admin-lockout-duration <seconds>
end
```

The default value of `admin-lockout-threshold` is 3 and the range of values is between 1 and 10. The `admin-lockout-duration` is set to 60 seconds by default and the range of values is between 1 and 4294967295 seconds.

Keep in mind that the higher the lockout threshold, the higher the risk that someone may be able to break into the FortiGate unit.

Example:

To set the `admin-lockout-threshold` to one attempt and the `admin-lockout-duration` to a five minute duration before the administrator can try to log in again, enter the commands:

```
config system global
set admin-lockout-threshold 1
set admin-lockout-duration 300
end
```

If the time span between the first failed login attempt and the `admin-lockout-threshold` failed login attempt is less than `admin-lockout-duration`, the lockout will be triggered.

Passwords

Using secure passwords are vital for preventing unauthorized access to your FortiGate. When changing the password, consider the following to ensure better security:

- Do not make passwords that are obvious, such as the company name, administrator names, or other obvious words or phrases.
- Use numbers in place of letters, for example, `passw0rd`.
- Administrator passwords can be up to 64 characters.
- Include a mixture of letters, numbers, and upper and lower case.
- Use multiple words together, or possibly even a sentence, for example `keytothehighway`.
- Use a password generator.
- Change the password regularly and always make the new password unique and not a variation of the existing password, such as changing from `password` to `password1`.
- Make note of the password and store it in a safe place away from the management computer, in case you forget it or ensure that at least two people know the password in the event that one person becomes ill, is away on vacation, or leaves the company. Alternatively, have two different admin logins.

Downgrades will typically maintain the administrator password. If you need to downgrade to FortiOS 4.3, remove the password before the downgrade, then log in after the downgrade and re-configure the password.

Password policy

The FortiGate includes the ability to create a password policy for administrators and IPsec pre-shared keys. With this policy, you can enforce regular changes and specific criteria for a password including:

- minimum length between 8 and 64 characters.
- if the password must contain uppercase (A, B, C) and/or lowercase (a, b, c) characters.
- if the password must contain numbers (1, 2, 3).
- if the password must contain special or non-alphanumeric characters (!, @, #, \$, %, ^, &, *, (, and)).
- where the password applies (admin or IPsec or both).
- the duration of the password before a new one must be specified.

To create a password policy - GUI

1. Go to **System > Settings**.
2. Configure **Password Policy** settings as required.
3. Click **Apply**.

If you add a password policy or change the requirements on an existing policy, the next time that administrator logs into the FortiGate, they are prompted to update their password to meet the new requirements before proceeding to log in.

For information about recovering a lost password and enhancements to the process, see: [Resetting a lost Admin password](#) on the Fortinet Cookbook site.

Firmware

Fortinet periodically updates the FortiGate firmware to include new features and resolve important issues. After you have registered your FortiGate unit, you can download firmware updates from the support web site, <https://support.fortinet.com>.

Before you install any new firmware, be sure to follow the steps below:

- Review the Release Notes for a new firmware release.
- Review the [Supported Upgrade Paths](#) Sys Admin note on the Fortinet Cookbook site to make sure the upgrade from your current image to the desired new image is supported.
- Backup the current configuration, including local certificates.
- Test the new firmware until you are satisfied that it applies to your configuration.

Installing new firmware without reviewing release notes or testing the firmware may result in changes to settings or unexpected issues.

Only FortiGate admin users and administrators whose access profiles contain system read and write privileges can change the FortiGate firmware.

Backing up the current configuration

You should always back up the configuration before installing new firmware, in case you need to restore your FortiGate configuration.

To create a local backup:

1. Open to the administrator's dropdown menu in the top-right corner of the GUI and select **Configuration > Backup**.
2. Choose either **Local PC** or **USB Disk** to save the configuration file. The USB option will not be available if there is no USB drive in the USB port.
3. If desired, select **Encryption**.
4. Select **OK**.

For more information, see [Configuration Backups](#).

Downloading firmware

Firmware images for all FortiGate units are available on the Fortinet Customer Support website, <https://support.fortinet.com>.

To download firmware:

1. Log into the site using your user name and password.
2. Go to **Download > Firmware Images**.
3. A list of Release Notes is shown. If you have not already done so, download and review the Release Notes for the firmware you wish to upgrade your FortiGate unit to.
4. Select **Download**.

Firmware can also be downloaded using FTP; however, as FTP is not an encrypted file transferring protocol, HTTPS downloading is recommended.

5. Navigate to the folder for the firmware version you wish to use.
6. Select your FortiGate model from the list. If your unit is a FortiWiFi, the firmware will have a filename starting with 'FWF'.
7. Save the firmware image to your computer.

Testing new firmware

The integrity of firmware images downloaded from Fortinet's support portal can be verified using a file checksum. A file checksum that does not match the expected value indicates a corrupt file. The corruption could be caused by errors in transfer or by file modification. A list of expected checksum values for each build of released code is available on Fortinet's support portal.

Image integrity is also verified when the FortiGate is booting up. This integrity check is done through a cyclic redundancy check (CRC). If the CRC fails, the FortiGate unit will encounter an error during the boot process.

Lastly, firmware images are signed and the signature is attached to the code as it is built. When upgrading an image, the running OS will generate a signature and compare it with the signature attached to the image. If the signatures do not match, the new OS will not load.

Testing before installation

FortiOS lets you test a new firmware image by installing the firmware image from a system reboot and saving it to system memory. After completing this procedure, the FortiGate unit operates using the new firmware image with the current configuration. This new firmware image is not permanently installed. The next time the FortiGate unit restarts, it operates with the originally installed firmware image using the current configuration. If the new firmware image operates successfully, you can install it permanently using the procedure explained in [Testing new firmware on page 346](#).

To use this procedure, you must connect to the CLI using the FortiGate console port and an RJ-45 to DB-9 or null modem cable. This procedure temporarily installs a new firmware image using your current configuration.

For this procedure, you must install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

To test the new firmware image:

1. Connect to the CLI using an RJ-45 to DB-9 or null modem cable.
2. Make sure the TFTP server is running.
3. Copy the new firmware image file to the root directory of the TFTP server.
4. Make sure the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Enter the following command to restart the FortiGate unit:

```
execute reboot
```
6. As the FortiGate unit reboots, press any key to interrupt the system startup. As the FortiGate unit starts, a series of system startup messages appears:

```
Press any key to display configuration menu....
```

7. Immediately press any key to interrupt the system startup.

You have only three (3) seconds to press any key. If you do not press a key quickly enough, the FortiGate unit reboots and you must log in and repeat the `execute reboot` command.

If you successfully interrupt the startup process, the following messages appears:

```
[G]: Get firmware image from TFTP server.
[F]: Format boot device.
[B]: Boot with backup firmware and set as default
[C]: Configuration and information
[Q]: Quit menu and continue to boot with default firmware.
[H]: Display this list of options.
Enter G, F, Q, or H:
```

8. Type **G** to get the new firmware image from the TFTP server. The following message appears:
Enter TFTP server address [192.168.1.168]:
9. Type the address of the TFTP server and press **Enter**. The following message appears:
Enter Local Address [192.168.1.188]:
10. Type an IP address of the FortiGate unit to connect to the TFTP server. The IP address must be on the same network as the TFTP server.

Make sure you do not enter the IP address of another device on this network.

The following message appears:

```
Enter File Name [image.out]:
```

11. Enter the firmware image file name and press **Enter**. The TFTP server uploads the firmware image file to the FortiGate unit and the following appears:
Save as Default firmware/Backup firmware/Run image without saving: [D/B/R]
12. Type **R**. The FortiGate image is installed to system memory and the FortiGate unit starts running the new firmware image, but with its current configuration.

You can test the new firmware image as required. When done testing, you can reboot the FortiGate unit, and the FortiGate unit will resume using the firmware that was running before you installed the test firmware.

Upgrading the firmware

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date. You can also use the CLI command `execute update-now` to update the antivirus and attack definitions.

Always remember to back up your configuration before making any changes to the firmware.

Be sure to read the topics on [downloading](#) and [testing](#) firmware before upgrading.

To upgrade the firmware - GUI:

1. Log into the GUI as the admin administrative user.
2. Go to **System > Firmware**.
3. Under **Upload Firmware**, select **Browse** and locate the firmware image file.
4. Select **OK**.

The FortiGate unit uploads the firmware image file, upgrades to the new firmware version, restarts, and displays the FortiGate login. This process takes a few minutes.

You can also upgrade firmware using Secure File Copy (SCP). See [How to download/upload a FortiGate configuration file using secure file copy \(SCP\)](#).

You enable SCP support using the following command:

```
config system global
    set admin-scp enable
end
```

For more information about this command and about SCP support, see [config system global](#).

To upgrade the firmware - CLI:

Before you begin, ensure you have a TFTP server running and accessible to the FortiGate unit.

1. Make sure the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log into the CLI.
4. Make sure the FortiGate unit can connect to the TFTP server. You can use the following command to ping the computer running the TFTP server. For example, if the IP address of the TFTP server is 192.168.1.168:

```
execute ping 192.168.1.168
```

5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

```
execute restore image tftp <filename> <tftp_ipv4>
```

Where `<name_str>` is the name of the firmware image file and `<tftp_ipv4>` is the IP address of the TFTP server. For example, if the firmware image file name is `image.out` and the IP address of the TFTP server is 192.168.1.168, enter:

```
execute restore image tftp image.out 192.168.1.168
```

The FortiGate unit responds with the message:

```
This operation will replace the current firmware version!
Do you want to continue? (y/n)
```

6. Type `y`. The FortiGate unit uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.
7. Reconnect to the CLI.
8. Update antivirus and attack definitions, by entering:

```
execute update-now
```

Reverting to a previous firmware version

The following procedure reverts the FortiGate unit to its factory default configuration and deletes any configuration settings. If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.

Always remember to back up your configuration before making any changes to the firmware.

To revert to a previous firmware version - GUI:

1. Log into the GUI as the admin user.
2. Go to **System > Firmware**.
3. Under **Upload Firmware**, select **Browse** and locate the firmware image file.
4. Select **OK**.

The FortiGate unit uploads the firmware image file, reverts to the old firmware version, resets the configuration, restarts, and displays the FortiGate login. This process takes a few minutes.

To revert to a previous firmware version - CLI:

Before beginning this procedure, it is recommended that you:

- Backup the FortiGate unit system configuration using the command `execute backup config`.
- Backup the IPS custom signatures using the command `execute backup ipsuserdefsig`.
- Backup web content and email filtering lists.

To use the following procedure, you must have a TFTP server the FortiGate unit can connect to.

1. Make sure the TFTP server is running.
2. Copy the firmware image file to the root directory of the TFTP server.
3. Log into the FortiGate CLI.
4. Make sure the FortiGate unit can connect to the TFTP server by using the `execute ping` command.
5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

```
execute restore image tftp <name_str> <tftp_ipv4>
```

Where `<name_str>` is the name of the firmware image file and `<tftp_ipv4>` is the IP address of the TFTP server. For example, if the firmware image file name is `imagev28.out` and the IP address of the TFTP server is `192.168.1.168`, enter:

```
execute restore image tftp image28.out 192.168.1.168
```

The FortiGate unit responds with this message:

```
This operation will replace the current firmware version!
Do you want to continue? (y/n)
```

6. Type `y`. The FortiGate unit uploads the firmware image file. After the file uploads, a message similar to the following appears:

```
Get image from tftp server OK.
Check image OK.
```

```
This operation will downgrade the current firmware version!  
Do you want to continue? (y/n)
```

7. Type `y`. The FortiGate unit reverts to the old firmware version, resets the configuration to factory defaults, and restarts. This process takes a few minutes.
8. Reconnect to the CLI.
9. To restore your previous configuration, if needed, use the command:

```
execute restore config <name_str> <tftp_ipv4>
```
10. Update antivirus and attack definitions using the command:

```
execute update-now
```

Installing firmware from a system reboot - CLI

In the event that the firmware upgrade does not load properly and the FortiGate unit will not boot, or continuously reboots, it is best to perform a fresh install of the firmware from a reboot using the CLI.

This procedure installs a firmware image and resets the FortiGate unit to default settings. You can use this procedure to upgrade to a new firmware version, revert to an older firmware version, or re-install the current firmware.

To use this procedure, you must connect to the CLI using the FortiGate console port and a RJ-45 to DB-9, or null modem cable. This procedure reverts the FortiGate unit to its factory default configuration.

For this procedure you install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

Before beginning this procedure, ensure you backup the FortiGate unit configuration.

If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

To install firmware from a system reboot:

1. Connect to the CLI using the RJ-45 to DB-9 or null modem cable.
2. Make sure the TFTP server is running.
3. Copy the new firmware image file to the root directory of the TFTP server.
4. Make sure the internal interface is connected to the same network as the TFTP server.
5. To confirm the FortiGate unit can connect to the TFTP server, use the following command to ping the computer running the TFTP server. For example, if the IP address of the TFTP server is 192.168.1.168:

```
execute ping 192.168.1.168
```

6. Enter the following command to restart the FortiGate unit.

```
execute reboot
```

The FortiGate unit responds with the following message:

```
This operation will reboot the system!  
Do you want to continue? (y/n)
```

7. Type **y**. As the FortiGate unit starts, a series of system startup messages appears. When the following messages appears:

Press any key to display configuration menu.....

Immediately press any key to interrupt the system startup.

You have only three (3) seconds to press any key. If you do not press a key quickly enough, the FortiGate unit reboots and you must log in and repeat the `execute reboot` command.

If you successfully interrupt the startup process, the following messages appears:

```
[G]: Get firmware image from TFTP server.
[F]: Format boot device.
[B]: Boot with backup firmware and set as default
[C]: Configuration and information
[Q]: Quit menu and continue to boot with default firmware.
[H]: Display this list of options.
Enter G, F, Q, or H:
```

8. Type **G** to get to the new firmware image form the TFTP server. The following message appears:

Enter TFTP server address [192.168.1.168]:

9. Type the address of the TFTP server and press **Enter**. The following message appears:

Enter Local Address [192.168.1.188]:

10. Type an IP address the FortiGate unit can use to connect to the TFTP server. The IP address can be any IP address that is valid for the network to which the interface is connected.

Make sure you do not enter the IP address of another device on this network.

The following message appears:

Enter File Name [image.out]:

11. Enter the firmware image filename and press **Enter**.
The TFTP server uploads the firmware image file to the FortiGate unit and a message similar to the following appears:

Save as Default firmware/Backup firmware/Run image without saving: [D/B/R]

12. Type **D**. The FortiGate unit installs the new firmware image and restarts. The installation might take a few minutes to complete.

Restoring firmware from a USB key - CLI

1. Log into the CLI.
2. Enter the following command to restore an unencrypted configuration file:

```
execute restore image usb Restore image from USB disk.
{string} Image file name on the USB disk.
```

The FortiGate unit responds with the following message:

```
This operation will replace the current firmware version!  
Do you want to continue? (y/n)
```

3. Type `y`.

Configuration revision

You can manage multiple versions of configuration files on models that have a 512MB flash memory and higher. Revision control requires either a configured central management server or the local hard drive, if your FortiGate has this feature. Typically, configuration backup to local drive is not available on lower-end models.

The central management server can either be a FortiManager unit or FortiCloud.

If central management is not configured on your FortiGate unit, a message appears instructing you to either:

- Enable central management, **or**
- obtain a valid license.

When revision control is enabled on your FortiGate unit, and configuration backups have been made, a list of saved revisions of those backed-up configurations appears.

Configuration revisions are viewed by clicking on **admin** in the upper right-hand corner of the screen and selecting **Configuration > Revisions**.

Controlled upgrade

Using a controlled upgrade, you can upload a new version of the FortiOS firmware to a separate partition in the FortiGate memory for later upgrade. The FortiGate unit can also be configured so that when it is rebooted, it will automatically load the new firmware (CLI only). Using this option, you can stage a number of FortiGate units to do an upgrade simultaneously to all devices using FortiManager or script.

To load the firmware for later installation - CLI:

```
execute restore secondary-image {ftp | tftp | usb} <filename_str>
```

To set the FortiGate unit so that when it reboots, the new firmware is loaded, use the CLI command . . .

```
execute set-next-reboot {primary | secondary}
```

where {primary | secondary} is the partition with the preloaded firmware.

Configuration Backups

Once you successfully configure the FortiGate, it is extremely important that you backup the configuration. In some cases, you may need to reset the FortiGate to factory defaults or perform a TFTP upload of the firmware, which will erase the existing configuration. In these instances, the configuration on the device will have to be recreated, unless a backup can be used to restore it. You should also backup the local certificates, as the unique SSL inspection CA and server certificates that are generated by your FortiGate by default are not saved in a system backup.

It is also recommended that you backup the configuration after *any* future changes are made, to ensure you have the most current configuration available. Also, backup the configuration before any upgrades of the FortiGate's firmware. Should anything happen to the configuration during the upgrade, you can easily restore the saved configuration.

Always backup the configuration and store it on the management computer or off-site. You have the option to save the configuration file to various locations including the local PC, USB key, FTP, and TFTP server. The last two are configurable through the CLI only.

If you have VDOMs, you can back up the configuration of the entire FortiGate or only a specific VDOM. Note that if you are using FortiManager or FortiCloud, full backups are performed and the option to backup individual VDOMs will not appear.

You can also backup and restore your configuration using Secure File Copy (SCP). See [How to download/upload a FortiGate configuration file using secure file copy \(SCP\)](#).

You enable SCP support using the following command:

```
config system global
    set admin-scp enable
end
```

For more information about this command and about SCP support, see [config system global](#).

Backing up the configuration using the GUI

1. Click on **admin** in the upper right-hand corner of the screen and select **Configuration > Backup**.
2. Direct the backup to your **Local PC** or to a **USB Disk**.
The **USB Disk** option will be grayed out if no USB drive is inserted in the USB port. You can also backup to the FortiManager using the CLI.
3. If VDOMs are enabled, indicate whether the scope of the backup is for the entire FortiGate configuration (**Global**) or only a specific VDOM configuration (**VDOM**).
4. If backing up a VDOM configuration, select the VDOM name from the list.
5. Select **Encryption**.
Encryption must be enabled on the backup file to back up VPN certificates.
6. Enter a password and enter it again to confirm it. You will need this password to restore the file.
7. Select **OK**.
8. The web browser will prompt you for a location to save the configuration file. The configuration file will have a .conf extension.

Backing up the configuration using the CLI

Use one of the following commands:

```
execute backup config management-station <comment>
```

or:

```
execute backup config usb <backup_filename> [<backup_password>]
```

or for FTP, note that port number, username are optional depending on the FTP site:

```
execute backup config ftp <backup_filename> <ftp_server> [<port>] [<user_name>]
    [<password>]
```

or for TFTP:

```
execute backup config tftp <backup_filename> <tftp_servers> <password>
```

Use the same commands to backup a VDOM configuration by first entering the commands:

```
config vdom
edit <vdom_name>
```

Backup and restore the local certificates

This procedure exports a server (local) certificate and private key together as a password protected PKCS12 file. The export file is created through a customer-supplied TFTP server. Ensure that your TFTP server is running and accessible to the FortiGate before you enter the command.

To back up the local certificates:

Connect to the CLI and use the following command:

```
execute vpn certificate local export tftp <cert_name> <filename> <tftp_ip>
```

where:

- <cert_name> is the name of the server certificate.
- <filename> is a name for the output file.
- <tftp_ip> is the IP address assigned to the TFTP server host interface.

To restore the local certificates - GUI:

1. Move the output file from the TFTP server location to the management computer.
2. Go to **System > Certificates** and select **Import**.
3. Select the appropriate type of certificate from the dropdown menu and fill in any required fields.
4. Select **Upload**. Browse to the location on the management computer where the exported file has been saved, select the file and select **Open**.
5. If required, enter the **Password** needed to upload the exported file.
6. Select **OK**.

To restore the local certificates - CLI:

Connect to the CLI and use the following command:

```
execute vpn certificate local import tftp <filename> <tftp_ip>
```

Restore a configuration

Should you need to restore a configuration file, use the following steps:

To restore the FortiGate configuration - GUI:

1. Click on **admin** in the upper right-hand corner of the screen and select **Configuration > Restore**.
2. Identify the source of the configuration file to be restored : your **Local PC** or a **USB Disk**.
The **USB Disk** option will be grayed out if no USB drive is inserted in the USB port. You can restore from the FortiManager using the CLI.
3. Enter the path and file name of the configuration file, or select **Browse** to locate the file.
4. Enter a password if required.
5. Select **Restore**.

To restore the FortiGate configuration - CLI:

```
execute restore config management-station normal 0
```

or:

```
execute restore config usb <filename> [<password>]
```

or for FTP, note that port number, username are optional depending on the FTP site:

```
execute restore config ftp <backup_filename> <ftp_server> [<port>] [<user_name>]  
[<password>]
```

or for TFTP:

```
execute restore config tftp <backup_filename> <tftp_server> <password>
```

The FortiGate will load the configuration file and restart. Once the restart has completed, verify that the configuration has been restored.

Troubleshooting

During the installation, some possible errors may occur, but the solutions are usually straightforward.

Error message	Reason and Solution
Configuration file error	<p>This error occurs when attempting to upload a configuration file that is incompatible with the device. This may be due to the configuration file being for a different model or being saved from a different version of firmware.</p> <p>Solution: Upload a configuration file that is for the correct model of FortiGate device and the correct version of the firmware.</p>
Invalid password	<p>When the configuration file is saved, it can be protected by a password. The password entered during the upload process is not matching the one associated with the configuration file.</p> <p>Solution: Use the correct password if the file is password protected.</p>

Configuration revision

You can manage multiple versions of configuration files on models that have a 512MB flash memory and higher. Revision control requires either a configured central management server or the local hard drive, if your FortiGate has this feature. Typically, configuration backup to local drive is not available on lower-end models.

The central management server can either be a FortiManager unit or FortiCloud.

If central management is not configured on your FortiGate unit, a message appears instructing you to either:

- Enable central management, **or**
- obtain a valid license.

When revision control is enabled on your FortiGate unit, and configuration backups have been made, a list of saved revisions of those backed-up configurations appears.

Configuration revisions are viewed by clicking on **admin** in the upper right-hand corner of the screen and selecting **Configuration > Revisions**.

Restore factory defaults

There may be a need to reset the FortiGate to its original defaults; for example, to begin with a fresh configuration. There are two options when restoring factory defaults. The first resets the entire device to the original out-of-the-box configuration.

You can reset using the CLI by entering the command:

```
execute factoryreset
```

When prompted, type `y` to confirm the reset.

Alternatively, in the CLI you can reset the factory defaults but retain the interface and VDOM configuration. Use the following command:

```
execute factoryreset2
```

FortiGuard

The FortiGuard Distribution Network (FDN) of servers provides updates to antivirus, antispam, and IPS definitions to your FortiGate. FortiGuard Subscription Services provides comprehensive Unified Threat Management (UTM) security solutions to enable protection against content and network level threats.

The FortiGuard team can be found around the globe, monitoring virus, spyware and vulnerability activities. As vulnerabilities are found, signatures are created and pushed to the subscribed FortiGates. The Global Threat Research Team enables Fortinet to deliver a combination of multi-layered security intelligence and provide true zero-day protection from new and emerging threats. The FortiGuard Network has data centers around the world located in secure, high availability locations that automatically deliver updates to the Fortinet security platforms to protect the network with the latest information.

FortiGuard provides a number of services to monitor world-wide activity and provide the best possible security, including:

- **Intrusion Prevention System (IPS)** - IPS uses a customizable database of more than 4000 known threats to stop attacks that evade conventional firewall defenses. It also provides behavior-based heuristics, enabling the system to recognize threats when no signature has yet been developed. It also provides more than 1000 application identity signatures for complete application control.
- **Application Control** - Application Control allows you to identify and control applications on networks and endpoints regardless of port, protocol, and IP address used. It gives you unmatched visibility and control over application traffic, even traffic from unknown applications and sources. Application Control is a free FortiGuard service and the database for Application Control signatures is separate from the IPS database (Botnet Application signatures are still part of the IPS signature database since these are more closely related with security issues and less about application detection). Application Control signature database information is displayed under the **System > FortiGuard** page in the FortiCare section.

Please note that while the Application Control profile can be used for free, signature database updates require a valid FortiGuard subscription.

- **AntiVirus** - The FortiGuard AntiVirus Service provides fully automated updates to ensure protection against the latest content level threats. It employs advanced virus, spyware, and heuristic detection engines to prevent both new and evolving threats from gaining access to your network and protects against vulnerabilities.

- **Web Filtering** - Web Filtering provides Web URL filtering to block access to harmful, inappropriate, and dangerous web sites that may contain phishing/pharming attacks, malware such as spyware, or objectionable content that can expose your organization to legal liability. Based on automatic research tools and targeted research analysis, real-time updates enable you to apply highly-granular policies that filter web access based on six major categories and nearly 80 micro-categories, over 45 million rated web sites, and more than two billion web pages - all continuously updated.
- **Vulnerability Scanning** - FortiGuard Services provide comprehensive and continuous updates for vulnerabilities, remediation, patch scan, and configuration benchmarks.
- **Email Filtering** - The FortiGuard Antispam Service uses both a sender IP reputation database and a spam signature database, along with sophisticated spam filtering tools on Fortinet appliances and agents, to detect and block a wide range of spam messages. Updates to the IP reputation and spam signature databases are provided continuously via the FDN.
- **Messaging Services** - Messaging Services allow a secure email server to be automatically enabled on your FortiGate to send alert email or send email authentication tokens. With the SMS gateway, you can enter phone numbers where the FortiGate will send the SMS messages. Note that depending on your carrier, there may be a slight time delay on receiving messages.
- **DNS and DDNS** - The FortiGuard DNS and DDNS services provide an efficient method of DNS lookups once subscribed to the FortiGuard network. This is the default option. The FortiGate connects automatically to the FortiGuard DNS server. If you do not register, you need to configure an alternate DNS server.

Configure the DDNS server settings using the CLI command:

```
config system fortiguard
    set ddns-server-ip
    set ddns-server-port
end
```

Support Contract and FortiGuard Subscription Services

The FDN support **Contract** is available under **System > FortiGuard**.

The License Information area displays the status of your FortiGate's support contract.

You can also manually update the AntiVirus and IPS engines.

Verifying your connection to FortiGuard

If you are not getting FortiGuard web filtering or antispam services, there are a few things to verify that communication to the FDN is working. Before any troubleshooting, ensure that the FortiGate has been registered and subscribed to the FortiGuard services.

Verification - GUI:

The simplest method to check that the FortiGate is communicating with the FDN, is to check the **License Information** dashboard widget. Any subscribed services should have a green check mark beside them indicating that connections are successful. Any other icon indicates a problem with the connection, or you are not subscribed to the FortiGuard services.

You can also view the FortiGuard connection status by going to **System > FortiGuard**.

Verification - CLI:

You can also use the CLI to see what FortiGuard servers are available to your FortiGate. Use the following CLI command to ping the FDN for a connection:

```
execute ping guard.fortinet.net
```

You can also use the following diagnose command to find out what FortiGuard servers are available:

```
diagnose debug rating
```

From this command, you will see output similar to the following:

```
Locale : english
License : Contract
Expiration : Sun Jul 24 20:00:00 2011
Hostname : service.fortiguard.net
== Server List (Tue Nov 2 11:12:28 2010) ==

IP Weight      RTT  Flags  TZ   Packets  Curr Lost  Total Lost
69.20.236.180  0    10     -5   77200 0         42
69.20.236.179  0    12     -5   52514 0         34
66.117.56.42   0    32     -5   34390 0         62
80.85.69.38    50   164     0   34430 0        11763
208.91.112.194 81   223 D  -8   42530 0         8129
216.156.209.26 286  241 DI -8   55602 0        21555
```

An extensive list of servers are available. Should you see a list of three to five available servers, the FortiGuard servers are responding to DNS replies to service FortiGuard.net, but the INIT requests are not reaching FDS services on the servers.

The rating flags indicate the server status:

D	Indicates the server was found via the DNS lookup of the hostname. If the hostname returns more than one IP address, all of them will be flagged with 'D' and will be used first for INIT requests before falling back to the other servers.
I	Indicates the server to which the last INIT request was sent.
F	The server has not responded to requests and is considered to have failed.
T	The server is currently being timed.

The server list is sorted first by weight and then the server with the smallest RTT is put at the top of the list, regardless of weight. When a packet is lost, it will be resent to the next server in the list.

The weight for each server increases with failed packets and decreases with successful packets. To lower the possibility of using a distant server, the weight is not allowed to dip below a base weight, which is calculated as the difference in hours between the FortiGate and the server, multiplied by 10. The further away the server, the higher its base weight and the lower in the list it will appear.

Port assignment

The FortiGate contacts FDN for the latest list of FDN servers by sending UDP packets with typical source ports of 1027 or 1031, and destination port 8888. The FDN reply packets have a destination port of 1027 or 1031.

If your ISP blocks UDP packets in this port range, the FortiGate cannot receive the FDN reply packets. As a result, the FortiGate will not receive the complete FDN server list.

If your ISP blocks the lower range of UDP ports (around 1024), you can configure your FortiGate to use higher-numbered ports, using the CLI command:

```
config system global
```

```
set ip-src-port-range <start port>-<end port>
end
```

where the `<start port>` and `<end port>` are numbers ranging of 1024 to 25000.

For example, you could configure the FortiGate to not use ports lower than 2048 or ports higher than the following range:

```
config system global
set ip-src-port-range 2048-20000
end
```

Trial and error may be required to select the best source port range. You can also contact your ISP to determine the best range to use. Push updates might be unavailable if:

- there is a NAT device installed between the unit and the FDN, and/or
- your unit connects to the Internet using a proxy server.

Configuring AntiVirus and IPS Options

Go to **System > FortiGuard**, and scroll down to the **AntiVirus & IPS Updates** section to configure the antivirus and IPS options for connecting and downloading definition files.

Accept push updates	Select to allow updates to be sent automatically to your FortiGate. New definitions will be added as soon as they are released by FortiGuard.
Use override push	<p>Appears only if Accept push updates is enabled.</p> <p>Enable to configure an override server if you cannot connect to the FDN or if your organization provides updates using their own FortiGuard server. Once enabled, enter the following:</p> <ul style="list-style-type: none"> • Enter the IP address and port of the NAT device in front of your FortiGate. FDS will connect to this device when attempting to reach the FortiGate. • The NAT device must be configured to forward the FDS traffic to the FortiGate on UDP port 9443.
Scheduled Updates	<p>Enable for updates to be sent to your FortiGate at a specific time. For example, to minimize traffic lag times, you can schedule the update to occur on weekends or after work hours.</p> <p>Note that a schedule of once a week means any urgent updates will not be pushed until the scheduled time. However, if there is an urgent update required, select the Update Now button.</p>
Improve IPS quality	Enable to help Fortinet maintain and improve IPS signatures. The information sent to the FortiGuard servers when an attack occurs can be used to keep the database current as variants of attacks evolve.
Use extended IPS signature package	Regular IPS database protects against the latest common and in-the-wild attacks. Extended IPS database includes protection from legacy attacks.
Update AV & IPS Definitions	Select to manually initiate an FDN update.

Manual updates

To manually update the signature definitions file, you need to first go to the Support web site at <https://support.fortinet.com>. Once logged in, select **Download > FortiGuard Service Updates**. The browser will present you the most current IPS and AntiVirus signature definitions which you can download.

Once downloaded to your computer, log into the FortiGate to load the definition file.

To load the definition file onto the FortiGate:

1. Go to **System > FortiGuard**.
2. In the **License Information** table, select the **Upgrade Database** link in either the **Application Control Signature**, **IPS**, or **AntiVirus** row.
3. In the pop-up window, select **Upload** and locate the downloaded file and select **Open**.
The upload may take a few minutes to complete.

Automatic updates

The FortiGate can be configured to request updates from FDN on a scheduled basis, or via push notification.

Scheduling updates

Scheduling updates ensures that the virus and IPS definitions are downloaded to your FortiGate on a regular basis, ensuring that you do not forget to check for the definition files yourself.

Updating definitions can cause a very short disruption in traffic currently being scanned while the FortiGate unit applies the new signature database. Ideally, schedule updates during off-peak hours, such as evenings or weekends, when network usage is minimal, to ensure that the network activity will not suffer from the added traffic of downloading the definition files.

To enable scheduled updates - GUI:

1. Go to **System > FortiGuard** and scroll down to **AntiVirus & IPS Updates**.
2. Enable **Scheduled Updates**.
3. Select the frequency of updates.
4. Select **Apply**.

To enable scheduled updates - CLI:

```
config system autoupdate schedule
  set status enable
  set frequency {every | daily | weekly}
  set time <hh:mm>
  set day <day_of_week>
end
```

Push updates

Push updates enable you to get immediate updates when new viruses or intrusions have been discovered and new signatures created. This ensures that the latest signature will be sent to the FortiGate as soon as possible.

When a push notification occurs, the FortiGuard server sends a notice to the FortiGate that there is a new signature definition file available. The FortiGate then initiates a download of the definition file, similar to the scheduled update.

To ensure maximum security for your network, you should have a scheduled update as well as enable the push update, in case an urgent signature is created, and your cycle of the updates only occurs weekly.

To enable push updates - GUI:

1. Go to **System > FortiGuard** and scroll down to **AntiVirus & IPS Updates**.
2. Enable **Accept push updates**.
3. Select **Apply**.

To enable push updates - CLI:

```
config system autoupdate push-update
    set status enable
end
```

Push IP override

If the FortiGate is behind another NAT device (or another FortiGate), to ensure it receives the push update notifications, you need to use an override IP address for the notifications. To do this, you create a virtual IP to map to the external port of the NAT device.

Generally speaking, if there are two FortiGate devices, the following steps need to be completed on the FortiGate NAT device to ensure the FortiGate on the internal network receives the updates:

- Add a port forwarding virtual IP to the FortiGate NAT device that connects to the Internet by going to **Policy & Objects > Virtual IPs**.
- Add a security policy to the FortiGate NAT device that connects to the Internet that includes the port forwarding virtual IP.
- Configure the FortiGate on the internal network with an override push IP and port.

On the FortiGate internal device, the virtual IP is entered as the **Use push override** IP address.

To enable push update override- GUI:

1. Go to **System > FortiGuard** and scroll down to **AntiVirus & IPS Updates**.
2. Enable **Accept push updates**.
3. Enable **Use override push**.
4. Enter the virtual IP address configured on the NAT device.
5. Select **Apply**.

To enable push updates - CLI:

```
config system autoupdate push-update
    set status enable
    set override enable
    set address <vip_address>
end
```

Sending malware statistics to FortiGuard

To support following malware trends and making zero-day discoveries, FortiGate units send encrypted statistics to FortiGuard about IPS, Application Control, and AntiVirus events detected by the FortiGuard services running on your FortiGate. FortiGuard uses the statistics collected to achieve a balance between performance and security effectiveness by moving inactive signatures to an extended signature database.

The statistics include some non-personal information that identifies your FortiGate and its country. The information is never shared with external parties. You can choose to disable the sharing of this information by entering the following CLI command:

```
config system global
    set fds-statistics disable
end
```

Configuring Web Filtering and Email Filtering Options

Go to **System > FortiGuard**, and scroll down to **Filtering** to set the size of the caches and ports.

Web Filter Cache	Set the Time To Live (TTL) value. This is the number of seconds the FortiGate will store a blocked IP or URL locally, saving time and network access traffic, checking the FortiGuard server. Once the TTL has expired, the FortiGate will contact an FDN server to verify a web address. The TTL must be between 300 and 86400 seconds.
Anti-Spam Cache	Set the TTL value (see above).
FortiGuard Filtering Port	Select the port assignments for contacting the FortiGuard servers.
Filtering Service Availability	Indicates the status of the filtering service. Select Check Again if the filtering service is not available.
Request re-evaluation of a URL's category	Select to re-evaluate a URL's category rating on the FortiGuard Web Filter service.

Email filtering

The FortiGuard data centers monitor and update email databases of known spam sources. With FortiGuard Anti-Spam filtering enabled, the FortiGate verifies incoming email sender addresses and IPs against the database, and takes the necessary actions as defined within the antivirus profiles.

Spam source IP addresses can also be cached locally on the FortiGate, providing a quicker response time, while easing load on the FortiGuard servers, aiding in a quicker response time for less common email address requests.

By default, the anti-spam cache is enabled. The cache includes a TTL value, which is the amount of time an email address will stay in the cache before expiring. You can change this value to shorten or extend the time between 5 and 1,440 minutes.

To modify the antispam cache TTL - GUI:

1. Go to **System > FortiGuard**.
2. Under **Filtering**, enable **Anti-Spam Cache**.

3. Enter the TTL value in minutes.
4. Select **Apply**.

To modify the Anti-Spam filter TTL - CLI:

```
config system fortiguard
    set antispam-cache-ttl <integer>
end
```

Further antispam filtering options can be configured to block, allow, or quarantine specific email addresses. These configurations are available through the **Security Profiles > Anti-Spam** menu.

Online Security Tools

The FortiGuard online center provides a number of online security tools, including but not limited to:

- **URL lookup** — By entering a website address, you can see if it has been rated and what category and classification it is filed as. If you find your website or a site you commonly go to has been wrongly categorized, you can use this page to request that the site be re-evaluated.
<https://fortiguard.com/webfilter>
- **Threat Encyclopedia** — Browse the Fortiguard Labs extensive encyclopedia of threats. Search for viruses, botnet C&C, IPS, endpoint vulnerabilities, and mobile malware.
<https://www.fortiguard.com/encyclopedia>
- **Application Control** — Browse the Fortiguard Labs extensive encyclopedia of applications.
<https://fortiguard.com/appcontrol>

FortiCloud

FortiCloud is a hosted security management and log retention service for FortiGate devices. It gives you centralized reporting, traffic analysis, configuration management, and log retention without the need for additional hardware or software.

FortiCloud offers a wide range of features:

- **Simplified central management** — FortiCloud provides a central web-based management console to manage individual or aggregated FortiGate and FortiWiFi devices. Adding a device to the FortiCloud management subscription is straightforward. FortiCloud has detailed traffic and application visibility across the whole network.
- **Hosted log retention with large default storage allocated** — Log retention is an integral part of any security and compliance program but administering a separate storage system is burdensome. FortiCloud takes care of this automatically and stores the valuable log information in the cloud. Each device is allowed up to 200GB of log retention storage. Different types of logs can be stored including Traffic, System Events, Web, Applications, and Security Events.
- **Monitoring and alerting in real time** — Network availability is critical to a good end-user experience. FortiCloud enables you to monitor your FortiGate network in real time with different alerting mechanisms to pinpoint potential issues. Alerting mechanisms can be delivered via email.
- **Customized or pre-configured reporting and analysis tools** — Reporting and analysis are your eyes and ears into your network's health and security. Pre-configured reports are available, as well as custom reports that can be tailored to your specific reporting and compliance requirements. For example, you may want to look closely at application usage or website violations. The reports can be emailed as PDFs and can cover different time periods.

- **Maintain important configuration information uniformly** — The correct configuration of the devices within your network is essential to maintaining an optimum performance and security posture. In addition, maintaining the correct firmware (operating system) level allows you to take advantage of the latest features.
- **Service security** — All communication (including log information) between the devices and the clouds is encrypted. Redundant data centers are always used to give the service high availability. Operational security measures have been put in place to make sure your data is secure — only you can view or retrieve it.

Registration and Activation

Before you can activate a FortiCloud account, you must first register your device.

FortiCloud accounts can be registered manually through the FortiCloud website, <https://www.forticloud.com>, but you can easily register and activate your account directly from your FortiGate.

Activating your FortiCloud Account

1. On your device's dashboard, in the **FortiCloud** widget, select the **Activate** button in the status field.
2. A dialogue asking you to register your FortiCloud account appears. Select **Create Account**, enter your information, view and accept the terms and conditions, and select **OK**.
3. A second dialogue window appears, asking you to enter your information to confirm your account. This sends a confirmation email to your registered email. The dashboard widget then updates to show that confirmation is required.
4. Open your email, and follow the confirmation link it contains.

Results

A FortiCloud page will open, stating that your account has been confirmed. The Activation Pending message on the dashboard will change to state the type of account you have ('1GB Free' or '200GB Subscription'), and will provide a link to the FortiCloud portal.

Enabling logging to FortiCloud

1. Go to **Log & Report > Log Settings**.
2. Enable **Send Logs to FortiCloud**.
3. Select **Test Connectivity** to ensure that your FortiGate can connect to the registered FortiCloud account.
4. Scroll down to **GUI Preferences**, set **Display Logs/FortiView From**, to see FortiCloud logs within the FortiGate's GUI.

Logging into the FortiCloud portal

Once logging has been configured and you have registered your account, you can log into the FortiCloud portal and begin viewing your logging results. There are two methods to reach the FortiCloud portal:

- If you have direct networked access to the FortiGate, you can simply open your **Dashboard** and check the **License Information** widget. Next to the current FortiCloud connection status will be a link to reach the FortiCloud Portal.
- If you do not currently have access to the FortiGate's interface, you can visit the FortiCloud website (<https://forticloud.com>) and log in remotely, using your email and password. It will ask you to confirm the FortiCloud

account you are connecting to and then you will be granted access. Connected devices can be remotely configured using the Scripts page in the Management Tab, useful if an administrator may be away from the unit for a long period of time.

Cloud Sandboxing

FortiCloud can be used for automated sample tracking, or sandboxing, for files from a FortiGate. This allows suspicious files to be sent to be inspected without risking network security. If the file exhibits risky behavior, or is found to contain a virus, a new virus signature is created and added to the FortiGuard antivirus signature database.

Cloud sandboxing is configured by going to **Security Fabric > Settings**. After enabling **Sandbox Inspection**, select the **FortiSandbox type**.

Sandboxing results are shown in a new tab called **AV Submissions** in the FortiCloud portal. This tab only appears after a file has been sent for sandboxing.

For more information about FortiCloud, see the [FortiCloud documentation](#).

Troubleshooting your FortiGate Installation

If your FortiGate does not function as desired after installation, try the following troubleshooting tips:

1. Use FortiExplorer if you can't connect to the FortiGate over Ethernet

If you can't connect to the FortiGate GUI or CLI, you may be able to connect using FortiExplorer. Refer to the QuickStart Guide or see the section on the [FortiExplorer](#) for more details.

2. Check for equipment issues

Verify that all network equipment is powered on and operating as expected. Refer to the QuickStart Guide for information about connecting your FortiGate to the network. You will also find detailed information about the FortiGate LED indicators.

3. Check the physical network connections

Check the cables used for all physical connections to ensure that they are fully connected and do not appear damaged, and make sure that each cable connects to the correct device and the correct Ethernet port on that device.

4. Verify that you can connect to the internal IP address of the FortiGate

Connect to the GUI from the FortiGate's internal interface by browsing to its IP address. From the PC, try to ping the internal interface IP address; for example, `ping 192.168.1.99`.

If you cannot connect to the internal interface, verify the IP configuration of the PC. If you can ping the interface but can't connect to the GUI, check the settings for administrative access on that interface.

5. Check the FortiGate interface configurations

Check the configuration of the FortiGate interface connected to the internal network by going to **Network > Interfaces** and make sure **Addressing mode** is set to the correct mode.

6. Verify the security policy configuration

Go to **Policy & Objects > IPv4 Policy** and verify that the internal interface to Internet-facing interface security policy has been added and is located near the top of the policy list. Check the **Active Sessions** column to ensure that traffic has been processed (if this column does not appear, right-click on the title row, select **Active Sessions**).

If you are using NAT mode, check the configuration of the policy to make sure that **NAT** is enabled and that **Use Outgoing Interface Address** is selected.

7. Verify that you can connect to the Internet-facing interface's IP address

Ping the IP address of the FortiGate's Internet-facing interface. If you cannot connect to the interface, the FortiGate is not allowing sessions from the internal interface to Internet-facing interface.

8. Verify the static routing configuration

Go to **Network > Static Routes** and verify that the default route is correct. Go to **Monitor > Routing Monitor** and verify that the default route appears in the list as a static route. Along with the default route, you should see two routes shown as **Connected**, one for each connected FortiGate interface.

9. Verify that you can connect to the gateway provided by your ISP

Ping the default gateway IP address from a PC on the internal network. If you cannot reach the gateway, contact your ISP to verify that you are using the correct gateway.

10. Verify that you can communicate from the FortiGate to the Internet

Access the FortiGate CLI and use the command `execute ping 8.8.8.8`. You can also use the `execute traceroute 8.8.8.8` command to troubleshoot connectivity to the Internet.

11. Verify the DNS configurations of the FortiGate and the PCs

Check for DNS errors by pinging or using traceroute to connect to a domain name; for example: `ping www.fortinet.com`.

If the name cannot be resolved, the FortiGate or PC cannot connect to a DNS server and you should confirm that the DNS server IP addresses are present and correct.

12. Confirm that the FortiGate can connect to the FortiGuard network

Once registered, the FortiGate obtains AntiVirus and Application Control and other updates from the FortiGuard network. Once the FortiGate is on your network, you should confirm that it can reach the FortiGuard network. First, check the **License Information** widget to make sure that the status of all FortiGuard services matches the services that you have purchased.

Go to **System > FortiGuard**. Scroll down to **Filtering Services Availability** and select **Check Again**. After a minute, the GUI should indicate a successful connection.

13. Consider changing the MAC address of your external interface

Some ISPs do not want the MAC address of the device connecting to their network cable to change. If you have added a FortiGate to your network, you may have to change the MAC address of the Internet-facing interface using the following CLI command:

```
config system interface
  edit <interface>
    set macaddr <xx:xx:xx:xx:xx:xx>
  end
end
```

14. Either reset the FortiGate to factory defaults or contact Fortinet Support for assistance. See the note below before contacting support.

To reset the FortiGate to factory defaults, use the CLI command `execute factoryreset`. When prompted, type `y` to confirm the reset.

You can also contact Fortinet Support for assistance. Read the following article found on the Fortinet Cookbook website: [How to work with Fortinet Support](#) to understand what type of support is available and to determine which level of support is right for you. For further information, go to support.fortinet.com.

Resources

Here's a list of some resources you can check out next to help you get the most out of your newly installed and configured FortiGate.

Best Practices

The Best Practices document is a collection of guidelines to ensure the most secure and reliable operation of FortiGates in a customer environment. It is updated periodically as new issues are identified.

This document can be found at <http://docs.fortinet.com/>.

The Fortinet Cookbook

The Fortinet Cookbook contains a variety of step-by-step examples of how to integrate a FortiGate into your network and apply features such as security profiles, wireless networking, and VPN.

Using the Cookbook, you can go from idea to execution in simple steps, configuring a secure network for better productivity with reduced risk.

The Fortinet Cookbook can be found at <http://cookbook.fortinet.com>.

The Fortinet Video Library

The Fortinet Video Library contains video tutorials showing how to configure various Fortinet products, including FortiGates. Many FortiGate videos are based on recipes from the FortiGate Cookbook.

The Fortinet Video Library can be found at <http://video.fortinet.com>. You can also [subscribe to Fortinet's YouTube channel](#).

The FortiOS Handbook

The FortiOS Handbook is the complete guide to FortiOS, covering a variety of FortiGate configurations. The Handbook is available as a single complete document online. Handbook chapters are also available as standalone documents.

The FortiOS Handbook can be found at <http://docs.fortinet.com/>.

Chapter 3 - Authentication

Authentication

Welcome and thank you for selecting Fortinet products for your network protection.

This chapter contains the following topics:

- [Before you begin](#)
- [How this guide is organized](#)

Before you begin

Before you begin using this guide, please ensure that:

- You have administrative access to the web-based manager and/or CLI.
- The FortiGate unit is integrated into your network.
- The operation mode has been configured.
- The system time, DNS settings, administrator password, and network interfaces have been configured.
- Firmware, FortiGuard Antivirus and FortiGuard Antispam updates are completed.
- Any third-party software or servers have been configured using their documentation.

While using the instructions in this guide, note that administrators are assumed to be super_admin administrators unless otherwise specified. Some restrictions will apply to other administrators.

How this guide is organized

This Handbook chapter contains the following sections:

[Introduction to authentication](#) describes some basic elements and concepts of authentication.

[Authentication servers](#) describes external authentication servers, where a FortiGate unit fits into the topology, and how to configure a FortiGate unit to work with that type of authentication server.

[Users and user groups](#) describes the different types of user accounts and user groups. Authenticated access to resources is based on user identities and user group membership. Two-factor authentication methods, including FortiToken, provide additional security.

[Managing Guest Access](#) explains how to manage temporary accounts for visitors to your premises.

[Configuring authenticated access](#) provides detailed procedures for setting up authenticated access in security policies and authenticated access to VPNs.

[Captive portals](#) describes how to authenticate users through a web page that the FortiGate unit presents in response to any HTTP request until valid credentials are entered. This can be used for wired or WiFi network interfaces.

[Certificate-based authentication](#) describes authentication by means of X.509 certificates.

[Single Sign-On using a FortiAuthenticator unit](#) describes how to use a FortiAuthenticator unit as an SSO agent that can integrate with external network authentication systems such as RADIUS and LDAP to gather user logon information and send it to the FortiGate unit. Users can also log on through a FortiAuthenticator-based web portal or the FortiClient SSO Mobility Agent.

[Single Sign-On to Windows AD](#) describes how to set up Single Sign-On in a Windows AD network by configuring the FortiGate unit to poll domain controllers for information user logons and user privileges.

[Agent-based FSSO](#) describes how to set up Single Sign-On in Windows AD, Citrix, or Novell networks by installing Fortinet Single Sign On (FSSO) agents on domain controllers. The FortiGate unit receives information about user logons and allows access to network resources based on user group memberships.

[SSO using RADIUS accounting records](#) describes how to set up Single Sign-On in a network that uses RADIUS authentication. In this configuration, the RADIUS server send RADIUS accounting records to the FortiGate unit when users log on or off the network. The record includes a user group name that can be used in FortiGate security policies to determine which resources each user can access.

[Monitoring authenticated users](#) describes FortiOS authenticated user monitor screens.

[Examples and Troubleshooting](#) provides configuration examples and troubleshooting suggestions.

Whats new in FortiOS 5.6

This chapter describes new authentication features added to FortiOS 5.6.

FortiOS 5.6.4

These features first appeared in FortiOS 5.6.4.

- "Authentication binds to MAC address" on page 382
- "RADIUS accounting start message options" on page 394
- "IPv6 TACACS+ server IP address" on page 407
- "Login credentials for guest users shown in clear text on GUI and voucher" on page 429

FortiOS 5.6.3

These features first appeared in FortiOS 5.6.3.

Certificate Import page updates (267949)

The importation of a non-CA certificate into FortiGate CA store now shows a warning message showing why the import didn't work (as expected).

Improvements to the execute fortitoken import command (401979)

The `execute fortitoken import` command has been removed and replaced by three new commands, allowing the importation of FortiToken seed files from either an FTP server, a TFTP server, or a USB drive:

- `execute fortitoken import ftp <file name> <ip>[:ftp port] <Enter> <user> <password>`
- `execute fortitoken import tftp <file name> <ip>`
- `execute fortitoken import usb <file name>`

These commands allow seed files to be imported from an external source more easily.

Improved 2FA workflow in GUI (405487, 409100, 444430, 446856, 456752)

Various improvements to the two-factor authentication workflow in the GUI which addressed the following issues:

- No email was sent after creating an administrator account with a FortiToken.
- Inconsistent view on admin and user dialog.
- Empty activation codes would be sent.
- If Norway was selected as the country code for a user, the phone number was not recognized after saving.
- Couldn't select custom SMS server when setting the phone number.
- When a FortiToken from a non-management VDOM was selected for an admin, the activation code wouldn't be sent.

Support FTM Push when FortiAuthenticator is the authentication server (408273, 438314)

FortiGate supports when the FortiAuthenticator initiates FTM Push notifications, for when users are attempting to authenticate through a VPN and/or RADIUS (with FortiAuthenticator as the RADIUS server).

Support exact match for subject and CN fields in peer user (416359)

Administrators can now specify which way a peer user authenticates, in order to avoid any unintentional admin access by a regular user. When searching for a matching certificate, use the commands below to control how to find matches in the certificate subject name (`subject-match`) or the cn attribute (`cn-match`) of the certificate subject name. This match can be any string (`substring`) or an exact match (`value`) of the cn attribute value.

Syntax

```
config vpn certificate setting
  edit <name>
    set subject-match {substring | value}
    set cn-match {substring | value}
  next
end
```

FortiToken GUI improvement (435229)

Various FortiToken import functionalities have been improved in the GUI, including the ability to import from serial number file correctly, validation of serial numbers once imported, and removing the Activate button once a token has already been activated.

Improve FTM Push notification workflow (436642, 448734)

Updated GUI and logincheck module to use a non-blocking version of the FTM Push notification procedure and periodically polls the device for any status updates from fam daemon.

FortiClient shares Social ID data with FortiOS (438610)

Support has been added to record the social ID data from FortiClient so that if an email or phone number is changed on FortiClient, the new values are updated on the FortiGate.

The data will be sent in KeepAlive messages in the following format:

```
USR_NAME|<full name for the service account>|USR_EMAIL|<email for the service account>|SERVICE|<os|custom|linkedin|google|salesforce>|
```

Wildcard certificate support/handling for SAN/CN reference identifiers (440307)

As a requirement of Network Device Collaborative Protection Profile (NDcPP), FortiOS supports and handles the use of wildcards for the following certificate reference parameters:

- Subject Alternative Name (SAN)
- Common Name (CN)

Support for FTP and TFTP to update certificates (441695)

Support has been added for FTP and TFTP servers to update the certificate bundle using a new `execute` command.

Syntax

```
execute vpn certificate ca import bundle <file-name.pkg> <ftp/tftp-server-ip>
```

Global option to enable/disable SHA1 algorithm in SSH key exchanges (444827)

Support has been added for a global option to enable/disable SHA1 algorithm in SSH key exchanges. The algorithm is enabled by default and provides administrators with the ability to disable the option for the purposes of security and compliance testing.

Syntax

```
config system global
    set ssh-kex-shal {enable | disable}
end
```

Support for HTTP tunnel authentication (449406)

Support has been added for an option to trigger user authentication on HTTP CONNECT request at the policy level. A new CLI entry has been added under `config firewall proxy-policy` which will trigger the authentication process `get-user`, even when there is no user or group configured.

Note that, as shown below, explicit web proxy must be set.

Syntax

```
config firewall proxy-policy
    edit {policyid}
        set proxy explicit-web
        set http-tunnel-auth {enable | disable}
    next
end
```

FortiOS 5.6.1

These features first appeared in FortiOS 5.6.1.

IPv6 RADIUS Support (309235, 402437, 439773)

RADIUS authentication is supported with IPv6, allowing administrators to configure an IPv6 RADIUS server on the FortiGate for IPv6 RADIUS authentication traffic to pass between the server and FortiGate.

Note that while you can set the primary RADIUS server's IPv6 address, the source IP address for communications to the RADIUS server cannot be configured as IPv6.

Syntax

Allow IPv6 access on an interface:

```
config system interface
    edit <name>
        config ipv6
            set ip6-allowaccess {ping | https | ssh | snmp | http | telnet | fgfm | capwap}
            set ip6-address <xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx/xxx>
```

```
    next
  next
end
```

Configure the IPv6 RADIUS server:

```
config user radius
  edit <name>
    set server <xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx>
    ...
  next
end
```

Full certificate chain CRL checking (407988)

Certificate revocation/status check for peer certificates and intermediate CAs is now supported. Redesigned `fnbam_auth_cert()` API to use stack type of X509 instead of array for certificate chain. Removed obsolete `fnbam` API and parameters. Now `authd`, `sslvpn`, and GUI send full certificate chains to `fnbamd` for verification.

New option under `user > setting` to allow/forbid SSL renegotiation in firewall authentication (386595)

A new option `auth-ssl-allow-renegotiation` is now available under `config user setting` to allow/forbid renegotiation. The default value is `disable`, where a session would be terminated by `authd` once renegotiation is detected and this login would be recorded as failure. Other behavior follows regular auth settings.

Syntax

```
config user setting
  set auth-ssl-allow-renegotiation {enable | disable}
end
```

New option to allow spaces in RADIUS DN format (422978)

Previously, IKEv2 RADIUS group authentication introduced a regression because it removed spaces from ASN.1 DN peer identifier string.

Reverted default DN format to include spaces. Added a new CLI option `ike-dn-format` to allow the user to select either `with-space` or `no-space`. Customers using the `group-authentication` option can select the `ike-dn-format` setting to match the format used in their RADIUS user database.

Added LDAP filter when `group-member-check` is `user-attr` (403140)

Added LDAP filter when `group-member-check` is `user-attr`. LDAP filter is deployed when checking user attribute.

Syntax

```
config user ldap
  edit <name>
    set group-filter ?
  next
end
```

- `group-filter` is `none` by default, where the process is the same as before.
When `group-filter` is set, the LDAP filter takes effect for retrieving the group information.

Added Refresh button to the LDAP browser (416649)

Previously, cached LDAP data was used even if the LDAP server configuration was updated.

In FortiOS 5.6.1, a **Refresh** button has been added in the LDAP browser. In the LDAP server dialog page, the user can delete the DN field to browse the root level tree when clicking the **Fetch DN** button.

Differentiate DN option for user authentication and membership searching (435791)

Previously, LDAP used the same DN option for user authentication and membership searching. New CLI commands are introduced to `config user ldap` to resolve this issue:

- `group-member-check user-attr`
For user attribute checking, a new attribute `group-search-base` is added, which indicates the starting point for the group search. If the `group-search-base` is not set, `binddn` is used as the search base. Removed `search-type` when `group-member-check` is `user-attr`.
- `group-member-check group-object`
For group object checking, the group names in user group match rule will be picked up as the group search base. If there are multiple matching rules, each group name will trigger the `ldapsearch` query once.
- `group-member-check posix-group-object`
Changed `group-object-search-base` to `group-search-base` for `posix-group-object` `group-member-check`.

FTM Push when FAC is auth server (408273)

This feature adds support for FortiToken Mobile (FTM) push with FortiAuthenticator server in FortiOS. It also fixes a crash when adding a node to an RB tree, by checking if the same key has already been used in the tree. If yes, remove the node using the same key before adding a new node.

Non-blocking LDAP authentication (433700)

The previous LDAP authentication in `fnbamd` used `openldap` library. OpenLDAP supports non-blocking BIND but it is not event driven.

To support non-blocking LDAP in `fnbamd`, we stopped using the `openLDAP` library in `fnbamd`, instead using only `liblber`. Instead of using `openLDAP`, `fnbamd` will create its own event-driven connection with LDAP servers over LDAP/LDAPS/STARTTLS, make it non-blocking, do CRL checking if necessary, and compose all LDAP requests using `liblber` (including bind, unbind, search, password renewal, password query, send request and receive response, and parse response). The whole process is done in one connection.

This doesn't change any `openLDAP` implementation but moves some data structure definitions and API definitions from some internal header files to public header files.

Manual certificate SCEP renewal (423997)

Added support of manual certificate SCEP renewal besides the auto-regeneration feature that already exists.

More detailed RADIUS responses shown in connectivity test (434303)

Improved on-demand test connectivity for RADIUS servers. Test results show RADIUS server reachability, NAS client rejection, and invalid User/Password. Test also shows RADIUS Attributes returned from the RADIUS server.

Example

```
FG100D3G12807101 # diagnose test authserver radius-direct
<server_name or IP> <port no(0 default port)> <secret> <user> <password>

FG100D3G12807101 # diagnose test authserver radius-direct 1.1.1.1 0 dd
RADIUS server '1.1.1.1' status is Server unreachable

FG100D3G12807101 # diagnose test authserver radius-direct 172.18.5.28 0 dd
RADIUS server '172.18.5.28' status is Secret invalid

FG100D3G12807101 # diagnose test authserver radius-direct 172.18.5.28 0 fortinet jeff1
asdfasdf
RADIUS server '172.18.5.28' status is OK
Access-Reject

FG100D3G12807101 # diagnose test authserver radius-direct 172.18.5.28 0 fortinet ychen1
asdfasdf
RADIUS server '172.18.5.28' status is OK
Access-Accept
AVP: l=6 t=Framed-Protocol(7)
  Value: 1

```

User group authentication timeout range increased to 30 days (378085)

You can now use the following command to override the default user authentication timeout for users in a user group to up to 30 days.

```
config user group
  edit <group-name>
    set authtimeout 43200
  end
```

Where `authtimeout` is the length of the timeout in minutes. An `authtimeout` of 43200 minutes is equivalent to 30 days. Set `authtimeout` to 0 to use the default authentication timeout.

FortiOS 5.6.0

These features first appeared in FortiOS 5.6.0.

FortiToken Mobile Push (397912, 408273, 399839, 404872)

FortiToken Mobile push supports two-factor authentication without requiring users to enter a four-digit code to authenticate. Instead they can just accept the authentication request from their FortiToken Mobile app.

A new command has been added under `config system ftm-push` allowing you to configure the FortiToken Mobile Push services server IP address and port number. The Push service is provided by Apple (APNS) and Google (GCM) for iPhone and Android smartphones respectively. This will help to avoid tokens becoming locked after an already enabled two-factor authentication user has been disabled.

CLI syntax

```
config system ftm-push
  set server-ip <ip-address>
  set server-port [1-65535] Default is 4433.
end
```

If an SSL VPN user authenticates with their token, then logs out and attempts to reauthenticate again within a minute, a new message will display showing "Please wait x seconds to login again." This replaces a previous error/permission denied message.

The "x" value will depend on the calculation of how much time is left in the current time step.

CLI syntax

```
config system interface
  edit <name>
    set allowaccess ftm
  next
end
```

Support V4 BIOS certificate (392960)

FortiOS now supports backwards compatibility between new BIOS version 4 and old BIOS version 3.

New BIOS V4 certificates:

- Fortinet_CA
- Fortinet_Sub_CA
- Fortinet_Factory

Old BIOS V3 certificates:

- Fortinet_CA_Backup
- Fortinet_Factory_Backup

When FortiOS connects to FortiGuard, FortiCloud, FortiManager, FortiAnalyzer, FortiSandbox as a client, the new BIOS certificate **Fortinet_Factory** will be the default client certificate. When the server returns its certificate (chain) back, FortiOS looks up the issuer of the server certificate and either keeps client certificate as is or switches to the old BIOS certificate **Fortinet_Factory_Backup**. This process occurs in one handshake.

When FortiOS connects to FortiCare, the new BIOS certificate **Fortinet_Factory** is the only client certificate and Server Name Indication (SNI) is set. There is no switchover of certificate during SSL handshake.

When FortiOS acts as a server when connected by FortiExtender, FortiSwitch, FortiAP, etc., **Fortinet_Factory** is the default server certificate. FortiOS detects SNI in client hello, and if no SNI is found or if the CN in SNI is different from the CN of **Fortinet_CA**, it switches to use the old **Fortinet_Factory_Backup**.

Support extendedKeyUsage for x.509 certificates (390393)

As per Network Device Collaborative Protection Profile (NDcPP) v1.0 requirements, server certificates used for TLS connections between FortiGate and FortiAnalyzer should have the "Server Authentication" and "Client Authentication" extendedKeyUsage fields in FIPS/CC mode.

To implement this, a new CLI command has been added under `log fortianalyzer setting` to allow you to specify the certificate used to communicate with FortiAnalyzer.

CLI syntax

```
config log fortianalyzer setting
    set certificate <name>
end
```

Administrator name added to system event log (386395)

The administrator's name now appears in the system event log when the admin issues a user quarantine ban on a source address.

Support RSA-4096 bit key-length generation (380278)

In anticipation of quantum computers, RSA-4096 bit key-length CSRs can now be imported.

New commands added to config user ldap to set UPN processing method and filter name (383561)

Added two new commands to `config user ldap` allowing you to keep or strip domain string of UPN in the token as well as the search name for this kind of UPN.

CLI syntax:

```
config user ldap
    set account-key-processing
    set account-key-name
end
```

User authentication max timeout setting change (378085)

To accommodate wireless hotspot users authenticated on the FortiGate, the user authentication max timeout setting has been extended to three days (from one day, previously).

Changes to Authentication Settings > Certificates GUI (374980)

Added new icons for certificate types and updated formatters to use these new icons.

Password for private key configurable in both GUI and CLI (374593)

FortiOS 5.4.1 introduced a feature that allowed you to export a local certificate and its private key in password protected p12, and later import them to any device. This option to set password for private key was available only in the CLI (when requesting a new certificate via SCEP or generating a CSR). This feature is now also configurable through the GUI.

The new **Password for private key** option is available under **System > Certificates** when generating a new CSR.

RADIUS password encoding (365145)

A new CLI command, under `config user radius`, has been added to allow you to configure RADIUS password encoding to use ISO-8859-1 (as per [RFC 2865](#)).

Certain RADIUS servers use ISO-8859-1 password encoding instead of others such as UTF-8. In these instances, the server will fail to authenticate the user, if the user's password is using UTF-8.

CLI syntax

```
config user radius
  edit <example>
    set password-encoding <auto | ISO-8859-1>
  end
```

This option will be skipped if the `auth-type` is neither `auto` nor `pap`.

RSSO supports Delegated-IPv6-Prefix and Framed-IPv6-Prefix (290990)

Two attributes, **Delegated-IPv6-Prefix** and **Framed-IPv6-Prefix**, have been introduced for RSSO to provide a /56 prefix for DSL customers. All devices connected from the same location (/56 per subscriber) can be mapped to the same profile without the need to create multiple /64 or smaller entries.

Introduction to authentication

Identifying users and other computers—authentication—is a key part of network security. This section describes some basic elements and concepts of authentication.

The following topics are included in this section:

- [What is authentication?](#)
- [Methods of authentication](#)
- [Types of authentication](#)
- [User's view of authentication](#)
- [FortiGate administrator's view of authentication](#)

What is authentication?

Businesses need to authenticate people who have access to company resources. In the physical world this may be a swipe card to enter the building, or a code to enter a locked door. If a person has this swipe card or code, they have been authenticated as someone allowed in that building or room.

Authentication is the act of confirming the identity of a person or other entity. In the context of a private computer network, the identities of users or host computers must be established to ensure that only authorized parties can access the network. The FortiGate unit enables controlled network access and applies authentication to users of security policies and VPN clients.

Methods of authentication

FortiGate unit authentication is divided into three basic types: password authentication for people, certificate authentication for hosts or endpoints, and two-factor authentication for additional security beyond just passwords. An exception to this is that FortiGate units in an HA cluster and FortiManager units use password authentication.

Password authentication verifies individual user identities, but access to network resources is based on membership in user groups. For example, a security policy can be configured to permit access only to the members of one or more user groups. Any user who attempts to access the network through that policy is then authenticated through a request for their username and password.

Methods of authentication include:

- [Local password authentication](#)
- [Server-based password authentication](#)
- [Certificate-based authentication](#)
- [Two-factor authentication](#)

Local password authentication

The simplest authentication is based on user accounts stored locally on the FortiGate unit. For each account, a username and password is stored. The account also has a disable option so that you can suspend the account without deleting it.

Local user accounts work well for a single-FortiGate installation. If your network has multiple FortiGate units that will use the same accounts, the use of an external authentication server can simplify account configuration and maintenance.

You can create local user accounts in the web-based manager under **User & Device > User Definition**. This page is also used to create accounts where an external authentication server stores and verifies the password.

Server-based password authentication

Using external authentication servers is desirable when multiple FortiGate units need to authenticate the same users, or where the FortiGate unit is added to a network that already contains an authentication server. FortiOS supports the use of LDAP, RADIUS, TACACS+, AD or POP3 servers for authentication.

When you use an external authentication server to authenticate users, the FortiGate unit sends the user's entered credentials to the external server. The password is encrypted. The server's response indicates whether the supplied credentials are valid or not.

You must configure the FortiGate unit to access the external authentication servers that you want to use. The configuration includes the parameters that authenticate the FortiGate unit to the authentication server.

You can use external authentication servers in two ways:

- Create user accounts on the FortiGate unit, but instead of storing each user's password, specify the server used to authenticate that user. As with accounts that store the password locally, you add these users to appropriate user groups.
- Add the authentication server to user groups. Any user who has an account on the server can be authenticated and have the access privileges of the FortiGate user group. Optionally, when an LDAP server is a FortiGate user group member, you can limit access to users who belong to specific groups defined on the LDAP server.

Certificate-based authentication

An RSA X.509 server certificate is a small file issued by a Certificate Authority (CA) that is installed on a computer or FortiGate unit to authenticate itself to other devices on the network. When one party on a network presents the certificate as authentication, the other party can validate that the certificate was issued by the CA. The identification is therefore as trustworthy as the Certificate Authority (CA) that issued the certificate.

To protect against compromised or misused certificates, CAs can revoke any certificate by adding it to a Certificate Revocation List (CRL). Certificate status can also be checked online using Online Certificate Status Protocol (OCSP).

RSA X.509 certificates are based on public-key cryptography, in which there are two keys: the private key and the public key. Data encrypted with the private key can be decrypted only with the public key and vice versa. As the names suggest, the private key is never revealed to anyone and the public key can be freely distributed. Encryption with the recipient's public key creates a message that only the intended recipient can read. Encryption with the sender's private key creates a message whose authenticity is proven because it can be decrypted only with the sender's public key.

Server certificates contain a signature string encrypted with the CA's private key. The CA's public key is contained in a CA root certificate. If the signature string can be decrypted with the CA's public key, the certificate is genuine.

Certificate authorities

A certificate authority can be:

- an organization, such as VeriSign Inc., that provides certificate services
- a software application, such as Microsoft Certificate Services or OpenSSH

For a company web portal or customer-facing SSL VPN, a third-party certificate service has some advantages. The CA certificates are already included in popular web browsers and customers trust the third-party. On the other hand, third-party services have a cost.

For administrators and for employee VPN users, the local CA based on a software application provides the required security at low cost. You can generate and distribute certificates as needed. If an employee leaves the organization, you can simply revoke their certificate.

Certificates for users

FortiGate unit administrators and SSL VPN users can install certificates in their web browsers to authenticate themselves. If the FortiGate unit uses a CA-issued certificate to authenticate itself to the clients, the browser will also need the appropriate CA certificate.

FortiGate IPsec VPN users can install server and CA certificates according to the instructions for their IPsec VPN client software. The FortiClient Endpoint Security application, for example, can import and store the certificates required by VPN connections.

FortiGate units are also compatible with some Public Key Infrastructure systems. For an example of this type of system, see [RSA ACE \(SecurID\) servers on page 410](#).

Two-factor authentication

A user can be required to provide both something they know (their username and password combination) and something they have (certificate or a random token code). Certificates are installed on the user's computer.

Two-factor authentication is available for PKI users. For more information, see [Certificate on page 420](#).

Another type of two-factor authentication is to use a randomly generated token (multi-digit number) along with the username and password combination. One method is a FortiToken — a one time passcode (OTP) generator that generates a unique code every 60 seconds. Others use email or SMS text messaging to deliver the random token code to the user or administrator.

When one of these methods is configured, the user enters this code at login after the username and password have been verified. The FortiGate unit verifies the token code after as well as the password and username. For more information, see [Two-factor authentication on page 419](#)

Authentication binds to MAC address

In FortiOS 5.4.3 and earlier, firewall authentication was source IP based, thus there was no action in response to a MAC address change. This was a security flaw that allowed an unauthenticated user to access restricted resources, especially in a Wi-Fi environment where the IP and MAC binding changed frequently.

FortiOS 5.6.4+ solves this issue by binding the MAC address with the user identity (auth logon) so that the MAC address is matched while matching an auth logon.

Types of authentication

FortiOS supports two different types of authentication based on your situation and needs.

Security policy authentication is easily applied to all users logging on to a network, or network service. For example if a group of users on your network such as the accounting department who have access to sensitive

data need to access the Internet, it is a good idea to make sure the user is a valid user and not someone trying to send company secrets to the Internet. Security policy authentication can be applied to as many or as few users as needed, and it supports a number of authentication protocols to easily fit with your existing network.

Virtual Private Network (VPN) authentication enables secure communication with hosts located outside the company network, making them part of the company network while the VPN tunnel is operating. Authentication applies to the devices at both ends of the VPN and optionally VPN users can be authenticated as well.

Security policy authentication

Security policies enable traffic to flow between networks. Optionally, the policy can allow access only to specific originating addresses, device types, users or user groups. Where access is controlled by user or user group, users must authenticate by entering valid username and password credentials.

The user's authentication expires if the connection is idle for too long, five minutes by default but that can be customized.

Security policies are the mechanism for FSSO, NTLM, certificate based, and RADIUS SSO authentication.

FSSO

Fortinet Single Sign on (FSSO) provides seamless authentication support for Microsoft Windows Active Directory (AD) and Novell eDirectory users in a FortiGate environment.

On a Microsoft Windows or Novell network, users authenticate with the Active Directory or Novell eDirectory at logon. FSSO provides authentication information to the FortiGate unit so that users automatically get access to permitted resources. See [Introduction to agent-based FSSO on page 508](#).

NTLM

The NT LAN Manager (NTLM) protocol is used when the MS Windows Active Directory (AD) domain controller can not be contacted. NTLM is a browser-based method of authentication.

The FSSO software is installed on each AD server and the FortiGate unit is configured to communicate with each FSSO client. When a user successfully logs into their Windows PC (and is authenticated by the AD Server), the FSSO client communicates the user's name, IP address, and group login information to the FortiGate unit. The FortiGate unit sets up a temporary access policy for the user, so when they attempt access through the firewall they do not need to re-authenticate. This model works well in environments where the FSSO client can be installed on all AD servers.

In system configurations where it is not possible to install FSSO clients on all AD servers, the FortiGate unit must be able to query the AD servers to find out if a user has been properly authenticated. This is achieved using the NTLM messaging features of Active Directory and Internet Explorer.

Even when NTLM authentication is used, the user is not asked again for their username and password. Internet Explorer stores the user's credentials and the FortiGate unit uses NTLM messaging to validate them in the Windows AD environment.

Note that if the authentication reaches the timeout period, the NTLM message exchange restarts. For more information on NTLM, see [NTLM authentication on page 450](#) and [FSSO NTLM authentication support on page 514](#).

Certificates

Certificates can be used as part of a policy. All users being authenticated against the policy are required to have the proper certificate. See [Certificate-based authentication on page 474](#)

RADIUS SSO

RADIUS Single Sign-On (RSSO) is a remote authentication method that does not require any local users to be configured, and relies on RADIUS Start records to provide the FortiGate unit with authentication information. That information identifies the user and user group, which is then matched using a security policy. See [SSO using RADIUS accounting records on page 552](#).

FortiGuard Web Filter override authentication

Optionally, users can be allowed the privilege of overriding FortiGuard Web Filtering to view blocked web sites. Depending on the override settings, the override can apply to the user who requested it, the entire user group to which the user belongs, or all users who share the same web filter profile. As with other FortiGate features, access to FortiGuard overrides is controlled through user groups. Firewall and Directory Services user groups are eligible for the override privilege. For more information about web filtering and overrides, see the UTM chapter of this FortiOS Handbook.

VPN authentication

Authentication involves authenticating the user. In IPsec VPNs authenticating the user is optional, but authentication of the peer device is required.

This section includes:

- [Authenticating IPsec VPN peers \(devices\)](#)
- [Authenticating IPsec VPN users](#)
- [Authenticating SSL VPN users](#)
- [Authenticating PPTP and L2TP VPN users](#)

Authenticating IPsec VPN peers (devices)

A VPN tunnel has one end on a local trusted network, and the other end is at a remote location. The remote peer (device) must be authenticated to be able to trust the VPN tunnel. Without that authentication, it is possible for a malicious hacker to masquerade as a valid VPN tunnel device and gain access to the trusted local network.

The three ways to authenticate VPN peers are with a preshared key, RSA X.509 certificate, or a specific peer ID value.

The simplest way for IPsec VPN peers to authenticate each other is through the use of a preshared key, also called a shared secret. The preshared key is a text string used to encrypt the data exchanges that establish the VPN tunnel. The preshared key must be six or more characters. The VPN tunnel cannot be established if the two peers do not use the same key. The disadvantage of preshared key authentication is that it can be difficult to securely distribute and update the preshared keys.

RSA X.509 certificates are a better way for VPN peers to authenticate each other. Each peer offers a certificate signed by a Certificate Authority (CA) which the other peer can validate with the appropriate CA root certificate. For more information about certificates, see [Certificate-based authentication on page 474](#).

You can supplement either preshared key or certificate authentication by requiring the other peer to provide a specific peer ID value. The peer ID is a text string configured on the peer device. On a FortiGate peer or FortiClient Endpoint Security peer, the peer ID provided to the remote peer is called the Local ID.

Authenticating IPsec VPN users

An IPsec VPN can be configured to accept connections from multiple dynamically addressed peers. You would do this to enable employees to connect to the corporate network while traveling or from home. On a FortiGate unit, you create this configuration by setting the **Remote Gateway** to **Dialup User**.

It is possible to have an IPsec VPN in which remote peer devices authenticate using a common preshared key or a certificate, but there is no attempt to identify the user at the remote peer. To add user authentication, you can do one of the following:

- require a unique preshared key for each peer
- require a unique peer ID for each peer
- require a unique peer certificate for each peer
- require additional user authentication (XAuth)

The peer ID is a text string configured on the peer device. On a FortiGate peer or FortiClient Endpoint Security peer, the peer ID provided to the remote peer is called the Local ID.

Authenticating SSL VPN users

SSL VPN users can be

- user accounts with passwords stored on the FortiGate unit
- user accounts authenticated by an external RADIUS, LDAP or TACACS+ server
- PKI users authenticated by certificate

You need to create a user group for your SSL VPN. Simply create a firewall user group, enable SSL VPN access for the group, and select the web portal the users will access.

SSL VPN access requires an SSL VPN security policy that permits access to members of your user group.

Authenticating PPTP and L2TP VPN users

PPTP and L2TP are older VPN tunneling protocols that do not provide authentication themselves. FortiGate units restrict PPTP and L2TP access to users who belong to one specified user group. Users authenticate themselves to the FortiGate unit by username/password. You can configure PPTP and L2TP VPNs only in the CLI. Before you configure the VPN, create a firewall user group and add to it the users who are permitted to use the VPN. Users are authenticated when they attempt to connect to the VPN. For more information about configuring PPTP or L2TP VPNs, see the FortiGate CLI Reference.

Single Sign-On authentication for users

“Single Sign-On” means that users logged on to a computer network are authenticated for access to network resources through the FortiGate unit without having to enter their username and password again. FortiGate units directly provide Single Sign On capability for:

- Microsoft Windows networks using either Active Directory or NTLM authentication
- Novell networks, using eDirectory

In combination with a FortiAuthenticator unit, the FortiGate unit can provide Single Sign-On capability that integrates multiple external network authentication systems such as Windows Active Directory, Novell e-Directory, RADIUS and LDAP. The FortiAuthenticator unit gathers user logon information from all of these sources and sends it to the FortiGate unit.

Through the SSO feature, the FortiGate unit knows the username, IP address, and external user groups to which the user belongs. When the user tries to access network resources, the FortiGate unit selects the appropriate security policy for the destination. If the user belongs to one of the permitted user groups, the connection is allowed.

For detailed information about SSO, see

- [Single Sign-On using a FortiAuthenticator unit on page 496](#)
- [Agent-based FSSO on page 508](#)

User's view of authentication

From the user's point of view, they see a request for authentication when they try to access a protected resource, such as an FTP repository of intellectual property or simply access a website on the Internet. The way the request is presented to the user depends on the method of access to that resource.

VPN authentication usually controls remote access to a private network.

Web-based user authentication

Security policies usually control browsing access to an external network that provides connection to the Internet. In this case, the FortiGate unit requests authentication through the web browser.

The user types a username and password and then selects **Continue** or **Login**. If the credentials are incorrect, the authentication screen is redisplayed with blank fields so that the user can try again. When the user enters valid credentials, access is granted to the required resource. In some cases, if a user tries to authenticate several times without success, a message appears, such as: "Too many bad login attempts. Please try again in a few minutes." This indicates the user is locked out for a period of time. This prevents automated brute force password hacking attempts. The administrator can customize these settings if required.

After a defined period of user inactivity (the authentication timeout, defined by the FortiGate administrator), the user's access expires. The default is 5 minutes. To access the resource, the user will have to authenticate again.

VPN client-based authentication

A VPN provides remote clients with access to a private network for a variety of services that include web browsing, email, and file sharing. A client program such as FortiClient negotiates the connection to the VPN and manages the user authentication challenge from the FortiGate unit.

FortiClient can store the username and password for a VPN as part of the configuration for the VPN connection and pass them to the FortiGate unit as needed. Or, FortiClient can request the username and password from the user when the FortiGate unit requests them.

Social ID data from FortiClient is recorded so that if an email or phone number is changed on FortiClient, the new values are updated on the FortiGate.

The data is sent in KeepAlive messages in the following format:

```
USR_NAME|<full name for the service account>|USR_
EMAIL|<email for the service
account>|SERVICE|<os|custom|linkedin|google|salesforce>|
```

SSL VPN is a form of VPN that can be used with a standard Web browser. There are two modes of SSL VPN operation (supported in NAT mode only):

- web-only mode, for remote clients equipped with a web-browser only
- tunnel mode, for remote computers that run a variety of client and server applications.

After a defined period of user inactivity on the VPN connection (the idle timeout, defined by the FortiGate administrator), the user's access expires. The default is 30 minutes. To access the resource, the user will have to authenticate again.

FortiGate administrator's view of authentication

Authentication is based on user groups. The FortiGate administrator configures authentication for security policies and VPN tunnels by specifying the user groups whose members can use the resource. Some planning is required to determine how many different user groups need to be created. Individual user accounts can belong to multiple groups, making allocation of user privileges very flexible.

A member of a user group can be:

- a user whose username and password are stored on the FortiGate unit
- a user whose name is stored on the FortiGate unit and whose password is stored on a remote or external authentication server
- a remote or external authentication server with a database that contains the username and password of each person who is permitted access

The general process of setting up authentication is as follows:

1. If remote or external authentication is needed, configure the required servers.
2. Configure local and peer (PKI) user identities. For each local user, you can choose whether the FortiGate unit or a remote authentication server verifies the password. Peer members can be included in user groups for use in security policies.
3. Create user groups.
4. Add local/peer user members to each user group as appropriate. You can also add an authentication server to a user group. In this case, all users in the server's database can authenticate. You can only configure peer user groups through the CLI.
5. Configure security policies and VPN tunnels that require authenticated access.

For authentication troubleshooting, see the specific chapter for the topic or for general issues see [Troubleshooting on page 578](#).

General authentication settings

Go to **User & Device > Authentication Settings** to configure authentication timeout, protocol support, and authentication certificates.

When user authentication is enabled within a security policy, the authentication challenge is normally issued for any of the four protocols (depending on the connection protocol):

- HTTP (can also be set to redirect to HTTPS)
- HTTPS
- FTP
- Telnet

The selections made in the **Protocol Support** list of **Authentication Settings** control which protocols support the authentication challenge. Users must connect with a supported protocol first so they can subsequently connect with other protocols. If HTTPS is selected as a method of protocol support, it allows the user to authenticate with a customized Local certificate.

When you enable user authentication within a security policy, the security policy user will be challenged to authenticate. For user ID and password authentication, users must provide their user names and passwords. For certificate authentication (HTTPS or HTTP redirected to HTTPS only), you can install customized certificates on the unit and the users can also have customized certificates installed on their browsers. Otherwise, users will see a warning message and have to accept a default Fortinet certificate.

Authentication Timeout	Enter a length of time in minutes, from 1 to 1440 minutes (24 hours). Authentication timeout controls how long an authenticated firewall connection can be idle before the user must authenticate again. The default value is 5.
Protocol Support	Select the protocols to challenge during firewall user authentication.
Certificate	If using HTTPS protocol support, select the local certificate to use for authentication. Available only if HTTPS protocol support is selected.
Apply	Select to apply the selections for user authentication settings.

Authentication servers

FortiGate units support the use of external authentication servers. An authentication server can provide password checking for selected FortiGate users or it can be added as a member of a FortiGate user group.

If you are going to use authentication servers, you must configure the servers before you configure FortiGate users or user groups that require them.

Mac OS and iOS devices, including iPhones and iPads, can perform user authentication with FortiOS units using RADIUS servers, but not with LDAP or TACACS+ servers.

This section includes the following topics:

- [FortiAuthenticator servers](#)
- [RADIUS servers](#)
- [LDAP servers](#)
- [TACACS+ servers](#)
- [POP3 servers](#)
- [SSO servers](#)
- [RSA ACE \(SecurID\) servers](#)

FortiAuthenticator servers

FortiAuthenticator is an Authentication, Authorization, and Accounting (AAA) server, that includes a RADIUS server, an LDAP server, and can replace the FSSO Collector Agent on a Windows AD network. Multiple FortiGate units can use a single FortiAuthenticator for FSSO, remote authentication, and FortiToken management.

For more information, see [FortiAuthenticator documentation](#).

RADIUS servers

Remote Authentication and Dial-in User Service (RADIUS) is a broadly supported client-server protocol that provides centralized authentication, authorization, and accounting functions. RADIUS clients are built into gateways that allow access to networks such as Virtual Private Network servers, Network Access Servers (NAS), as well as network switches and firewalls that use authentication. FortiGate units fall into the last category.

RADIUS servers use UDP packets to communicate with the RADIUS clients on the network to authenticate users before allowing them access to the network, to authorize access to resources by appropriate users, and to account or bill for those resources that are used. RADIUS servers are currently defined by RFC 2865 (RADIUS) and RFC 2866 (Accounting), and listen on either UDP ports 1812 (authentication) and 1813 (accounting) or ports 1645 (authentication) and 1646 (accounting) requests. RADIUS servers exist for all major operating systems.

You must configure the RADIUS server to accept the FortiGate unit as a client. FortiGate units use the authentication and accounting functions of the RADIUS server.

FortiOS does not accept all characters from auto generated keys from MS Windows 2008. These keys are very long and as a result RADIUS authentication will not work. Maximum key length for MS Windows 2008 is 128 bytes. In older versions of FSAE, it was 40 bytes.

Microsoft RADIUS servers

Microsoft Windows Server 2000, 2003, and 2008 have RADIUS support built-in. Microsoft specific RADIUS features are defined in RFC 2548. The Microsoft RADIUS implementation can use Active Directory for user credentials.

For details on Microsoft RADIUS server configurations, refer to Microsoft documentation.

RADIUS user database

The RADIUS user database is commonly an SQL or LDAP database, but can also be any combination of:

- usernames and passwords defined in a configuration file
- user account names and passwords configured on the computer where the RADIUS server is installed.

If users are members of multiple RADIUS groups, then the user group authentication timeout value does not apply. See [Membership in multiple groups on page 431](#).

RADIUS authentication with a FortiGate unit

To use RADIUS authentication with a FortiGate unit

- configure one or more RADIUS servers on the FortiGate unit
- assign users to a RADIUS server

When a configured user attempts to access the network, the FortiGate unit will forward the authentication request to the RADIUS server which will match the username and password remotely. Once authenticated the RADIUS server passes the authorization granted message to the FortiGate unit which grants the user permission to access the network.

The RADIUS server uses a “shared secret” key along with MD5 hashing to encrypt information passed between RADIUS servers and clients, including the FortiGate unit. Typically only user credentials are encrypted. Additional security can be configured through IPsec tunnels by placing the RADIUS server behind another VPN gateway.

RADIUS attribute value pairs

RADIUS packets include a set of attribute value pairs (AVP) to identify information about the user, their location and other information. The FortiGate unit sends the following RADIUS attributes.

FortiOS supported RADIUS attributes

RADIUS Attribute	Name	Description	AVP type
1	Acct-Session-ID	Unique number assigned to each start and stop record to make it easy to match them, and to eliminate duplicate records.	44

RADIUS Attribute	Name	Description	AVP type
2	Username	Name of the user being authenticated	1
3	NAS-Identifier	Identifier or IP address of the Network Access Server (NAS) that is requesting authentication. In this case, the NAS is the FortiGate unit.	32
4	Framed-IP-Address	Address to be configured for the user.	8
5	Fortinet-VSA	See Vendor-specific attributes on page 392	26
6	Acct-Input-Octets	Number of octets received from the port over the course of this service being provided. Used to charge the user for the amount of traffic they used.	42
7	Acct-Output-Octets	Number of octets sent to the port while delivering this service. Used to charge the user for the amount of traffic they used.	43
8	NAS-IP-Address	IP address of the Network Access Server (NAS) that is requesting authentication. In this case, the NAS is the FortiGate unit.	4
9	Called-Station-Id	Used to send the telephone number the user called as part of the Access-Request packet.	30
10	Framed-IP-Address	IP address to be configured for the user, by sending the IP address of a user to the RADIUS server in the Access-Request packet.	8
11	Event-Timestamp	Records the time that the event occurred on the NAS. The timestamp is measured in seconds since January 1, 1970 00:00 UTC. Before the Event-Timestamp attribute can be sent in a packet, make sure that the correct time is set on the FortiGate.	55
12	Class	Used in accounting packets and requests for firewall, WiFi, and proxy authentication. The attribute is returned in Access-Accept message and is added to all accounting packets.	25

The following table describes the supported authentication events and the RADIUS attributes that are sent in the RADIUS accounting message.

RADIUS attributes sent in RADIUS accounting message

Authentication Method	RADIUS Attributes						
	1	2	3	4	5	6	7
Web	X	X	X		X		
XAuth of IPsec (without DHCP)	X	X	X		X		
XAuth of IPsec (with DHCP)	X	X	X	X	X		
PPTP/L2TP (in PPP)	X	X	X	X	X	X	X
SSL-VPN	X	X	X	X	X		

External captive portal POST message

In external RADIUS captive portal, the captive portal web page is a script that gathers the user's logon credentials and sends it back to the FortiGate as a POST message. Session URL parameters are sent from the client in a POST messages, and in the redirect. These parameters are separated by **&** characters (see examples below):

POST message to redirect server:

```
http://<redirectserver>/index2.php/?login&post=http://192.168.200.1:1000/fgtauth&magic=02050f889bc21644&usermac=54:26:96:16:a2:45&apmac=00:09:0f:b9:f4:c0&apip=127.0.0.1&userip=192.168.200.2
```

POST message back to the FortiGate:

```
http://FGT_IP_addr:1000/fgtauth
```

The magic text data, provided in the initial FortiGate request to the web server, contains the username, password parameters:

```
magic=00050c839182f095&username=<username>&password=<password>
```

Vendor-specific attributes

Vendor specific attributes (VSA) are the method RADIUS servers and client companies use to extend the basic functionality of RADIUS. Some major vendors, such as Microsoft, have published their VSAs, however many do not.

In order to support vendor-specific attributes (VSA), the RADIUS server requires a dictionary to define which VSAs to support. This dictionary is typically supplied by the client or server vendor.

The Fortinet RADIUS vendor ID is 12356.

The FortiGate unit RADIUS VSA dictionary is supplied by Fortinet and is available through the Fortinet Knowledge Base (<http://kb.forticare.com>) or through Technical Support. Fortinet's dictionary for FortiOS 4.0 and up is configured this way:

```
##
Fortinet's VSA's
```

```
#
VENDOR fortinet 12356
BEGIN-VENDOR fortinet
ATTRIBUTE Fortinet-Group-Name 1 string
ATTRIBUTE Fortinet-Client-IP-Address 2 ipaddr
ATTRIBUTE Fortinet-Vdom-Name 3 string
ATTRIBUTE Fortinet-Client-IPv6-Address 4 octets
ATTRIBUTE Fortinet-Interface-Name 5 string
ATTRIBUTE Fortinet-Access-Profile 6 string
#
# Integer Translations
#
END-VENDOR Fortinet
```

Note that using the Fortinet-Vdom-Name, users can be tied to a specific VDOM on the FortiGate unit. See the documentation provided with your RADIUS server for configuration details.

RADIUS CoA support

As of FortiOS 5.4, RADIUS Change of Authorization (CoA) settings can be configured via the CLI. CoA is a common feature in user authentication that provides the ability to change authentication attributes for sessions even after they have authenticated.

User, user group, and captive portal authentication supports RADIUS CoA, when the back end authentication server is RADIUS. The main use case of this feature is with external captive portal, where it can be used to disconnect hotspot users when their time, credit, or bandwidth has been used up.

The commands below control CoA settings.

1. Set the name of the FortiAP connected to the FortiGate as a location identifier.

```
config system global
set alias <name>
```

2. Set URL of external authentication logout server.

```
config vdom
edit root
config wireless-controller vap
edit <example>
set security captive-portal
set external-logout
```

3. Set URL of external authentication logout server

```
config vdom
edit root
config system interface
edit <example>
set security captive-portal
set security-external-logout
```

4. Set class name(s) included in an Access-Accept message.

```
config vdom
edit root
config user radius
edit accounting
set class <"A1=aaa" "B2=bbb" "C3=ccc">
```

Role Based Access Control

In Role Based Access Control (RBAC), network administrators and users have varying levels of access to network resources based on their role, and that role's requirement for access specific resources. For example, a junior accountant does not require access to the sales presentations, or network user account information.

There are three main parts to RBAC: role assignment, role authorization, and transaction authorization. Role assignment is accomplished when someone in an organization is assigned a specific role by a manager or HR. Role authorization is accomplished when a network administrator creates that user's RADIUS account and assigns them to the required groups for that role. Transaction authorization occurs when that user logs on and authenticates before performing a task.

RBAC is enforced when FortiOS network users are remotely authenticated via a RADIUS server. For users to authenticate, a security policy must be matched. That policy only matches a specific group of users. If VDOMs are enabled, the matched group will be limited to a specific VDOM. Using this method network administrators can separate users into groups that match resources, protocols, or VDOMs. It is even possible to limit users to specific FortiGate units if the RADIUS servers serve multiple FortiOS units.

For more information on security policies, see [Authentication in security policies on page 445](#).

RADIUS password encoding

Certain RADIUS servers use ISO-8859-1 password encoding instead of others such as UTF-8. In these instances, the server will fail to authenticate the user, if the user's password is using UTF-8.

CLI syntax

```
config user radius
  edit <example>
    set password-encoding <auto | ISO-8859-1>
  end
```

This option will be skipped if the `auth-type` is neither `auto` nor `pap`.

RADIUS accounting start message options

Administrators can now choose between sending accounting start messages to all configured accounting servers, or just the one server that was previously connected.

Syntax

```
config user radius
  edit <name>
    set acct-interim-interval <seconds>
    set acct-all-servers {enable | disable}
  next
end
```

Configuring the FortiGate unit to use a RADIUS server

The information you need to configure the FortiGate unit to use a RADIUS server includes

- the RADIUS server's domain name or IP address
- the RADIUS server's shared secret key.

You can optionally specify the NAS IP or Called Station ID. When configuring the FortiGate to use a RADIUS server, the FortiGate is a Network Access Server (NAS). If the FortiGate interface has multiple IP addresses, or you want the RADIUS requests to come from a different address you can specify it here. Called Station ID applies to carrier networks. However, if the NAS IP is not included in the RADIUS configuration, the IP of the FortiGate unit interface that communicates with the RADIUS server is used instead.

A maximum of 10 remote RADIUS servers can be configured on the FortiGate unit. One or more servers must be configured on FortiGate before remote users can be configured. To configure remote users, see [Local and remote users on page 416](#).

On the FortiGate unit, the default port for RADIUS traffic is 1812. Some RADIUS servers use port 1645. If this is the case with your server, you can either:

- Re-configure the RADIUS server to use port 1812. See your RADIUS server documentation for more information on this procedure.

or

- Change the FortiGate unit default RADIUS port to 1645 using the CLI:

```
config system global
    set radius-port 1645
end
```

One wildcard admin account can be added to the FortiGate unit when using RADIUS authentication. This uses the wildcard character to allow multiple admin accounts on RADIUS to use a single account on the FortiGate unit. See [Example — wildcard admin accounts - CLI on page 402](#).

To configure the FortiGate unit for RADIUS authentication - web-based manager:

1. Go to **User & Device > RADIUS Servers** and select **Create New**.
2. Enter the following information and select **OK**.

Name	A name to identify the RADIUS server on the FortiGate unit.
Primary Server Name/IP	Enter the domain name (such as fgt.exmaple.com) or the IP address of the RADIUS server.
Primary Server Secret	Enter the server secret key, such as radiusSecret. This can be a maximum of 16 characters long. This must match the secret on the RADIUS primary server.
Secondary Server Name/IP	Optionally enter the domain name (such as fgt.exmaple.com) or the IP address of the secondary RADIUS server.
Secondary Server Secret	Optionally, enter the secondary server secret key, such as radiusSecret2. This can be a maximum of 16 characters long. This must match the secret on the RADIUS secondary server.
Authentication Scheme	If you know the RADIUS server uses a specific authentication protocol, select it from the list. Otherwise select Use Default Authentication Scheme . The Default option will usually work.

NAS IP/ Called Station ID

Enter the IP address to be used as an attribute in RADIUS access requests.

NAS-IP-Address is RADIUS setting or IP address of FortiGate interface used to talk to RADIUS server, if not configured.

Called Station ID is same value as NAS-IP Address but in text format.

Include in every User Group

When enabled this RADIUS server will automatically be included in all user groups. This is useful if all users will be authenticating with the remote RADIUS server.

For MAC OS and iOS devices to authenticate, you must use MS-CHAP-v2 authentication. In the CLI, the command is `set auth-type ms_chap_v2`.

3. Select OK.**To configure the FortiGate unit for RADIUS authentication - CLI example:**

```
config user radius
edit ourRADIUS
set auth-type auto
set server 10.11.102.100
set secret radiusSecret
end
```

For more information about RADIUS server options, refer to the FortiGate CLI Reference.

Troubleshooting RADIUS

To test the connection to the RADIUS server use the following command:

```
diagnose test authserver radius-direct <server_name or IP> <port number> <secret>
```

For the port number, enter `-1` to use the default port. Otherwise enter the port number to check.

Test results show RADIUS server reachability, NAS client rejection, and invalid User/Password. Test also shows RADIUS Attributes returned from the RADIUS server.

LDAP servers

Lightweight Directory Access Protocol (LDAP) is an Internet protocol used to maintain authentication data that may include departments, people, groups of people, passwords, email addresses, and printers. LDAP consists of a data-representation scheme, a set of defined operations, and a request/response network.

The scale of LDAP servers range from big public servers such as BigFoot and Infospace, to large organizational servers at universities and corporations, to small LDAP servers for workgroups that may be using OpenLDAP. This document focuses on the institutional and workgroup applications of LDAP.

This section includes:

- [Components and topology](#)
- [LDAP directory organization](#)
- [Configuring the FortiGate unit to use an LDAP server](#)
- [Example — wildcard admin accounts - CLI](#)
- [Example of LDAP to allow Dial-in through member-attribute - CLI](#)
- [Troubleshooting LDAP](#)

Components and topology

LDAP organization starts with directories. A directory is a set of objects with similar attributes organized in a logical and hierarchical way. Generally, an LDAP directory tree reflects geographic and organizational boundaries, with the Domain name system (DNS) names to structure the top level of the hierarchy. The common name identifier for most LDAP servers is `cn`, however some servers use other common name identifiers such as `uid`.

When LDAP is configured and a user is required to authenticate the general steps are:

1. The FortiGate unit contacts the LDAP server for authentication.
2. To authenticate with the FortiGate unit, the user enters a username and password.
3. The FortiGate unit sends this username and password to the LDAP server.
4. If the LDAP server can authenticate the user, the user is successfully authenticated with the FortiGate unit.
5. If the LDAP server cannot authenticate the user, the connection is refused by the FortiGate unit.

Binding

Binding is the step where the LDAP server authenticates the user. If the user is successfully authenticated, binding allows the user access to the LDAP server based on that user's permissions.

The FortiGate unit can be configured to use one of three types of binding:

- anonymous - bind using anonymous user search
- regular - bind using username/password and then search
- simple - bind using a simple password authentication without a search

You can use simple authentication if the user records all fall under one domain name (`dn`). If the users are under more than one `dn`, use the anonymous or regular type, which can search the entire LDAP database for the required username.

If your LDAP server requires authentication to perform searches, use the regular type and provide values for username and password.

Supported versions

The FortiGate unit supports LDAP protocol functionality defined in RFC 2251: Lightweight Directory Access Protocol v3, for looking up and validating user names and passwords. FortiGate LDAP supports all LDAP servers compliant with LDAP v3, including FortiAuthenticator. In addition, FortiGate LDAP supports LDAP over SSL/TLS, which can be configured only in the CLI.

FortiGate LDAP does not support proprietary functionality, such as notification of password expiration, which is available from some LDAP servers. FortiGate LDAP does not supply information to the user about why authentication failed.

LDAP user authentication is supported for PPTP, L2TP, IPsec VPN, and firewall authentication.

However, with PPTP, L2TP, and IPsec VPN, PAP (Packet Authentication Protocol) is supported, while CHAP (Challenge Handshake Authentication Protocol) is not.

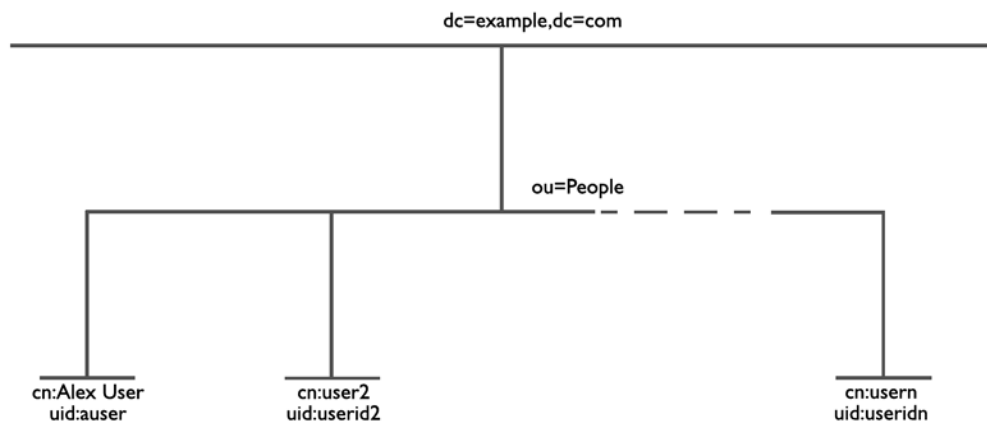

LDAP directory organization

To configure your FortiGate unit to work with an LDAP server, you need to understand the organization of the information on the server.

The top of the hierarchy is the organization itself. Usually this is defined as Domain Component (DC), a DNS domain. If the name contains a dot, such as `example.com`, it is written as two parts separated by a comma: `dc=example,dc=com`.

In this example, Common Name (CN) identifiers reside at the Organization Unit (OU) level, just below DC. The Distinguished Name (DN) is `ou=People,dc=example,dc=com`.

LDAP object hierarchy

In addition to the DN, the FortiGate unit needs an identifier for the individual person. Although the FortiGate unit GUI calls this the Common Name (CN), the identifier you use is not necessarily CN. On some servers, CN is the full name of a person. It might be more convenient to use the same identifier used on the local computer network. In this example, User ID (UID) is used.

Locating your identifier in the hierarchy

You need to determine the levels of the hierarchy from the top to the level that contain the identifier you want to use. This defines the DN that the FortiGate unit uses to search the LDAP database. Frequently used distinguished name elements include:

- uid (user identification)
- pw (password)
- cn (common name)
- ou (organizational unit)
- o (organization)
- c (country)

One way to test this is with a text-based LDAP client program. For example, OpenLDAP includes a client, `ldapsearch`, that you can use for this purpose.

Enter the following at the command line:

```
ldapsearch -x '(objectclass=*)'
```

The output is lengthy, but the information you need is in the first few lines:

```
version: 2
#
# filter: (objectclass=*)
# requesting: ALL

dn: dc=example,dc=com
dc: example
objectClass: top
objectClass: domain

dn: ou=People,dc=example,dc=com
ou: People
objectClass: top
objectClass: organizationalUnit
...
dn: uid=tbrown,ou=People,dc=example,dc=com
uid: tbrown
cn: Tom Brown
```

In the output above, you can see `tbrown` (uid) and `Tom Brown` (cn). Also note the dn is `ou=People, dc=example, dc=com`.

Configuring the FortiGate unit to use an LDAP server

After you determine the common name and distinguished name identifiers and the domain name or IP address of the LDAP server, you can configure the server on the FortiGate unit. The maximum number of remote LDAP servers that can be configured is 10.

One or more servers must be configured on FortiGate before remote users can be configured. To configure remote users, see [Local and remote users on page 416](#).

To configure the FortiGate unit for LDAP authentication - web-based manager:

1. Go to **User & Device > LDAP Servers** and select **Create New**.
2. Enter a **Name** for the LDAP server.
3. In **Server Name/IP** enter the server's FQDN or IP address.
4. If necessary, change the **Server Port** number. The default is port 389.
5. Enter the **Common Name Identifier** (20 characters maximum).
`cn` is the default, and is used by most LDAP servers.
6. In the **Distinguished Name** field, enter the base distinguished name for the server using the correct X.500 or LDAP format.
The FortiGate unit passes this distinguished name unchanged to the server. The maximum number of characters is 512.
If you don't know the distinguished name, leave the field blank and select the Query icon to the right of the field.
See [Using the Query icon on page 401](#).

7. In the **Distinguished Name** field, enter the base distinguished name for the server using the correct X.500 or LDAP format.
The FortiGate unit passes this distinguished name unchanged to the server. The maximum number of characters is 512.
If you don't know the distinguished name, leave the field blank and select the Query icon to the right of the field.
See [Using the Query icon on page 401](#).
8. In **Bind Type**, select **Regular**.
9. In **User DN**, enter the LDAP administrator's distinguished name.
10. In **Password**, enter the LDAP administrator's password.
11. Select **OK**.

To verify your Distinguished Name field is correct, you can select the **Test** button. If your DN field entry is valid, you will see the part of the LDAP database it defines. If your DN field entry is not valid, it will display an error message and return no information.

For detailed information about configuration options for LDAP servers, see the Online Help on your FortiGate unit or the FortiGate CLI Reference.

To configure the FortiGate unit for LDAP authentication - CLI example:

```
config user ldap
  edit ourLDAPsrv
    set server 10.11.101.160
    set cnid cn
    set dn cn=users,dc=office,dc=example,dc=com
    set type regular
    set username cn=administrator,cn=users,dc=office,dc=example,dc=com
    set password w5AiGVMLkgyPQ
    set password-expiry-warning enable
    set password-renewal enable
  end
```

password-expiry-warning and password-renewal

In SSLVPN, when an LDAP user is connecting to the LDAP server it is possible for them to receive any pending password expiry or renewal warnings. When the password renewal or expiry warning exists, SSLVPN users will see a prompt allowing them to change their password.

`password-expiry-warning` allows FortiOS to detect from the OpenLDAP server when a password is expiring or has expired using server controls or error codes. Please note that this is currently not supported for Windows AD LDAP.

`password-renewal` allows FortiOS to perform the online LDAP password renewal operations the LDAP server expects.

On an OpenLDAP server, when a user attempts to logon with an expired password they are allowed to logon but only to change their password.

When changing passwords on a Windows AD system, the connection must be SSL-protected.

UPN processing method and filter name

The following CLI commands available under `config user ldap` allow you to keep or strip the domain string of UPN in the token as well as the search name for this kind of UPN.

CLI syntax:

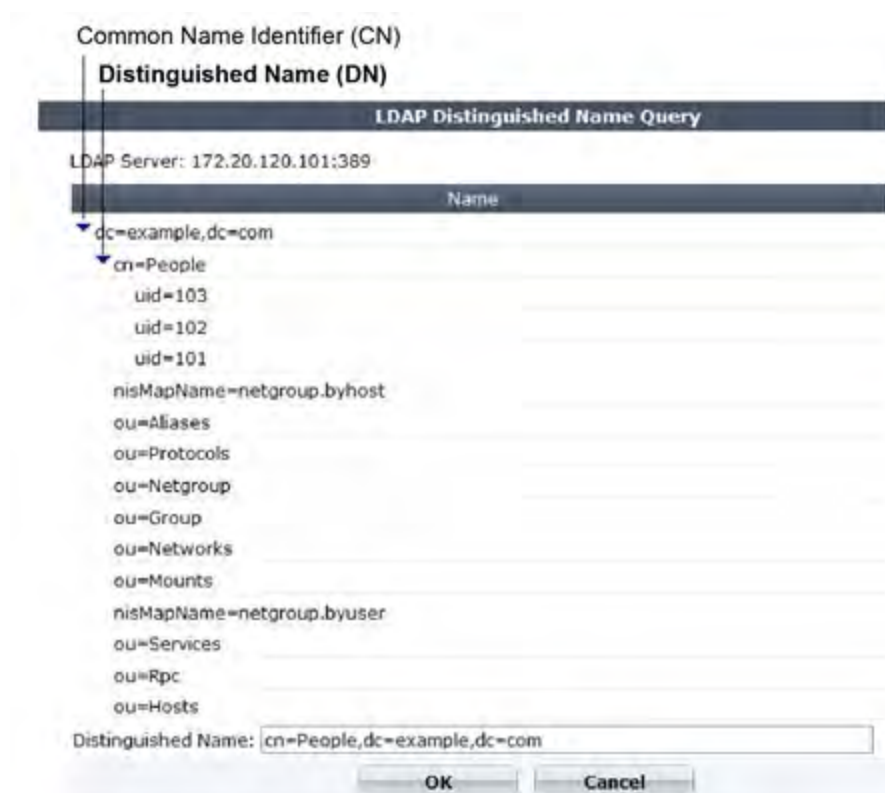

```
config user ldap
  set account-key-processing
  set account-key-name
end
```

Using the Query icon

The LDAP Distinguished Name Query list displays the LDAP directory tree for the LDAP server connected to the FortiGate unit. This helps you to determine the appropriate entry for the DN field. To see the distinguished name associated with the Common Name identifier, select the Expand icon next to the CN identifier. Select the DN from the list. The DN you select is displayed in the Distinguished Name field. Select OK and the Distinguished Name you selected will be saved in the Distinguished Name field of the LDAP Server configuration.

To see the users within the LDAP Server user group for the selected Distinguished Name, expand the Distinguished Name in the LDAP Distinguished Name Query tree.

LDAP server Distinguished Name Query tree

Non-blocking LDAP authentication

To support non-blocking LDAP authentication, `fnbamd` will create its own event-driven connection with LDAP servers over LDAP/LDAPS/STARTTLS, make it non-blocking, do CRL checking if necessary, and compose all LDAP requests using `liblber` (including bind, unbind, search, password renewal, password query, send request and receive response, and parse response). The whole process is done in one connection.

This doesn't change any openLDAP implementation but moves some data structure definitions and API definitions from some internal header files to public header files.

Example — wildcard admin accounts - CLI

A wildcard admin account is an administrator account with the wildcard option enabled. This option allows multiple different remote administration accounts to match one local administration account, avoiding the need to set up individual admin accounts on the FortiGate unit. Instead multiple LDAP admin accounts will all be able to use one FortiGate admin account.

The initial benefit of wildcard admin accounts is fast configuration of the FortiGate unit's administration account to work with your LDAP network. The many to one ratio saves on effort, and potential errors.

The ongoing benefit is that as long as the users on the LDAP system belong to that group, and the test admin user settings don't change on the FortiGate unit, no other work is required. This point is important as it can help avoid system updates or changes that would otherwise require changes to the LDAP administrator account configuration. Even if a user is added to or removed from the LDAP group, no changes are required on the FortiGate unit.

Two potential issues with wildcard admin accounts are that multiple users may be logged on to the same account at the same time. This becomes an issue if they are changing the same information at the same time. The other potential issue is that security is reduced because multiple people have login access for the same account. If each user was assigned their own account, a hijacking of one account would not affect the other users.

Note that wildcard admin configuration also applies to RADIUS. When configuring for RADIUS, configure the RADIUS server, and RADIUS user group instead of LDAP. When using web-based management, wildcard admin is the only type of remote administrator account that does not require you to enter a password on account creation. That password is normally used when the remote authentication server is unavailable during authentication.

In this example, default values are used where possible. If a specific value is not mentioned, it is set to its default value.

Configuring the LDAP server

The important parts of this configuration are the username and group lines. The username is the domain administrator account. The group binding allows only the group with the name `GRP` to access.

The `dn` used here is as an example only. On your network use your own domain name.

To configure LDAP server - CLI:

```
config user ldap
  edit "ldap_server"
    set server "192.168.201.3"
```

```

        set cnid "sAMAccountName"
        set dn "DC=example,DC=com,DC=au"
        set type regular
        set username "CN=Administrator,CN=Users,DC=example,DC=COM"
        set password *
        set group-member-check group-object
        set group-object-filter (&
            (objectcategory=group)member="CN=GRP,OU=training,DC=example,DC=COM")
    next
end

```

To configure the user group and add the LDAP server - CLI:

```

config user group
    edit "ldap_grp"
        set member "ldap"
        config match
            edit 1
                set server-name "ldap_server"
                set group-name "CN=GRP,OU=training,DC=example,DC=COM"
            next
        end
    next
end

```

Configuring the admin account

The wildcard part of this example is only available in the CLI for admin configuration. When enabled, this allows all LDAP group members to login to the FortiGate unit without the need to create a separate admin account for each user. In effect the members of that group will each be able to login as “test”.

To configure the admin account - CLI:

```

config system admin
    edit "test"
        set remote-auth enable
        set accprofile "super_admin"
        set wildcard enable
        set remote-group "ldap_grp"
    next
end

```

For troubleshooting, test that the admin account is operational, and see [Troubleshooting LDAP on page 404](#).

Example of LDAP to allow Dial-in through member-attribute - CLI

In this example, users defined in MicroSoft Windows Active Directory (AD) are allowed to setup a VPN connection simply based on an attribute that is set to TRUE, instead of based on being part of a specific group.

In AD, the “Allow Dial-In” property is activated in the user properties, and this sets the `msNPAllowDialin` attribute to “TRUE”.

This same procedure can be used for other member attributes, as your system requires.

Configuring LDAP member-attribute settings

To accomplish this with a FortiGate unit, the member attribute must be set. Setting member attributes can only be accomplished through the CLI using the `member-attr` keyword - the option is not available through the web-based manager.

Before configuring the FortiGate unit, the AD server must be configured and have the `msNPAllowDialin` attribute set to "TRUE" for the users in question. If not, those users will not be able to properly authenticate.

The dn used here is as an example only. On your network use your own domain name.

To configure user LDAP member-attribute settings - CLI:

```
config user ldap
  edit "ldap_server"
    set server "192.168.201.3"
    set cnid "sAMAccountName"
    set dn "DC=fortinet,DC=com,DC=au"
    set type regular
    set username "fortigate@example.com"
    set password *****
    set member-attr "msNPAllowDialin"
  next
end
```

Configuring LDAP group settings

A user group that will use LDAP must be configured. This example adds the member `ldap` to the group which is the LDAP server name that was configured earlier.

To configure LDAP group settings - CLI:

```
config user group
  edit "ldap_grp"
    set member "ldap"
    config match
    edit 1
      set server-name "ldap"
      set group-name "TRUE"
    next
  end
end
```

Once these settings are in place, users can authenticate.

Troubleshooting LDAP

The examples in this section use the values from the previous example.

LDAP user test

A quick way to see if the LDAP configuration is correct is to run a `diagnose` CLI command with LDAP user information. The following command tests with a user called `netAdmin` and a password of `fortinet`. If the configuration is correct the test will be successful.

```
FGT# diag test authserver ldap ldap_server netAdmin fortinet
```

'ldap_server' is not a valid ldap server name — an LDAP server by that name has not been configured on the FortiGate unit, check your spelling.

authenticate 'netAdmin' against 'ldap_server' failed! — the user netAdmin does not exist on ldap_server, check your spelling of both the user and sever and ensure the user has been configured on the FortiGate unit.

LDAP authentication debugging

For a more in-depth test, you can use a `diag debug` command. The sample output from a shows more information about the authentication process that may prove useful if there are any problems.

Ensure the “Allow Dial-in” attribute is still set to “TRUE” and run the following CLI command. `fnbamd` is the Fortinet non-blocking authentication daemon.

```
FGT# diag debug enable
FGT# diag debug reset
FGT# diag debug application fnbamd -1
FGT# diag debug enable
```

The output will look similar to:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='TRUE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Passed group matching
```

If the “Allow Dial-in” attribute is not set but it is expected, the last line of the above output will instead be:

```
fnbamd_auth_poll_ldap-Failed group matching
```

TACACS+ servers

When users connect to their corporate network remotely, they do so through a remote access server. As remote access technology has evolved, the need for security when accessing networks has become increasingly important. This need can be filled using a Terminal Access Controller Access-Control System (TACACS+) server.

TACACS+ is a remote authentication protocol that provides access control for routers, network access servers, and other networked computing devices via one or more centralized servers. TACACS+ allows a client to accept a username and password and send a query to a TACACS+ authentication server. The server host determines whether to accept or deny the request and sends a response back that allows or denies the user access to the network.

TACACS+ offers fully encrypted packet bodies, and supports both IP and AppleTalk protocols. TACACS+ uses TCP port 49, which is seen as more reliable than RADIUS's UDP protocol.

There are several different authentication protocols that TACACS+ can use during the authentication process:

Authentication protocols

Protocol	Definition
ASCII	Machine-independent technique that uses representations of English characters. Requires user to type a username and password that are sent in clear text (unencrypted) and matched with an entry in the user database stored in ASCII format.
PAP	Password Authentication Protocol (PAP) Used to authenticate PPP connections. Transmits passwords and other user information in clear text.
CHAP	Challenge-Handshake Authentication Protocol (CHAP) Provides the same functionality as PAP, but is more secure as it does not send the password and other user information over the network to the security server.
MS-CHAP	MicroSoft Challenge-Handshake Authentication Protocol v1 (MSCHAP) Microsoft-specific version of CHAP.
default	The default protocol configuration, Auto, uses PAP, MS-CHAP, and CHAP, in that order.

TACACS+ attribute value pairs

FortiGate sends the following proprietary TACACS+ attributes to the TACACS+ server during authorization requests:

- **service=<name>**: The user must be authorized to access the service specified.
- **memberof**: The group that the user belongs to.
- **admin_prof**: The administrator profile (admin access only).

Note that only the **memberof** and **admin_prof** attributes are also parsed in authentication replies.

Configuring a TACACS+ server on the FortiGate unit

A maximum of 10 remote TACACS+ servers can be configured for authentication.

One or more servers must be configured on FortiGate before remote users can be configured. To configure remote users, see [Local and remote users on page 416](#).

The TACACS+ page in the web-based manager (**User & Device > TACACS+ Servers**) is not available until a TACACS+ server has been configured in the CLI. For more information see the CLI Reference.

To configure the FortiGate unit for TACACS+ authentication - web-based manager:

1. Go to **User & Device > TACACS+ Servers** and select **Create New**.
2. Enter the following information, and select **OK**.

Name	Enter the name of the TACACS+ server.
-------------	---------------------------------------

Server Name/IP	Enter the server domain name or IP address of the TACACS+ server.
Server Key	Enter the key to access the TACACS+ server.
Authentication Type	Select the authentication type to use for the TACACS+ server. Auto tries PAP, MSCHAP, and CHAP (in that order).

To configure the FortiGate unit for TACACS+ authentication - CLI:

```

config user tacacs+
    edit "TACACS-SERVER"
        set server [IP_ADDRESS]
        set key [PASSWORD]
        set authen-type ascii
    next
end
config user group
    edit "TACACS-GROUP"
        set group-type firewall
        set member "TACACS-SERVER"
    next
end
config system admin
    edit TACACS-USER
        set remote-auth enable
        set accprofile "super_admin"
        set vdom "root"
        set wildcard enable
        set remote-group "TACACS-GROUP"
    next
end

```

IPv6 TACACS+ server IP address

IPv6 address support is available for TACACS+ servers.

Syntax

```

config user tacacs+
    edit <name>
        set server <ipv6 address>
        set source-ipv6 <ipv6 address>
    next
end

```

POP3 servers

FortiOS can authenticate users who have accounts on POP3 or POP3s email servers. POP3 authentication can be configured only in the CLI.

To configure the FortiGate unit for POP3 authentication:

```

config user pop3
    edit pop3_server1
        set server pop3.fortinet.com

```

```
set secure starttls
set port 110
end
```

To configure a POP3 user group:

```
config user group
edit pop3_grp
set member pop3_server1
end
```

A user group can list up to six POP3 servers as members.

SSO servers

Novell and Microsoft Windows networks provide user authentication based on directory services: eDirectory for Novell, Active Directory for Windows. Users can log on at any computer in the domain and have access to resources as defined in their user account. The Fortinet Single Sign On (FSSO) agent enables FortiGate units to authenticate these network users for security policy or VPN access without asking them again for their username and password.

When a user logs in to the Windows or Novell domain, the FSSO agent sends to the FortiGate unit the user's IP address and the names of the user groups to which the user belongs. The FortiGate unit uses this information to maintain a copy of the domain controller user group database. Because the domain controller authenticates users, the FortiGate unit does not perform authentication. It recognizes group members by their IP address.

In the FortiOS FSSO configuration, you specify the server where the FSSO Collector agent is installed. The Collector agent retrieves the names of the Novell or Active Directory user groups from the domain controllers on the domains, and then the FortiGate unit gets them from the Collector agent. You cannot use these groups directly. You must define FSSO type user groups on your FortiGate unit and then add the Novell or Active Directory user groups to them. The FSSO user groups that you created are used in security policies and VPN configurations to provide access to different services and resources.

FortiAuthenticator servers can replace the Collector agent when FSSO is using polling mode. The benefits of this is that FortiAuthenticator is a stand-alone server that has the necessary FSSO software pre-installed. For more information, see the FortiAuthenticator Administration Guide.

Single Sign-on Agent configuration settings

The following are SSO configuration settings in **User & Device > Single Sign-On**.

SSO Server List

Lists all the collector agents' lists that you have configured. On this page, you can create, edit or delete FSSO agents. There are different types of FSSO agents, each with its own settings.

You can create a redundant configuration on your unit if you install a collector agent on two or more domain controllers. If the current (or first) collector agent fails, the Fortinet unit switches to the next one in its list of up to five collector agents.

Create New	Creates a new agent. When you select Create New , you are automatically redirected to the New page.
Edit	<p>Modifies the settings for the selected SSO server.</p> <p>To remove multiple entries from the list, for each servers you want removed, select the check box and then select Delete.</p> <p>To remove all agents from the list, on the FSSO Agent page, select the check box at the top of the check box column and then select Delete.</p>
Delete	Removes an agent from the list on the page.

Settings when Type is Poll Active Directory Server

Server IP/Name	The IP address of the domain controller (DC).
User	The user ID used to access the domain controller.
Password	Enter the password for the account used to access the DC.
LDAP Server	Select the check box and select an LDAP server to access the Directory Service.
Enable Polling	Enable to allow the FortiGate unit to poll this DC.
Users/Groups	A list of user and user group names retrieved from the DC.

Settings when Type is Fortinet Single Sign On Agent

Name	Enter a name for the SSO server.
Primary Agent IP/Name	Enter the IP address or name of the Directory Service server where this SSO agent is installed. The maximum number of characters is 63.
Secondary Agent IP/Name	
Password	Enter the password for the collector agent. This is required only if you configured your Fortinet Single Sign On Agent collector agent to require authenticated access.
LDAP Server	Select the check box and select an LDAP server to access the Directory Service.
More FSSO agents	Select to add up to three additional SSO agents.
Users/Groups	A list of user and user group names retrieved from the server.

Settings when Type is RADIUS Single Sign On Agent

Use RADIUS Shared Secret	Enable
Shared Secret	Enter the RADIUS server shared secret.
Send RADIUS Responses	Enable.

RSA ACE (SecurID) servers

SecurID is a two-factor system that uses one-time password (OTP) authentication. It is produced by the company RSA. This system includes portable tokens carried by users, an RSA ACE/Server, and an Agent Host. In our configuration, the FortiGate unit is the Agent Host.

Components

When using SecurID, users carry a small device or “token” that generates and displays a pseudo-random password. According to RSA, each SecurID authenticator token has a unique 64-bit symmetric key that is combined with a powerful algorithm to generate a new code every 60 seconds. The token is time-synchronized with the SecurID RSA ACE/Server.

The RSA ACE/Server is the management component of the SecurID system. It stores and validates the information about the SecurID tokens allowed on your network. Alternately the server could be an RSA SecurID 130 Appliance.

The Agent Host is the server on your network, in this case it is the FortiGate unit, that intercepts user logon attempts. The Agent Host gathers the user ID and password entered from their SecurID token, and sends that information to the RSA ACE/Server to be validated. If valid, a reply comes back indicating it is a valid logon and the FortiGate unit allows the user access to the network resources specified in the associated security policy.

Configuring the SecurID system

To use SecurID with a FortiGate unit, you need:

- to configure the RSA server and the RADIUS server to work with each other (see RSA server documentation)
- [to configure the RSA SecurID 130 Appliance](#)
- or
- [to configure the FortiGate unit as an Agent Host on the RSA ACE/Server](#)
- [to configure the FortiGate unit to use the RADIUS server](#)
- [to create a SecurID user group](#)
- [to configure a security policy with SecurID authentication](#)

The following instructions are based on RSA ACE/Server version 5.1, or RSA SecurID 130 Appliance, and assume that you have successfully completed all the external RSA and RADIUS server configuration steps listed above.

For this example, the RSA server is on the internal network, with an IP address of 192.128.100.100. The FortiGate unit internal interface address is 192.168.100.3, RADIUS shared secret is fortinet123, RADIUS server is at IP address 192.168.100.102.

To configure the RSA SecurID 130 Appliance

1. Go to the IMS Console for SecurID and logon.
2. Go to **RADIUS > RADIUS Clients**, and select **Add New**.
3. Enter the following information to configure your FortiGate as a SecurID Client, and select Save.

RADIUS Client Basics	
Client Name	FortiGate
Associated RSA Agent	FortiGate
RADIUS Client Settings	
IP Address	192.168.100.3
	The IP address of the FortiGate unit internal interface.
Make / Model	Select Standard Radius
Shared Secret	fortinet123
	The RADIUS shared secret.
Accounting	Leave unselected
Client Status	Leave unselected

To configure the FortiGate unit as an Agent Host on the RSA ACE/Server

1. On the RSA ACE/Server computer, go to **Start > Programs > RSA ACE/Server**, and then **Database Administration - Host Mode**.
2. On the **Agent Host** menu, select **Add Agent Host**.
3. Enter and save the following information.

Name	FortiGate
Network Address	192.168.100.3
	The IP address of the FortiGate unit.
Secondary Nodes	Optionally enter other IP addresses that resolve to the FortiGate unit.

If needed, refer to the RSA ACE/Server documentation for more information.

To configure the FortiGate unit to use the RADIUS server

1. Go to **User & Device > RADIUS Servers** and select **Create New**.
2. Enter the following information, and select **OK**.

Name	RSA
Primary Server IP/Name	192.168.100.102 Optionally select Test to ensure the IP address is correct and the FortiGate can contact the RADIUS server.
Primary Server Secret	fortinet123
Authentication Scheme	Select Use Default Authentication Scheme .

To create a SecurID user group

1. Go to **User & Device > User Groups**, and select **Create New**.
2. Enter the following information.

Name	RSA_group
Type	Firewall

3. In **Remote Groups**, select **Add**, then select the RSA server.
4. Select **OK**.

To create a SecurID user:

1. Go to **User & Device > User Definition**, and select **Create New**.
2. Use the wizard to enter the following information, and then select **Create**.

User Type	Remote RADIUS User
User Name	wloman
RADIUS Server	RSA
Contact Info	(optional) Enter Email or SMS information
User Group	RSA_group

To test this configuration, on your FortiGate unit use the CLI command:

```
diagnose test authserver radius RSA auto wloman 111111111
```

The series of 1s is the one time password that your RSA SecurID token generates and you enter.

Using the SecurID user group for authentication

You can use the SecurID user group in several FortiOS features that authenticate by user group including

- [Security policy](#)
- [IPsec VPN XAuth](#)
- [PPTP VPN](#)
- [SSL VPN](#)

The following sections assume the SecurID user group is called `securIDgrp` and has already been configured. Unless otherwise states, default values are used.

Security policy

To use SecurID in a security policy, you must include the SecurID user group in a security policy. This procedure will create a security policy that allows HTTP, FTP, and POP3 traffic from the `internal` interface to `wan1`. If these interfaces are not available on your FortiGate unit, substitute other similar interfaces.

To configure a security policy with SecurID authentication

1. Go to **Policy & Objects > IPv4 Policy**.
2. Select **Create New**.
3. Enter:

Incoming Interface	internal
Source Address	all
Source User(s)	securIDgrp
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Services	HTTP, FTP, POP3
Action	ACCEPT
NAT	On
Shared Shaper	On, if you want to either limit traffic or guarantee minimum bandwidth for traffic that uses the SecurID security policy. Use the default shaper guarantee-100kbps .
Log Allowed Traffic	On, if you want to generate usage reports on traffic authenticated with this policy.

4. Select **OK**.
The SecurID security policy is configured.

For more detail on configuring security policies, see the FortiOS Handbook FortiGate Fundamentals guide.

IPsec VPN XAuth

Extended Authentication (XAuth) increases security by requiring user authentication in addition to the preshared key.

When creating an IPsec VPN using the wizard, under **VPN > IPsec Wizard**, select the SecurID **User Group** on the Authentication page. Members of the SecurID group are required to enter their SecureID code to authenticate.

For more on XAuth, see [Configuring XAuth authentication on page 462](#)

PPTP VPN

PPTP VPN is configured in the CLI. In the PPTP configuration (`config vpn pptp`), set `usrgrp` to the SecurID user group.

SSL VPN

You need to map the SecurID user group to the portal that will serve SecurID users and include the SecurID user group in the **Source User(s)** field in the security policy.

To map the SecurID group to an SSL VPN portal:

1. Go to **VPN > SSL-VPN Settings**.
2. In **Authentication/Portal Mapping**, select **Create New**.
3. Enter

Users/Groups	securIDgrp
Portal	Choose the portal.

4. Select **OK**.

Users and user groups

FortiGate authentication controls system access by user group. By assigning individual users to the appropriate user groups you can control each user's access to network resources. The members of user groups are user accounts, of which there are several types. Local users and peer users are defined on the FortiGate unit. User accounts can also be defined on remote authentication servers.

This section describes how to configure local users and peer users and then how to configure user groups. For information about configuration of authentication servers see [Authentication servers on page 389](#).

This section contains the following topics:

- [Users](#)
- [User groups](#)

Users

A user is a user account consisting of username, password, and in some cases other information, configured on the FortiGate unit or on an external authentication server. Users can access resources that require authentication only if they are members of an allowed user group. There are several different types of user accounts with slightly different methods of authentication:

User type	Authentication
Local user	The username and password must match a user account stored on the FortiGate unit. Authentication by FortiGate security policy.
Remote user	The username must match a user account stored on the FortiGate unit and the username and password must match a user account stored on the remote authentication server. FortiOS supports LDAP, RADIUS, and TACACS+ servers.
Authentication server user	A FortiGate user group can include user accounts or groups that exist on a remote authentication server.
FSSO user	With Fortinet Single Sign On (FSSO), users on a Microsoft Windows or Novell network can use their network authentication to access resources through the FortiGate unit. Access is controlled through FSSO user groups which contain Windows or Novell user groups as their members.
PKI or Peer user	A Public Key Infrastructure (PKI) or peer user is a digital certificate holder who authenticates using a client certificate. No password is required, unless two-factor authentication is enabled.
IM Users	IM users are not authenticated. The FortiGate unit can allow or block each IM user name from accessing the IM protocols. A global policy for each IM protocol governs access to these protocols by unknown users.
Guest Users	Guest user accounts are temporary. The account expires after a selected period of time.

This section includes:

- [Local and remote users](#)
- [PKI or peer users](#)
- [Two-factor authentication](#)
- [FortiToken](#)
- [Monitoring users](#)

Local and remote users

Local and remote users are defined on the FortiGate unit in **User & Device > User Definition**.

Create New	Creates a new user account. When you select Create New , you are automatically redirected to the User Creation Wizard.
Edit User	Modifies a user's account settings. When you select Edit , you are automatically redirected to the Edit User page.
Delete	<p>Removes a user from the list. Removing the user name removes the authentication configured for the user.</p> <p>The Delete icon is not available if the user belongs to a user group.</p> <p>To remove multiple local user accounts from within the list, on the User page, in each of the rows of user accounts you want removed, select the check box and then select Delete.</p> <p>To remove all local user accounts from the list, on the User page, select the check box in the check box column and then select Delete.</p>
User Name	The user name. For a remote user, this username must be identical to the username on the authentication server.
Type	Local indicates a local user authenticated on the FortiGate unit. For remote users, the type of authentication server is shown: LDAP, RADIUS, or TACACS+.
Two-factor Authentication	Indicates whether two-factor authentication is configured for the user.
Ref.	<p>Displays the number of times this object is referenced by other objects. Select the number to open the Object Usage window and view the list of referring objects. The list is grouped into expandable categories, such as Firewall Policy. Numbers of objects are shown in parentheses.</p> <p>To view more information about the referring object, use the icons:</p> <ul style="list-style-type: none"> • View the list page for these objects – available for object categories. Goes to the page where the object is listed. For example, if the category is User Groups, opens User Groups list. • Edit this object – opens the object for editing. • View the details for this object – displays current settings for the object.

To create a local or remote user account - web-based manager:

1. Go to **User & Device > User Definition** and select **Create New**.
2. On the **Choose User Type** page select:

Local User	Select to authenticate this user using a password stored on the FortiGate unit.
Remote RADIUS User Remote TACACS+ User Remote LDAP User	To authenticate this user using a password stored on an authentication server, select the type of server and then select the server from the list. You can select only a server that has already been added to the FortiGate unit configuration.

3. Select **Next** and provide user authentication information.
For a local user, enter the **User Name** and **Password**.
For a remote user, enter the **User Name** and the server name.
4. Select **Next** and enter **Contact Information**.
If email or SMS is used for two-factor authentication, provide the email address or SMS cell number at which the user will receive token password codes. If a custom SMS service is used, it must already be configured. See [FortiToken on page 422](#).
5. Select **Next**, then on the **Provide Extra Info** page enter

Two-factor Authentication	Select to enable two-factor authentication. Then select the Token (FortiToken or FortiToken Mobile) for this user account. See Associating FortiTokens with accounts on page 425 .
User Group	Select the user groups to which this user belongs.

6. Select **Create**.

To create a local user - CLI example:

Locally authenticated user

```
config user local
  edit user1
    set type password
    set passwd ljt_pj2gpepfdw
  end
```

To create a remote user - CLI example:

```
config user local
  edit user2
    set type ldap
    set ldap_server ourLDAPsrv
  end
```

For a RADIUS or TACACS+ user, set `type` to `radius` or `tacacs+`, respectively.

To create a user with FortiToken Mobile two-factor authentication - CLI example:

```
config user local
```

```
edit user5
  set type password
  set passwd ljt_pj2gpepfdw
  set two_factor fortitoken
  set fortitoken 182937197
end
```

Remote users are configured for FortiToken two-factor authentication similarly.

To create a user with SMS two-factor authentication using FortiGuard messaging Service - CLI example:

```
config user local
  edit user6
    set type password
    set passwd 3ww_pjt68dw
    set two_factor sms
    set sms-server fortiguard
    set sms-phone 1365984521
  end
```

Removing users

Best practices dictate that when a user account is no longer in use, it should be deleted. Removing local and remote users from FortiOS involve the same steps.

If the user account is referenced by any configuration objects, those references must be removed before the user can be deleted. See [Removing references to users on page 418](#).

To remove a user from the FortiOS configuration - web-based manager:

1. Go to **User & Device > User Definition**.
2. Select the check box of the user that you want to remove.
3. Select **Delete**.
4. Select **OK**.

To remove a user from the FortiOS configuration - CLI example:

```
config user local
  delete user4444
end
```

Removing references to users

You cannot remove a user that belongs to a user group. Remove the user from the user group first, and then delete the user.

To remove references to a user - web-based manager

1. Go to **User & Device > User Definition**.
2. If the number in the far right column for the selected user contains any number other than zero, select it.
3. A more detailed list of object references to this user is displayed. Use its information to find and remove these references to allow you to delete this user.

PKI or peer users

A PKI, or peer user, is a digital certificate holder. A PKI user account on the FortiGate unit contains the information required to determine which CA certificate to use to validate the user's certificate. Peer users can be included in firewall user groups or peer certificate groups used in IPsec VPNs. For more on certificates, see [Certificates overview on page 475](#).

To define a peer user you need:

- a peer username
- the text from the subject field of the user's certificate, or the name of the CA certificate used to validate the user's certificate

Creating a peer user

The peer user can be configured only in the CLI.

To create a peer user for PKI authentication - CLI example:

```
config user peer
edit peer1
set subject peer1@mail.example.com
set ca CA_Cert_1
end
```

There are other configuration settings that can be added or modified for PKI authentication. For example, you can configure the use of an LDAP server to check access rights for client certificates. For information about the detailed PKI configuration settings, see the FortiGate CLI Reference.

Two-factor authentication

The standard logon requires a username and password. This is one factor authentication—your password is one piece of information you need to know to gain access to the system.

Two factor authentication adds the requirement for another piece of information for your logon. Generally the two factors are something you know (password) and something you have (certificate, token, etc.). This makes it harder for a hacker to steal your logon information. For example if you have a FortiToken device, the hacker would need to both use it and know your password to gain entry to your account.

Two-factor authentication is available on both user and admin accounts. But before you enable two-factor authentication on an administrator account, you need to ensure you have a second administrator account configured to guarantee administrator access to the FortiGate unit if you are unable to authenticate on the main admin account for some reason.

Two-factor authentication does not work with explicit proxies.

The methods of two-factor authentication include:

- [Certificate](#)
- [Email](#)

- [SMS](#)
- [FortiToken](#)

Certificate

You can increase security by requiring both certificate and password authentication for PKI users. Certificates are installed on the user's computer. Requiring a password also protects against unauthorized use of that computer.

Optionally peer users can enter the code from their FortiToken instead of the certificate.

To create a peer user with two-factor authentication - CLI example

```
config user peer
  edit peer1
    set subject E=peer1@mail.example.com
    set ca CA_Cert_1
    set two-factor enable
    set passwd fdktguefheygfe
  end
```

For more information on certificates, see [Certificates overview on page 475](#).

Email

Two-factor email authentication sends a randomly generated six digit numeric code to the specified email address. Enter that code when prompted at logon. This token code is valid for 60 seconds. If you enter this code after that time, it will not be accepted.

A benefit is that you do not require mobile service to authenticate. However, a potential issue is if your email server does not deliver the email before the 60 second life of the token expires.

The code will be generated and emailed at the time of logon, so you must have email access at that time to be able to receive the code.

To configure an email provider - web-based manager:

1. Go to **System > Advanced** and enable **Use Custom Email Server** under **Email Service**.
2. Enter **SMTP Server** and **Default Reply To** address.
3. If applicable, enable **Authentication** and enter the **SMTP User** and **Password** to use.
4. Select a **Security Mode**, options are: **None**, **SMTPS** or **STARTTLS**.
5. Enter the **Port** number, the default is 25.
6. Select **Apply**.

To configure an email provider - CLI:

```
config system email-server
  set server <server_domain-name>
  set reply-to <Recipient_email_address>
end
```

To enable email two-factor authentication - web-based manager:

1. To modify an administrator account, go to **System > Administrators**. To modify a user account go to **User & Device > User Definition**.

2. Edit the user account.
3. Enable and enter the user's **Email Address**.
4. Select **Enable Two-factor Authentication**.
5. Select **Email based two-factor authentication**.
6. Select **OK**.

If **Email based two-factor authentication** option doesn't appear after selecting **Enable Two-factor Authentication**, you need to enable it via the CLI as follows.

To enable email two-factor authentication - CLI:

```
config user local
  edit <user_name>
    set email-to <user_email>
    set two-factor email
  end
```

SMS

SMS two-factor authentication sends the token code in an SMS text message to the mobile device indicated when this user attempts to logon. This token code is valid for 60 seconds. If you enter this code after that time, it will not be accepted. Enter this code when prompted at logon to be authenticated.

SMS two-factor authentication has the benefit that you do not require email service before logging on. A potential issue is if the mobile service provider does not send the SMS text message before the 60 second life of the token expires.

FortiGuard Messaging Service include four SMS Messages at no cost. If you need more, you should acquire a license through support.fortinet.com or via customer service.

If you do not use the FortiGuard Messaging Service, you need to configure an SMS service.

To configure an SMS service - CLI:

```
config system sms-server
  edit <provider_name>
    set mail-server <server_domain-name>
  next
end
```

To configure SMS two-factor authentication - web-based manager:

1. To modify an:
 - administrator account, go to **System > Administrators**, or
 - user account go to **User & Device > User Definition**.
2. Edit the user account.
3. Select **SMS** and enter the **Country Dial Code** and **Phone Number**.
4. Select **Enable Two-factor Authentication**, and select the correct **Token**.
5. Select **OK**.

If you have problems receiving the token codes via SMS messaging, contact your mobile provider to ensure you are using the correct phone number format to receive text messages and that your current mobile plan allows text messages.

FortiToken

FortiToken is a disconnected one-time password (OTP) generator. It is a small physical device with a button that when pressed displays a six digit authentication code. This code is entered with a user's username and password as two-factor authentication. The code displayed changes every 60 seconds, and when not in use the LCD screen is blanked to extend the battery life.

There is also a mobile phone application, FortiToken Mobile, that performs much the same function.

FortiTokens have a small hole in one end. This is intended for a lanyard to be inserted so the device can be worn around the neck, or easily stored with other electronic devices. Do not put the FortiToken on a key ring as the metal ring and other metal objects can damage it. The FortiToken is an electronic device like a cell phone and must be treated with similar care.

Any time information about the FortiToken is transmitted, it is encrypted. When the FortiGate unit receives the code that matches the serial number for a particular FortiToken, it is delivered and stored encrypted. This is in keeping with the Fortinet's commitment to keeping your network highly secured.

FortiTokens can be added to user accounts that are local, IPsec VPN, SSL VPN, and even Administrators. See [Associating FortiTokens with accounts on page 425](#).

A FortiToken can be associated with only one account on one FortiGate unit.

If a user loses their FortiToken, it can be locked out using the FortiGate so it will not be used to falsely access the network. Later if found, that FortiToken can be unlocked on the FortiGate to allow access once again. See [FortiToken maintenance on page 427](#).

There are three tasks to complete before FortiTokens can be used to authenticate accounts:

1. [Adding FortiTokens to the FortiGate](#)
2. [Activating a FortiToken on the FortiGate](#)
3. [Associating FortiTokens with accounts](#)

In addition, this section includes the following:

- [FortiToken maintenance](#)
- [FortiToken Mobile Push](#)

The FortiToken authentication process

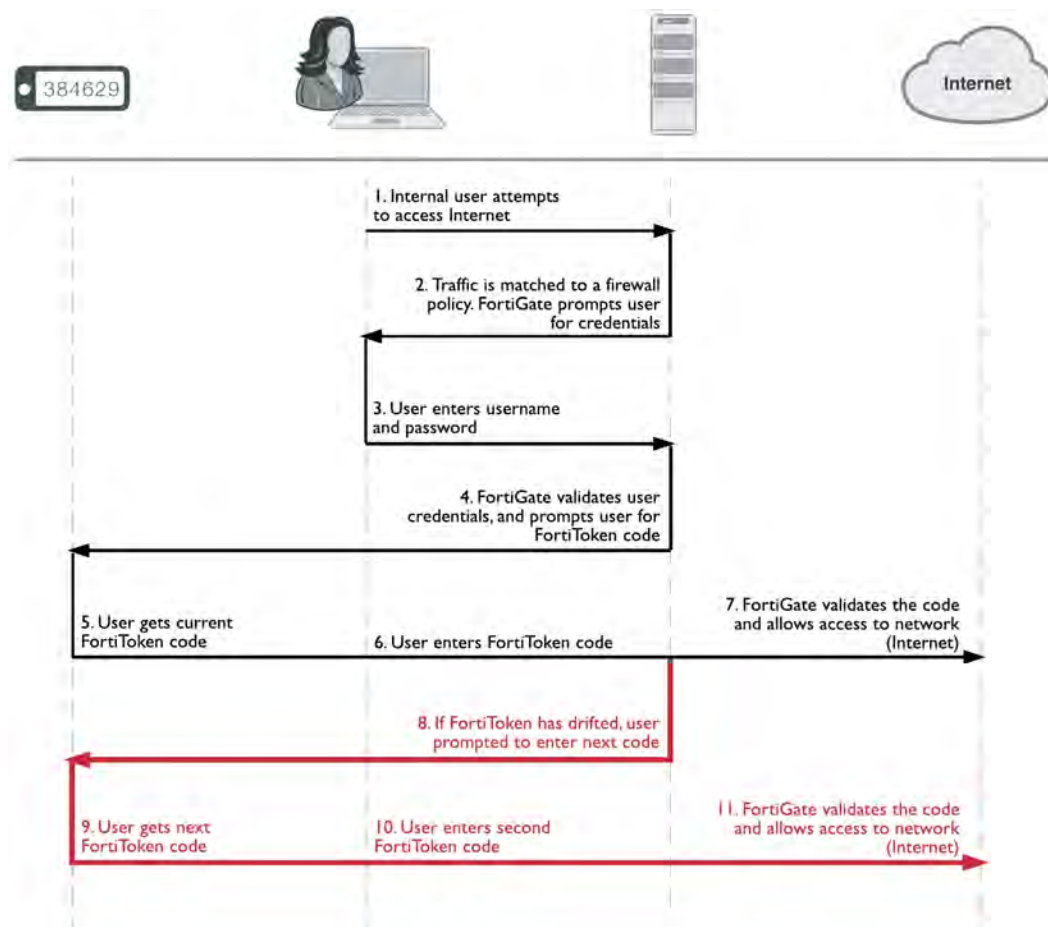

The steps during FortiToken two-factor authentication are as follows.

1. User attempts to access a network resource.
2. FortiGate unit matches the traffic to an authentication security policy, and FortiGate unit prompts the user for username and password.
3. User enters their username and password.
4. FortiGate unit verifies their information, and if valid prompts the user for the FortiToken code.
5. User gets the current code from their FortiToken device.
6. User enters current code at the prompt.
7. FortiGate unit verifies the FortiToken code, and if valid allows access to the network resources such as the Internet.

The following steps are needed only if the time on the FortiToken has drifted and needs to be re-synchronized with the time on the FortiGate unit.

8. If time on FortiToken has drifted, FortiGate unit will prompt user to enter a second code to confirm.
9. User gets the next code from their FortiToken device
10. User enters the second code at the prompt.
11. FortiGate unit uses both codes to update its clock to match the FortiToken and then proceeds as in step "Users and user groups" on page 415.

The FortiToken authentication process is illustrated below:

When configured the FortiGate unit accepts the username and password, authenticates them either locally or remotely, and prompts the user for the FortiToken code. The FortiGate then authenticates the FortiToken code. When FortiToken authentication is enabled, the prompt field for entering the FortiToken code is automatically added to the authentication screens.

Even when an Administrator is logging in through a serial or Telnet connection and their account is linked to a FortiToken, that Administrator will be prompted for the token's code at each login.

If you have attempted to add invalid FortiToken serial numbers, there will be no error message. The serial numbers will simply not be added to the list.

Adding FortiTokens to the FortiGate

Before one or more FortiTokens can be used to authenticate logons, they must be added to the FortiGate. The import feature is used to enter many FortiToken serial numbers at one time. The serial number file must be a text file with one FortiToken serial number per line.

Both FortiToken Mobile and physical FortiTokens store their encryption seeds on the cloud, therefore you will only be able to register them to a single FortiGate or FortiAuthenticator.

Because FortiToken-200CD seed files are stored on the CD, these tokens can be registered on multiple FortiGates and/or FortiAuthenticators, but **not** simultaneously.

To manually add a FortiToken to the FortiGate - web-based manager:

1. Go to **User & Device > FortiTokens**.
2. Select **Create New**.
3. In **Type**, select **Hard Token** or **Mobile Token**.
4. Enter one or more FortiToken serial numbers (hard token) or activation codes (mobile token).
5. Select **OK**.

For mobile token, you receive the activation code in the license certificate once you purchase a license. FortiOS include a license for two mobile token at no cost.

To import multiple FortiTokens to the FortiGate - web-based manager:

1. Go to **User & Device > FortiTokens**.
2. Select **Create New**.
3. In **Type**, select **Hard Token**.
4. Select **Import**.
5. Select **Serial Number File** or **Seed File**, depending on which file you have.
6. Browse to the local file location on your local computer.
7. Select **OK**.
The file is imported.
8. Select **OK**.

To import FortiTokens to the FortiGate from External Sources - CLI:

FortiToken seed files (both physical and mobile versions) can be imported from either FTP or TFTP servers, or a USB drive, allowing seed files to be imported from an external source more easily:

```
execute fortitoken import ftp <file name> <ip>[:ftp port] <Enter> <user> <password>
execute fortitoken import tftp <file name> <ip>
execute fortitoken import usb <file name>
```

To import seed files for FortiToken Mobile, replace `fortitoken` with `fortitoken-mobile`.

To add two FortiTokens to the FortiGate - CLI:

```
config user fortitoken
  edit <serial_number>
  next
  edit <serial_number2>
  next
end
```

Activating a FortiToken on the FortiGate

Once one or more FortiTokens have been added to the FortiGate unit, they must be activated before being available to be associated with accounts. The process of activation involves the FortiGate querying FortiGuard servers about the validity of each FortiToken. The serial number and information is encrypted before it is sent for added security.

A FortiGate unit requires a connection to FortiGuard servers to activate a FortiToken.

To activate a FortiToken on the FortiGate unit - web-based manager:

1. Go to **User & Device > FortiTokens**.
2. Select one or more FortiTokens with a status of Available.
3. Right-click the FortiToken entry and select **Activate**.
4. Select **Refresh**.

The status of selected FortiTokens will change to Activated.

The selected FortiTokens are now available for use with user and admin accounts.

To activate a FortiToken on the FortiGate unit - CLI:

```
config user fortitoken
  edit <token_serial_num>
    set status activate
  next
end
```

Associating FortiTokens with accounts

The final step before using the FortiTokens to authenticate logons is associating a FortiToken with an account. The accounts can be local user or administrator accounts.

To add a FortiToken to a local user account - web-based manager:

1. Ensure that your FortiToken serial number has been added to the FortiGate successfully, and its status is Available.
2. Go to **User & Device > User Definition**, and edit the user account.

3. Enter the user's **Email Address**.
4. Enable **Two-factor Authentication**.
5. Select the user's FortiToken serial number from the **Token** list.
6. Select **OK**.

For mobile token, click on **Send Activation Code** to be sent to the email address configured previously. The user will use this code to activate his mobile token. An **Email Service** has to be set under **System > Advanced** in order to send the activation code.

To add a FortiToken to a local user account - CLI:

```
config user local
  edit <username>
    set type password
    set passwd "myPassword"
    set two-factor fortitoken
    set fortitoken <serial_number>
    set email-to "username@example.com"
    set status enable
  next
end
```

To add a FortiToken to an administrator account - web-based manager:

1. Ensure that your FortiToken serial number has been added to the FortiGate successfully, and its status is Available.
2. Go to **System > Administrators**, and edit the admin account.
This account is assumed to be configured except for two-factor authentication.
3. Enter admin's **Email Address**.
4. Enable **Two-factor Authentication**.
5. Select the user's FortiToken serial number from the **Token** list.
6. Select **OK**.

For mobile token, click on **Send Activation Code** to be sent to the email address configured previously. The admin will use this code to activate his mobile token. An **Email Service** has to be set under **System > Advanced** in order to send the activation code.

To add a FortiToken to an administrator account - CLI:

```
config system admin
  edit <username>
    set password "myPassword"
    set two-factor fortitoken
    set fortitoken <serial_number>
    set email-to "username@example.com"
  next
end
```

The `fortitoken` keyword will not be visible until `fortitoken` is selected for the `two-factor` option.

Before a new FortiToken can be used, it may need to be synchronized due to clock drift.

FortiToken maintenance

Once FortiTokens are entered into the FortiGate unit, there are only two tasks to maintain them — changing the status,

To change the status of a FortiToken between Activated and Locked - CLI:

```
config user fortitoken
    edit <token_serial_num>
        set status lock
    next
end
```

Any user attempting to login using this FortiToken will not be able to authenticate.

To list the drift on all FortiTokens configured on this FortiGate unit - CLI:

```
# diag fortitoken info
FORTITOKEN DRIFT STATUS
FTK2000BHV1KRZCC 0 token already activated, and seed won't be returned
FTK2001C5YCRRVEE 0 token already activated, and seed won't be returned
FTKMOB4B94972FBA 0 provisioned
FTKMOB4BA4BE9B84 0 new
Total activated token: 0
Total global activated token: 0
Token server status: reachable
```

This command lists the serial number and drift for each FortiToken configured on this FortiGate unit. This command is useful to check if it is necessary to synchronize the FortiGate and any particular FortiTokens.

FortiToken Mobile Push

A command under `config system ftm-push` allows you to configure the FortiToken Mobile Push services server IP address and port number. The Push service is provided by Apple (APNS) and Google (GCM) for iPhone and Android smartphones respectively. This will help to avoid tokens becoming locked after an already enabled two-factor authentication user has been disabled.

CLI syntax

```
config system ftm-push
    set server-ip <ip-address>
    set server-port [1-65535] Default is 4433.
end
```

Note that the `server-ip` is the public IP address of the FortiGate interface that the FTM will call back to; it is the IP address used by the FortiGate for incoming FTM calls.

If an SSL VPN user authenticates with their token, then logs out and attempts to reauthenticate again within a minute, a new message will display showing "Please wait x seconds to login again." This replaces a previous error/permission denied message.

The "x" value will depend on the calculation of how much time is left in the current time step.

CLI syntax

```
config system interface
  edit <name>
    set allowaccess ftm
  next
end
```

FortiGate supports when the FortiAuthenticator initiates FTM Push notifications, for when users are attempting to authenticate through a VPN and/or RADIUS (with FortiAuthenticator as the RADIUS server).

Monitoring users

To monitor user activity in the web-based manager, go to **Monitor > Firewall User Monitor**. The list of users who are logged on is displayed with some information about them such as their user group, security policy ID, how long they have been logged on, their IP address, traffic volume, and their authentication method as one of FSSO, NTLM, or firewall (FW-auth).

From this screen you can de-authenticate all users who are logged on. The de-authenticate button is at the top left of this screen.

To see information about banned users go to **Monitor > Quarantine Monitor**. Displayed information about users who have been banned includes what application triggered the ban (Application Protocol), the reason for the ban (Cause or rule), Created, and when the ban expires.

Filtering the list of users

When there are many users logged on, it can be difficult to locate a specific user or multiple users to analyze. Applying filters to the list allows you to organize the user list to meet your needs, or only display some the users that meet your current requirements.

Select settings bottom at the top right of the screen to adjust columns that are displayed for users, including what order they are displayed in. This can be very helpful in locating information you are looking for.

Each column heading has a grey filter icon. Click on the filter icon to configure a filter for the data displayed in that column. Each column has similar options including a field to enter the filtering information, a check box to select the negative of the text in the field, and the options to add more fields, apply the filter, clear all filters, or cancel without saving. To enter multiple terms in the field, separate each of them with a comma. To filter entries that contain a specific prefix, use an * (asterisk).

For example, to create a filter to display only users with an IP address of 10.11.101.x who authenticated using one of security policies five through eight, and who belong to the user group Accounting.

1. Go to **Monitor > Quarantine Monitor**.
2. Enter 10.11.101.* and select **Apply**.
3. Select the filter icon beside **Policy ID**.
4. Enter 5-8 and select **Apply**.

5. Select the filter icon beside **User Group**.
6. Enter `Accounting` and select **Apply**.

**Login credentials for guest users shown in clear text on GUI and voucher**

In FortiOS 5.6.4, login credentials for guest users is displayed/printed in clear text on the GUI and in the voucher. It is also sent in clear text by SMS and email.

User groups

A user group is a list of user identities. An identity can be:

- a local user account (username/password stored on the FortiGate unit)
- a remote user account (password stored on a RADIUS, LDAP, or TACACS+ server)
- a PKI user account with digital client authentication certificate stored on the FortiGate unit
- a RADIUS, LDAP, or TACACS+ server, optionally specifying particular user groups on that server
- a user group defined on an FSSO server.

Security policies and some types of VPN configurations allow access to specified user groups only. This restricted access enforces Role Based Access Control (RBAC) to your organization's network and its resources. Users must be in a group and that group must be part of the security policy.

In most cases, the FortiGate unit authenticates users by requesting their username and password. The FortiGate unit checks local user accounts first. If a match is not found, the FortiGate unit checks the RADIUS, LDAP, or TACACS+ servers that belong to the user group. Authentication succeeds when a matching username and password are found. If the user belongs to multiple groups on a server, those groups will be matched as well.

FortiOS does not allow username overlaps between RADIUS, LDAP, or TACACS+ servers.

There are four types of FortiGate user groups: Firewall, Fortinet Single Sign-On (FSSO), Guest, and RADIUS Single Sign-On (RSSO) user groups.

Firewall user groups

Firewall user groups are used locally as part of authentication. When a security policy allows access only to specified user groups, users must authenticate. If the user authenticates successfully and is a member of one of the permitted groups, the session is allowed to proceed.

This section includes:

- [SSL VPN access](#)
- [IPsec VPN access](#)
- [Configuring a firewall user group](#)
- [User group timeouts](#)

SSL VPN access

SSL VPN settings include a list of the firewall user groups that can access the SSL VPN and the SSL VPN portal that each group will use. When the user connects to the FortiGate unit via HTTPS on the SSL VPN port (default 10443), the FortiGate unit requests a username and password.

SSL VPN access also requires a security policy where the destination is the SSL interface.

IPsec VPN access

A firewall user group can provide access for dialup users of an IPsec VPN. In this case, the IPsec VPN phase 1 configuration uses the **Accept peer ID in dialup group** peer option. The user's VPN client is configured with the username as peer ID and the password as pre-shared key. The user can connect successfully to the IPsec VPN only if the username is a member of the allowed user group and the password matches the one stored on the FortiGate unit.

A user group cannot be used as a dialup group if any member of the group is authenticated using an external authentication server.

Configuring a firewall user group

A user group can contain:

- local users, whether authenticated by the FortiGate unit or an authentication server
- PKI users
- authentication servers, optionally specifying particular user groups on the server

To create a Firewall user group - web-based manager:

1. Go to **User & Device > User Groups** and select **Create New**.
2. Enter a name for the user group.
3. In **Type**, select **Firewall**.
4. Add user names to the **Members** list.
5. Add authentication servers to the **Remote groups** list.
By default all user accounts on the authentication server are members of this FortiGate user group. To include only specific user groups from the authentication server, deselect **Any** and enter the group name in the appropriate format for the type of server. For example, an LDAP server requires LDAP format, such as:
cn=users,dn=office,dn=example,dn=com
Remote servers must already be configured in **User & Device**.
6. Select **OK**.

To create a firewall user group - CLI example:

In this example, the members of `accounting_group` are `User1` and all of the members of `rad_accounting_group` on myRADIUS external RADIUS server.

```
config user group
  edit accounting_group
    set group-type firewall
    set member User1 myRADIUS
  config match
```

```

edit 0
    set server-name myRADIUS
    set group-name rad_accounting_group
end
end

```

Matching user group names from an external authentication server might not work if the list of group memberships for the user is longer than 8000 bytes. Group names beyond this limit are ignored.

`server_name` is the name of the RADIUS, LDAP, or TACACS+ server, but it must be a member of this group first and must also be a configured remote server on the FortiGate unit.

`group_name` is the name of the group on the RADIUS, LDAP, or TACACS+ server such as “engineering” or “cn=users,dc=test,dc=com”.

Before using group matching with TACACS+, you must first enable authentication. For example if you have a configured TACACS+ server called myTACS, use the following CLI commands.

```

config user tacacs+
    edit myTACS
        set authorization enable
    next
end

```

User group timeouts

User groups can have timeout values per group in addition to FortiGate-wide timeouts. There are essentially three different types of timeouts that are configurable for user authentication on the FortiGate unit — idle timeout, hard timeout, and session timeout. These are in addition to any external timeouts such as those associated with RADIUS servers.

If VDOMs are enabled, the global level user setting `authtimeout` is the default all VDOMs inherit. If VDOMs are not enabled, user settings `authtimeout` is the default. The default timeout value is used when the `authtimeout` keyword for a user group is set to zero.

Each type of timeout will be demonstrated using the existing user group `example_group`. Timeout units are minutes. A value of zero indicates the global timeout is used.

Membership in multiple groups

When a user belongs to multiple groups in RADIUS groups, the group auth-timeout values are ignored. Instead the global timeout value is used. The default value is 5 minutes, but it can be set from 1 to 43200 minutes (30 days).

```

config user setting
    set auth-timeout-type idle-timeout
    set auth-timeout 300
end

```

Idle timeout

The default type of timeout is idle timeout. When a user initiates a session, it starts a timer. As long as data is transferred in this session, the timer continually resets. If data flow stops, the timer is allowed to advance until it

reaches its limit. At that time the user has been idle for too long, and the user is forced to re-authenticate before traffic is allowed to continue in that session.

To configure user group authentication idle timeout - CLI:

```
config user settings
    set auth-timeout-type idle-timeout
end
config user group
    edit example_group
        set authtimeout 5 //range is 0-43200 minutes (0 = use global authtimeout value)
    next
end
```

Hard timeout

Where the idle timeout is reset with traffic, the hard timeout is absolute. From the time the first session a user establishes starts, the hard timeout counter starts. When the timeout is reached, all the sessions for that user must be re-authenticated. This timeout is not affected by any event.

To configure user group authentication hard timeout - CLI:

```
config user settings
    set auth-timeout-type hard-timeout
end
config user group
    edit example_group
        set authtimeout 43200 //range is 0-43200 minutes (0 = use global authtimeout value)
    next
end
```

Session timeout

The session timeout works much like the hard timeout in that its an absolute timer that can not be affected by events. However, when the timeout is reached existing sessions may continue but new sessions are not allowed until re-authentication takes place.

To configure a user group authentication new session hard timeout - CLI:

```
config user setting
    set auth-timeout-type new-session
end

config user group
    edit example_group
        set authtimeout 30 //range is 0-43200 minutes (0 = use global authtimeout value)
    next
end
```

SSO user groups

SSO user groups are part of FSSO authentication and contain only Windows or Novell network users. No other user types are permitted as members. Information about the Windows or Novell user groups and the logon activities of their members is provided by the Fortinet Single Sign On (FSSO) which is installed on the network domain controllers.

You can specify FSSO user groups in security policies in the same way as you specify firewall user groups. FSSO user groups cannot have SSL VPN or dialup IPsec VPN access.

For information about configuring FSSO user groups, see [Creating Fortinet Single Sign-On \(FSSO\) user groups on page 544](#). For complete information about installing and configuring FSSO, see [Agent-based FSSO on page 508](#).

Configuring Peer user groups

Peer user groups can only be configured using the CLI. Peers are digital certificate holders defined using the `config user peer` command. The peer groups you define here are used in dialup IPsec VPN configurations that accept RSA certificate authentication from members of a peer certificate group.

To create a peer group - CLI

```
config user peergrp
  edit vpn_peergrp1
    set member pki_user1 pki_user2 pki_user3
  end
```

Viewing, editing and deleting user groups

To view the list of FortiGate user groups, go to **User & Device > User Groups**.

Editing a user group

When editing a user group in the CLI you must set the type of group this will be — either a firewall group, a Fortinet Single Sign-On Service group (FSSO), a Radius based Single Sign-On Service group (RSSO), or a guest group. Once the type of group is set, and members are added you cannot change the group type without removing the members.

In the web-based manager, if you change the type of the group any members will be removed automatically.

To edit a user group - web-based manager

1. Go to **User & Device > User Groups**.
2. Select the user group that you want to edit.
3. Select the **Edit** button.
4. Modify the user group as needed.
5. Select **OK**.

To edit a user group - CLI

This example adds user3 to Group1. Note that you must re-specify the full list of users:

```
config user group
  edit Group1
    set group-type firewall
    set member user2 user4 user3
  end
```

Deleting a user group

Before you delete a user group, you must ensure there are no objects referring to, it such as security policies. If there are, you must remove those references before you are able to delete the user group.

To remove a user group - web-based manager

1. Go to **User & Device > User Groups**.
2. Select the user group that you want to remove.
3. Select the **Delete** button.
4. Select **OK**.

To remove a user group - CLI

```
config user group
    delete Group2
end
```

SSL renegotiation in firewall authentication

The `auth-ssl-allow-renegotiation` option is available under `config user setting` to allow/forbid SSL renegotiation in firewall authentication. The default value is `disable`, where a session would be terminated by `authd` once renegotiation is detected and this login would be recorded as a failure. Other behavior follows regular authentication settings.

To enable SSL renegotiation - CLI

```
config user setting
    set auth-ssl-allow-renegotiation enable
end
```

Managing Guest Access

Visitors to your premises might need user accounts on your network for the duration of their stay. If you are hosting a large event such as a conference, you might need to create many such temporary accounts. The FortiOS Guest Management feature is designed for this purpose.

A guest user account User ID can be the user's email address, a randomly generated string, or an ID that the administrator assigns. Similarly, the password can be administrator-assigned or randomly generated.

You can create many guest accounts at once using randomly-generated User IDs and passwords. This reduces administrator workload for large events.

User's view of guest access

1. The user receives an email, SMS message, or printout from a FortiOS administrator listing a User ID and password.
2. The user logs onto the network with the provided credentials.
3. After the expiry time, the credentials are no longer valid.

Administrator's view of guest access

1. Create one or more guest user groups.
All members of the group have the same characteristics: type of User ID, type of password, information fields used, type and time of expiry.
2. Create guest accounts using Guest Management.
3. Use captive portal authentication and select the appropriate guest group.

Configuring guest user access

To set up guest user access, you need to create at least one guest user group and add guest user accounts. Optionally, you can create a guest management administrator whose only function is the creation of guest accounts in specific guest user groups. Otherwise, any administrator can do guest management.

Creating guest management administrators

To create a guest management administrator

1. Go to **System > Administrators** and create a regular administrator account.
2. Select **Restrict to Provision Guest Accounts**.
3. In **Guest Groups**, add the guest groups that this administrator manages.

Creating guest user groups

The guest group configuration determines the fields that are provided when you create a guest user account.

To create a guest user group:

1. Go to **User & Device > User Groups** and select **Create New**.
2. Enter the following information:

Name	Enter a name for the group.
Type	Guest
Enable Batch Account Creation	<p>Create multiple accounts automatically. When this is enabled:</p> <ul style="list-style-type: none"> • User ID and Password are set to Auto-Generate. • The user accounts have only User ID, Password, and Expiration fields. Only the Expiration field is editable. If the expiry time is a duration, such as “8 hours”, this is the time after first login. • You can print the account information. Users do not receive email or SMS notification. <p>See To create multiple guest user accounts automatically on page 437.</p>
User ID	<p>Select one of:</p> <ul style="list-style-type: none"> • Email — User’s email address • Specify — Administrator assigns user ID • Auto-Generate — FortiGate unit creates a random user ID
Password	<p>Select one of:</p> <ul style="list-style-type: none"> • Specify — Administrator assigns user ID • Auto-Generate — FortiGate unit creates a random password • Disable — no password
Expire Type	<p>Choose one of:</p> <ul style="list-style-type: none"> • Immediately — expiry time is counted from creation of account • After first login — expiry time is counted from user’s first login
Default Expire Time	Set the expire time. The administrator can change this for individual users.
Enable Name	If enabled, user must provide a name.
Enable Sponsor	If enabled, user form has Sponsor field. Select Required if required.
Enable Company	If enabled, user form has Company field. Select Required if required.
Enable Email	If enabled, user is notified by email.
Enable SMS	If enabled, user is notified by SMS. Select whether FortiGuard Messaging Service or a another SMS provider is used.

Creating guest user accounts

Guest user accounts are not the same as local user accounts created in **User & Device > User Definition**. Guest accounts are not permanent; they expire after a defined time period. You create guest accounts in **User & Device > Guest Management**.

To create a guest user account

1. Go to **User & Device > Guest Management**.
2. In **Guest Groups**, select the guest group to manage.
3. Select **Create New** and fill in the fields in the **New User** form.

Fields marked Optional can be left blank. The guest group configuration determines the fields that are available.

4. Select **OK**.

To create multiple guest user accounts automatically

1. Go to **User & Device > Guest Management**.
2. In **Guest Groups**, select the guest group to manage.
The guest group must have the **Enable Batch Guest Account Creation** option enabled.
3. Select **Create New > Multiple Users**.
Use the down-pointing caret to the right of **Create New**.
4. Enter **Number of Accounts**.
5. Optionally, change the **Expiration**.
6. Select **OK**.

Guest Management Account List

Go to **User & Device > Guest Management** to create, view, edit or delete guest user accounts.

Create New	Creates a new guest user account.
Edit	Edit the selected guest user account.
Delete	Delete the selected guest user account.
Purge	Remove all expired accounts from the list.
Send	Send the user account information to a printer or to the guest. Depending on the group settings and user information, the information can be sent to the user by email or SMS.
Refresh	Update the list.
Guest Groups	Select the guest group to list. New accounts are added to this group.
User ID	The user ID. Depending on the guest group settings, this can be the user's email address, an ID that the administrator specified, or a randomly-generated ID.
Expires	Indicates a duration such as "3 hours". A duration on its own is relative to the present time. Or, the duration is listed as "after first login."

Guest access in a retail environment

Some retail businesses such as coffee shops provide free Wi-Fi Internet access for their customers. For this type of application, the FortiOS guest management feature is not required; the Wi-Fi access point is open and customers do not need logon credentials. However, the business might want to contact its customers later with promotional offers to encourage further patronage. Using an Email Collection portal, it is possible to collect customer email addresses for this purpose. The security policy grants network access only to users who provide a valid email address.

The first time a customer's device attempts to use the Wi-Fi connection, FortiOS requests an email address, which it validates. The customer's subsequent connections go directly to the Internet without interruption.

Creating an email harvesting portal

The customer's first contact with your network will be with a captive portal which presents a web page requesting an email address. When FortiOS has validated the email address, the customer's device MAC address is added to the Collected Emails device group.

To create the email collection portal:

1. Go to **WiFi & Switch Controller > SSID** and edit your SSID.
2. Set **Security Mode** to **Captive Portal**.
3. Set **Portal Type** to **Email Collection**.
4. Optionally, in **Customize Portal Messages** select **Email Collection**.

You can change the portal content and appearance. See [Customizing captive portal pages on page 468](#).

To create the email collection portal - CLI:

In this example the `freewifi` Wi-Fi interface is modified to present an email collection captive portal.

```
config wireless-controller vap
  edit freewifi
    set security captive-portal
    set portal-type email-collect
  end
```

Creating the security policy

You need configure a security policy that allows traffic to flow from the Wi-Fi SSID to the Internet interface but only for members of the Collected Emails device group. This policy must be listed first. Unknown devices are not members of the Collected Emails device group, so they do not match the policy.

To create the security policy:

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information:

Incoming Interface	freewifi
Source Address	all
Source Device Type	Collected Emails
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	ALL

Action	ACCEPT
NAT	On

3. Select **OK**.

To create the authentication rule - CLI:

```
config firewall policy
edit 3
set srcintf "freewifi"
set dstintf "wan1"
set srcaddr "all"
set action accept
set devices collected-emails
set nat enable
set schedule "always"
set service "ALL"
end
```

Checking for harvested emails

In the web-based manager, go to **User & Device > Device Inventory**. In the CLI you can use the `diagnose user device list` command. For example,

```
FGT-100D # diagnose user device list
hosts
vd 0 d8:d1:cb:ab:61:0f gen 35 req 30 redir 1 last 43634s 7-11_2-int
ip 10.0.2.101 ip6 fe80::dad1:cbff:feab:610f
type 2 'iPhone' src http c 1 gen 29
os 'iPhone' version 'iOS 6.0.1' src http id 358 c 1
email 'yo@yourdomain.com'
vd 0 74:e1:b6:dd:69:f9 gen 36 req 20 redir 0 last 39369s 7-11_2-int
ip 10.0.2.100 ip6 fe80::76e1:b6ff:fedd:69f9
type 1 'iPad' src http c 1 gen 5
os 'iPad' version 'iOS 6.0' src http id 293 c 1
host 'Joes's-iPad' src dhcp
email 'you@fortinet.com'
```

Fall-through authentication policies

User authentication policies have an implicit fall-through feature that intentionally causes policy matching to fall through to a policy lower on the list that can also match the traffic. In other words the first user policy that is matched in the policy list, based on standard policy criteria, isn't the only policy that can be matched.

Fall-through is intended to match users in different user groups with different policies. For example, consider an organization with two user groups where one group requires a web filtering profile, while the other requires virus scanning. In this example, you would edit two basic Internet access policies: policy 1 assigning **User Group A** with a **Web Filtering** profile, and policy 2 assigning **User Group B** with an **AntiVirus** profile. Both policies are also assigned to the same internal subnet, named **subnet1**.

In this configuration, all users from **subnet1** will see an authentication prompt. If the user is found in **User Group A**, the traffic is accepted by policy 1 and is filtered by the **Web Filtering** profile. If the user is found in **User Group B**, the traffic is accepted by policy 2 and is virus scanned.

The fall-through feature is required for users to be matched with policy 2. Without the fall-through feature, traffic would never be matched with policy 2.

Configuring authenticated access

When you have configured authentication servers, users, and user groups, you are ready to configure security policies and certain types of VPNs to require user authentication.

This section describes:

- [Authentication timeout](#)
- [Password policy](#)
- [Authentication protocols](#)
- [Authentication in Captive Portals](#)
- [Authentication in security policies](#)
- [Authentication replacement messages](#)
- [VPN authentication](#)

Authentication timeout

An important feature of the security provided by authentication is that it is temporary—a user must re-authenticate after logging out. Also if a user is logged on and authenticated for an extended period of time, it is a good policy to have them re-authenticate at set periods. This ensures a user's session is cannot be spoofed and used maliciously for extended periods of time — re-authentication will cut any spoof attempts short. Shorter timeout values are more secure.

Security authentication timeout

You set the security user authentication timeout to control how long an authenticated connection can be idle before the user must authenticate again. The maximum timeout is 1440 minutes (24 hours).

To set the security authentication timeout - web-based manager:

1. Go to **User & Device > Authentication Settings**.
2. Enter the **Authentication Timeout** value in minutes.
The default authentication timeout is 5 minutes.
3. Select **Apply**.

SSL VPN authentication timeout

You set the SSL VPN user authentication timeout (**Idle Timeout**) to control how long an authenticated connection can be idle before the user must authenticate again. The maximum timeout is 259 200 seconds. The default timeout is 300 seconds.

To set the SSL VPN authentication timeout - web-based manager:

1. Go to **VPN > SSL-VPN Settings**.
2. Under **Idle Logout**, make sure that **Logout users when inactive for specified period** is enabled and enter the **Inactive For** value (seconds).
3. Select **Apply**.

Password policy

Password authentication is effective only if the password is sufficiently strong and is changed periodically. By default, the FortiGate unit requires only that passwords be at least eight characters in length, but up to 128 characters is permitted. You can set a password policy to enforce higher standards for both length and complexity of passwords. Password policies can apply to administrator passwords or IPsec VPN preshared keys.

To set a password policy in the web-based manager, go to **System > Settings**. In the CLI, use the `config system password-policy` command.

Users usually create passwords composed of alphabetic characters and perhaps some numbers. Password policy can require the inclusion of uppercase letters, lowercase letters, numerals or punctuation characters.

Configuring password minimum requirement policy

Best practices dictate that passwords include:

- one or more uppercase characters
- one or more lower case characters
- one or more of the numerals
- one or more special characters.

The minimum number of each of these types of characters can be set in both the web-based manager and the CLI.

The following procedures show how to force administrator passwords to contain at least two uppercase, four lower care, two digits, and one special character. Leave the minimum length at the default of eight characters.

To change administrator password minimum requirements - web-based manager:

1. Go to **System > Settings**.
2. Select **Enable Password Policy**.
3. Select **Must Contain at Least**.
4. Enter the following information:

Upper Case Letters	2
Lower Case Letters	4
Numbers	2
Special Characters	1

5. Under **Apply Password Policy to**, select **Administrator Password**.
6. Select **Apply**.

To change administrator password minimum requirements - CLI:

```
config system password-policy
  set status enable
  set apply-to admin-password
  set min-upper-case-letter 2
  set min-lower-case-letter 4
```

```

set min-number 2
set min-non-alphanumeric 1
set change-4-characters enable
end

```

The `change-4-characters` option forces new passwords to change a minimum of four characters in the old password. Changing fewer characters results in the new password being rejected. This option is only available in the CLI.

To configure a guest administrator password policy - CLI:

As of FortiOS 5.4, a password policy can also be created for guest administrators. The following command shows all possible commands, which are also available under `config system password-policy`.

```

config system password-policy
  set status {enable | disable} Enable/disable password policy.
  set apply-to {guest-admin-password} Guest admin to which this password policy applies.
  set minimum-length <8-128> Minimum password length.
  set min-lower-case-letter <0-128> Min. lowercase characters in password.
  set min-upper-case-letter <0-128> Min. uppercase characters in password.
  set min-non-alphanumeric <0-128> Min. non-alphanumeric characters in password.
  set min-number <0-128> Min. numeric characters in password.
  set change-4-characters {enable | disable} Enable/disable changing at least 4 characters for new password.
  set expire-status {enable | disable} Enable/disable password expiration.
  set expire-day <1-999> Number of days before password expires.
  set reuse-password {enable | disable} Enable/disable reuse of password.
end

```

Password best practices

In addition to length and complexity, there are security factors that cannot be enforced in a policy. Guidelines issued to users will encourage proper password habits.

Best practices dictate that password expiration also be enabled. This forces passwords to be changed on a regular basis. You can set the interval in days. The more sensitive the information this account has access to, the shorter the password expiration interval should be. For example 180 days for guest accounts, 90 days for users, and 60 days for administrators.

Avoid:

- real words found in any language dictionary
- numeric sequences, such as “12345”
- sequences of adjacent keyboard characters, such as “qwerty”
- adding numbers on the end of a word, such as “hello39”
- adding characters to the end of the old password, such as “hello39” to “hello3900”
- repeated characters
- personal information, such as your name, birthday, or telephone number.

In the case where the FortiGate is handling multiple keytabs in Kerberos authentication, use different passwords when generating each keytab.

Maximum logon attempts and blackout period

When you logon and fail to enter the correct password you could be a valid user, or a hacker attempting to gain access. For this reason, best practices dictate to limit the number of failed attempts to logon before a blackout period where you cannot logon.

To set a maximum of five failed authentication attempts before the blackout, using the following CLI command:

```
config user setting
    set auth-invalid-max 5
end
```

To set the length of the blackout period to five minutes, or 300 seconds, once the maximum number of failed logon attempts has been reached, use the following CLI command:

```
config user setting
    set auth-blackout-time 300
end
```

Authentication protocols

When user authentication is enabled on a security policy, the authentication challenge is normally issued for any of the four protocols, HTTP, HTTPS, FTP, and Telnet, which are dependent on the connection protocol. By making selections in the Protocol Support list, the user controls which protocols support the authentication challenge. The user must connect with a supported protocol first, so that they can subsequently connect with other protocols.

For example, if you have selected HTTP, FTP, or Telnet, a username and password-based authentication occurs. The FortiGate unit then prompts network users to input their security username and password. If you have selected HTTPS, certificate-based authentication (HTTPS, or HTTP redirected to HTTPS only) occurs.

FTP and Telnet authentication replacement messages cannot be customized. For HTTP and HTTPS replacement messages see [Authentication replacement messages on page 446](#).

For certificate-based authentication, you must install customized certificates on the FortiGate unit and on the browsers of network users. If you do not install certificates on the network user's web browser, the network users may see an SSL certificate warning message and have to manually accept the default FortiGate certificate. The network user's web browser may deem the default certificate as invalid.

When you use certificate authentication, if you do not specify any certificate when you create the security policy, the global settings are used. If you specify a certificate, the per-policy setting will overwrite the global setting. For more information about the use of certification authentication see [Certificate-based authentication on page 474](#).

To set the authentication protocols

1. Go to **User & Device > Authentication Settings**.
2. In **Protocol Support**, select the required authentication protocols.
3. If using HTTPS protocol support, in **Certificate**, select a Local certificate from the drop-down list.
4. Select **Apply**.

Authentication in Captive Portals

Network interfaces, including WiFi interfaces, can perform authentication at the interface level using a captive portal — an HTML form that requests the user's name and password. A captive portal is useful where all users connecting to the network interface must authenticate. Optionally, on a WiFi interface, the captive portal can be combined with a terms of service disclaimer to which the user must agree before gaining access. For more information, see [Captive portals on page 466](#).

Once successfully authenticated, the user's session passes to the firewall.

Authentication in security policies

Security policies control traffic between FortiGate interfaces, both physical interfaces and VLAN subinterfaces. The firewall tries to match the session's user or group identity, device type, destination, etcetera to a security policy. When a match is found, the user connects to the requested destination. If no security policy matches, the user is denied access.

A user who has not already been authenticated by a captive portal, FSSO, or RSSO can match only policies where no user or user group is specified. If no such policy exists, the firewall requests authentication. If the user can authenticate and the session can be matched to a policy, the user connects to the requested destination, otherwise, the user is denied access.

This section includes:

- [Enabling authentication protocols](#)
- [Authentication replacement messages](#)
- [Access to the Internet](#)
- [Configuring authentication security policies](#)
- [Identity-based policy](#)
- [NTLM authentication](#)
- [Certificate authentication](#)
- [Restricting number of concurrent user logons](#)

Enabling authentication protocols

Users can authenticate using FTP, HTTP, HTTPS, and Telnet. However, these protocols must be enabled first.

Another authentication option is to redirect any attempts to authenticate using HTTP to a more secure channel that uses HTTPS. This forces users to a more secure connection before entering their user credentials.

To enable support for authentication protocols - web-based manager:

1. Go to **User & Device > Authentication Settings**.
2. Select one or more of HTTP, HTTPS, FTP, Telnet, or Redirect HTTP Challenge to a Secure Channel (HTTPS). Only selected protocols will be available for use in authentication.
3. Select the **Certificate** to use, for example `Fortinet_Factory`.
4. Select **Apply**.

To enable support for authentication protocols - CLI:

```
config user setting
```

```

set auth-type ftp http https telnet
set auth-cert Fortinet_Factory
end

```

As of FortiOS 5.4, the `Fortinet_Factory` certificate has been re-signed with an expiration date of 2038. It is used instead of `Fortinet_Factory2`, which has been removed.

Authentication replacement messages

A replacement message is the body of a webpage containing a message about a blocked website message, a file too large message, a disclaimer, or even a login page for authenticating. The user is presented with this message instead of the blocked content.

Authentication replacement messages are the prompts a user sees during the security authentication process such as login page, disclaimer page, and login success or failure pages. These are different from most replacement messages because they are interactive requiring a user to enter information, instead of simply informing the user of some event as other replacement messages do.

Replacement messages have a system-wide default configuration, a per-VDOM configuration, and disclaimers can be customized for multiple security policies within a VDOM.

These replacement messages are used for authentication using HTTP and HTTPS. Authentication replacement messages are HTML messages. You cannot customize the security authentication messages for FTP and Telnet.

The authentication login page and the authentication disclaimer include replacement tags and controls not found on other replacement messages.

More information about replacement messages can be found in the `config system replacemsg` section of the [FortiOS CLI Reference](#).

List of authentication replacement messages

Replacement message name (CLI name)	Description
Login challenge page (auth-challenge-page)	<p>This HTML page is displayed if security users are required to answer a question to complete authentication. The page displays the question and includes a field in which to type the answer. This feature is supported by RADIUS and uses the generic RADIUS challenge-access auth response. Usually, challenge-access responses contain a Reply-Message attribute that contains a message for the user (for example, "Please enter new PIN"). This message is displayed on the login challenge page. The user enters a response that is sent back to the RADIUS server to be verified.</p> <p>The Login challenge page is most often used with RSA RADIUS server for RSA SecurID authentication. The login challenge appears when the server needs the user to enter a new PIN. You can customize the replacement message to ask the user for a SecurID PIN.</p> <p>This page uses the <code>%%QUESTION%%</code> tag.</p>

Replacement message name (CLI name)	Description
Disclaimer page (auth-disclaimer-page-1) (auth-disclaimer-page-2) (auth-disclaimer-page-3)	<p>This page prompts user to accept the displayed disclaimer when leaving the captive portal to access Internet resources. It is displayed when the captive portal type is Authentication and Disclaimer or Disclaimer Only.</p> <p>In the CLI, the auth-disclaimer-page-2 and auth-disclaimer-page-3 pages seamlessly extend the size of the disclaimer page from 8 192 characters to 16 384 and 24 576 characters respectively. In the web-based manager this is handled automatically.</p> <p>See Disclaimer on page 449.</p>
Email token page (auth-email-token-page)	<p>The page prompting a user to enter their email token. See Email on page 1.</p>
FortiToken page (auth-fortitoken-page)	<p>The page prompting a user to enter their FortiToken code. See FortiToken on page 422.</p>
Keepalive page (auth-keepalive-page)	<p>The HTML page displayed with security authentication keepalive is enabled using the following CLI command:</p> <pre>config system globalset auth-keepalive enable end</pre> <p>Authentication keepalive keeps authenticated firewall sessions from ending when the authentication timeout ends. In the web-based manager, go to User & Device > Authentication Settings to set the Authentication Timeout.</p> <p>This page includes %%TIMEOUT%%.</p>
Login failed page (auth-login-failed-page)	<p>The Disclaimer page replacement message does not re-direct the user to a redirect URL or the security policy does not include a redirect URL. When a user selects the button on the disclaimer page to decline access through the FortiGate unit, the Declined disclaimer page is displayed.</p>
Login page (auth-login-page)	<p>The authentication HTML page displayed when users who are required to authenticate connect through the FortiGate unit using HTTP or HTTPS.</p> <p>Prompts the user for their username and password to login.</p> <p>This page includes %%USERNAMEID%% and %%PASSWORDID%% tags.</p>
Declined disclaimer page (auth-reject-page)	<p>The page displayed if a user declines the disclaimer page. See Disclaimer on page 449.</p>

Replacement message name (CLI name)	Description
SMS Token page (auth-sms-token-page)	The page prompting a user to enter their SMS token. See SMS on page 421 .
Success message (auth-success-msg)	The page displayed when a user successfully authenticates. Prompts user to attempt their connection again (as the first was interrupted for authentication).

Access to the Internet

A policy for accessing the Internet is similar to a policy for accessing a specific network, but the destination address is set to **all**. The destination interface is the one that connects to the Internet Service Provider (ISP). For general purpose Internet access, the Service is set to ALL.

Access to HTTP, HTTPS, FTP and Telnet sites may require access to a domain name service. DNS requests do not trigger authentication. You must configure a policy to permit unauthenticated access to the appropriate DNS server, and this policy must **precede** the policy for Internet access. Failure to do this will result in the lack of a DNS connection and a corresponding lack of access to the Internet.

Configuring authentication security policies

To include authentication in a security policy, the policy must specify user groups. A security policy can authenticate by certificate, FSSO, and NTLM. The two exceptions to this are RADIUS SSO and FSSO Agents. See [SSO using RADIUS accounting records on page 552](#), and [Introduction to FSSO agents on page 509](#).

Before creating a security policy, you need to configure one or more users or user groups. For more information, see [Users and user groups on page 415](#).

Creating the security policy is the same as a regular security policy except you must select the action specific to your authentication method:

Authentication methods allowed for each policy Action

Action	Authentication method	Where authentication is used
ACCEPT	FSSO Agent or a security policy that specifies an FSSO user group	Agent-based FSSO on page 508 .
	NTLM	See NTLM authentication on page 450 .
	Certificates	See Configuring certificate-based authentication on page 487 .
	RADIUS SSO	See SSO using RADIUS accounting records on page 552 .
DENY	none	none

Disclaimer

A WiFi or SSL captive portal can include a disclaimer message presented after the user authenticates. The user must agree to the terms of the disclaimer to access network resources.

Customizing authentication replacement messages

Customizing disclaimers or other authentication replacement messages involves changing the text of the disclaimer message, and possibly the overall appearance of the message.

Changing the disclaimer in **System > Replacement Messages** is not the same as selecting to customize a disclaimer used in a captive portal. The captive portal location is a customized disclaimer that inherits the default format for the disclaimer message, but then can be customized for this portal.

To customize the disclaimer for a captive portal - web-based manager:

1. Go to **Network > Interfaces**. Either select an existing interface or create a new one.
2. Under **Security Mode**, select **Captive Portal**, and enable **Customize Portal Messages**.
3. Select the **Edit** icon. You can select and edit any of the pages. Change your text or layout as needed.

Enabling security logging

There are two types of logging that relate to authentication — event logging, and security logging.

When enabled, event logging records system events such as configuration changes, and authentication. To configure event logging, go to **Log & Report > Log Settings** and enable **Event Logging**. Select the events you want to log, such as **User activity event**.

When enabled, security logging will log security profile and security policy traffic.

You must enable logging within a security policy, as well as the options that are applied to a security policy, such as security profiles features. Event logs are enabled within the Event Log page.

For more information on logging, see the FortiOS Log and Reporting guide.

For more information on specific types of log messages, see the FortiOS Log Message Reference.

You need to set the logging severity level to **Notification** when configuring a logging location to record traffic log messages.

To enable logging within an existing security policy - web-based manager:

1. Go to **Policy & Objects > IPv4 Policy**.
2. Expand to reveal the policy list of a policy.
3. Select the security policy you want to enable logging on and then select **Edit**.
4. To log all general firewall traffic, select the check box beside **Log Allowed Traffic**, and choose to enable **Security Events** or **All Sessions**.
5. Select **OK**.

Identity-based policy

An identity-based policy (IBP) performs user authentication in addition to the normal security policy duties. If the user does not authenticate, access to network resources is refused. This enforces Role Based Access Control (RBAC) to your organization's network and resources.

Identity-based policies also support Single Sign-On operation. The user groups selected in the policy are of the Fortinet Single Sign-On (FSSO) type.

User authentication can occur through any of the following supported protocols, including: HTTP, HTTPS, FTP, and Telnet. The authentication style depends on which of these protocols is included in the selected security services group and which of those enabled protocols the network user applies to trigger the authentication challenge.

For username and password-based authentication (HTTP, FTP, and Telnet) the FortiGate unit prompts network users to enter their username, password, and token code if two-factor authentication is selected for that user account. For certificate-based authentication, including HTTPS or HTTP redirected to HTTPS only, see [Certificate authentication on page 460](#).

With identity-based policies, the FortiGate unit allows traffic that matches the source and destination addresses, device types, and so on. This means specific security policies must be placed **before** more general ones to be effective.

When the identity-based policy has been configured, the option to customize authentication messages is available. This allows you to change the text, style, layout, and graphics of the replacement messages associated with this firewall policy. When enabled, customizing these messages follows the same method as changing the disclaimer. See [Disclaimer on page 449](#).

Types of authentication also available in identity-based policies are

- [NTLM authentication](#)
- [Certificate authentication](#)

NTLM authentication

NT LAN Manager (NTLM) protocol can be used as a fallback for authentication when the Active Directory (AD) domain controller is unreachable. NTLM uses the web browser to send and receive authentication information. See "NTLM" and "FSSO NTLM authentication support".

To enable NTLM

1. Edit the policy in the CLI to enable NTLM. For example, if the policy ID is 4:
2. Go to **Policy & Objects > IPv4 Policy** and note the **ID** number of your FSSO policy.
3. The policy must have an FSSO user group as **Source User(s)**. There must be at least one FSSO Collector agent configured on the FortiGate unit.

```
config firewall policy
edit 4
set ntlm enable
end
```

NTLM guest access

Guest profile access may be granted to users who fail NTLM authentication, such as visitors who have no user credentials on the network. To allow guest user access, edit the FSSO security policy in the CLI, like this:

```

config firewall policy
  edit 4
    set ntlm enable
    set ntlm-guest enable
  end

```

NTLM enabled browsers - CLI

User agent strings for NTLM enabled browsers allow the inspection of initial HTTP-User-Agent values, so that non-supported browsers are able to go straight to guest access without needlessly prompting the user for credentials that will fail. `ntlm-guest` must be enabled to use this option.

```

config firewall policy
  edit 4
    set ntlm enable
    set ntlm-guest enable
    set ntlm-enabled-browsers <user_agent_string>
  next
end

```

`<user_agent_string>` is the name of the browser that is NTLM enabled. Examples of these values include "MSIE", "Mozilla" (which includes FireFox), and "Opera".

Value strings can be up to 63 characters in length, and may not contain cross site scripting (XSS) vulnerability characters such as brackets. The FortiGate unit prevents use of these characters to prevent exploit of cross site scripting (XSS) vulnerabilities.

Kerberos authentication for explicit web and transparent web proxy users

Kerberos authentication is a method for authenticating both explicit web proxy and transparent web proxy users. It has several advantages over NTLM challenge response:

- Does not require FSSO/AD agents to be deployed across domains.
- Requires fewer round-trips than NTLM SSO, making it less latency sensitive.
- Is (probably) more scalable than challenge response.
- Uses existing Windows domain components rather than added components.
- NTLM may still be used as a fallback for non-Kerberos clients.

Enhancements to Kerberos explicit and transparent web proxy

FortiOS 5.6.x authentication is managed by schemes and rules based on protocol and source address. As such, configurable authentication settings have been introduced to enhance authentication.

CLI commands (`config authentication rule`, `scheme`, and `setting`) allow explicit proxy rules and schemes to be created to separate user authentication (e.g. authentication rules and schemes used to match conditions in order to identify users) from user authorization (proxy-based policies with users and/or user groups).

CLI syntax - config authentication rule

```

config authentication rule
  edit <name>
    set name <name>
    set status {enable|disable}
    set protocol {http|ftp|socks}
    config srcaddr <addr-name or addrgrp-name>
  end
end

```

```
        edit <name>
            set name <ipv4-policy-name>
        next
    end
    config srcaddr6 <addr-name or addrgrp-name>
        edit <name>
            set name <ipv6-policy-name>
        next
    end
    set ip-based {enable|disable}
    set active-auth-method <scheme-name>
    set sso-auth-method <scheme-name>
    set transaction-based {enable|disable} - basic scheme + session-based
    set web-auth-cookie {enable|disable}
    set comments <comments>
next
end
```

Note: As shown above, HTTP, FTP, and SOCKSv5 authentication protocols are supported for explicit proxy.

Authentication rules are used to receive user-identity, based on the values set for protocol and source address. Having said this, if a rule fails to match based on source address, there will be no other attempt to match the rule, however the next policy will be attempted. This occurs only when:

- there is an authentication rule, but no authentication method has been set (under `config authentication scheme`; see below), so user identity cannot be found.
- the user is successfully matched in the rule, but fails to match the current policy.

Once a rule is positively matched through protocol and/or source address, it must also match the authentication method specified (`active-auth-method` and `sso-auth-method`). These methods point to schemes, as defined under `config authentication scheme`.

CLI syntax - config authentication scheme

```
config authentication scheme
    edit <name>
        set name <name>
        set method {basic|digest|ntlm|form|negotiate|fsso|rsso}
        set negotiate-ntlm {enable|disable}
        set require-tfa {enable|disable}
        set fsso-guest {enable|disable}
        config user-database
            edit <name>
                set name {local|<ldap-server>|<radius-server>|<fsso-name>|<rsso-name>|<tacacs+-
                    name>}
            next
        end
    next
end
```

Combining authentication rules and schemes, granular control can be exerted over users and IPs, creating an efficient process for users to successfully match a criteria before matching the policy.

Additional options can be set under `config authentication setting`.

CLI syntax - config authentication setting

```
config authentication setting
```

```

set sso-scheme <scheme-name>
set active-scheme <scheme-name>
set captive-portal <host-name>
set captive-portal-port <tcp-port>
end

```

Integration of Transparent and Explicit proxy HTTP policy checking

A CLI command, under `config firewall profile-protocol-options`, allows HTTP policy checking to be enable or disabled. When enabled, transparent traffic can be matched in a firewall policy and policy user authentication can occur. In addition, separate SSL inspection policies can be created:

```

config firewall profile-protocol-options
edit <name>
    set http-policy {enable|disable}
end

```

Internet Service Database in Explicit/Implicit proxy policies

CLI commands, under `config firewall proxy-policy`, implement the Internet Service Database (ISDB) as the webproxy matching factor, and override IP pool is also support:

```

config firewall proxy-policy
edit <name>
    set proxy {explicit-web|transparent-web|ftp|wanopt}
    set dstintf <dst-name>
    set poolname <ip-pool-name>
end

```

Multiple port/port range support for explicit web and explicit FTP proxy

Multiple port numbers and/or ranges can be set for explicit proxy, specifically for HTTP/HTTPS and FTP. Go to **Network > Explicit Proxy** and configure settings under **Explicit Web Proxy** and **Explicit FTP Proxy**, or under `config web-proxy explicit` in the CLI Console.

1. General configuration

1.1 Kerberos environment - Windows server setup

1. Build a Windows 2008 Platform server.
2. Enable domain configuration in windows server (dcpromo).
3. Set the domain name TEST.COM (realm name).

1.2 Create users

- *testuser* is a normal user (could be any existing domain user account).
- *testtgt* is the service name. In this case it should be the FQDN for the explicit proxy Interface, For example the hostname in the client browser proxy config.
- Recommendation: create username all in lowercase (even if against corporate standards).
 - The account only requires “domain users” membership
 - Password set to never expire
 - Set a very strong password

1.3 Add FortiGate to DNS

Add the FortiGate FQDN in to the Windows DNS domain, as well as in-addr.arpa

For Lab/Testing add the FortiGate Domain name and IP mapping in the hosts file (windows/system32/drivers/etc/hosts). e.g., TESTFGT.TEST.COM 10.10.1.10

1.4 Generate the Kerberos keytab

Use the *ktpass* command (found on Windows Servers and many domain workstations) to generate the Kerberos keytab.

Example:

```
ktpass -princ HTTP/<domain name of test fgt>@realm -mapuser testfgt -pass <password> -crypto all -ptype KRB5_NT_PRINCIPAL -out fgt.keytab
```

In the case where the FortiGate is handling multiple keytabs in Kerberos authentication, use different passwords when generating each keytab.

The ktpass on older Windows servers (i.e. 2003) may not support the “all” crypto option.

Example:

```
ktpass -princ HTTP/testfgt.test.com@TEST.COM -mapuser testfgt -pass 12345678 -crypto all -ptype KRB5_NT_PRINCIPAL -out fgt.keytab
```

The realm name is always presented in uppercase, and prefixed with the “@” character.

1.5 Encode base64

Use the *base64* command (available in most Linux distros) command to encode the *fgt.keytab* file. Any LF (Line Feed) need to be deleted from the file.

Example:

```
base64 fgt.keytab > fgt.txt
```

Use Notepad++ or some native Linux text editor. Windows Notepad and Wordpad are likely to introduce errors.

2. FortiGate configuration

2.1 Create LDAP Server instance

```
config user ldap
  edit "ldap" <<< Required for authorization
    set server "10.10.1.1" <<< LDAP server IP, normally it should be same as KDC server
    set cnid "cn"
    set dn "dc=test,dc=com"
    set type regular
    set username "CN=admin,CN=Users,DC=test,DC=com" <<< Your domain may require STARTTLS
    set password <FOOS>
  next
end
```

2.2 Define Kerberos as an authentication service

```
config user krb-keytab
  edit "http_service"
    set principal "HTTP/testfgt.test.com@TEST.COM" <<< Same as the principal name in 1.4
    set ldap-server "ldap" <<< the defined ldap server for authorization
    set keytab
      "BQIAAABNAAIACkJFUkJFU15DT00ABEhUVFAAGlRPT1lfRkdUXzEwMERfQS5CRVJCRVIuQ09NAAAAQA
      AAAAKABcAEJQl0MHgovwplu7XzfENJzw=" <<< base64 encoding keytab data, created in step 1.5
  next
end
```

2.3 Create user group(s)

```
config user group <<< the group is used for kerberos authentication
  edit "testgrp"
    set member "ldap"
    config match
      edit 1
        set server-name "ldap" <<< Same as ldap-server option in krb-keytab
        set group-name "CN=Domain Users,CN=Users,DC=TEST,DC=com"
      next
    end
  next
end
```

2.4 Create firewall policy

```
config firewall proxy-policy
  edit 1
    set uuid 5e5dd6c4-952c-51e5-b363-120ad77c1414
    set proxy explicit-web
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set service "webproxy"
    set action accept
    set schedule "always"
    set groups "CN=USERS LAB.PS FSSO"
  next
end
```

2.5 Diagnostics

Once the keytab is imported, check that it has been properly decoded. The filename generated will be relatively random, but should be clearly visible.

```
Artoo-Deetoo (root) # fnsysctl ls -la /tmp/kt
drwxr--r-- 2 0 0 Fri Dec 2 10:06:43 2016 60 .
drwxrwxrwt 22 0 0 Tue Dec 6 14:28:29 2016 3280 ..
-rw-r--r-- 1 0 0 Fri Dec 2 10:06:43 2016 392 1.0.89.keytab
```

If there is no file present, then the file hasn't decoded. Check the file for line feeds and try again.

3. Client side walkthrough

3.1 Check Kerberos is working

Log on to the domain by using *testuser*, created in 1.2. Use the *klist* command to list ticket information. In the below example, the client has received *krbtgt*, *CIFS*, and *LDAP* tickets. As there has been no interaction with the FortiGate, there are no references to it.

```
C:\Users\glenk>klist Cached Tickets: (5)

C:\Users\glenk>klist
Cached Tickets: (5)
#0> Client: glenk @ home.local

    Server: krbtgt/HOME.LOCAL @ HOME.LOCAL
    KerbTicket Encryption Type: AES-256-CTS-HMAC-SHA1-96
    Ticket Flags 0x60a00000 -> forwardable forwarded renewable pre_authent

End Time: 12/7/2016 0:58:04 (local)
Renew Time: 12/13/2016 14:58:04 (local)
Session Key Type: AES-256-CTS-HMAC-SHA1-96
```

3.2 Configure client

Set up web-proxy in browser through the FortiGate. This can be achieved via a PAC file or direct browser configuration.

Some Firefox documentation indicates that it is necessary to make manual advanced configuration changes to allow Kerberos authentication work. However, builds 48 (and possibly much earlier) require no additional configuration beyond setting of the proxy server.

3.3 Open a connection to the Internet

1. The client accesses the explicit proxy, but a *HTTP 407 Proxy Authentication Required* is returned.
2. As "Negotiate" is set, the client has knowledge of the KRBTGT, it requests a ticket from the KDC with a *krb-tgs-req* message. This includes the REALM (HOME.LOCAL) in the *req-body* section, and the provided instances SNAME and service (in this case, HTTP/artoo-deetoo.home.local).
3. The KDC responds with a next KRB-TGS-REP.

This ticket is then available on the client.

In the example below, the ticket-granted-service has issued Ticket #2.

```
#2> Client: glenk @ home.local
Server: HTTP/artoo-deetoo.home.local @ HOME.LOCAL
KerbTicket Encryption Type: RSADSI RC4-HMAC(NT)
Ticket Flags 0x40a00000 -> forwardable renewable pre_authent
Start Time: 12/6/2016 14:59:45 (local)
End Time: 12/7/2016 0:58:04 (local)
Renew Time: 12/13/2016 14:58:04 (local)
Session Key Type: RSADSI RC4-HMAC(NT)
```

4. The conversation between the client and the proxy continues, as the client responds with the Kerberos ticket in the response.

The whole process takes less than a second to complete. The user should be visible as a FSSO logon in the Web UI.

Transparent web-proxy Kerberos authentication

Transparent web-proxy is new to FortiOS 5.6, in which the FortiGate can process level 7 policy matching, even when the explicit web-proxy is not enabled on the client's browser. The transparent web-proxy policy is set in proxy-policy too. The policy matching rule is the same as the explicit web-proxy.

In the firewall policy level, transparent web-proxy is regarded as a special UTM. The HTTP/HTTPS traffic matches the firewall policy first, then traffic is redirected to the web-proxy daemon. If the transparent web-proxy feature is disabled, http-policy options in profile-protocol-options is used to enable transparent web-proxy feature.

IP-based

1. Captive portal and the captive portal port must be configured in transparent web-proxy for support of Kerberos authentication:

```
config authentication setting
    set captive-portal <fqdn-name>
    set captive-portal-port "9998"
end
```

2. Authentication rule, scheme, and krb-keytab need to be configured for Kerberos authentication (note the active-auth-method scheme referenced in the rule):

```
config authentication scheme
    edit <kerberos-scheme>
        set method negotiate
        set negotiate-ntlm <enable>
        set fsso-guest <disable>
    next
end

config authentication rule
    edit <name>
        set status <enable>
        set protocol <http>
        set srcaddr "all"
        set ip-based <enable>
        set active-auth-method <kerberos-scheme>
    next
end
```

```
config user krb-keytab
    edit <name>
        set principal "HTTP/TESTFGT.TEST.COM@TEST.COM"
        set ldap-server "ldap"
        set keytab <base64-encoding-keytab-data>
    next
end
```

3. Configure LDAP and user group used for authorization:

```
config user ldap
    edit "ldap"
        set server "10.10.1.1"
        set cnid
        set dn
        set type <regular>
        set username "CN=admin,CN=Users,DC=test,DC=com"
```

```

    set password ENC
    aW5lIAHkPMf4D+ZCKpGMU3x8Fpq0G+7uIbAvpblbXFA5vLfGb4/oRBx+B6R/v+CMCetP84e+Gdz5zEcM
    yOd3cjoBoIhFrpYJfXhRs4lSE0HezeVXfxwTSf5VJG+F11G/G5RpaY+AE8bortC8MBE7P2/uGQocFHu4
    Ilulp5I60Jvyk6Ei3hDZMjTd8iPp5IkRJZVVjQ==
  next
end

config user group
  edit "testgrp"
    set member "ldap"
    config match
      edit "1"
        set server-name "ldap"
        set group-name "CN=Domain Users,CN=Users,DC=TEST,DC=com"
      next
    end
  next
end

```

4. Create proxy-policy, with groups as the authorizing policy-matching element:

```

config firewall proxy-policy
  edit 1
    set uuid 1bbb891a-9cd2-51e7-42ff-d1fa13cac3da
    set proxy explicit-web
    set dstintf "any"
    set srcaddr "all"
    set dstaddr "all"
    set service "webproxy"
    set action accept
    set schedule "always"
    set groups testgrp
  next
end

```

5. UTM must be enabled in the firewall policy to support the transparent web-proxy:

```

config firewall policy
  edit "1"
    set name "policy1"
    set uuid 8a6ceeac-b016-51e6-2b5c-165070d5bf50
    set srcintf "mgmt1"
    set dstintf "mgmt1"
    set srcaddr "all"
    set dstaddr "all"
    set action <accept>
    set schedule "always"
    set service "ALL"
    set utm-status <enable>
    set profile-protocol-options "transparent-web-proxy"
    set ssl-ssh-profile "deep-inspection"
    set nat <enable>
  next
end

config firewall profile-protocol-options
  edit "transparent-web-proxy"
    config http
      set ports "80 8080"
    end
  next
end

```

```
        unset options
        set http-policy enable
        unset post-lang
    end
    ...
next
end
```

Session-based with web-auth cookie

The web-auth-cookie feature is necessary for session-based authentication under transparent web-proxy.

The configuration is the same as for IP-based authentication, except `ip-based` is disabled in the authentication rule:

```
config authentication rule
    edit "kerberos-rules"
        set status <enable>
        set protocol <http>
        set srcaddr "all"
        set ip-based <disable>
        set active-auth-method <kerberos-scheme>
    next

config authentication setting
    set captive-portal <fqdn-name>
    set captive-portal-port "9998"
end
```

HTTP tunnel authentication

You can trigger user authentication on HTTP CONNECT request at the policy level. A new CLI entry has been added under `config firewall proxy-policy` which will trigger the authentication process `get-user`, even when there is no user or group configured.

Note that, as shown below, explicit web proxy must be set.

Syntax

```
config firewall proxy-policy
    edit {policyid}
        set proxy explicit-web
        set http-tunnel-auth {enable | disable}
    next
end
```

Certificate authentication

You can configure certificate-based authentication for FortiGate administrators, SSL VPN users, and IPsec VPN users. See [Configuring certificate-based authentication on page 487](#).

Certificates are also inherent to the HTTPS protocol, where the browser validates the server's identity using certificates. A site certificate must be installed on the FortiGate unit and the corresponding Certificate Authority (CA) certificate installed in the web browser.

To force the use of HTTPS, go to **User & Device > Authentication Settings** and select **Redirect HTTP Challenge to a Secure Channel (HTTPS)**.

Restricting number of concurrent user logons

Some users on your network may often have multiple account sessions open at one time either to the same network resource or accessing to the admin interface on the FortiGate unit.

While there are valid reasons for having multiple concurrent sessions open, hackers also do this to speed up their malicious work. Often a hacker is making multiple attempts to gain access to the internal network or the admin interface of the FortiGate unit, usually from different IP addresses to appear to the FortiGate unit as legitimate users. For this reason, the more concurrent sessions a hacker has open at once, the faster they will achieve their goal.

To help prevent this, you can disallow concurrent administrative access using the same administrator user name. This allows only one session with the same username even if it is from the same IP.

To disable concurrent administrator sessions - CLI:

```
config system global
    set admin-concurrent disable
end
```

VPN authentication

All VPN configurations require users to authenticate. Authentication based on user groups applies to:

- SSL VPNs
- PPTP and L2TP VPNs
- an IPsec VPN that authenticates users using dialup groups
- a dialup IPsec VPN that uses XAUTH authentication (Phase 1)

You must create user accounts and user groups before performing the procedures in this section. If you create a user group for dialup IPsec clients or peers that have unique peer IDs, their user accounts must be stored locally on the FortiGate unit. You cannot authenticate these types of users using a RADIUS or LDAP server.

Configuring authentication of SSL VPN users

The general procedure for authenticating SSL VPN users is:

1. Configure user accounts.
2. Create one or more user groups for SSL VPN users.
3. Enable SSL VPN.
4. Optionally, set inactivity and authentication timeouts.
5. Configure a security policy with the user groups you created for SSL VPN users.
See FortiOS Handbook SSL VPN guide.

Configuring authentication timeout

By default, the SSL VPN authentication expires after 8 hours (28 800 seconds). You can change it only in the CLI, and the time entered must be in seconds. The maximum time is 72 hours (259 200 seconds). For example, to change this timeout to one hour, you would enter:

```
config vpn ssl settings
    set auth-timeout 3600
end
```

If you set the authentication timeout (`auth-timeout`) to 0 when you configure the timeout settings, the remote client does not have to re-authenticate unless they log out of the system. To fully take advantage of this setting, the value for `idle-timeout` has to be set to 0 also, so that the client does not time out if the maximum idle time is reached. If the `idle-timeout` is not set to the infinite value, the system will log out if it reaches the limit set, regardless of the `auth-timeout` setting.

Configuring authentication of remote IPsec VPN users

An IPsec VPN on a FortiGate unit can authenticate remote users through a dialup group. The user account name is the peer ID and the password is the pre-shared key.

Authentication through user groups is supported for groups containing only local users. To authenticate users using a RADIUS or LDAP server, you must configure XAUTH settings. See [Configuring XAuth authentication](#).

To configure user group authentication for dialup IPsec - web-based manager:

1. Configure the dialup users who are permitted to use this VPN. Create a user group with Type:Firewall and add them to it.
For more information, see [Users and user groups on page 415](#)
2. Go to **VPN > IPsec Wizard**, select **Remote Access**, choose a name for the VPN, and enter the following information.

Incoming Interface	Select the incoming interface name.
Authentication Method	List of authentication methods available for users. Select Preshared Key and enter the preshared key.
User Group	Select the user group that is to be allowed access to the VPN. The listed user groups contain only users with passwords on the FortiGate unit.

3. Select **Next** and continue configure other VPN parameters as needed.
4. Select **OK**.

To configure user group authentication for dialup IPsec - CLI example:

The `peer type` and `usrgrp` options configure user group-based authentication.

```
config vpn ipsec phase1
  edit office_vpn
    set interface port1
    set type dynamic
    set psksecret yORRAzltNGhzgtV32jend
    set proposal 3des-sha1 aes128-sha1
    set peer type dialup
    set usrgrp Group1
  end
```

Configuring XAuth authentication

Extended Authentication (XAuth) increases security by requiring additional user authentication information in a separate exchange at the end of the VPN Phase 1 negotiation. The FortiGate unit asks the user for a username and password. It then forwards the user's credentials (the password is encrypted) to an external RADIUS or LDAP server for verification.

XAuth can be used in addition to or in place of IPsec phase 1 peer options to provide access security through an LDAP or RADIUS authentication server. You must configure a dialup user group whose members are all externally authenticated.

To configure authentication for a dialup IPsec VPN - web-based manager:

1. Configure the users who are permitted to use this VPN. Create a user group and add the users to the group. For more information, see ["Users and user groups" on page 415](#).
2. Go to **VPN > IPsec Wizard**, select **Remote Access**, choose a name for the VPN, and enter the following information.

Incoming Interface	Select the incoming interface name.
Authentication Method	List of authentication methods available for users. Select Preshared Key and enter the preshared key.
User Group	Select the user group that is to be allowed access to the VPN. The listed user groups contain only users with passwords on the FortiGate unit.

3. Select **Next** and continue configure other VPN parameters as needed.
4. Select **OK**.
5. Go to **VPN > IPsec Tunnels**, edit the Tunnel just created, select **Convert To Custom Tunnel**, and edit **XAUTH** as following:

Type	Select PAP , CHAP , or AUTO . Use CHAP whenever possible. Use PAP with all implementations of LDAP and with other authentication servers that do not support CHAP, including some implementations of Microsoft RADIUS. Use AUTO with the Fortinet Remote VPN Client and where the authentication server supports CHAP but the XAuth client does not.
User Group	Select the user group that is to have access to the VPN. The list of user groups does not include any group that has members whose password is stored on the FortiGate unit.

6. Select **OK**.

For more information about XAUTH configuration, see the IPsec VPN chapter of the FortiOS Handbook.

To configure authentication for a dialup IPsec VPN - CLI example:

The `xauthtype` and `authusrgrp` fields configure XAuth authentication.

```
config vpn ipsec phase1
  edit office_vpn
    set interface port1
    set type dynamic
    set psksecret yORRAzltNGhzgtV32jend
    set proposal 3des-sha1 aes128-sha1
    set peertype dialup
    set xauthtype pap
    set usrgrp Group1
  end
```

Some parameters specific to setting up the VPN itself are not shown here. For detailed information about configuring IPsec VPNs, see the FortiOS Handbook IPsec VPN guide.

Configuring authentication of PPTP VPN users and user groups

Configuration of a PPTP VPN is possible only through the CLI. You can configure user groups and security policies using either CLI or web-based manager.

LDAP user authentication is supported for PPTP, L2TP, IPsec VPN, and firewall authentication.

However, with PPTP, L2TP, and IPsec VPN, PAP (Packet Authentication Protocol) is supported, while CHAP (Challenge Handshake Authentication Protocol) is not.

To configure authentication for a PPTP VPN

1. Configure the users who are permitted to use this VPN. Create a security user group and add them to it. For more information, see [Users and user groups on page 415](#).
2. Configure the PPTP VPN in the CLI as in this example.

```
config vpn pptp
  set status enable
  set sip 192.168.0.100
  set eip 192.168.0.110
  set usrgp PPTP_Group
end
```

The `sip` and `eip` fields define a range of virtual IP addresses assigned to PPTP clients.

Configure a security policy. The source interface is the one through which the clients will connect. The source address is the PPTP virtual IP address range. The destination interface and address depend on the network to which the clients will connect. The policy action is ACCEPT.

Configuring authentication of L2TP VPN users/user groups

Configuration of a L2TP VPN is possible only through the CLI. You can configure user groups and security policies using either CLI or web-based manager.

LDAP user authentication is supported for PPTP, L2TP, IPsec VPN, and firewall authentication.

However, with PPTP, L2TP, and IPsec VPN, PAP (Packet Authentication Protocol) is supported, while CHAP (Challenge Handshake Authentication Protocol) is not.

To configure authentication for a L2TP VPN

1. Configure the users who are permitted to use this VPN. Create a user group and add them to it. For more information, see [Users and user groups on page 415](#).
2. Configure the L2TP VPN in the CLI as in this example.

```
config vpn l2tp
  set status enable
  set sip 192.168.0.100
  set eip 192.168.0.110
  set usrgp L2TP_Group
end
```

The `sip` and `eip` fields define a range of virtual IP addresses assigned to L2TP clients.

3. Configure a security policy. The source interface is the one through which the clients will connect. The source address is the L2TP virtual IP address range. The destination interface and address depend on the network to which the clients will connect. The policy action is ACCEPT.

Captive portals

A captive portal is a convenient way to authenticate web users on wired or WiFi networks.

This section describes:

- [Introduction to Captive portals](#)
- [Configuring a captive portal](#)
- [Customizing captive portal pages](#)

Introduction to Captive portals

You can authenticate your users on a web page that requests the user's name and password. Until the user authenticates successfully, the authentication page is returned in response to any HTTP request. This is called a captive portal.

After successful authentication, the user accesses the requested URL and can access other web resources, as permitted by security policies. Optionally, the captive portal itself can allow web access to only the members of specified user group.

The captive portal can be hosted on the FortiGate unit or on an external authentication server. You can configure captive portal authentication on any network interface, including WiFi and VLAN interfaces.

When a captive portal is configured on a WiFi interface, the access point initially appears open. The wireless client can connect to the access point with no security credentials, but sees only the captive portal authentication page.

WiFi captive portal types:

- **Authentication** — until the user enters valid credentials, no communication beyond the AP is permitted.
- **Disclaimer + Authentication** — immediately after successful authentication, the portal presents the disclaimer page—an acceptable use policy or other legal statement—to which the user must agree before proceeding.
- **Disclaimer Only** — the portal presents the disclaimer page—an acceptable use policy or other legal statement—to which the user must agree before proceeding. The authentication page is not presented.
- **Email Collection** — the portal presents a page requesting the user's email address, for the purpose of contacting the person in future. This is often used by businesses who provide free WiFi access to their customers. The authentication page is not presented.

Configuring a captive portal

Captive portals are configured on network interfaces. On a physical (wired) network interface, you edit the interface configuration in **Network > Interfaces** and set **Security Mode** to **Captive Portal**. A WiFi interface does not exist until the WiFi SSID is created. You can configure a WiFi captive portal at the time that you create the SSID. Afterwards, the captive portal settings will also be available by editing the WiFi network interface in **Network > Interfaces**.

To configure a wired Captive Portal - web-based manager:

1. Go to **Network > Interfaces** and edit the interface to which the users connect.
2. In **Security Mode** select **Captive Portal**.

3. Enter

Authentication Portal	Local - portal hosted on the FortiGate unit. Remote - enter FQDN or IP address of external portal.
User Groups	Select permitted user groups or select Use Groups from Policies , which permits the groups specified in the security policy. Use Groups from Policies is not available in WiFi captive portals.
Exempt List	Select exempt lists whose members will not be subject to captive portal authentication.
Customize Portal Messages	Enable, then select Edit. See Customizing captive portal pages on page 468 .

4. Select OK.

To configure a WiFi Captive Portal - web-based manager:

- Go to **WiFi & Switch Controller > SSID** and create your SSID.
If the SSID already exists, you can edit the SSID or you can edit the WiFi interface in **Network > Interfaces**.
- In **Security Mode**, select **Captive Portal**.

3. Enter

Portal Type	The portal can provide authentication and/or disclaimer, or perform user email address collection. See Introduction to Captive portals on page 466 .
Authentication Portal	Local - portal hosted on the FortiGate unit. Remote - enter FQDN or IP address of external portal.
User Groups	Select permitted user groups.

Exempt List	Select exempt lists whose members will not be subject to captive portal authentication.
Customize Portal Messages	Click the link of the portal page that you want to modify. See " Captive portals " on page 468.

4. Select **OK**.

Exemption from the captive portal

A captive portal requires all users on the interface to authenticate. But some devices are not able to authenticate. You can create an exemption list of these devices. For example, a printer might need to access the Internet for firmware upgrades. Using the CLI, you can create an exemption list to exempt all printers from authentication.

```
config user security-exempt-list
  edit r_exempt
    config rule
      edit 1
        set devices printer
      end
    end
  end
```

Customizing captive portal pages

These pages are defined in replacement messages. Defaults are provided. In the web-based manager, you can modify the default messages in the SSID configuration by selecting **Customize Portal Messages**. Each SSID can have its own unique portal content.

The captive portal contains the following default web pages:

- **Login page**—requests user credentials

The image shows a Fortinet captive portal login page. At the top, the Fortinet logo is displayed in black with a red square icon containing a white cross. Below the logo, the text "Authentication Required" is written in a bold, black, sans-serif font. Underneath this, a message "Please enter your credentials to continue." is centered. Below the message are two input fields: "Username:" followed by a white text box, and "Password:" followed by a white text box. At the bottom right of the form is a button labeled "Continue". The entire form is enclosed in a thin red border.

Typical modifications for this page would be to change the logo and modify some of the text.

You can change any text that is not part of the HTML code nor a special tag enclosed in double percent (%) characters.

There is an exception to this rule. The line "Please enter your credentials to continue" is provided by the `%%QUESTION%%` tag. You can replace this tag with text of your choice. Except for this item, you should not remove any tags because they may carry information that the FortiGate unit needs.

- **Login failed page**—reports that the entered credentials were incorrect and enables the user to try again.

The Login failed page is similar to the Login page. It even contains the same login form. You can change any text that is not part of the HTML code nor a special tag enclosed in double percent (%) characters.

There is an exception to this rule. The line "Firewall authentication failed. Please try again." is provided by the %%FAILED_MESSAGE%% tag. You can replace this tag with text of your choice. Except for this item, you should not remove any tags because they may carry information that the FortiGate unit needs.

- **Disclaimer page**—is a statement of the legal responsibilities of the user and the host organization to which the user must agree before proceeding. (WiFi or SSL VPN only)

Terms and Disclaimer Agreement

You are about to access Internet content that is not under the control of the network access provider. The network access provider is therefore not responsible for any of these sites, their content or their privacy policies. The network access provider and its staff do not endorse nor make any representations about these sites, or any information, software or other products or materials found there, or any results that may be obtained from using them. If you decide to access any Internet content, you do this entirely at your own risk and you are responsible for ensuring that any accessed material does not infringe the laws governing, but not exhaustively covering, copyright, trademarks, pornography, or any other material which is slanderous, defamatory or might cause offence in any other way.

Do you agree to the above terms?

- **Declined disclaimer page**—is displayed if the user does not agree to the statement on the Disclaimer page. Access is denied until the user agrees to the disclaimer.

Changing images in portal messages

You can replace the default Fortinet logo with your organization's logo. First, import the logo file into the FortiGate unit and then modify the Login page code to reference your file.

To import a logo file:

1. Go to **System > Replacement Messages** and select **Manage Images**.
2. Select **Create New**.
3. Enter a **Name** for the logo and select the appropriate **Content Type**.
The file must not exceed 24 Kilo bytes.
4. Select **Browse**, find your logo file and then select **Open**.
5. Select **OK**.

To specify the new logo in the replacement message:

1. Go to **Network > Interfaces** and edit the interface.
The **Security Mode** must be **Captive Portal**.
2. Select the portal message to edit.
 - In SSL VPN or WiFi interfaces, in **Customize Portal Messages** click the link to the portal messages that you want to edit.
 - In other interfaces, make sure that **Customize Portal Messages** is selected, select the adjacent **Edit** icon, then select the message that you want to edit.
3. In the HTML message text, find the %%IMAGE tag.
By default it specifies the Fortinet logo: %%IMAGE:logo_fw_auth%%
4. Change the image name to the one you provided for your logo.
The tag should now read, for example, %%IMAGE:mylogo%%
5. Select **Save**.
6. Select **OK**.

Modifying text in portal messages

Generally, you can change any text that is not part of the HTML code nor a special tag enclosed in double percent (%) characters. You should not remove any tags because they may carry information that the FortiGate unit needs. See the preceding section for any exceptions to this rule for particular pages.

To modify portal page text

1. Go to **Network > Interfaces** and edit the interface.
The SSID **Security Mode** must be **Captive Portal**.
2. Select the portal message to edit.
 - In SSL VPN or WiFi interfaces, in **Customize Portal Messages** click the link to the portal messages that you want to edit.
 - In other interfaces, make sure that **Customize Portal Messages** is selected, select the adjacent **Edit** icon, then select the message that you want to edit.
3. Edit the HTML message text, then select **Save**.
4. Select **OK**.

Configuring disclaimer page for ethernet interface captive portals

While you can customize a disclaimer page for captive portals that connect via WiFi, the same can be done for wired connections. However, this can only be configured on the CLI Console, and only without configuring user groups.

When configuring a captive portal through the CLI, you may set `security-groups` to a specific user group. The result of this configuration will show an authentication form to users who wish to log in to the captive portal—**not** a disclaimer page. If you do not set any `security-groups` in your configuration, an "Allow all" status will be in effect, and the disclaimer page will be displayed for users.

The example CLI configuration below shows setting up a captive portal interface without setting security-groups, resulting in a disclaimer page for users:

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 172.16.101.1 255.255.255.0
    set allowaccess ping https ssh snmp http
    set type physical
    set explicit-web-proxy enable
    set alias "LAN"
    set security-mode captive-portal
    set snmp-index 1
  next
end
```

Certificate-based authentication

This section provides an overview of how the FortiGate unit verifies the identities of administrators, SSL VPN users, or IPsec VPN peers using X.509 security certificates.

The following topics are included in this section:

- [What is a security certificate?](#)
- [Certificates overview](#)
- [Managing X.509 certificates](#)
- [Configuring certificate-based authentication](#)
- [Support for per-VDOM certificates](#)
- [Certificate-based authentication](#)
- [Example — Generate and Import CA certificate with private key pair on OpenSSL](#)
- [Example — Generate an SSL certificate in OpenSSL](#)

What is a security certificate?

A security certificate is a small text file that is part of a third-party generated public key infrastructure (PKI) to help guarantee the identity of both the user logging on and the web site they where they are logging in.

A certificate includes identifying information such as the company and location information for the web site, as well as the third-party company name, the expiry date of the certificate, and the public key.

FortiGate units use X.509 certificates to authenticate single sign-on (SSO) for users. The X.509 standard has been in use since before 2000, but has gained popularity with the Internet's increased popularity. X.509 v3 is defined in RFC 5280 and specifies standard formats for public key certificates, certificate revocation lists, and a certification path validation algorithm. The unused earlier X.509 version 1 was defined in RFC 1422.

The main difference between X.509 and PGP certificates is that where in PGP anyone can sign a certificate, for X.509 only a trusted authority can sign certificates. This limits the source of certificates to well known and trustworthy sources. Where PGP is well suited for one-to-one communications, the X.509 infrastructure is intended to be used in many different situations including one-to-many communications. Some common filename extensions for X.509 certificates are listed below.

Common certificate filename extensions

Filetype	Format name	Description
.pem	Privacy Enhanced Mail (PEM)	Base64 encoded DER certificate, that uses: "-----BEGIN CERTIFICATE-----" and "-----END CERTIFICATE-----"
.cer .crt .der	Security CERTificate	Usually binary DER form, but Base64-encoded certificates are common too.
.p7b .p7c		Structure without data, just certificates or CRLs. PKCS#7 is a standard for signing or encrypting (officially called "enveloping") data.
.p12	PKCS#12	May contain certificate(s) (public) and private keys (password protected).
.pfx	personal information exchange (PFX)	Older format. Came before PKCS#12. Usually today data is in PKCS#12 format.

Certificates overview

Certificates play a major role in authentication of clients connecting to network services via HTTPS, both for administrators and SSL VPN users. Certificate authentication is optional for IPsec VPN peers.

This section includes:

- [Certificates and protocols](#)
- [IPsec VPNs and certificates](#)
- [Certificate types on the FortiGate unit](#)

Public CA certificates found on the FortiGate are provided through firmware upgrades and installations.

Certificates and protocols

There are a number of protocols that are commonly used with certificates including SSL and HTTPS, and other certificate-related protocols.

SSL and HTTPS

The secure HTTP (HTTPS) protocol uses SSL. Certificates are an integral part of SSL. When a web browser connects to the FortiGate unit via HTTPS, a certificate is used to verify the FortiGate unit's identity to the client. Optionally, the FortiGate unit can require the client to authenticate itself in return.

By default, the FortiGate unit uses a self-signed security certificate to authenticate itself to HTTPS clients. When the certificate is offered, the client browser displays two security messages.

- The first message prompts users to accept and optionally install the FortiGate unit's self-signed security certificate. If the user does not accept the certificate, the FortiGate unit refuses the connection. When the user accepts the certificate, the FortiGate login page is displayed, and the credentials entered by the user are encrypted before they are sent to the FortiGate unit. If the user chooses to install the certificate, the prompt is not displayed again.
- Just before the FortiGate login page is displayed, a second message informs users that the FortiGate certificate distinguished name differs from the original request. This message is displayed because the FortiGate unit redirects the connection (away from the distinguished name recorded in the self-signed certificate) and can be ignored.

Optionally, you can install an X.509 server certificate issued by a certificate authority (CA) on the FortiGate unit. You can then configure the FortiGate unit to identify itself using the server certificate instead of the self-signed certificate.

For more information, see the FortiOS Handbook SSL VPN guide.

After successful certificate authentication, communication between the client browser and the FortiGate unit is encrypted using SSL over the HTTPS link.

Certificate-related protocols

There are multiple protocols that are required for handling certificates. These include the Online Certificate Status Protocol (OCSP), Secure Certificate Enrollment Protocol (SCEP), and Server-based Certificate Validation Protocol (SCVP).

Online Certificate Status Protocol

Online Certificate Status Protocol (OCSP) allows the verification of X.509 certificate expiration dates. This is important to prevent hackers from changing the expiry date on an old certificate to a future date.

Normally certificate revocation lists (CRLs) are used, but OCSP is an alternate method available. However a CRL is a public list, and some companies may want to avoid the public exposure of their certificate structure even if it is only invalid certificates.

The OCSP check on the certificate's revocation status is typically carried out over HTTP with a request-response format. The authority responding can reply with a status of good, revoked, or unknown for the certificate in question.

Secure Certificate Enrollment Protocol

Secure Certificate Enrollment Protocol (SCEP) is an automated method of signing up for certificates. Typically this involves generating a request you send directly to the SCEP service, instead of generating a file request that may or may not be signed locally.

Server-based Certificate Validation Protocol

Server-based Certificate Validation Protocol (SCVP) is used to trace a certificate back to a valid root level certificate. This ensures that each step along the path is valid and trustworthy.

IPsec VPNs and certificates

Certificate authentication is a more secure alternative to preshared key (shared secret) authentication for IPsec VPN peers. Unlike administrators or SSL VPN users, IPsec peers use HTTP to connect to the VPN gateway configured on the FortiGate unit. The VPN gateway configuration can require certificate authentication before it

permits an IPsec tunnel to be established. See [Authenticating IPsec VPN users with security certificates on page 489](#).

Certificate types on the FortiGate unit

There are different types of certificates available that vary depending on their intended use. FortiOS supports local, remote, CA, and CRL certificates.

Local certificates

Local certificates are issued for a specific server, or web site. Generally they are very specific, and often for an internal enterprise network. For example a personal web site for John Smith at www.example.com (such as <http://www.example.com/home/jsmith>) would have its own local certificate.

These can optionally be just the certificate file, or also include a private key file and PEM passphrase for added security.

For information about generating a certificate request, see [Generating a certificate signing request on page 479](#). For information about installing a local certificate, see [Obtaining and installing a signed server certificate from an external CA on page 481](#).

Remote certificates

Remote certificates are public certificates without a private key. For dynamic certificate revocation, you need to use an Online Certificate Status Protocol (OCSP) server. The OCSP is configured in the CLI only. Installed Remote (OCSP) certificates are displayed in the Remote Certificates list. You can select **Import** to install a certificate from the management PC.

CA root certificates

CA root certificates are similar to local certificates, however they apply to a broader range of addresses or to whole company; they are one step higher up in the organizational chain. Using the local certificate example, a CA root certificate would be issued for all of www.example.com instead of just the smaller single web page.

Certificate revocation list

Certificate revocation list (CRL) is a list of certificates that have been revoked and are no longer usable. This list includes certificates that have expired, been stolen, or otherwise compromised. If your certificate is on this list, it will not be accepted. CRLs are maintained by the CA that issues the certificates and includes the date and time when the next CRL will be issued as well as a sequence number to help ensure you have the most current version of the CRL.

Certificate signing

The trust in a certificate comes from the authority that signs it. For example if VeriSign signs your CA root certificate, it is trusted by everyone. While these certificates are universally accepted, it is cumbersome and expensive to have all certificates on a corporate network signed with this level of trust.

With self-signed certificates nobody, except the other end of your communication, knows who you are and therefore they do not trust you as an authority. However this level is useful for encryption between two points — neither point may care about who signed the certificate, just that it allows both points to communicate. This is very useful for internal networks and communications.

A general rule is that CA signed certificates are accepted and sometimes required, but it is easier to self-sign certificates when you are able.

For more on the methods of certificate signing see [Generating a certificate signing request on page 479](#).

BIOS certificate compatibility

FortiOS supports backwards compatibility between BIOS version 4 and BIOS version 3.

BIOS V4 certificates:

- Fortinet_CA
- Fortinet_Sub_CA
- Fortinet_Factory

BIOS V3 certificates:

- Fortinet_CA_Backup
- Fortinet_Factory_Backup

When FortiOS connects to FortiGuard, FortiCloud, FortiManager, FortiAnalyzer, FortiSandbox as a client, the BIOS certificate **Fortinet_Factory** will be the default client certificate. When the server returns its certificate (chain) back, FortiOS looks up the issuer of the server certificate and either keeps client certificate as is or switches to the BIOS certificate **Fortinet_Factory_Backup**. This process occurs in one handshake.

When FortiOS connects to FortiCare, the BIOS certificate **Fortinet_Factory** is the only client certificate and Server Name Indication (SNI) is set. There is no switchover of certificate during SSL handshake.

When FortiOS acts as a server when connected by FortiExtender, FortiSwitch, FortiAP, etc., **Fortinet_Factory** is the default server certificate. FortiOS detects SNI in client hello, and if no SNI is found or if the CN in SNI is different from the CN of **Fortinet_CA**, it switches to use the **Fortinet_Factory_Backup**.

Managing X.509 certificates

Managing security certificates is required due to the number of steps involved in both having a certificate request signed, and then distributing the correct files for use.

You use the FortiGate unit or CA software such as OpenSSL to generate a certificate request. That request is a text file that you send to the CA for verification, or alternately you use CA software to self-validate. Once validated, the certificate file is generated and must be imported to the FortiGate unit before it can be used. These steps are explained in more detail later in this section.

This section provides procedures for generating certificate requests, installing signed server certificates, and importing CA root certificates and CRLs to the FortiGate unit.

For information about how to install root certificates, CRLs, and personal or group certificates on a remote client browser, refer to your browser's documentation.

As a requirement of Network Device Collaborative Protection Profile (NDcPP), FortiOS supports and handles the use of wildcards for the following certificate reference parameters:

- Subject Alternative Name (SAN)
 - Common Name (CN)
-

This section includes:

- [Generating a certificate signing request](#)
- [Generating certificates with CA software](#)
- [Obtaining and installing a signed server certificate from an external CA](#)
- [Installing a CA root certificate and CRL to authenticate remote clients](#)
- [ExtendedKeyUsage for x.509 certificates](#)

Generating a certificate signing request

Whether you create certificates locally with a software application or obtain them from an external certificate service, you will need to generate a certificate signing request (CSR).

When you generate a CSR, a private and public key pair is created for the FortiGate unit. The generated request includes the public key of the FortiGate unit and information such as the FortiGate unit's public static IP address, domain name, or email address. The FortiGate unit's private key remains confidential on the FortiGate unit.

After you submit the request to a CA, the CA will verify the information and register the contact information on a digital certificate that contains a serial number, an expiration date, and the public key of the CA. The CA will then sign the certificate, and you install the certificate on the FortiGate unit.

The Certificate Request Standard is a public key cryptography standard (PKCS) published by RSA, specifically PKCS10 which defines the format for CSRs. This is defined in RFC 2986.

To generate a certificate request in FortiOS - web-based manager:

1. Go to **System > Certificates**.
2. Select **Generate**.
3. In the **Certificate Name** field, enter a unique meaningful name for the certificate request. Typically, this would be the hostname or serial number of the FortiGate unit or the domain of the FortiGate unit such as example.com.

Do not include spaces in the certificate name. This will ensure compatibility of a signed certificate as a PKCS12 file to be exported later on if required.

Prior to FortiOS 5.4, passwords for local certificates that were generated via either SCEP or CLI could not have their passwords reset. Passwords can be set in the CLI using the following command:

```
config vpn certificate local
edit <name>
set password <password>
next
end
```

4. Enter values in the **Subject Information** area to identify the FortiGate unit:
 - If the FortiGate unit has a static IP address, select **Host IP** and enter the public IP address of the FortiGate unit. If the FortiGate unit does not have a public IP address, use an email address (or fully qualified domain name (FQDN) if available) instead.

- If the FortiGate unit has a dynamic IP address and subscribes to a dynamic DNS service, use a FQDN if available to identify the FortiGate unit. If you select **Domain Name**, enter the FQDN of the FortiGate unit. Do not include the protocol specification (http://) or any port number or path names.

If a domain name is not available and the FortiGate unit subscribes to a dynamic DNS service, an “unable to verify certificate” type message may be displayed in the user’s browser whenever the public IP address of the FortiGate unit changes.

- If you select **E-Mail**, enter the email address of the owner of the FortiGate unit.

5. Enter values in the **Optional Information** area to further identify the FortiGate unit.

Organization Unit	Name of your department. You can enter a series of OUs up to a maximum of 5. To add or remove an OU, use the plus (+) or minus (-) icon.
Organization	Legal name of your company or organization.
Locality (City)	Name of the city or town where the FortiGate unit is installed.
State/Province	Name of the state or province where the FortiGate unit is installed.
Country	Select the country where the FortiGate unit is installed.
e-mail	Contact email address.
Subject Alternative Name	<p>Optionally, enter one or more alternative names for which the certificate is also valid. Separate names with a comma. A name can be:</p> <ul style="list-style-type: none"> • e-mail address • IP address • URI • DNS name (alternatives to the Common Name) • directory name (alternatives to the Distinguished Name) <p>You must precede the name with the name type. Examples:</p> <p>IP:1.1.1.1 email:test@fortinet.com email:my@other.address URI:http://my.url.here/</p>
Password for private key	Option to export local certificate and its private key in password protected p12.

6. From the **Key Type** list, select **RSA** or **Elliptic Curve**.
7. From the **Key Size** list, select **1024 Bit**, **1536 Bit**, **2048 Bit**, **4096 Bit** or **secp256r1**, **secp384r1**, **secp521r1** respectively. Larger keys are slower to generate but more secure.
8. In **Enrollment Method**, you have two methods to choose from. Select **File Based** to generate the certificate request, or **Online SCEP** to obtain a signed SCEP-based certificate automatically over the network. For the SCEP method, enter the URL of the SCEP server from which to retrieve the CA certificate, and the CA server challenge password.
9. Select **OK**.

10. The request is generated and displayed in the **Local Certificates** list with a status of `PENDING`.
 11. Select the **Download** button to download the request to the management computer.
 12. In the **File Download** dialog box, select **Save** and save the Certificate Signing Request on the local file system of the management computer.
 13. Name the file and save it on the local file system of the management computer.
- The certificate request is ready for the certificate authority to be signed.

Generating certificates with CA software

CA software allows you to generate unmanaged certificates and CA certificates for managing other certificates locally without using an external CA service. Examples of CA software include `ssl-ca` from OpenSSL (available for Linux, Windows, and Mac) or `gensslcert` from SuSE, MS Windows Server 2000 and 2003 come with a CA as part of their certificate services, and in MS Windows 2008 CA software can be installed as part of the Active Directory installation. See [Example — Generate and Import CA certificate with private key pair on OpenSSL on page 492](#).

The general steps for generating certificates with CA software are

1. Install the CA software as a stand-alone root CA.
2. Provide identifying information for your self-administered CA.

While following these steps, the methods vary slightly when generating server certificates, CA certificates, and PKI certificates.

Server certificate

1. Generate a Certificate Signing Request (CSR) on the FortiGate unit.
2. Copy the CSR base-64 encoded text (PKCS10 or PKCS7) into the CA software and generate the certificate. PKCS10 is the format used to send the certificate request to the signing authority. PKCS7 is the format the signing authority can use for the newly signed certificate.
3. Export the certificate as a X.509 DER encoded binary file with `.CER` extension
4. Upload the certificate file to the FortiGate unit Local Certificates page (type is Certificate).

CA certificate

1. Retrieve the CA Certificate from the CA software as a DER encoded file.
2. Import the CA certificate file to the FortiGate unit at **System > Certificates** and select **Import > Certificates**.

PKI certificate

1. Generate a Certificate Signing Request (CSR) on the FortiGate unit.
2. Copy the CSR base-64 encoded text (PKCS#10 or PKCS#7) into the CA software and generate the certificate. PKCS10 is the format used to send the certificate request to the signing authority. PKCS7 is the format the signing authority can use for the newly signed certificate.
3. Export the certificate as a X.509 DER encoded binary file with `.CER` extension.
4. Install the certificate in the user's web browser or IPsec VPN client as needed.

Obtaining and installing a signed server certificate from an external CA

To obtain a signed server certificate for a FortiGate unit, you must send a request to a CA that provides digital certificates that adhere to the X.509 standard. The FortiGate unit provides a way for you to generate the request.

To submit the certificate signing request (file-based enrollment):

1. Using the web browser on the management computer, browse to the CA web site.
2. Follow the CA instructions for a base-64 encoded PKCS#10 certificate request and upload your certificate request.
3. Follow the CA instructions to download their root certificate and CRL.
When you receive the signed server certificate from the CA, install the certificate on the FortiGate unit.

To install or import the signed server certificate - web-based manager

1. On the FortiGate unit, go to **System > Certificates** and select **Import > Local Certificates**.
2. From **Type**, select **Local Certificate**.
3. Select **Browse**, browse to the location on the management computer where the certificate was saved, select the certificate, and then select **Open**.
4. Select **OK**, and then select **Return**.

Installing a CA root certificate and CRL to authenticate remote clients

When you apply for a signed personal or group certificate to install on remote clients, you can obtain the corresponding root certificate and CRL from the issuing CA. When you receive the signed personal or group certificate, install the signed certificate on the remote client(s) according to the browser documentation. Install the corresponding root certificate (and CRL) from the issuing CA on the FortiGate unit according to the procedures given below.

To install a CA root certificate

1. After you download the root certificate of the CA, save the certificate on the management computer. Or, you can use online SCEP to retrieve the certificate.
2. On the FortiGate unit, go to **System > Certificates** and select **Import > CA Certificates**.
3. Do one of the following:
 - To import using SCEP, select **SCEP**. Enter the URL of the SCEP server from which to retrieve the CA certificate. Optionally, enter identifying information of the CA, such as the filename.
 - To import from a file, select **Local PC**, then select **Browse** and find the location on the management computer where the certificate has been saved. Select the certificate, and then select **Open**.
5. Select **OK**, and then select **Return**.

The system assigns a unique name to each CA certificate. The names are numbered consecutively (CA_Cert_1, CA_Cert_2, CA_Cert_3, and so on).

To import a certificate revocation list

A Certificate Revocation List (CRL) is a list of the CA certificate subscribers paired with certificate status information. The list contains the revoked certificates and the reason(s) for revocation. It also records the certificate issue dates and the CAs that issued them.

When configured to support SSL VPNs, the FortiGate unit uses the CRL to ensure that the certificates belonging to the CA and remote peers or clients are valid. The CRL has an “effective date” and a “next update” date. The interval is typically 7 days (for Microsoft CA). FortiOS will update the CRL automatically. Also, there is a CLI command to specify an “update-interval” in seconds. Recommendation should be 24 hours (86400 seconds) but depends on company security policy.

1. After you download the CRL from the CA web site, save the CRL on the management computer.
2. Go to **System > Certificates** and select **Import > CRL**.
3. Do one of the following:
 - To import using an HTTP server, select **HTTP** and enter the URL of the HTTP server.
 - To import using an LDAP server see this KB [article](#).
 - To import using an SCEP server, select **SCEP** and select the Local Certificate from the list. Enter the URL of the SCEP server from which the CRL can be retrieved.
 - To import from a file, select **Local PC**, then select **Browse** and find the location on the management computer where the CRL has been saved. Select the CRL and then select **Open**.
5. Select **OK**, and then select **Return**.

To import a PKCS12 certificate from the CLI

The following CLI syntax can be entered to import a local certificate file:

```
execute vpn certificate local import tftp <file name> <tftp ip address> <file type> <Enter
for 'cer'>|<password for 'p12'>
```

For example:

```
execute vpn certificate local import tftp FGTF-extern.p12 10.1.100.253 p12 123456
```

In addition, the following CLI syntax can be entered to update certificate bundles from an FTP or TFTP server:

```
execute vpn certificate ca import bundle <file-name.pkg> <ftp/tftp-server-ip>
```

ExtendedKeyUsage for x.509 certificates

As per Network Device Collaborative Protection Profile (NDcPP) v1.0 requirements, server certificates used for TLS connections between FortiGate and FortiAnalyzer have the "Server Authentication" and "Client Authentication" extendedKeyUsage fields in FIPS/CC mode.

The following CLI command is available under `log fortianalyzer setting` to allow you to specify the certificate used to communicate with FortiAnalyzer.

CLI syntax

```
config log fortianalyzer setting
  set certificate <name>
end
```

Troubleshooting certificates

There are times when there are problems with certificates — a certificate is seen as expired when its not, or it can't be found. Often the problem is with a third party web site, and not FortiOS. However, some problems can be traced back to FortiOS such as DNS or routing issues.

Enable and disable SHA1 algorithm in SSH key exchanges

In order to investigate your security and conduct compliance testing, a global option allows you to enable/disable SHA1 algorithm in SSH key exchange. Note that, the algorithm is enabled by default.

Syntax

```
config system global
    set ssh-key-shal {enable | disable}
end
```

Certificate is reported as expired when it is not

Certificates often are issued for a set period of time such as a day or a month, depending on their intended use. This ensures everyone is using up-to-date certificates. It is also more difficult for hackers to steal and use old certificates.

Reasons a certificate may be reported as expired include:

- It really has expired based on the “best before” date in the certificate
- The FortiGate unit clock is not properly set. If the FortiGate clock is fast, it will see a certificate as expired before the expiry date is really here.
- The requesting server clock is not properly set. A valid example is if your certificate is 2 hours from expiring, a server more than two time zones away would see the certificate as expired. Otherwise, if the server’s clock is set wrongly it will also have the same effect.
- The certificate was revoked by the issuer before the expiry date. This may happen if the issuer believes a certificate was either stolen or misused. Its possible it is due to reasons on the issuer’s side, such as a system change or such. In either case it is best to contact the certificate issuer to determine what is happening and why.

A secure connection cannot be completed (Certificate cannot be found)

Everyone who uses a browser has encountered a message such as *This connection is untrusted*. Normally when you try to connect securely to a web site, that web site will present its valid certificate to prove their identity is valid. When the web site’s certificate cannot be verified as valid, the message appears stating *This connection is untrusted* or something similar. If you usually connect to this web site without problems, this error could mean that someone is trying to impersonate or hijack the web site, and best practices dictates you not continue.

Reasons a web site’s certificate cannot be validated include:

- The web site uses an unrecognized self-signed certificate. These are not secure because anyone can sign them. If you accept self-signed certificates you do so at your own risk. Best practices dictate that you must confirm the ID of the web site using some other method before you accept the certificate.
- The certificate is valid for a different domain. A certificate is valid for a specific location, domain, or sub-section of a domain such as one certificate for `support.example.com` that is not valid for `marketing.example.com`. If you encounter this problem, contact the webmaster for the web site to inform them of the problem.
- There is a DNS or routing problem. If the web site’s certificate cannot be verified, it will not be accepted. Generally to be verified, your system checks with the third party certificate signing authority to verify the certificate is valid. If you cannot reach that third party due to some DNS or routing error, the certificate will not be verified.
- Firewall is blocking required ports. Ensure that any firewalls between the requesting computer and the web site allow the secure traffic through the firewall. Otherwise a hole must be opened to allow it through. This includes ports such as 443 (HTTPS) and 22 (SSH).

Online updates to certificates and CRLs

If you obtained your local or CA certificate using SCEP, you can configure online renewal of the certificate before it expires. Similarly, you can receive online updates to CRLs.

Local certificates

In the `config vpn certificate local` command, you can specify automatic certificate renewal. The relevant fields are:

<code>scep-url <URL_str></code>	The URL of the SCEP server. This can be HTTP or HTTPS. The following options appear after you add the <code><URL_str></code> .
<code>scep-password <password_str></code>	The password for the SCEP server.
<code>auto-regenerate-days <days_int></code>	How many days before expiry the FortiGate unit requests an updated local certificate. The default is 0, no auto-update.
<code>auto-regenerate-days-warning <days_int></code>	How many days before local certificate expiry the FortiGate generates a warning message. The default is 0, no warning.

In this example, an updated certificate is requested three days before it expires.

```
config vpn certificate local
edit mycert
set scep-url http://scep.example.com/scep
set scep-server-password my_pass_123
set auto-regenerate-days 3
set auto-regenerate-days-warning 2
end
```

CA certificates

In the `config vpn certificate ca` command, you can specify automatic certificate renewal. The relevant fields are:

Variable	Description
<code>scep-url <URL_str></code>	The URL of the SCEP server. This can be HTTP or HTTPS.
<code>auto-update-days <days_int></code>	How many days before expiry the FortiGate unit requests an updated CA certificate. The default is 0, no auto-update.
<code>auto-update-days-warning <days_int></code>	How many days before CA certificate expiry the FortiGate generates a warning message. The default is 0, no warning.

In this example, an updated certificate is requested three days before it expires.

```
config vpn certificate ca
edit mycert
set scep-url http://scep.example.com/scep
set auto-update-days 3
set auto-update-days-warning 2
end
```

Certificate Revocation Lists

If you obtained your CRL using SCEP, you can configure online updates to the CRL using the `config vpn certificate crl` command. The relevant fields are:

Variable	Description
<code>http-url <http_url></code>	URL of the server used for automatic CRL certificate updates. This can be HTTP or HTTPS.
<code>scep-cert <scep_certificate></code>	Local certificate used for SCEP communication for CRL auto-update.
<code>scep-url <scep_url></code>	URL of the SCEP CA server used for automatic CRL certificate updates. This can be HTTP or HTTPS.
<code>update-interval <seconds></code>	How frequently, in seconds, the FortiGate unit checks for an updated CRL. Enter 0 to update the CRL only when it expires. Not available for http URLs.
<code>update-vdom <update_vdom></code>	VDOM used to communicate with remote SCEP server for CRL auto-update.

In this example, an updated CRL is requested only when it expires.

```
config vpn certificate crl
  edit cert_crl
    set http-url http://scep.example.com/scep
    set scep-cert my-scep-cert
    set scep-url http://scep.ca.example.com/scep
    set update-interval 0
    set update-vdom root
  end
```

Backing up and restoring local certificates

The FortiGate unit provides a way to export and import a server certificate and the FortiGate unit's personal key through the CLI. If required (to restore the FortiGate unit configuration), you can import the exported file through the **System > Certificates** page of the web-based manager.

As an alternative, you can back up and restore the entire FortiGate configuration through the **System Information** widget on the Dashboard of the web-based manager. Look for **[Backup]** and **[Restore]** in the **System Configuration** row. The backup file is created in a FortiGate-proprietary format.

To export a server certificate and private key - CLI:

This procedure exports a server (local) certificate and private key together as a password protected PKCS12 file. The export file is created through a customer-supplied TFTP server. Ensure that your TFTP server is running and accessible to the FortiGate unit before you enter the command.

1. Connect to the FortiGate unit through the CLI.
2. Type the following command:

```
execute vpn certificate local export tftp <cert_name> <exp_filename> <tftp_ip>
<password>
```

where:

- <cert_name> is the name of the server certificate; typing ? displays a list of installed server certificates.
- <exp_filename> is a name for the output file.
- <tftp_ip> is the IP address assigned to the TFTP server host interface.

3. Move the output file from the TFTP server location to the management computer for future reference.

To import a server certificate and private key - web-based manager:

1. Go to **System > Certificates** and select **Import**.
2. In **Type**, select **PKCS12 Certificate**.
3. Select **Browse**. Browse to the location on the management computer where the exported file has been saved, select the file, and then select **Open**.
4. In the **Password** field, type the password needed to upload the exported file.
5. Select **OK**, and then select **Return**.

To import a server certificate and private key - CLI:

1. Connect to the FortiGate unit through the CLI.
2. Type the following command:

```
execute vpn certificate local import tftp <file_name> <tftp_ip_address> <file_type> <Enter>
for 'cer'|<password for 'p12'>
```

For example:

```
execute vpn certificate local import tftp FGTF-extern.p12 10.1.100.253 p12 123456
```

To import separate server certificate and private key files - web-based manager

Use the following procedure to import a server certificate and the associated private key file when the server certificate request and private key were not generated by the FortiGate unit. The two files to import must be available on the management computer.

1. Go to **System > Certificates** and select **Import**.
2. In **Type**, select **Certificate**.
3. Select the **Browse** button beside the **Certificate file** field. Browse to the location on the management computer where the certificate file has been saved, select the file, and then select **Open**.
4. Select the **Browse** button beside the **Key file** field. Browse to the location on the management computer where the key file has been saved, select the file, and then select **Open**.
5. If required, in the **Password** field, type the associated password, and then select **OK**.
6. Select **Return**.

Configuring certificate-based authentication

You can configure certificate-based authentication for FortiGate administrators, SSL VPN users, and IPsec VPN users.

In Microsoft Windows 7, you can use the certificate manager to keep track of all the different certificates on your local computer. To access certificate manager, in Windows 7 press the Windows key, enter “certmgr.msc” at the search prompt, and select the displayed match. Remember that in addition to these system certificates, many applications require you to register certificates with them directly.

To see FortiClient certificates, open the FortiClient Console, and select VPN. The VPN menu has options for My Certificates (local or client) and CA Certificates (root or intermediary certificate authorities). Use Import on those screens to import certificate files from other sources.

Authenticating administrators with security certificates

You can install a certificate on the management computer to support strong authentication for administrators. When a personal certificate is installed on the management computer, the FortiGate unit processes the certificate after the administrator supplies a username and password.

To enable strong administrative authentication:

- Obtain a signed personal certificate for the administrator from a CA and load the signed personal certificate into the web browser on the management computer according to the browser documentation.
- Install the root certificate and the CRL from the issuing CA on the FortiGate unit (see [Installing a CA root certificate and CRL to authenticate remote clients on page 482](#)).
- Create a PKI user account for the administrator.
- Add the PKI user account to a firewall user group dedicated to PKI-authenticated administrators.
- In the administrator account configuration, select **PKI** as the account **Type** and select the **User Group** to which the administrator belongs.

Support exact match for subject and CN fields in peer user

In order to avoid any unintentional admin access by regular users, administrators can specify which way a peer user authenticates.

When searching for a matching certificate, use the commands below to control how to find matches in the certificate subject name (`subject-match`) or the cn attribute (`cn-match`) of the certificate subject name. This match can be any string (`substring`) or an exact match (`value`) of the cn attribute value.

To determine certificate subject name matches - CLI:

```
config vpn certificate setting
  edit <name>
    set subject-match {substring | value}
    set cn-match {substring | value}
  next
end
```

Authenticating SSL VPN users with security certificates

While the default self-signed certificates can be used for HTTPS connections, it is preferable to use the X.509 server certificate to avoid the redirection as it can be misinterpreted as possible session hijacking. However, the server certificate method is more complex than self-signed security certificates. Also the warning message is typically displayed for the initial connection, and future connections will not generate these messages.

X.509 certificates can be used to authenticate IPsec VPN peers or clients, or SSL VPN clients. When configured to authenticate a VPN peer or client, the FortiGate unit prompts the VPN peer or client to authenticate itself using

the X.509 certificate. The certificate supplied by the VPN peer or client must be verifiable using the root CA certificate installed on the FortiGate unit in order for a VPN tunnel to be established.

To enable certificate authentication for an SSL VPN user group:

1. Install a signed server certificate on the FortiGate unit and install the corresponding root certificate (and CRL) from the issuing CA on the remote peer or client.
2. Obtain a signed group certificate from a CA and load the signed group certificate into the web browser used by each user. Follow the browser documentation to load the certificates.
3. Install the root certificate and the CRL from the issuing CA on the FortiGate unit (see [Installing a CA root certificate and CRL to authenticate remote clients on page 482](#)).
4. Create a PKI user for each SSL VPN user. For each user, specify the text string that appears in the Subject field of the user's certificate and then select the corresponding CA certificate.
5. Use the `config user peergrp` CLI command to create a peer user group. Add to this group all of the SSL VPN users who are authenticated by certificate.
6. Go to **Policy & Objects > IPv4 Policy**.
7. Edit the SSL-VPN security policy.
8. Select the user group created earlier in the **Source User(s)** field.
9. Select **OK**.

Authenticating IPsec VPN users with security certificates

To require VPN peers to authenticate by means of a certificate, the FortiGate unit must offer a certificate to authenticate itself to the peer.

To enable the FortiGate unit to authenticate itself with a certificate:

1. Install a signed server certificate on the FortiGate unit.
See [To install or import the signed server certificate - web-based manager on page 482](#).
2. Install the corresponding CA root certificate on the remote peer or client. If the remote peer is a FortiGate unit, see [To install a CA root certificate on page 482](#).
3. Install the certificate revocation list (CRL) from the issuing CA on the remote peer or client. If the remote peer is a FortiGate unit, see [To import a certificate revocation list on page 482](#).
4. In the VPN phase 1 configuration, set **Authentication Method** to **Signature** and from the **Certificate Name** list select the certificate that you installed in Step 1.

To authenticate a VPN peer using a certificate, you must install a signed server certificate on the peer. Then, on the FortiGate unit, the configuration depends on whether there is only one VPN peer or if this is a dialup VPN that can be multiple peers.

To configure certificate authentication of a single peer

1. Install the CA root certificate and CRL.
2. Create a PKI user to represent the peer. Specify the text string that appears in the Subject field of the user's certificate and then select the corresponding CA certificate.
3. In the VPN phase 1 **Peer Options**, select **peer certificate** for **Accept Types** field and select the PKI user that you created in the **Peer certificate** field.

To configure certificate authentication of multiple peers (dialup VPN)

1. Install the corresponding CA root certificate and CRL.
2. Create a PKI user for each remote VPN peer. For each user, specify the text string that appears in the Subject field of the user's certificate and then select the corresponding CA certificate.
3. Use the `config user peergrp` CLI command to create a peer user group. Add to this group all of the PKI users who will use the IPsec VPN.

In the VPN phase 1 **Peer Options**, select **peer certificate group** for **Accept Types** field and select the PKI user group that you created in the **Peer certificate group** field.

Support for per-VDOM certificates

The CA and local certificate configuration is available per-VDOM. When an admin uploads a certificate to a VDOM, it will only be accessible inside that VDOM. When an admin uploads a certificate to global, it will be accessible to all VDOMs and global.

There are factory default certificates such as Fortinet_CA_SSL, Fortinet_SSL, Fortinet_Wifi, and Fortinet_Factory. These certificates are moved to per-VDOM and automatically generated when a new VDOM is created.

The Fortinet_Firmware certificate has been removed and all the attributes that use Fortinet_Firmware now use Fortinet_Factory.

CLI Changes

Two new attributes `range` and `source` have been added:

`range` can be global or per-VDOM, if the certificate file is imported from global, it is a global certificate. If the certificate file is imported from a VDOM, it is VDOM certificate.

`source` can be either `factory`, `user`, or `fortiguard`:

- `factory`: The factory certificate file with FortiOS version, this includes: Fortinet_CA_SSL, Fortinet_SSL, PositiveSSL_CA, Fortinet_Wifi, Fortinet_Factory.
- `user`: Certificate file imported by the user.
- `fortiguard`: Certificate file imported from FortiGuard.

```
config certificate local
  edit Fortinet_Factory
    set range {global | vdom}
    set source {factory | user | fortiguard}
  end
end
```

GUI Changes

Global and new VDOMs have the following factory default certificates:

Generate	Edit	Delete	Import	View Details	Download	Search					
T Name	T Subject	T Comments	T Issuer	T Expires	T Status	T Source	T Ref				
Certificates (12)											
Fortinet_SSL_ECDSA	C = US, CN = FGT6HD3916800525, L = Sunnyvale, O = Fortinet, ST = California, emailAddress = support@fortinet.com, OU = FortiGate	This certificate is embedded in...	Fortinet	2027-03-10 18:39:25 GMT	OK	Factory	0

External CA Certificates (3)											
Fortinet_CA	C = US, CN = support, L = Sunnyvale, O = Fortinet, ST = California, emailAddress = support@fortinet.com, OU = Certificate Authority		Fortinet	2038-01-19 22:34:39 GMT	OK	Factory	0				
Fortinet_Web_CA	C = US, OU = (c) 2012 Entrust, Inc. - for authorized use only, O = Entrust, Inc., CN = Entrust Certification Authority - L1K		Entrust, Inc.	2030-12-05 19:43:56 GMT	OK	Factory	0				
Fortinet_Web_CA2	C = US, OU = (c) 2009 Entrust, Inc. - for authorized use only, O = Entrust, Inc., CN = Entrust Root Certification Authority - G2		Entrust, Inc.	2024-09-23 01:31:53 GMT	OK	Factory	0				

These certificates are created automatically when a new VDOM is created, with every VDOM having its own versions of these certificates.

Example — Generate a CSR on the FortiGate unit

This example follows all the steps required to create and install a local certificate on the FortiGate unit, without using CA software.

The FortiGate unit is called myFortiGate60, and is located at 10.11.101.101 (a private IP address) and <http://myfortigate.example.com>. Mr. John Smith (john.smith@myfortigate.example.com) is the IT administrator for this FortiGate unit, and the unit belongs to the Sales department located in Greenwich, London, England.

To generate a certificate request on the FortiGate unit - web-based manager:

1. Go to **System > Certificates**.
2. Select **Generate**.
3. In the **Certificate Name** field, enter `myFortiGate60`.

Do not include spaces in the certificate name. This will ensure compatibility of a signed certificate as a PKCS12 file to be exported later on if required.

Since the IP address is private, we will use the FQDN instead.

4. Select **Domain Name**, and enter `http://myfortigate.example.com`.
5. Enter values in the **Optional Information** area to further identify the FortiGate unit.

Organization Unit	Sales
Organization	Example.com
Locality (City)	Greenwich
State/Province	London
Country	England
e-mail	john.smith@myfortigate.example.com

6. From the **Key Type** list, select **RSA** or **Elliptic Curve**.
7. If RSA is selected, from the **Key Size** list, select **2048 Bit**. If Elliptic Curve is selected, from the **Curve Name** list, select **secp256r1**.
8. In **Enrollment Method**, select **File Based** to generate the certificate request
9. Select **OK**.
The request is generated and displayed in the **Local Certificates** list with a status of PENDING.
10. Select the **Download** button to download the request to the management computer.
11. In the **File Download** dialog box, select **Save** and save the Certificate Signing Request on the local file system of the management computer.
12. Name the file and save it on the local file system of the management computer.

Example — Generate and Import CA certificate with private key pair on OpenSSL

This example explains how to generate a certificate using OpenSSL on MS Windows. OpenSSL is available for Linux and Mac OS as well, however their terminology will vary slightly from what is presented here.

Assumptions

Before starting this procedure, ensure that you have downloaded and installed OpenSSL on Windows. One source is: <http://www.slproweb.com/products/Win32OpenSSL.html>.

Generating and importing the CA certificate and private key

The two following procedures will generate a CA certificate file and private key file, and then import it to the FortiGate unit as a local certificate.

To generate the private key and certificate

1. At the Windows command prompt, go to the OpenSSL bin directory. If you installed to the default location this will be the command:

```
cd c:\OpenSSL-Win32\bin
```

2. Enter the following command to generate the private key. You will be prompted to enter your PEM pass phrase. Choose something easy to remember such as fortinet123.

```
openssl genrsa -aes256 -out fgtppriv.key 2048
```

This command generates an RSA AES256 2048-bit encryption key.

3. The following command will generate the certificate using the key from the previous step.

```
openssl req -new -x509 -days 3650 -extensions v3_ca -key fgtppriv.key -out  
fgtca.crt
```

This step generates an X509 CA certificate good for 10 years that uses the key generated in the previous step. The certificate filename is `fgtca.crt`.

You will be prompted to enter information such as PEM Pass Phrase from the previous step, Country Name, State, Organization Name, Organizational Unit (such as department name), Common Name (the FQDN), and Email Address.

To import the certificate to the FortiGate unit - web-based manager:

1. Go to **System > Certificates**.
2. Select **Import > Local Certificate**.
3. Select **Certificate** for **Type**.
Fields for Certificate file, Key file, and Password are displayed.
4. For **Certificate file**, enter `c:\OpenSSL-Win32\bin\fgtca.crt`.
5. For **Key file**, enter `c:\OpenSSL-Win32\bin\fgtcapriv.key`.
6. For **Password**, enter the PEM Pass Phrase you entered earlier, such as `fortinet123`.
7. Select **OK**.

The Certificate will be added to the list of Local Certificates and be ready for use. It will appear in the list as the filename you uploaded — `fgtca`. You can add comments to this certificate to make it clear where its from and how it is intended to be used. If you download the certificate from FortiOS, it is a .CER file.

It can now be used in [Authenticating IPsec VPN users with security certificates on page 489](#), and [Authenticating SSL VPN users with security certificates on page 488](#).

Example — Generate an SSL certificate in OpenSSL

This example explains how to generate a CA signed SSL certificate using OpenSSL on MS Windows. OpenSSL is available for Linux and Mac OS as well, however their terminology will vary slightly from what is presented here.

In this example, you will:

- Generate a CA signed SSL certificate
- Generate a self-signed SSL certificate
- Import the SSL certificate into FortiOS

Assumptions

- Before starting this procedure, ensure that you have downloaded and installed OpenSSL on MS Windows. One download source is <http://www.slproweb.com/products/Win32OpenSSL.html>.

Generating a CA signed SSL certificate

This procedure assumes that you have already completed [Example — Generate and Import CA certificate with private key pair on OpenSSL on page 492](#) successfully.

To generate the CA signed SSL certificate:

1. At the Windows command prompt, go to the OpenSSL bin directory. If you installed to the default location this will be the following command:

```
cd c:\OpenSSL-Win32\bin
```

2. Enter the following command to generate the private key. You will be prompted to enter your PEM pass phrase. Choose something easy to remember such as `fortinet`.

```
openssl genrsa -aes256 -out fgtssl.key 2048
```

This command generates an RSA AES256 2048-bit encryption key.

3. Create a certificate signing request for the SSL certificate. This step requires you to enter the information listed in step 3 of the previous example — [To generate the private key and certificate](#). You can leave the Challenge Password blank.

```
openssl req -new -sha256 -key fgtssl.key -out fgtssl.csr
```

Most Certificate Authorities will ignore the value that is set in the CSR and use whatever value they are set to use in their configuration. This means that the client will likely need to modify their openssl.conf file to use SHA-256 (or another SHA-2 variant).

4. Using the CSR from the previous step, you can now create the SSL certificate using the CA certificate that was created in [Example — Generate and Import CA certificate with private key pair on OpenSSL](#).

```
openssl x509 -req -days 365 -in fgtssl.csr -CA fgtca.crt -CAkey fgtpcapriv.key -set_  
serial 01 -out fgtssl.crt
```

This will generate an X.509 certificate good for 365 days signed by the CA certificate fgtca.crt.

Generating a self-signed SSL certificate

This procedure does not require any existing certificates.

1. At the Windows command prompt, go to the OpenSSL bin directory. If you installed to the default location this will be the following command:

```
cd c:\OpenSSL-Win32\bin
```

2. Enter the following command to generate the private key. You will be prompted to enter your PEM pass phrase. Choose something easy to remember such as fortinet.

```
openssl genrsa -aes256 -out fgtssl.key 2048  
openssl req -new -key fgtssl.key -out fgtssl.csr  
openssl x509 -req -days 365 -in fgtssl.csr -signkey fgtssl.key -out fgtssl.crt
```

These commands:

- generate an RSA AES256 2048-bit private key,
- generate an SSL certificate signing request, and
- sign the CSR to generate an SSL .CRT certificate file.

Import the SSL certificate into FortiOS

To import the certificate to FortiOS- web-based manager

1. Go to **System > Certificates**.
2. Select **Import > Local Certificate**.
3. Select **Certificate** for **Type**.
Fields for Certificate file, Key file, and Password are displayed.
4. For **Certificate file**, enter `c:\OpenSSL-Win32\bin\fgtssl.crt`.
5. For **Key file**, enter `c:\OpenSSL-Win32\bin\fgtssl.key`.

6. For **Password**, enter the PEM Pass Phrase you entered, such as fortinet.

7. Select **OK**.

The SSL certificate you just uploaded can be found under **System > Certificates** under the name of the file you uploaded — fgtssl.

To confirm the certificate is uploaded properly - CLI:

```
config vpn certificate local
  edit fgtssl
    get
  end
```

The get command will display all the certificate's information. If it is not there or the information is not correct, you will need to remove the corrupted certificate (if it is there) and upload it again from your PC.

To use the new SSL certificate - CLI

```
config vpn ssl settings
  set servercert fgtssl
end
```

This assigns the fgtssl certificate as the SSL server certificate. For more information see the FortiOS Handbook SSL VPN guide.

Single Sign-On using a FortiAuthenticator unit

If you use a FortiAuthenticator unit in your network as a single sign-on agent,

- Users can authenticate through a web portal on the FortiAuthenticator unit.
- Users with FortiClient Endpoint Security installed can be automatically authenticated by the FortiAuthenticator unit through the FortiClient SSO Mobility Agent.

The FortiAuthenticator unit can integrate with external network authentication systems such as RADIUS and LDAP to gather user login information and send it to the FortiGate unit.

User's view of FortiAuthenticator SSO authentication

There are two different ways users can authenticate through a FortiAuthenticator unit.

Users without FortiClient Endpoint Security - SSO widget

To log onto the network, the user accesses the organization's web page with a web browser. Embedded on that page is a simple logon widget, like this:

Login	User not logged in. Click Login to go to the FortiAuthenticator login page.
jsmith Logout	User logged in. Name displayed. Logout button available.

The SSO widget sets a cookie on the user's browser. When the user browses to a page containing the login widget, the FortiAuthenticator unit recognizes the user and updates its database if the user's IP address has changed. The user will not need to re-authenticate until the login timeout expires, which can be up to 30 days.

Users with FortiClient Endpoint Security - FortiClient SSO Mobility Agent

The user simply accesses resources and all authentication is performed transparently with no request for credentials. IP address changes, such as those due to WiFi roaming, are automatically sent to the FortiAuthenticator unit. When the user logs off or otherwise disconnects from the network, the FortiAuthenticator unit is aware of this and deauthenticates the user.

The FortiClient SSO Mobility Agent, a feature of FortiClient Endpoint Security v5.0, must be configured to communicate with the appropriate FortiAuthenticator unit. After that, the agent automatically provides user name and IP address information to the FortiAuthenticator unit for transparent authentication.

Administrator's view of FortiAuthenticator SSO authentication

You can configure either or both of these authentication types on your network.

SSO widget

You need to configure the Single Sign-On portal on the FortiAuthenticator unit. Go to **Fortinet SSO Methods > SSO > Portal Services** to do this. Copy the **Embeddable login widget** code for use on your organization's

home page. Identity-based security policies on the FortiGate unit determine which users or groups of users can access which network resources.

FortiClient SSO Mobility Agent

Your users must be running at least FortiClient Endpoint Security v5.0 to make use of this type of authentication.

On the FortiAuthenticator unit, you need to select **Enable FortiClient SSO Mobility Agent Service**, optionally select **Enable Authentication** and choose a **Secret key**. Go to **Fortinet SSO Methods > SSO > General**. You need to provide your users the FortiAuthenticator IP address and secret key so that they can configure the FortiClient SSO Mobility Agent on their computers. See [Configuring the FortiGate unit on page 498](#).

Configuring the FortiAuthenticator unit

The FortiAuthenticator unit can poll FortiGate units, Windows Active Directory, RADIUS servers, LDAP servers, and FortiClients for information about user logon activity.

To configure FortiAuthenticator polling:

1. Go to **Fortinet SSO Methods > SSO > General**.
2. In the **FortiGate** section, leave the Listening port at 8000, unless your network requires you to change this. The FortiGate unit must allow traffic on this port to pass through the firewall. Optionally, you can set the Login Expiry time. This is the length of time users can remain logged in before the system logs them off automatically. The default is 480 minutes (8 hours).
3. Select **Enable Authentication** and enter the **Secret key**. Be sure to use the same secret key when configuring the FSSO Agent on FortiGate units.
4. In the **Fortinet Single Sign-On (FSSO)** section, enter

Enable Windows Active Directory domain controllers	Select for integration with Windows Active Directory.
Enable Radius accounting SSO clients	Select if you want to use a Remote Radius server.
Enable Syslog SSO	Select for integration with Syslog server.
Enable FortiClient SSO Mobility Agent service	Select both options to enable single sign-on by clients running FortiClient Endpoint Security. Enter the Secret key . Be sure to use the same secret key in the FortiClient Single Sign-On Mobility Agent settings.
Enable Authentication	

5. Select **OK**.

For more information, see the FortiAuthenticator Administration Guide.

Configuring the FortiGate unit

Adding a FortiAuthenticator unit as an SSO agent

On the FortiGate unit, you need to add the FortiAuthenticator unit as a Single Sign-On agent that provides user logon information.

To add a FortiAuthenticator unit as SSO agent:

1. Go to **User & Device > Single Sign-On** and select **Create New**.
2. In **Type**, select **Fortinet Single-Sign-On Agent**.
3. Enter a **Name** for the FortiAuthenticator unit.
4. In Primary Agent IP/Name, enter the IP address of the FortiAuthenticator unit.
5. In Password, enter the secret key that you defined for the FortiAuthenticator unit.
On the FortiAuthenticator unit, you go to **Fortinet SSO Methods > SSO > General** to define the secret key. Select **Enable Authentication**.
6. Select **OK**.

In a few minutes, the FortiGate unit receives a list of user groups from the FortiAuthenticator unit. The entry in the Single Sign-On server list shows a blue caret.

When you open the server, you can see the list of groups. You can use the groups in identity-based security policies.

Configuring an FSSO user group

You cannot use FortiAuthenticator SSO user groups directly in a security policy. Create an FSSO user group and add FortiAuthenticator SSO user groups to it. FortiGate FSSO user groups are available for selection in identity-based security policies.

To create an FSSO user group:

1. Go to **User & Device > User Groups** and select **Create New**.
2. Enter a **Name** for the group.
3. In **Type**, select **Fortinet Single Sign-On (FSSO)**.
4. Add **Members**.
The groups available to add as members are SSO groups provided by SSO agents.
5. Select **OK**.

Configuring security policies

You can create identity-based policies based on FSSO groups as you do for local user groups. For more information about security policies see the Firewall chapter.

Configuring the FortiClient SSO Mobility Agent

The user's device must have at least FortiClient Endpoint Security v5.0 installed. Only two pieces of information are required to set up the SSO Mobility Agent feature: the FortiAuthenticator unit IP address and the preshared secret.

The user needs to know the FortiAuthenticator IP address and preshared secret to set up the SSO Mobility Agent. Or, you could preconfigure FortiClient.

To configure FortiClient SSO Mobility Agent:

1. In FortiClient Endpoint Security, go to **File > Settings**.
You must run the FortiClient application as an administrator to access these settings.
2. Select **Enable single sign-on mobility agent**. Enter the FortiAuthenticator unit IP address, including the listening port number specified on the FortiAuthenticator unit.
Example: 192.168.0.99:8001. You can omit the port number if it is 8005.
3. Enter the preshared key.
4. Select **OK**.

Viewing SSO authentication events on the FortiGate unit

User authentication events are logged in the FortiGate event log.

Go to **Log & Report > System Events**.

#	Date/Time	Level	User	Action	Message	Group
1	1 minute ago	notice	KADIMUNDI	FSSO-logon	FSSO-logon event from FortiAuthenticator_2.0: user KADIMUNDI logged on 192.168.1.100"

Single Sign-On to Windows AD

The FortiGate unit can authenticate users transparently and allow them network access based on their privileges in Windows AD. This means that users who have logged on to the network are not asked again for their credentials to access network resources through the FortiGate unit, hence the term “Single Sign-On”.

The following topics are included:

- [Introduction to Single Sign-On with Windows AD](#)
- [Configuring Single Sign On to Windows AD](#)
- [FortiOS FSSO log messages](#)
- [Testing FSSO](#)
- [Troubleshooting FSSO](#)

Introduction to Single Sign-On with Windows AD

Introduced in FortiOS 5.0, Single Sign-On (SSO) support provided by FortiGate polling of domain controllers is simpler than the earlier method that relies on agent software installed on Windows AD network servers. No Fortinet software needs to be installed on the Windows network. The FortiGate unit needs access only to the Windows AD global catalog and event log.

When a Windows AD user logs on at a workstation in a monitored domain, the FortiGate unit

- detects the logon event in the domain controller’s event log and records the workstation name, domain, and user,
- resolves the workstation name to an IP address,
- uses the domain controller’s LDAP server to determine which groups the user belongs to,
- creates one or more log entries on the FortiGate unit for this logon event as appropriate.

When the user tries to access network resources, the FortiGate unit selects the appropriate security policy for the destination. The selection consist of matching the FSSO group or groups the user belongs to with the security policy or policies that match that group. If the user belongs to one of the permitted user groups associated with that policy, the connection is allowed. Otherwise the connection is denied.

Configuring Single Sign On to Windows AD

On the FortiGate unit, security policies control access to network resources based on user groups. With Fortinet Single Sign On, this is also true but each FortiGate user group is associated with one or more Windows AD user groups. This is how Windows AD user groups get authenticated in the FortiGate security policy.

Fortinet Single Sign On sends information about Windows user logons to FortiGate units. If there are many users on your Windows AD domains, the large amount of information might affect the performance of the FortiGate unit.

To configure your FortiGate unit to operate with either a Windows AD or a Novell eDirectory FSSO install, you

- Configure LDAP access to the Windows AD global catalog. See [Configuring LDAP server access on page 501](#).
- Configure the LDAP Server as a Single Sign-On server. See [Configuring the LDAP Server as a Single Sign-On server on page 502](#).

- Add Active Directory user groups to FortiGate FSSO user groups. See [Creating Fortinet Single Sign-On \(FSSO\) user groups on page 503](#).
- Create security policies for FSSO-authenticated groups. See [Creating security policies on page 503](#).
- Optionally, specify a guest protection profile to allow guest access. See [Enabling guest access through FSSO security policies on page 505](#)

Configuring LDAP server access

The FortiGate unit needs access to the domain controller's LDAP server to retrieve user group information.

The LDAP configuration on the FortiGate unit not only provides access to the LDAP server, it sets up the retrieval of Windows AD user groups for you to select in FSSO. The LDAP Server configuration, found under **User & Device > LDAP Servers**, includes a function to preview the LDAP server's response to your distinguished name query. If you already know the appropriate Distinguished Name (DN) and User DN settings, you may be able to skip some of the following steps.

To add an LDAP server - web-based manager:

1. Go to **User & Device > LDAP Servers** and select **Create New**.
2. Enter the **Server IP/Name** and **Server Port** (default 389).
3. In the **Common Name Identifier** field, enter **sAMAccountName**. The default common name identifier is **cn**. This is correct for most LDAP servers. However some servers use other identifiers such as **uid**.
4. In the **Distinguished Name** field, enter your organization distinguished name. In this example, Distinguished Name is **dc=techdoc,dc=local**
5. Select **Fetch DN**, this will fetch the Windows AD directory.

The screenshot displays the LDAP configuration interface. The 'Name' field is set to 'LDAP'. The 'Server IP/Name' is '10.10.20.3' and the 'Server Port' is '389'. The 'Common Name Identifier' is 'sAMAccountName' and the 'Distinguished Name' is 'dc=techdoc,dc=local'. The 'Bind Type' section has 'User DN' and 'Password' options. There is an unchecked 'Secure Connection' checkbox and a 'Test' button. A preview window titled 'LDAP Distinguished Name Query' shows an 'LDAP Tree' with the root 'dc=techdoc,dc=local' expanded, listing various organizational units and containers like 'CN=Computers', 'CN=ForeignSecurityPrincipals', 'CN=Managed Service Accounts', 'CN=Program Data', 'CN=System', 'CN=Users', and 'OU=Domain Controllers'.

6. Set **Bind Type** to **Regular**.
7. In the **User DN** field, enter the administrative account name that you created for FSSO. For example, if the account is administrator, enter "administrator@techdoc.local".

8. Enter the administrative account password in the **Password** field.
9. Optionally select **Secure Connection**.
 - In the **Protocol** field, select **LDAPS** or **STARTTLS**.
 - In the **Certificate** field, select the appropriate certificate for authentication.

Note that you need to configure the Windows AD for secure connection accordingly.
10. Select **OK**.
11. Test your configuration by selecting the **Test** button. A successful message confirming the right settings appears.

The screenshot shows a configuration window titled "Successful" with a question mark icon. The window contains the following fields and controls:

- Name:** LDAP
- Server IP/Name:** 10.10.20.3
- Server Port:** 389
- Common Name Identifier:** sAMAccountName
- Distinguished Name:** dc=techdoc,dc=local
- Fetch DN:** A button.
- Bind Type:** Radio buttons for Simple, Anonymous, and Regular (selected).
- User DN:** administrator@techdoc.local
- Password:** A masked password field (dots).
- Secure Connection:** An unchecked checkbox.
- Test:** A button.

To configure LDAP for FSSO - CLI example:

```
config user ldap
edit LDAP
set server 10.10.20.3
set cnid sAMAccountName
set dn dc=techdoc,dc=local
set type regular
set username administrator@techdoc.local
set password <your_password>
next
end
```

Configuring the LDAP Server as a Single Sign-On server

The LDAP server must be added to the FortiGate Single Sign-On configuration.

To add the LDAP server as a Single Sign-On server:

1. Go to **User & Device > Single Sign-On** and select **Create New**.
2. Enter

Type	Poll Active Directory Server
Server IP/Name	Server Name or IP address of the Domain Controller
User	A Domain user name
Password	The user's password

LDAP Server	Select the LDAP server you added earlier.
Enable Polling	Select

3. Select **OK**.

Creating Fortinet Single Sign-On (FSSO) user groups

You cannot use Windows or Novell groups directly in FortiGate security policies. You must create FortiGate user groups of the FSSO type and add Windows or Novell groups to them.

To create a user group for FSSO authentication - web-based manager:

1. Go to **User & Device > User Groups** and select **Create New**.
The **New User Group** dialog box opens.
2. In the **Name** box, enter a name for the group, FSSO_Internet_users for example.
3. In **Type**, select **Fortinet Single Sign-On (FSSO)**.
4. In **Members**, select the required **FSSO** groups.
5. Select **OK**.

To create the FSSO_Internet-users user group - CLI

```
config user group
  edit FSSO_Internet_users
    set group-type fss-service
    set member CN=Engineering,cn=users,dc=office,dc=example,dc=com
    CN=Sales,cn=users,dc=office,dc=example,dc=com
  end
```

Default FSSO group

FSSO_Guest_users is a default user group enabled when FSSO is configured. It allows guest users on the network who do not have an FSSO account to authenticate and have access to network resources. See [Enabling guest access through FSSO security policies on page 505](#).

Creating security policies

Policies that require FSSO authentication are very similar to other security policies. Using identity-based policies, you can configure access that depends on the FSSO user group. This allows each FSSO user group to have its own level of access to its own group of services.

In this situation, Example.com is a company that has its employees and authentication servers on an internal network. The FortiGate unit intercepts all traffic leaving the internal network and requires FSSO authentication to access network resources on the Internet. The following procedure configures the security policy for FSSO authentication. FSSO is installed and configured including the RADIUS server, FSSO Collector agent, and user groups on the FortiGate.

For the following procedure, the internal interface is `port1` and the external interface connected to the Internet is `port2`. There is an address group for the internal network called `company_network`. The FSSO user group is called `fss_group`, and the FSSO RADIUS server is `fss_rad_server`.

To configure an FSSO authentication security policy - web-based manager:

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information.

Incoming Interface	port1
Source Address	company_network
Source User(s)	fsso_group
Outgoing Interface	port2
Destination Address	all
Schedule	always
Service	HTTP, HTTPS, FTP, and Telnet
Action	ACCEPT
NAT	ON
UTM Security Profiles	ON for AntiVirus, IPS, Web Filter, and Email Filter, all using default profiles.
Log Allowed Traffic	ON. Select Security Events .

3. Select **OK**.
4. Ensure the FSSO authentication policy is higher in the policy list than more general policies for the same interfaces.

To create a security policy for FSSO authentication - CLI:

```
config firewall policy
  edit 0
    set srcintf port1
    set dstintf port2
    set srcaddr company_network
    set dstaddr all
    set action accept
    set groups fsso_group
    set schedule always
    set service HTTP HTTPS FTP TELNET
    set nat enable
  end
```

Here is an example of how this FSSO authentication policy is used. Example.com employee on the internal company network logs on to the internal network using their RADIUS username and password. When that user attempts to access the Internet, which requires FSSO authentication, the FortiGate authentication security policy intercepts the session, checks with the FSSO Collector agent to verify the user's identity and credentials, and then if everything is verified the user is allowed access to the Internet.

Enabling guest access through FSSO security policies

You can enable guest users to access FSSO security policies. Guests are users who are unknown to Windows AD and servers that do not logon to a Windows AD domain.

To enable guest access in your FSSO security policy, add an identity-based policy assigned to the built-in user group `SSO_Guest_Users`. Specify the services, schedule and UTM profiles that apply to guest users — typically guests have access to a reduced set of services. See [Creating security policies on page 503](#).

FortiOS FSSO log messages

There are two types of FortiOS log messages — firewall and event. FSSO related log messages are generated from authentication events. These include user logon and log off events, and NTLM authentication events. These log messages are central to network accounting policies, and can also be useful in troubleshooting issues. For more information on firewall logging, see [Enabling security logging on page 449](#). For more information on logging, see the FortiOS Handbook Logging and Reporting guide.

Enabling authentication event logging

For the FortiGate unit to log events, that specific type of event must be enabled under logging.

When VDOMs are enabled certain options may not be available, such as CPU and memory usage events. You can enable event logs only when you are logged on to a VDOM; you cannot enable event logs globally.

To ensure you log all the events needed, set the minimum log level to Notification or Information. Firewall logging requires Notification as a minimum. The closer to Debug level, the more information will be logged.

To enable event logging:

1. Go to **Log & Report > Log Settings**.
2. Under **Log Settings**, set **Event Logging** to **Customize** and select

System activity event	All system-related events, such as ping server failure and gateway status.
User activity event	All administration events, such as user logins, resets, and configuration updates.

3. Select **Apply**.

List of FSSO related log messages

Message ID	Severity	Description
43008	Notification	Authentication was successful
43009	Notification	Authentication session failed
43010	Warning	Authentication locked out
43011	Notification	Authentication timed out
43012	Notification	FSSO authentication was successful

Message ID	Severity	Description
43013	Notification	FSSO authentication failed
43014	Notification	FSSO user logged on
43015	Notification	FSSO user logged off
43016	Notification	NTLM authentication was successful
43017	Notification	NTLM authentication failed

For more information on logging, see the FortiOS Handbook Logging and Reporting guide.

Extra filter options for security events

Logon events are detected by the FSSO CA by monitoring the Security Event logs. Additional logon event filters, such as ServiceName and ServiceID, have been implemented so as to avoid instances of conflicting security events, where existing user information could be overwritten.

Testing FSSO

Once FSSO is configured, you can easily test to ensure your configuration is working as expected. For additional FSSO testing, see [Troubleshooting FSSO on page 506](#).

1. Logon to one of the stations on the FSSO domain, and access an Internet resource.
2. Connect to the CLI of the FortiGate unit, and if possible log the output.
3. Enter the following command: `diagnose debug authd fsso list`
4. Check the output. If FSSO is functioning properly you will see something similar to the following:

```

----FSSO logons----
IP: 192.168.1.230 User: ADMINISTRATOR Groups: VLAD-AD/DOMAIN USERS
IP: 192.168.1.240 User: ADMINISTRATOR Groups: VLAD-AD/DOMAIN USERS
Total number of users logged on: 2
----end of FSSO logons----
```

The exact information will vary based on your installation.

5. Check the FortiGate event log, for FSSO-auth action or other FSSO related events with FSSO information in the message field.
6. To check server connectivity, run the following commands from the CLI:

```

FGT# diagnose debug enable
FGT# diagnose debug authd fsso server-status
FGT# Server Name Connection Status
-----
SBS-2003 connected
```

Troubleshooting FSSO

When installing, configuring, and working with FSSO some problems are quite common. A selection of these problems follows including explanations and solutions.

Some common Windows AD problems include:

- General troubleshooting tips for FSSO
- Users on a particular computer (IP address) can not access the network
- Guest users do not have access to network

General troubleshooting tips for FSSO

The following tips are useful in many FSSO troubleshooting situations.

- Ensure all firewalls are allowing the FSSO required ports through.
FSSO has a number of required ports that must be allowed through all firewalls or connections will fail. These include: ports 139, 389 (LDAP), 445, 636 (LDAP).
- Ensure there is at least 64kbps bandwidth between the FortiGate unit and domain controllers. If there is insufficient bandwidth, some FSSO information might not reach the FortiGate unit. The best solution is to configure traffic shaping between the FortiGate unit and the domain controllers to ensure that the minimum bandwidth is always available.

Users on a particular computer (IP address) can not access the network

Windows AD Domain Controller agent gets the username and workstation where the logon attempt is coming from. If there are two computers with the same IP address and the same user trying to logon, it is possible for the authentication system to become confused and believe that the user on computer_1 is actually trying to access computer_2.

Windows AD does not track when a user logs out. It is possible that a user logs out on one computer, and immediately logs onto a second computer while the system still believes the user is logged on the original computer. While this is allowed, information that is intended for the session on one computer may mistakenly end up going to the other computer instead. The result would look similar to a hijacked session.

Solutions

- Ensure each computer has separate IP addresses.
- Encourage users to logout on one machine before logging onto another machine.
- If multiple users have the same username, change the usernames to be unique.
- Shorten timeout timer to flush inactive sessions after a shorter time.

Guest users do not have access to network

A group of guest users was created, but they don't have access.

Solution

The group of the guest users was not included in a policy, so they do not fall under the guest account. To give them access, associate their group with a security policy.

Additionally, there is a default group called `SSO_Guest_Users`. Ensure that group is part of an identity-based security policy to allow traffic.

Agent-based FSSO

FortiOS can provide single sign-on capabilities to Windows AD, Citrix, Novell eDirectory, or, as of FortiOS 5.4, Microsoft Exchange users with the help of agent software installed on these networks. The agent software sends information about user logons to the FortiGate unit. With user information such as IP address and user group memberships from the network, FortiGate security policies can allow authenticated network access to users who belong to the appropriate user groups without requesting their credentials again.

For Windows AD networks, FortiGate units can provide SSO capability without agent software by directly polling the Windows AD domain controllers. For information about this type of SSO, see [Single Sign-On to Windows AD on page 500](#).

The following topics are included:

- [Introduction to agent-based FSSO](#)
- [FSSO NTLM authentication support](#)

Introduction to agent-based FSSO

Fortinet Single Sign-On (FSSO), through agents installed on the network, monitors user logons and passes that information to the FortiGate unit. When a user logs on at a workstation in a monitored domain, FSSO

- detects the logon event and records the workstation name, domain, and user,
- resolves the workstation name to an IP address,
- determines which user groups the user belongs to,
- sends the user logon information, including IP address and groups list, to the FortiGate unit
- creates one or more log entries on the FortiGate unit for this logon event as appropriate.

When the user tries to access network resources, the FortiGate unit selects the appropriate security policy for the destination. If the user belongs to one of the permitted user groups associated with that policy, the connection is allowed. Otherwise the connection is denied.

FSSO can also provide NTLM authentication service for requests coming from FortiGate. SSO is very convenient for users, but may not be supported across all platforms. NTLM is not as convenient, but it enjoys wider support. See [FSSO NTLM authentication support on page 514](#).

Introduction to FSSO agents

There are several different FSSO agents that can be used in an FSSO implementation:

- Domain Controller (DC) agent
- eDirectory agent
- Citrix/Terminal Server (TS) agent
- Collector (CA) agent

Consult the latest FortiOS and FSSO Release Notes for operating system compatibility information.

Domain Controller (DC) agent

The Domain Controller (DC) agent must be installed on every domain controller if you will use DC Agent mode, but is not required if you use Polling mode. See [FSSO for Windows AD on page 510](#).

eDirectory agent

The eDirectory agent is installed on a Novell network to monitor user logons and send the required information to the FortiGate unit. It functions much like the Collector agent on a Windows AD domain controller. The agent can obtain information from the Novell eDirectory using either the Novell API or LDAP.

Citrix/Terminal Server (TS) agent

The Citrix/Terminal Server (TS) agent is installed on a Citrix terminal server to monitor user logons in real time. It functions much like the DC Agent on a Windows AD domain controller.

Collector (CA) agent

This agent is installed as a service on a server in the Windows AD network to monitor user logons and send the required information to the FortiGate unit. The Collector agent can collect information from

- Domain Controller agent (Windows AD)
- TS agent (Citrix Terminal Server)

In a Windows AD network, the Collector agent can optionally obtain logon information by polling the AD domain controllers. In this case, DC agents are not needed.

The Collector can obtain user group information from the DC agent or optionally, a FortiGate unit can obtain group information directly from AD using Lightweight Directory Access Protocol (LDAP).

On a Windows AD network, the FSSO software can also serve NT LAN Manager (NTLM) requests coming from client browsers (forwarded by the FortiGate unit) with only one or more Collector agents installed. See [FSSO NTLM authentication support on page 514](#).

The CA is responsible for DNS lookups, group verification, workstation checks, and as mentioned FortiGate updates of logon records. The FSSO Collector Agent sends Domain Local Security Group and Global Security Group information to FortiGate units. The CA communicates with the FortiGate over TCP port 8000 and it listens on UDP port 8002 for updates from the DC agents.

The FortiGate unit can have up to five CAs configured for redundancy. If the first on the list is unreachable, the next is attempted, and so on down the list until one is contacted. See [Configuring FSSO on FortiGate units on page 541](#).

All DC agents must point to the correct Collector agent port number and IP address on domains with multiple DCs.

A FortiAuthenticator unit can act much like a Collector agent, collecting Windows AD user logon information and sending it to the FortiGate unit. It is particularly useful in large installations with several FortiGate units. For more information, see the [FortiAuthenticator Administration Guide](#).

FSSO for Microsoft Exchange Server

As of FortiOS 5.4, FSSO supports monitoring Microsoft Exchange Server. This is useful for situations when the user accesses the domain account to view their email, even when the client device might not be in the domain.

Support for the Exchange server is configured on the Back-end FSSO collector agent. For more information on the collector agent, see [Collector agent installation](#):

1. On the FSSO collector agent, go to **Advanced Settings > Exchange Server**.
2. Select **Add** and enter the following information and select **OK**:

Domain Name	Enter your domain name.
Server IP/Hostname	Enter the IP address or the hostname of your exchange server.
Polling forwarded event log	This option for scenarios when you do not want that CA polls the Exchange Server logs directly. In this case you need to configure event log forwarding on the Exchange server. Exchange event logs can be forwarded to any member server. If you enable this, instead of the IP of the Exchange server configured in the previous step, you must then configure the IP of this member server. CA will then contact the member server.
Ignore Name	<p>Because CA will also check Windows log files for logon events and when a user authenticates to Exchange Server there is also a logon event in Windows event log, which CA will read and this will overwrite the Exchange Server logon event (ESEventLog) on CA. So it is recommended to set the ignore list to the domain the user belongs to.</p> <p>To do so, enter the domain name in the Ignore Name field and select Add.</p>

FSSO for Windows AD

FSSO for Windows AD requires at least one Collector agent. Domain Controller agents may also be required depending on the Collector agent working mode. There are two working modes to monitor user logon activity: DC Agent mode or Polling mode.

Collector agent DC Agent mode versus Polling mode

	DC Agent mode	Polling Mode
Installation	Complex — Multiple installations: one agent per DC plus Collector agent, requires a reboot	Easy — Only Collector agent installation, no reboot required

	DC Agent mode	Polling Mode
Resources	Shares resources with DC system	Has own resources
Network load	Each DC agent requires minimum 64kpbs bandwidth, adding to network load	Increase polling period during busy period to reduce network load
Level of Confidence	Captures all logons	Potential to miss a login if polling period is too great

DC Agent mode

DC Agent mode is the standard mode for FSSO. In DC Agent mode, a Fortinet authentication agent is installed on each domain controller. These DC agents monitor user logon events and pass the information to the Collector agent, which stores the information and sends it to the FortiGate unit.

The DC agent installed on the domain controllers is not a service like the Collector agent — it is a DLL file called `dcagent.dll` and is installed in the `Windows\system32` directory. It must be installed on all domain controllers of the domains that are being monitored.

FSSO in DC agent mode

DC Agent mode provides reliable user logon information, however you must install a DC agent on every domain controller. A reboot is needed after the agent is installed. Each installation requires some maintenance as well. For these reasons it may not be possible to use the DC Agent mode.

Each domain controller connection needs a minimum guaranteed 64kpbs bandwidth to ensure proper FSSO functionality. You can optionally configure traffic shapers on the FortiGate unit to ensure this minimum bandwidth is guaranteed for the domain controller connections.

Polling mode

In Polling mode there are three options — NetAPI polling, Event log polling, and Event log using WMI. All share the advantages of being transparent and agentless.

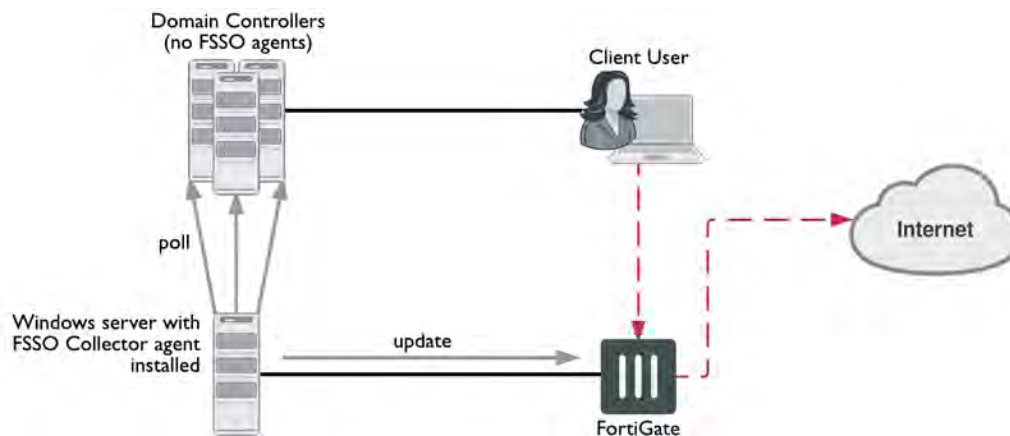

NetAPI polling is used to retrieve server logon sessions. This includes the logon event information for the Controller agent. NetAPI runs faster than Event log polling but it may miss some user logon events under heavy system load. It requires a query round trip time of less than 10 seconds.

Event log polling may run a bit slower, but will not miss events, even when the installation site has many users that require authentication. It does not have the 10 second limit on NetAPI polling. Event log polling requires fast network links. Event log polling is required if there are Mac OS users logging into Windows AD.

Event log using WMI polling: WMI is a Windows API to get system information from a Windows server, CA is a WMI client and sends WMI queries for user logon events to DC, which in this case is a WMI server. Main advantage in this mode is that CA does not need to search security event logs on DC for user logon events, instead, DC returns all requested logon events via WMI. This also reduces network load between CA and DC.

In Polling mode, the Collector agent polls port 445 of each domain controller for user logon information every few seconds and forwards it to the FortiGate unit. There are no DC Agents installed, so the Collector agent polls the domain controllers directly.

FSSO in Polling mode

A major benefit of Polling mode is that no FSSO DC Agents are required. If it is not possible to install FSSO DC Agents on your domain controllers, this is the alternate configuration available to you. Polling mode results in a less complex install, and reduces ongoing maintenance. The minimum permissions required in Polling mode are to read the event log or call NetAPI.

Collector agent AD Access mode - Standard versus Advanced

The Collector agent has two ways to access Active Directory user information. The main difference between Standard and Advanced mode is the naming convention used when referring to username information.

Standard mode uses regular Windows convention: Domain\Username. Advanced mode uses LDAP convention: CN=User, OU=Name, DC=Domain.

If there is no special requirement to use LDAP— best practices suggest you set up FSSO in Standard mode. This mode is easier to set up, and is usually easier to maintain and troubleshoot.

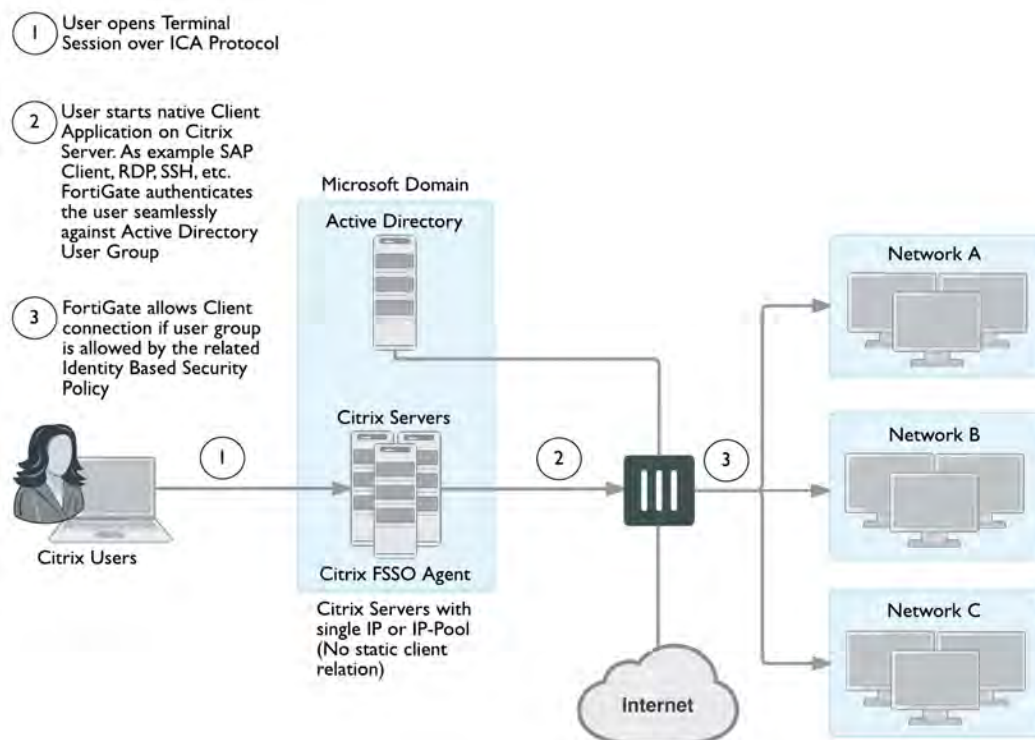

Standard and advanced modes have the same level of functionality with the following exceptions:

- Users have to create Group filters on the Collector agent. This differs from Advanced mode where Group filters are configured from the FortiGate unit. Fortinet strongly encourages users to create filters from CA.
- Advanced mode supports nested or inherited groups. This means that users may be a member of multiple monitored groups. Standard mode does not support nested groups so a user must be a direct member of the group being monitored.

FSSO for Citrix

Citrix users can enjoy a similar Single Sign-On experience as Windows AD users. The FSSO TS agent installed on each Citrix server provides user logon information to the FSSO Collector agent on the network. The FortiGate unit uses this information to authenticate the user in security policies.

Citrix SSO topology

Citrix users do not have unique IP addresses. When a Citrix user logs on, the TS agent assigns that user a range of ports. By default each user has a range of 200 ports.

FSSO for Novell eDirectory

FSSO in a Novell eDirectory environment works similar to the FSSO Polling mode in the Windows AD environment. The eDirectory agent polls the eDirectory servers for user logon information and forwards the information to the FortiGate unit. There is no need for the Collector agent.

When a user logs on at a workstation, FSSO:

- detects the logon event by polling the eDirectory server and records the IP address and user ID,
- looks up in the eDirectory which groups this user belongs to,
- sends the IP address and user groups information to the FortiGate unit.

When the user tries to access network resources, the FortiGate unit selects the appropriate security policy for the destination. If the user belongs to one of the permitted user groups, the connection is allowed.

FSSO is supported on the Novell E-Directory 8.8 operating system.

For a Novell network, there is only one FSSO component to install — the eDirectory agent. In some cases, you also need to install the Novell Client.

FSSO security issues

When the different components of FSSO are communicating there are some inherent security features.

FSSO installation requires an account with network admin privileges. The security inherent in these types of accounts helps ensure access to FSSO configurations is not tampered with.

User passwords are never sent between FSSO components. The information that is sent is information to identify a user including the username, group or groups, and IP address.

NTLM uses base-64 encoded packets, and uses a unique randomly generated challenge nonce to avoid sending user information and password between the client and the server.

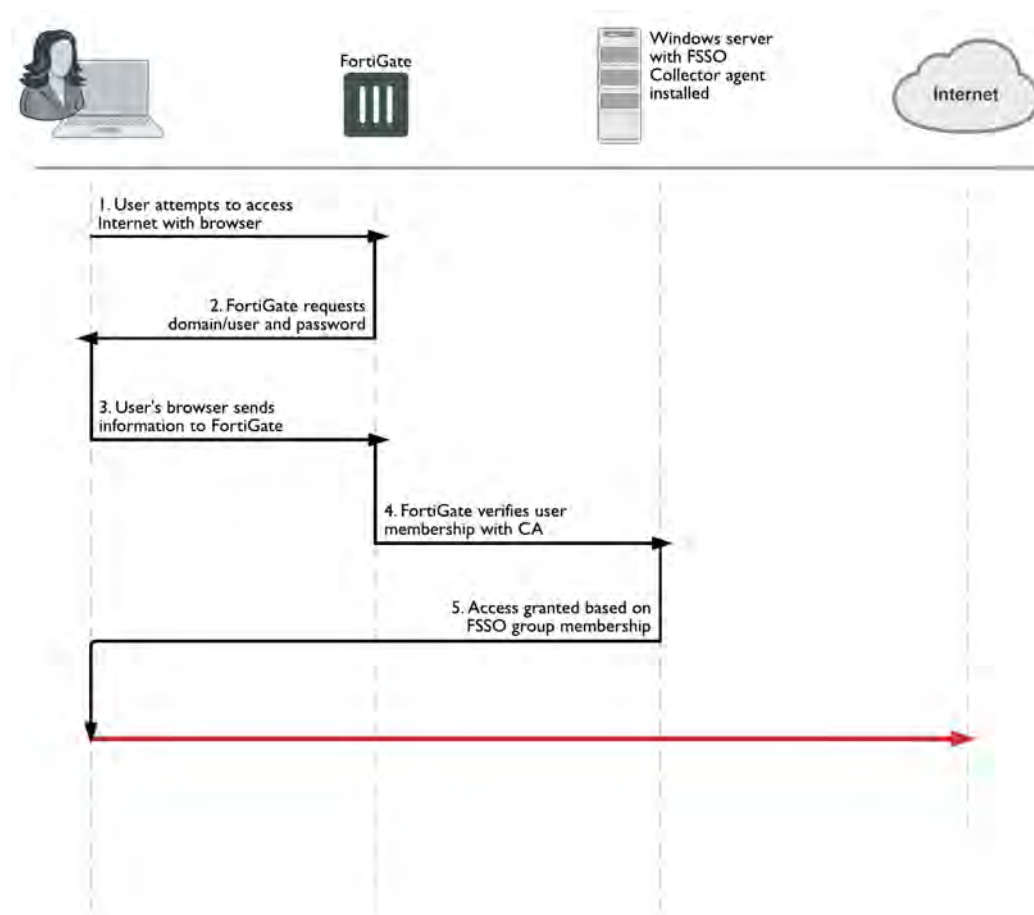

FSSO NTLM authentication support

In a Windows AD network, FSSO can also provide NTLM authentication service to the FortiGate unit. When the user makes a request that requires authentication, the FortiGate unit initiates NTLM negotiation with the client browser. The FortiGate unit does not process the NTLM packets itself. Instead, it forwards all the NTLM packets to the FSSO service to process.

NTLM has the benefit of not requiring an FSSO agent, but it is not transparent to users, and the user's web browser must support NTLM.

The NTLM protocol protects the user's password by not sending it over the network. Instead, the server sends the client a random number that the client must encrypt with the hash value of the user's password. The server compares the result of the client's encryption with the result of its own encryption. The two will match only if both parties used the same password.

NTLM authentication

If the NTLM authentication with the Windows AD network is successful, and the user belongs to one of the groups permitted in the applicable security policy, the FortiGate unit allows the connection but will require authentication again in the future when the current authentication expires.

Fortinet has tested NTLM authentication with Internet Explorer and Firefox browsers.

NTLM in a multiple domain environment

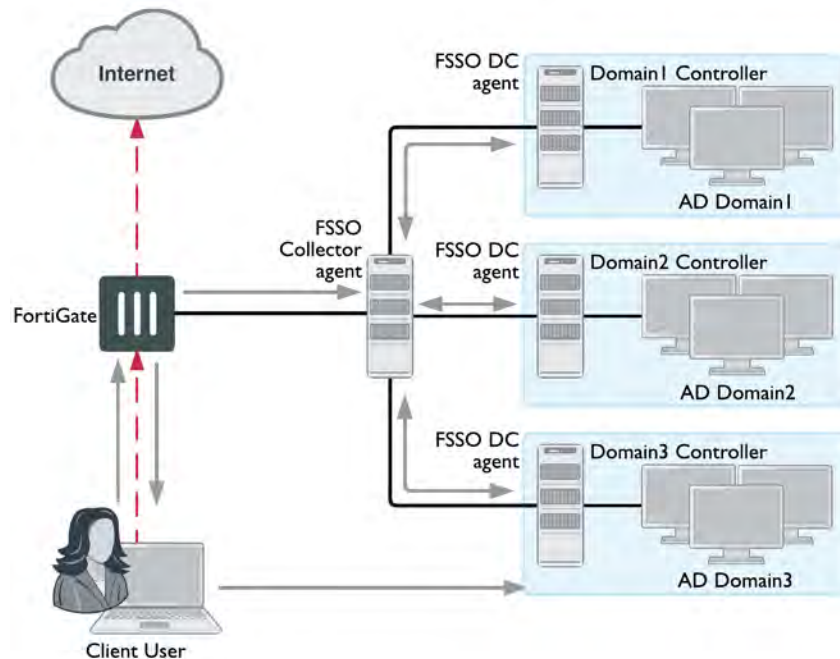

In a multiple domain environment for NTLM, the important factor is that there is a trust relation between the domains. In a forest, this relation is automatically created. So you can install FSSO agent on one of the domain controllers without worry.

But in case of multiple domains that are not in a forest, you need to create a trust relation between the domains. If you do not want to have a trust relation between your multiple domains, you need to use FSAE 4.0 MR1 and the DC agent needs to be installed once on each domain. Then you can use security policies to configure server access.

In the figure below, three domains are shown connected to the FSSO Collector agent server. The Client logs on to their local Domain Controller, which then sends the user logon event information to the Collector Agent. When the Client attempts to access the Internet, the FortiGate unit contacts the Collector Agent for the logon information, sees the Client is authenticated, and allows access to the Internet. There are multiple domains each

with a domain controller agent (DCagent) that sends logon information to the Collector agent. If the multiple domains have a trust relationship, only one DCagent is required instead of one per domain.

FSSO NTLM with multiple domains not in a forest

Understanding the NTLM authentication process

1. The user attempts to connect to an external (internet) HTTP resource. The client application (browser) on the user's computer issues an unauthenticated request through the FortiGate unit.
2. The FortiGate is aware that this client has not authenticated previously, so responds with a 401 Unauthenticated status code, and tells the client which authentication method to reply with in the header: Proxy-Authenticated: NTLM. Then the initial session is dismantled.
3. The client application connects again to the FortiGate, and issues a GET-request, with a Proxy-Authorization: NTLM <negotiate string> header. <negotiate-string> is a base64-encoded NTLM Type 1 negotiation packet.
4. The FortiGate unit replies with a 401 "proxy auth required" status code, and a Proxy-Authenticate: NTLM <challenge string> (a base 64-encoded NTLM Type 2 challenge packet). In this packet is the challenge nonce, a random number chosen for this negotiation that is used once and prevents replay attacks.

The TCP connection must be kept alive, as all subsequent authentication-related information is tied to the TCP connection. If it is dropped, the authentication process must start again from the beginning.

5. The client sends a new GET-request with a header: Proxy-Authenticate: NTLM <authenticate string>, where <authenticate string> is a NTLM Type 3 Authentication packet that contains:

- username and domain
 - the challenge nonce encoded with the client password (it may contain the challenge nonce twice using different algorithms).
6. If the negotiation is successful and the user belongs to one of the groups permitted in the security policy, the connection is allowed. Otherwise, the FortiGate unit denies the authentication by issuing a 401 return code and prompts for a username and password. Unless the TCP connection is broken, no further credentials are sent from the client to the proxy.

If the authentication policy reaches the authentication timeout period, a new NTLM handshake occurs.

Agent installation

After reading the appropriate sections of [Introduction to agent-based FSSO on page 508](#) to determine which FSSO agents you need, you can proceed to perform the necessary installations.

Ensure you have administrative rights on the servers where you are installing FSSO agents. It is best practice to install FSSO agents using the built-in local administrator account. Optionally, you can install FSSO without an admin account. See [Installing FSSO without using an administrator account on page 519](#).

In Windows 2008 by default, you do not have administrative user rights if you are logged on as a user other than as the built-in administrator, even if you were added to the local Administrators group on the computer.

The FSSO installer first installs the Collector agent. You can then continue with installation of the DC agent, or you can install it later by going to **Start > Programs > Fortinet > Fortinet Single Sign On Agent > Install DC Agent**. The installer will install a DC agent on the domain controllers of all of the trusted domains in your network.

Each domain controller connection needs a minimum guaranteed 64kpbs bandwidth to ensure proper FSSO functionality. Traffic shapers configured on the FortiGate can help guarantee these minimum bandwidths.

Collector agent installation

To install FSSO, you must obtain the FSSO_Setup file from the [Fortinet Support web site](#). This is available as either an executable (.exe) or a Microsoft Installer (.msi) file. Then you follow these two installation procedures on the server that will run the Collector agent. This can be any server or domain controller that is part of your network. These procedures also install the DC Agent on all of the domain controllers in your network.

IPv6 source addresses can be configured for connecting to an FSSO agent.

To install the Collector agent:

1. Create an account with administrator privileges and a password that does not expire. See Microsoft Advanced Server documentation for help with this task.
To use a non-admin read only account, see [Installing FSSO without using an administrator account on page 519](#).
2. Log on to the account that you created in Step 1.
3. Double-click the `FSSOSetup.exe` file.
The Fortinet SSO Collector Agent Setup Wizard starts.
4. Select **Next**.
5. Read and accept the license agreement. Select **Next**.
6. Optionally, you can change the installation location. Select **Next**.
7. Optionally, change the **User Name**.
8. By default, the agent is installed using the currently running account. If you want FSSO to use another existing admin account, change the **User Name** using the format `DomainName \ UserName`. For example if the account is `jsmith` and the domain is **example_corp** you would enter `example_corp\jsmith`.
9. In the **Password** field, enter the password for the account listed in the **User Name** field.
10. Select **Next**.
11. Enable as needed:
 - Monitor user logon events and send the information to the FortiGate unit
 - Serve NTLM authentication requests coming from FortiGateBy default, both methods are enabled. You can change these options after installation.
12. Select the access method to use for Windows Directory:
13. Select **Standard** to use Windows domain and username credentials.
14. Select **Advanced** if you will set up LDAP access to Windows Directory.
See [Collector agent AD Access mode - Standard versus Advanced on page 512](#).
15. Select **Next** and then select **Install**.
If you want to use DC Agent mode, ensure that **Launch DC Agent Install Wizard** is selected. This will start DC agent installation immediately after you select **Finish**.
16. Select **Finish**.

If you see an error such as Service Fortinet Single Sign On agent (service_FSAE) failed to start, there are two possible reasons for this. Verify the user account you selected has sufficient privileges to run the FSSO service. Also verify the computer system you are attempting to install on is a supported operating system and version.

DC agent installation

The `FSSO_Setup` file contains both the Collector agent and DC Agent installers, but the DC Agent installer is also available separately as either a `.exe` or `.msi` file named `DCAgent_Setup`.

To install the DC Agent

1. If you have just installed the Collector agent, the FSSO - Install DC Agent wizard starts automatically. Otherwise, go to **Start > Programs > Fortinet > Fortinet Single Sign On Agent > Install DC Agent**.
2. Select **Next**.
3. Read and accept the license agreement. Select **Next**.
4. Optionally, you can change the installation location. Select **Next**.

5. Enter the **Collector agent IP address**.
6. If the Collector agent computer has multiple network interfaces, ensure that the one that is listed is on your network. The listed **Collector agent listening port** is the default. Only change this if the port is already used by another service.
7. Select **Next**.
8. Select the domains to monitor and select **Next**.
9. If any of your required domains are not listed, cancel the wizard and set up the proper trusted relationship with the domain controller. Then run the wizard again by going to **Start > Programs > Fortinet > Fortinet Single Sign On Agent > Install DC Agent**.
10. Optionally, select users that you do not want monitored. These users will not be able to authenticate to FortiGate units using FSSO. You can also do this later. See [Configuring the FSSO Collector agent for Windows AD on page 522](#).
11. Select **Next**.
12. Optionally, clear the check boxes of domain controllers on which you do not want to install the DC Agent.
13. Select the **Working Mode** as DC Agent Mode. While you can select Polling Mode here, in that situation you would not be installing a DC Agent. For more information, see [DC Agent mode on page 511](#) and [Polling mode on page 511](#).
14. Select **Next**.
15. Select **Yes** when the wizard requests that you reboot the computer.

If you reinstall the FSSO software on this computer, your FSSO configuration is replaced with default settings.

If you want to create a redundant configuration, repeat the Collector agent installation procedure on at least one other Windows AD server.

When you start to install a second Collector agent, cancel the Install Wizard dialog appears the second time. From the configuration GUI, the monitored domain controller list will show your domain controllers un-selected. Select the ones you wish to monitor with this Collector agent, and select **Apply**.

Before you can use FSSO, you need to configure it on both Windows AD and on the FortiGate units. [Configuring FSSO on FortiGate units on page 541](#) will help you accomplish these two tasks.

Installing FSSO without using an administrator account

Normally when installing services in Windows, it is best to use the Domain Admin account, as stated earlier. This ensures installation goes smoothly and uninterrupted, and when using the FSSO agent there will be no permissions issues. However, it is possible to install FSSO with a non-admin account in Windows 2003 or 2008 AD.

The following instructions for Windows 2003 are specific to the event log polling mode only. Do not use this procedure with other FSSO configurations.

Windows 2003

There are two methods in Windows 2003 AD for installing FSSO without an admin account — add the non-admin user to the security log list, and use a non-admin account with read-only permissions. A problem with the first method is that full rights (read, write, and clear) are provided to the event log. This can be a problem when audits require limited or no write access to logs. In those situations, the non-admin account with read-only permissions is the solution.

To add the non-admin user account to the Windows 2003 security log list :

1. Go to **Default Domain Controller Security Settings > Security Settings > User Rights Assignment > Manage auditing and security log**.
2. Add the user account to this list.
3. Repeat these steps on every domain controller in Windows 2003 AD.
A reboot is required.

To use a non-admin account with read-only permissions to install FSSO on Windows 2003:

The following procedure provides the user account specified with read only access to the Windows 2003 AD Domain Controller Security Event Log which allows FSSO to function.

1. Find out the SID of the account you intend to use.
Tools for this can be downloaded for free from <http://technet.microsoft.com/en-us/sysinternals/bb897417>.
2. Then create the permission string. For example:
 - (A;;0x1;;;S-1-5-21-4136056096-764329382-1249792191-1107)
 - A means Allow,
 - 0x1 means Read, and
 - S-1-5-21-4136056096-764329382-1249792191-1107 is the SID.
3. Then, append it to the registry key:
HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\Eventlog\Security\CustomSD
4. Repeat these steps on every domain controller in Windows 2003 AD.
A reboot is required.

Windows 2008

In Windows 2008 AD, if you do not want to use the Domain Admin account then the user account that starts the FSSO agent needs to be added to the Event Log Readers group.

When the user is added to the Event Log Readers group, that user is now allowed to have read only access to the event log and this is the minimal rights required for FSSO to work.

Citrix TS agent installation

To install the Citrix TS agent, you must obtain the TSAgent_Setup file from the [Fortinet Support web site](#). Perform the following installation procedure on the Citrix server.

To install the FSSO TS agent:

1. On the Citrix server, create an account with administrator privileges and a password that does not expire. See Citrix documentation for more information.
2. Log on to the account that you created in step 1.

3. Double-click the TSAgent_Setup installation file.
The Fortinet SSO Terminal Server Agent Setup Wizard starts.
4. Select **Next**.
5. Read and accept the license agreement. Select **Next**.
6. Optionally, you can change the installation location. Select **Next**.
7. Verify that **This Host IP Address** is correct.
8. In the **FSSO Collector Agent List**, enter the IP address(es) of your Collector Agents.
9. Select **Next** and then select **Install**.
The TS agent is installed.
10. Select **Finish**.

Novell eDirectory agent installation

To install the eDirectory agent, you must obtain the FSSO_Setup_eDirectory file from the [Fortinet Support web site](#). Perform the following installation procedure on the computer that will run the eDirectory agent. This can be any server or domain controller that is part of your network. You will need to provide some setup information.

To install the FSSO eDirectory agent:

1. Create an account with administrator privileges and a password that does not expire. See Novell documentation for more information.
2. Log on to the account that you created in step 1.
3. Double-click the FSSO_Setup_edirectory file to start the installation wizard.
4. Select **Next**.
5. Read and accept the license agreement. Select **Next**.
6. Optionally, change the installation location. Select **Next**.
7. Enter:

eDirectory Server	
Server Address	Enter the IP address of the eDirectory server.
Use secure connection (SSL)	Select to connect to the eDirectory server using SSL security.
Search Base DN	Enter the base Distinguished Name for the user search.

eDirectory Authentication	
Username	Enter a username that has access to the eDirectory, using LDAP format.
User password	Enter the password.

8. Select **Next**.
9. Select **Install**. When the installation completes, select **Finish**.

Updating FSSO agents on Windows AD

After FSSO is installed on your network, you may want to upgrade to a newer version. The following procedure helps ensure you have a trouble free upgrade. How you update FSSO depends on if you are using polling mode or

DCAgent mode.

For polling mode, since there are no DC agents you only need to upgrade the Collector. However in DCAgent mode, each DC Agent must be updated as well.

To update FSSO in DC Agent mode:

1. Go to the system32 directory on all DC's and rename the `dcagent.dll` file to `dcagent.dll.old`. This ensures that when the upgrade is pushed to the DC it does not overwrite the old file. If there are any problems this makes it easy to revert to the old version.
2. Run the FSSO setup .exe file to update the collector. When this is completed, ignore any reboot message.
3. Go to **Programs > Fortinet > Fortinet Single Sign On Agent > Install DC Agent** and push the DC agent out to all servers. All DC's will now need to be rebooted so that the new DLL file is loaded.
4. After the reboot, go to all DC's and delete the `dcagent.dll.old` files.

Configuring the FSSO Collector agent for Windows AD

On the FortiGate unit, security policies control access to network resources based on user groups. With Fortinet Single Sign On, this is also true but each FortiGate user group is associated with one or more Windows AD user groups. This is how Windows AD user groups get authenticated in the FortiGate security policy.

Fortinet Single Sign On sends information about Windows user logons to FortiGate units. If there are many users on your Windows AD domains, the large amount of information might affect the performance of the FortiGate units.

To avoid this problem, you can configure the Fortinet Single Sign On Collector agent to send logon information only for groups named in the FortiGate unit's security policies. See [Configuring FortiGate group filters on page 529](#).

On each server with a Collector agent, you will be

- [Configuring Windows AD server user groups](#)
- [Configuring Collector agent settings](#), including the domain controllers to be monitored
- [Selecting Domain Controllers and working mode for monitoring](#)
- [Configuring Directory Access settings](#)
- [Configuring the Ignore User List](#)
- [Configuring FortiGate group filters](#) for each FortiGate unit
- [Configuring FSSO ports](#)
- [Configuring alternate user IP address tracking](#)
- [Viewing FSSO component status](#)

Configuring Windows AD server user groups

FortiGate units control network resource access at the group level. All members of a user group have the same network access as defined in FortiGate security policies.

You can use existing Windows AD user groups for authentication to FortiGate units if you intend that all members within each group have the same network access privileges.

Otherwise, you need to create new user groups for this purpose.

If you change a user's group membership, the change does not take effect until the user logs off and then logs on again.

The FSSO Agent sends only Domain Local Security Group and Global Security Group information to FortiGate units. You cannot use Distribution group types for FortiGate access. No information is sent for empty groups.

Refer to Microsoft documentation for information about creating and managing Windows AD user groups.

Configuring Collector agent settings

You need to configure which domain controllers the Collector agent will use and which domains to monitor for user logons. You can also alter default settings and settings you made during installation. These tasks are accomplished by configuring the FSSO Collector Agent, and selecting either Apply to enable the changes.

At any time to refresh the FSSO Agent settings, select Apply.

To configure the Collector agent:

1. From the Start menu, select **Programs > Fortinet > Fortinet Single Sign-On Agent > Configure Fortinet Single Sign-On Agent**.
2. Enter the following information.

Monitoring user logon events	By default, this is enabled to automatically authenticate users as they log on to the Windows domain. Disable the Monitor feature only if you have a large network where this feature will slow responses too much.
Support NTLM authentication	By default, this is enabled to facilitate logon of users who are connected to a domain that does not have the FSSO DC Agent installed. Disable NTLM authentication only if your network does not support NTLM authentication for security or other reasons.
Collector Agent Status	Shows RUNNING when Collector agent is active.
Listening ports	You can change FSSO Collector Agent related port numbers if necessary.
FortiGate	TCP port for FortiGate units. Default 8000.
DC Agent	UDP port for DC Agents. Default 8002.
Logging	
Log level	Select the minimum severity level of logged messages.
Log file size limit (MB)	Enter the maximum size for the log file in MB. Default is 10.
View Log	View all Fortinet Single Sign On agent logs.
	Record user login-related information separately from other logs. The information in this log includes:
Log logon events in separate logs	<ul style="list-style-type: none">• data received from DC agents• user logon/logoff information• workstation IP change information• data sent to FortiGate units
View Logon Events	If Log logon events in separate logs is enabled, you can view user login-related information.
Authentication	
Require authenticated connection from FortiGate	Select to require the FortiGate unit to authenticate before connecting to the Collector agent.
Password	Enter the password that FortiGate units must use to authenticate. The maximum password length is 15 characters. The default password is "fortinetcanada". It is highly recommended to modify this password.
Timers	

Workstation verify interval (minutes)

Enter the interval in minutes at which the Fortinet Single Sign On Collector agent connects to client computers to determine whether the user is still logged on. The default is every 5 minutes. The interval may be increased if your network has too much traffic.

Note: This verification process creates security log entries on the client computer.

If ports 139 or 445 cannot be opened on your network, set the interval to 0 to prevent checking. See [Configuring FSSO ports on page 530](#).

Enter the interval in minutes after which Fortinet Single Sign On Agent purges information for user logons that it cannot verify. The default is 480 minutes (8 hours).

Dead entry timeout interval

Dead entries usually occur because the computer is unreachable (such as in standby mode or disconnected) but the user has not logged off. A common reason for this is when users forget to logoff before leaving the office for the day.

You can also prevent dead entry checking by setting the interval to 0.

IP address change verify interval

Fortinet Single Sign On Agent periodically checks the IP addresses of logged-in users and updates the FortiGate unit when user IP addresses change. IP address verification prevents users from being locked out if they change IP addresses, as may happen with DHCP assigned addresses.

Enter the verification interval in seconds. The default is 60 seconds. You can enter 0 to prevent IP address checking if you use static IP addresses.

This does not apply to users authenticated through NTLM.

Cache user group lookup result

Enable caching.

Caching can reduce group lookups and increase performance.

Fortinet Single Sign On Agent caches group information for logged-in users.

Cache expire in (minutes)

Enter the duration in minutes after which the cache entry expires. If you enter 0, the cache never expires.

A long cache expire interval may result in more stale user group information. This can be an issue when a user's group information is changed.

Clear Group Cache

Clear group information of logged-in users.

This affects all logged-in users, and may force them to re-login.

3. You can select **Save&Close** now or leave the agent configuration window open to complete additional configuration in the following sections.

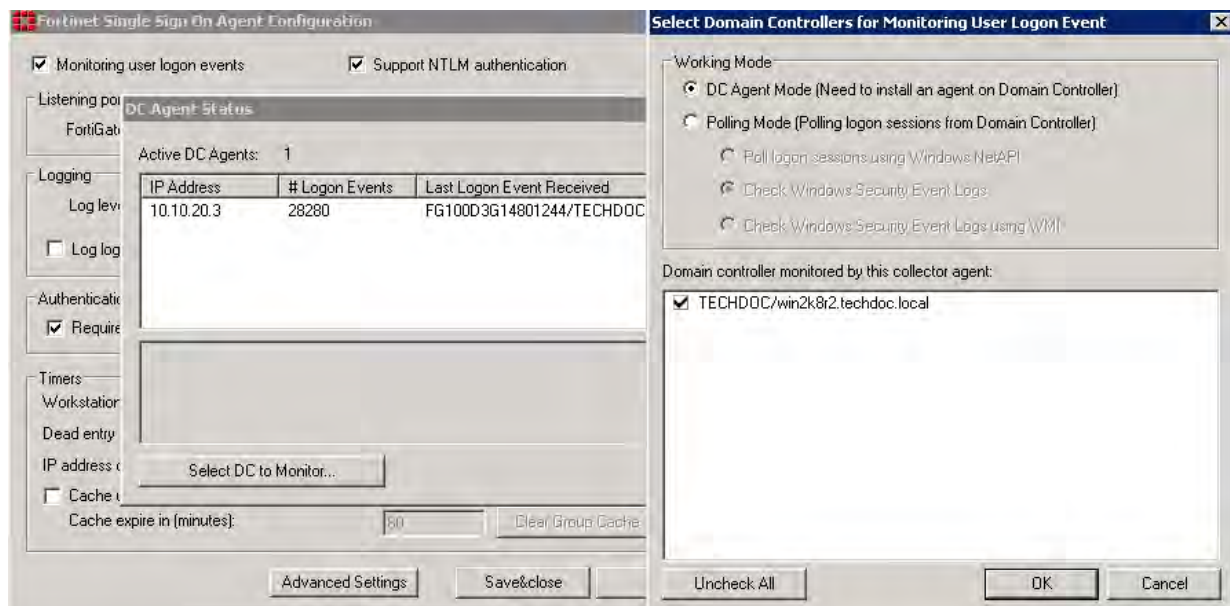

To view the version and build number information for your FSSO Collector Agent configuration, selecting the Fortinet icon in the upper left corner of the Collector agent Configuration screen and select **About Fortinet Single Sign On Agent configuration**.

Selecting Domain Controllers and working mode for monitoring

You can change which DC agents are monitored or change the working mode for logon event monitoring between DC agent mode and polling mode.

When polling mode is selected, it will poll port 445 of the domain controller every few seconds to see who is logged on.

1. From the Start menu select **Programs > Fortinet Fortinet Single Sign-On Agent > Configure Fortinet Single Sign On Agent**.
2. In the **Common Tasks** section, select **Show Monitored DCs**.
3. Select **Select DC to Monitor**.

4. Choose the **Working Mode**:
 - **DC Agent mode** — a Domain Controller agent monitors user logon events and passes the information to the Collector agent. This provides reliable user logon information, however you must install a DC agent on every domain controller in the domain.
 - **Polling mode** — the Collector agent polls each domain controller for user logon information. Under heavy system load this might provide information less reliably. However installing a DC agent on each domain controller is not required in this mode.
5. You also need to choose the method used to retrieve logon information:
 - Poll logon sessions using Windows NetAPI
 - Check Windows Security Event Logs
 - Check Windows Security Event Logs using WMI

For more information about these options, see [Polling mode on page 511](#).

6. Select **OK**.
7. Select **Close**.
8. Select **Save & Close**.

Configuring Directory Access settings

The FSSO Collector Agent can access Windows Active Directory in one of two modes:

- **Standard** — the FSSO Collector Agent receives group information from the Collector agent in the **domain\user** format. This option is available on FortiOS 3.0 and later.
- **Advanced** — the FSSO Collector Agent obtains user group information using LDAP. The benefit of this method is that it is possible to nest groups within groups. This option is available on FortiOS 3.0 MR6 and later. The group information is in standard LDAP format.

If you change AD access mode, you must reconfigure your group filters to ensure that the group information is in the correct format.

To configure Directory Access settings:

1. From the Start menu select **Programs > Fortinet > Fortinet Single Sign On Agent > Configure Fortinet Single Sign On Agent**.
2. In the **Common Tasks** section, select **Set Directory Access Information**.
The **Set Directory Access Information** dialog box opens.
3. From the **AD access mode** list, select either **Standard** or **Advanced**.
4. If you selected Advanced AD access mode, select **Advanced Setting** and configure the following settings and then select **OK**:

AD server address	Enter the address of your network's global catalog server.
AD server port	The default AD server port is 3268. This must match your server port.
BaseDN	Enter the Base distinguished name for the global catalog. This is the point in the tree that will be considered the starting point by default-See following example.
Username	If the global catalog accepts your Fortinet Single Sign On Agent agent's credentials, you can leave these fields blank. Otherwise, enter credentials for an account that can access the global catalog.
Password	

BaseDN example

An example DN for Training Fortinet Canada is `ou=training, ou=canada, dc=fortinet, dc=com`. If you set the **BaseDN** to `ou=canada, dc=fortinet, dc=com` then when Fortinet Single Sign On Agent is looking up user credentials, it will only search the Canada organizational unit, instead of all the possible countries in the company. Its a short cut to entering less information and faster searches.

However, you may have problems if you narrow the BaseDN too much when you have international employees from the company visiting different offices. If someone from Fortinet Japan is visiting the Canada office in the example above, their account credentials will not be matched because they are in `ou=japan, dc=fortinet, dc=com` instead of the BaseDN `ou=canada, dc=fortinet, dc=com`. The easy solution

is to change the BaseDN to simply be `dc=fortinet, dc=com`. Then any search will check all the users in the company.

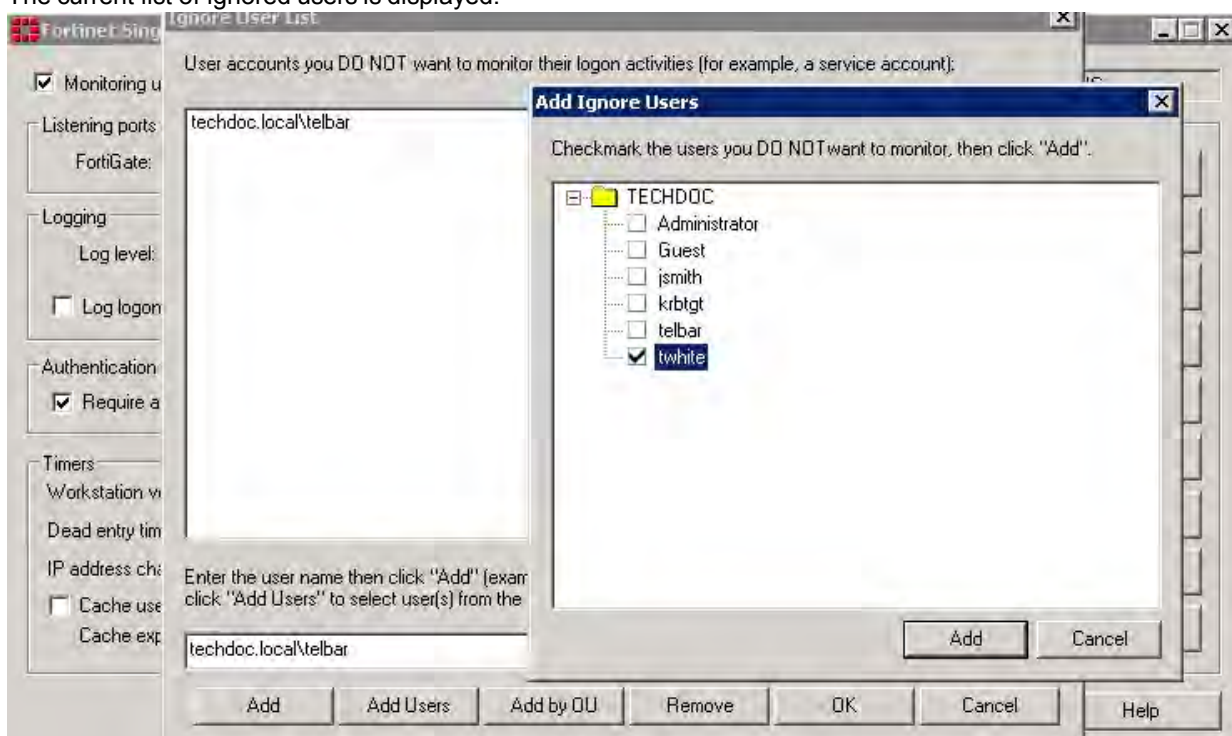

Configuring the Ignore User List

The Ignore User List excludes users that do not authenticate to any FortiGate unit, such as system accounts. The logons of these users are not reported to FortiGate units. This reduces the amount of required resources on the FortiGate unit especially when logging logon events to memory.

To configure the Ignore User List:

1. From the Start menu select **Programs > Fortinet > Fortinet Single Sign On Agent > Configure Fortinet Single Sign On Agent**.
2. In the **Common Tasks** section, select **Set Ignore User List**.

The current list of ignored users is displayed:

3. Do any of the following:
 - To remove a user from the list, select the the username and then select **Remove**. The user's login is no longer ignored.
 - To add users to be ignored,
 - enter the username in the format **domain\username** and select **Add** or
 - select **Add Users**, an **Add Ignore Users** window is displayed, checkmark the users you do not want to monitor, then select **Add** or
 - select **Add by OU**, an **Add Ignore Users by OU** window is displayed, select an OU from the directory tree, then select **Add**. All users under the selected OU will be added to the ignore user list.
4. Select **OK**.

Configuring FortiGate group filters

FortiGate group filters actively control which user logon information is sent to each FortiGate unit. You need to configure the group filter list so that each FortiGate unit receives the correct user logon information for the user groups that are named in its security policies. These group filters help limit the traffic sent to the FortiGate unit, and help limit the logon events logged.

The maximum number of Windows AD user groups allowed on a FortiGate depends on the model. Low end models support 256 Windows AD user groups, where mid and high end models support 1024 groups. This is per VDOM if VDOMs are enabled on the FortiGate unit.

You do not need to configure a group filter on the Collector agent if the FortiGate unit retrieves group information from Windows AD using LDAP. In that case, the Collector agent uses the list of groups you selected on the FortiGate unit as its group filter.

The filter list is initially empty. You need to configure filters for your FortiGate units using the Add function. At a minimum, create a default filter that applies to all FortiGate units without a defined filter.

If no filter is defined for a FortiGate unit and there is no default filter, the Collector agent sends all Windows AD group and user logon events to the FortiGate unit. While this normally is not a problem, limiting the amount of data sent to the FortiGate unit improves performance by reducing the amount of memory the unit uses to store the group list and resulting logs.

To configure a FortiGate group filter:

1. From the Start menu select **Programs > Fortinet > Fortinet Single Sign On Agent > Configure Fortinet Single Sign On Agent**.
2. In the **Common Tasks** section, select **Set Group Filters**.
The FortiGate Filter List opens. It has the following columns:

FortiGate SN	The serial number of the FortiGate unit to which this filter applies.
Description	An optional description of the role of this FortiGate unit.
Monitored Groups	The Windows AD user groups that are relevant to the security policies on this FortiGate unit.
Add	Create a new filter.
Edit	Modify the filter selected in the list.
Remove	Remove the filter selected in the list.
OK	Save the filter list and exit.
Cancel	Cancel changes and exit.

3. Select **Add** to create a new filter. If you want to modify an existing filter, select it in the list and then select **Edit**.
4. Enter the following information and then select **OK**.

Default filter	Select to create the default filter. The default filter applies to any FortiGate unit that does not have a specific filter defined in the list.
FortiGate Serial Number	Enter the serial number of the FortiGate unit to which this filter applies. This field is not available if Default is selected.
Description	Enter a description of this FortiGate unit's role in your network. For example, you could list the resources accessed through this unit. This field is not available if Default is selected.
Monitor the following groups	The Collector agent sends to the FortiGate unit the user logon information for the Windows AD user groups in this list. Edit this list using the Add, Advanced and Remove buttons.
Add	<p>In the preceding single-line field, enter the Windows AD domain name and user group name, and then select Add. If you don't know the exact name, use the Advanced button instead.</p> <p>The format of the entry depends on the AD access mode (see Configuring Directory Access settings on page 527):</p> <p>Standard: Domain\Group</p> <p>Advanced: cn=group, ou=corp, dc=domain</p>
Advanced	Select Advanced , select the user groups from the list, and then select Add .
Remove	Remove the user groups selected in the monitor list.

Configuring FSSO ports

For FSSO to function properly a small number of TCP and UDP ports must be open through all firewalls on the network. These ports listed in this section assume the default FSSO ports are used.

TCP ports for FSSO agent with client computers

Windows AD records when users log on but not when they log off. For best performance, Fortinet Single Sign On Agent monitors when users log off. To do this, Fortinet Single Sign On Agent needs read-only access to each client computer's registry over TCP port 139 or 445. Open at least one of these ports — ensure it is not blocked by firewalls.

If it is not feasible or acceptable to open TCP port 139 or 445, you can turn off Fortinet Single Sign On Agent logoff detection. To do this, set the Collector agent **workstation verify interval** to 0. The FSSO Collector Agent assumes that the logged on computer remains logged on for the duration of the Collector agent dead entry timeout interval — by default this is eight hours.

Configuring ports on the Collector agent computer

On the computer where you install the Collector agent, you must make sure that the firewall does not block the listening ports for the FortiGate unit and the DC Agent. By default, these are TCP port 8000 and UDP port 8002.

For more information about setting these ports, see [Configuring FSSO Advanced Settings on page 536](#).

Configuring alternate user IP address tracking

In environments where user IP addresses change frequently, you can configure Fortinet Single Sign On Agent to use an alternate method to track user IP address changes. Using this method, Fortinet Single Sign On Agent responds more quickly to user IP address changes because it directly queries workstation IP addresses to match users and IP addresses.

This feature requires FSAE version 3.5.27 or later, Fortinet Single Sign On Agent any version, and FortiOS 3.0 MR7 or later.

To configure alternate user IP address tracking:

1. On the computer where the Collector agent is installed, go to **Start > Run**.
2. Enter `regedit` or `regedt32` and select **OK**.
The Registry Editor opens.
3. Find the registry key `HKEY_LOCAL_MACHINE\SOFTWARE\Fortinet\FSAE\collectoragent`.
4. Set the `supportFSAEauth` value (dword) to `00000001`.
If needed, create this new dword.
5. Close the Registry Editor.
6. From the Start menu select **Programs > Fortinet > Fortinet Single Sign On Agent > Configure Fortinet Single Sign On Agent**.
7. Select **Apply**.
The Fortinet Single Sign On Agent service restarts with the updated registry settings.

Viewing FSSO component status

It is important to know the status of both your Collector agents and DC agents.

Viewing Collector agent status

Use the **Show Service Status** to view your Collector agent information in the Status window. The Status window displays:

- the version of the software
- the status of the service
- the number of connected FortiGate units
- connected FortiGate information such as serial number, IP address, and connect time

To view Collector agent status:

1. From the Start menu select **Programs > Fortinet > Fortinet Single Sign On Agent > Configure Fortinet Single Sign On Agent**.
2. In the **Common Tasks** section, select **Show Service Status**.
The Fortinet Single Sign On Collector agent Status window opens.
3. Optionally select **Get NTLM statistics** in the Status window to display NTLM information such as number of messages received, processed, failed, in the queue.

Viewing DC agent status

Use the **Show Monitored DCs** to view the status of DC agents.

To view domain controller agent status:

1. From the Start menu select **Programs > Fortinet > Fortinet Single Sign On Agent > Configure Fortinet Single Sign On Agent**.
2. In the **Common Tasks** section, select **Show Monitored DCs**.
For each DC Agent, the following information is displayed:
 - IP address
 - number of logon events received
 - the last logon event
 - when last logon was received

To change which DC agents are monitored or change the working mode for logon event monitoring, select **Select DC to Monitor**

Configuring the FSSO TS agent for Citrix

The FSSO TS agent works with the same FSSO Collector agent that is used for integration with Windows Active Directory. Install the Collector agent first. Follow the Collector agent installation procedure in [Collector agent installation on page 517](#).

FortiOS 5.6 supports FSSO DC/TS Agent v.5.x.

Configuration steps include:

- Install the Fortinet Citrix FSSO agent on the Citrix server.
- Install the Fortinet FSSO collector on a server on the network.
- Add the Citrix FSSO agent to the FortiGate Single-sign-On configuration.
- Add Citrix FSSO groups and users to an FSSO user group.
- Add an FSSO identity-based security policy that includes the Citrix FSSO user groups.

To change the TS agent configuration, select from the Start menu **Programs > Fortinet > Fortinet Single Sign-On Agent > TSAgent Config**. In addition to the host and Collector agent IP addresses that you set during installation, you can adjust port allocations for Citrix users. When a Citrix user logs on, the TS agent assigns that user a range of ports. By default each user has a range of 200 ports.

Fortinet SSO Collector Agent IP and Port needs to point to the current configured listening port on the collector which is port 8002 by default. Though it may be configured to a custom port.

Configuring the TS agent

Fortinet SSO Terminal Server Agent Configuration

Terminal Server Agent Status: RUNNING

Connection

This Host IP Address: 172.20.120.52

Fortinet SSO Collector Agent IP and Port: 172.20.120.100
e.g. 192.168.0.100:8002;172.16.1.200:9999

Port Allocation

System Dynamic Allocation Port Range: 1024-5000

Port Allocation Pool (Port Ranges): 5001-65535
e.g. 20000-39999

Number of Port Per Allocation: 200 Maximum Number of Port Alloc Ranges: 2

Configuring FSSO with Novell networks

You need to configure the eDirectory agent for it to communicate with eDirectory servers. You may have provided some of this information during installation.

This section includes:

- [Configuring the eDirectory agent](#)
- [Adding an eDirectory server](#)
- [Configuring a group filter](#)

Configuring the eDirectory agent

You need to configure the eDirectory agent for it to communicate with eDirectory servers.

To configure the eDirectory agent:

1. From the Start menu select **Programs > Fortinet > eDirectory Agent > eDirectory Config Utility**.
2. The eDirectory Agent Configuration Utility dialog opens. Enter the following information and select **OK**.

eDirectory Authentication	
Username	Enter a username that has access to the eDirectory, using LDAP format.
Password	Enter the password.
Listening port	Enter the TCP port on which Fortinet Single Sign On Agent listens for connections from FortiGate units. The default is 8000. You can change the port if necessary.
Refresh interval	Enter the interval in seconds between polls of the eDirectory server to check for new logons. The default is 30 seconds.

FortiGate Connection Authentication	
Require authenticated connection from FortiGate	Select to require the FortiGate unit to authenticate before connecting to the eDirectory Agent.
Password	Enter the password that FortiGate units must use to authenticate. The maximum password length is 15 characters. The default password is "FortinetCanada".
User logon Info Search Method	<p>Select how the eDirectory agent accesses user logon information: LDAP or Native (Novell API). LDAP is the default.</p> <p>If you select Native, you must also have the Novell Client installed on the PC.</p>

Logging	
Log file size limit (MB)	Enter the maximum size for the log file in MB.
View Log	View the current log file.
Dump Session	List the currently logged-on users in the log file. This can be useful for troubleshooting.
Log level	Select Debug , Info , Warning or Error as the minimum severity level of message to log or select None to disable logging.

eDirectory Server List	
Add	Add an eDirectory server. See Adding an eDirectory server on page 536 .
Delete	Delete the selected eDirectory server.
Edit	Modify the settings for the selected server.
Set Group Filters...	Select the user groups whose user logons will be reported to the FortiGate unit. This is used only if user groups are not selected on the FortiGate unit.

Adding an eDirectory server

Once the eDirectory agent is configured, you add one or more eDirectory servers.

To add an eDirectory server:

1. In the eDirectory Agent Configuration Utility dialog box (see the preceding procedure, [Configuring the eDirectory agent](#)), select **Add**.
2. The eDirectory Setup dialog box opens. Enter the following information and select OK:

eDirectory Server Address	Enter the IP address of the eDirectory server.
Port	If the eDirectory server does not use the default port 389, clear the Default check box and enter the port number.
Use default credential	Select to use the credentials specified in the eDirectory Configuration Utility. See Configuring the eDirectory agent on page 534 . Otherwise, leave the check box clear and enter a username and Password below.
User name	Enter a username that has access to the eDirectory, using LDAP format.
User password	Enter the password.
Use secure connection (SSL)	Select to connect to the eDirectory server using SSL security.
Search Base DN	Enter the base Distinguished Name for the user search.

Configuring a group filter

The eDirectory agent sends user login information to the FortiGate unit for all user groups unless you either configure an LDAP server entry for the eDirectory on the FortiGate unit and select the groups that you want to monitor or configure the group filter on the eDirectory agent.

If both the FortiGate LDAP configuration and the eDirectory agent group filter are present, the FortiGate user group selections are used.

To configure the group filter:

1. From the Start menu select **Programs > Fortinet > eDirectory Agent > eDirectory Config Utility**.
2. Select **Set Group Filters**.
3. Do one of the following:
 - Enter group names, then select **Add**.
 - Select **Advanced**, select groups, and then select **Add**.
4. Select **OK**.

Configuring FSSO Advanced Settings

Depending on your network topologies and requirement, you may need to configure advanced settings in the FSSO Collector agent. To do so, from the Start menu, select **Programs > Fortinet > Fortinet Single Sign-On Agent > Configure Fortinet Single Sign-On Agent**, then from the **Common Tasks** section, select **Advanced Settings**.

This section include :

- General Settings
- Citrix/Terminal Server
- Exchange Server
- RADIUS Accounting

General Settings

In the General tab, enter the following information and select **OK**.

Worker thread count	Number of threads started in the CA process. Default is 128 on CA version 5.0.0241.
Maximum FortiGate connections	Number of FortiGates can be connected to the CA. Default is 64.
Group look-up interval	The interval in seconds to lookup users/groups. If an AD group membership of currently logged on user, CA can detect this and update information on the FortiGate. Enter 0 for no checking.
Windows security Event logs	Choose the event logs to poll.
Event IDs to poll	0: Default set, it includes Kerberos authentication event logs : 672 for Windows server 2003, 4768 for Windows server 2008 and 2012 and NTLM authentication event logs : 680 for Windows server 2003, 4776 for Windows server 2008 and 2012. 1: Extended set, it includes Kerberos service ticket event logs : 673 for Windows server 2003, 4769 for Windows server 2008 and 2012. Service tickets are obtained whenever a user or computer accesses a server on the network. List the event ids separated by ";".
Workstation Check	Optionally enable Use WMI to check user logoff for the collector agent to query whether users is still logged on.
Workstation Name Resolution Advance Options	
Alternative DNS server(s)	Collector Agent uses the DNS server configured on the machine it is running on by default. If CA should use another DNS server then one or more alternative DNS server can be configured here.
Alternative workstation suffix(es)	If only host name is available CA uses the default domain suffix to build a FQDN for DNS queries. In case CA should use a different suffix, it can be configured as well.

FSSO Collector Agent Advanced Settings

General | Citrix/Terminal Server | Exchange Server | RADIUS Accounting

Worker thread count: 128

Maximum FortiGate connections: 64

Group lookup interval (in seconds): 0 (0 for no checking)

Windows Security Event Logs

Event IDs to poll: 0
(0:default set, 1:extended set, or list the eventids separated by ';')

Workstation Check

☒ Use WMI to check user logoff

Workstation Name Resolution Advanced Options

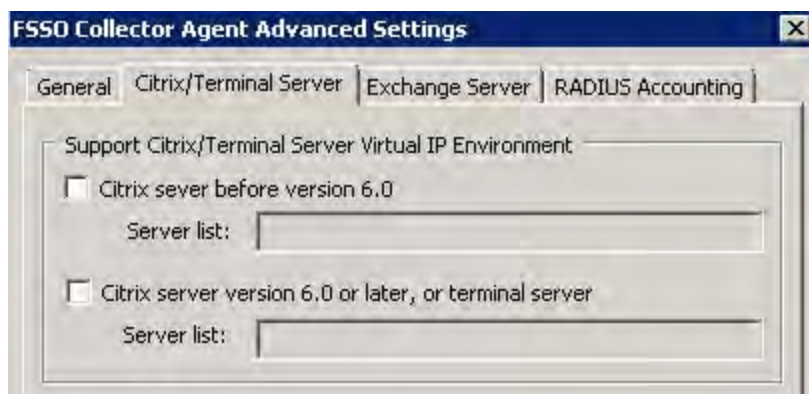

Alternative DNS server(s):

Alternative workstation suffix(es):

Citrix/Terminal Server

In the Citrix/Terminal Server tab, enter the following information and select **OK**.

Support Citrix/Terminal Server Virtual IP Environment	When Citrix server are configured with VIP, CA can get user logon events from these server. Citrix changed their interface and data format so version of Citrix server is important.
Citrix server before version 6.0	Enable this option if you Citrix server version is before 6.0.
Server list	Enter the list of servers separated by colon.
Citrix server version 6.0 or later, or Terminal Server	Enable this option if you Citrix server version is 6.0 or later.
Server list	Enter the list of servers separated by colon.

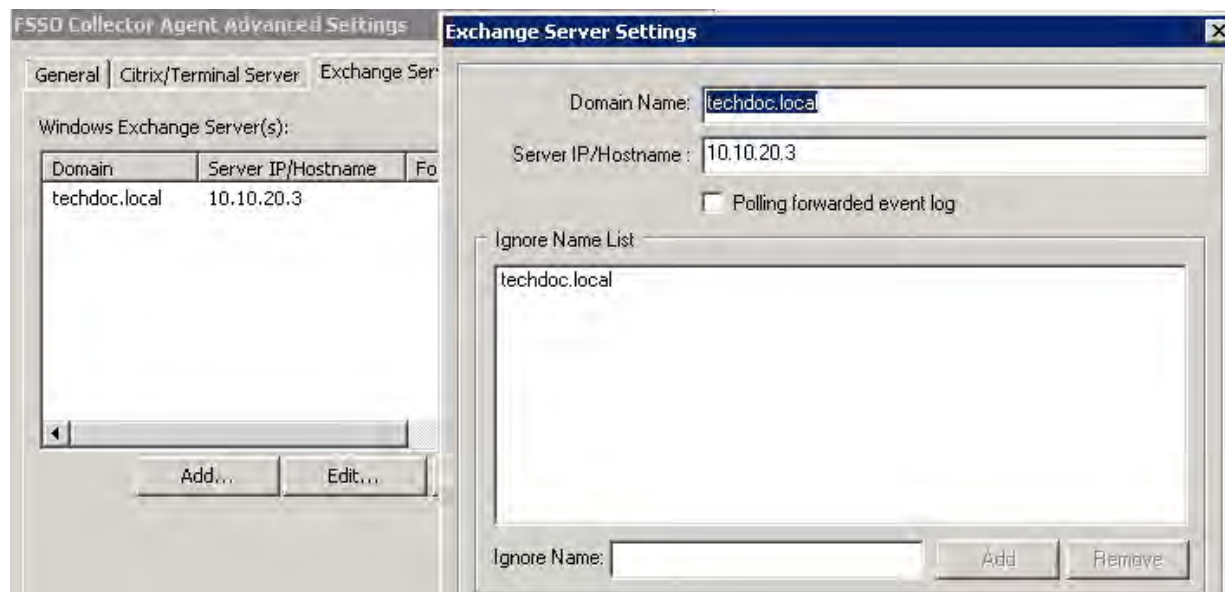

Exchange Server

FSSO supports monitoring Microsoft Exchange Server. This is useful for situation that the user use the domain account to access their email, but client device might or might not be in the domain. Support for Exchange server is configured on the Back-end FSSO collector agent under **Advanced Settings > Exchange Server**.

Select **Add** and enter the following information and select **OK**.

Domain Name	Enter your domain name.
Server IP/Hostname	Enter the IP address or the hostname of your exchange server.
Polling forwarded event log	<p>This option for scenarios when you do not want that CA polls the Exchange Server logs directly. In this case you need to configure event log forwarding on the Exchange server. Exchange event logs can be forwarded to any member server. If you enable this, instead of the IP of the Exchange server configured in the previous step, you must then configure the IP of this member server. CA will then contact the member server.</p>
Ignore Name	<p>Because CA will also check Windows log files for logon events and when a user authenticates to Exchange Server there is also a logon event in Windows event log, which CA will read and this will overwrite the Exchange Server logon event (ES-EventLog) on CA. So it is recommended to set the ignore list to the domain the user belongs to.</p> <p>To do so, enter the domain name in the Ignore Name field and select Add.</p>

RADIUS Accounting

A RADIUS server must be configured in your network to send accounting messages to the Collector Agent which can be configured to work with most RADIUS-based accounting systems. In most cases, you only need to do the following to your RADIUS accounting system:

- Add a user group name field to customer accounts on the RADIUS server so that the name is added to the RADIUS Start record sent by the accounting system to the Collector Agent. User group names do not need to be added for all users, only to the accounts of users who will use RADIUS Accounting feature on the Collector Agent.
- Configure your accounting system to send RADIUS Start records to the Collector Agent.

The Collector Agent should be configured to listen for RADIUS accounting messages as following.

RADIUS Accounting Server

Enable RADIUS Accounting Server

Enable this option to allow the CA to gather information about authenticated users via a RADIUS server and send these information to the FortiGate unit for monitoring.

Listen port

The port on which CA listens for RADIUS accounting messages. Default RADIUS accounting is 1813, but if RADIUS server sends accounting messages on different port, value can be configured here.

Shared secret

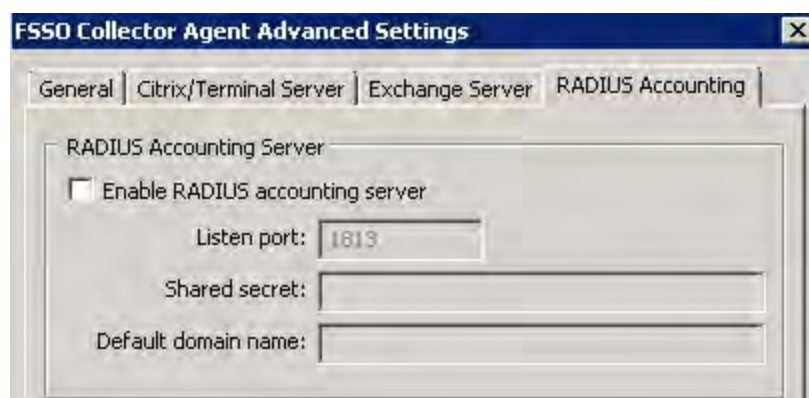

Common secret between CA and RADIUS server.

Default domain name

This should be the AD domain for which this CA is configured. In this case user name in RADIUS accounting message can be in simple format like user1.

If this value is empty, then user name in RADIUS accounting message must be in one of these formats user1@domain, Domain\user1 or domain/user1.

CA will use user name and domain to query group membership of user. Client IP address (Framed IP) should also be in RADIUS accounting message, so that CA can forward user name, IP address and groups to the FortiGate.

Configuring FSSO on FortiGate units

To configure your FortiGate unit to operate with agent-based FSSO, you

- Configure any access to LDAP servers that might be necessary. Skip this step if you are using FSSO Standard mode. See [Configuring LDAP server access on page 541](#).
- Specify the Collector agent or Novell eDirectory agent that will provide user logon information. See [Specifying your Collector agents or Novell eDirectory agents on page 543](#).
- Add Active Directory user groups to FortiGate user groups. See [Creating Fortinet Single Sign-On \(FSSO\) user groups on page 544](#).
- Create security policies for FSSO-authenticated groups. See [Creating security policies on page 545](#).
- Optionally, specify a guest security policy to allow guest access. See [Enabling guest access through FSSO security policies on page 546](#).

Configuring LDAP server access

LDAP access is required if your network has a Novell eDirectory agent or a Collector agent using Windows Advanced AD access mode. If you are using FSSO Standard mode, go to [Specifying your Collector agents or Novell eDirectory agents on page 543](#).

1. Go to **User & Device > LDAP Servers** and select **Create New**.
2. Enter the **Server IP/Name** and **Server Port** (default 389).
3. In the **Common Name Identifier** field, enter **sAMAccountName**. The default common name identifier is **cn**. This is correct for most LDAP servers. However some servers use other identifiers such as **uid**.

4. In the **Distinguished Name** field, enter your organization distinguished name. In this example, Distinguished Name is dc=techdoc,dc=local
5. Select **Fetch DN**, this will fetch the Windows AD directory.

Name: LDAP

Server IP/Name: 10.10.20.3

Server Port: 389

Common Name Identifier: sAMAccountName

Distinguished Name: dc=techdoc,dc=local

Bind Type:
☐ User DN
☐ Password
☐ Secure Connection

Test

LDAP Distinguished Name Query

LDAP Tree

- dc=techdoc,dc=local
 - CN=Computers
 - CN=ForeignSecurityPrincipals
 - CN=Managed Service Accounts
 - CN=Program Data
 - CN=System
 - CN=Users
 - OU=Domain Controllers

6. Set **Bind Type** to **Regular**.
7. In the **User DN** field, enter the administrative account name that you created for FSSO. For example, if the account is administrator, enter "administrator@techdoc.local".
8. Enter the administrative account password in the **Password** field.
9. Optionally select **Secure Connection**.
 - In the **Protocol** field, select **LDAPS** or **STARTTLS**.
 - In the **Certificate** field, select the appropriate certificate for authentication.

Note that you need to configure the Windows AD for secure connection accordingly.
10. Select **OK**.
11. Test your configuration by selecting the **Test** button. A successful message confirming the right settings appears.

Name: LDAP

Server IP/Name: 10.10.20.3

Server Port: 389

Common Name Identifier: sAMAccountName

Distinguished Name: dc=techdoc,dc=local

Fetch DN

Bind Type:
☐ Simple ☐ Anonymous ☒ Regular

User DN: administrator@techdoc.local

Password:

☐ Secure Connection

Test

Successful

To configure LDAP for FSSO - CLI example:

```

config user ldap
  edit LDAP
    set server 10.10.20.3
    set cnid sAMAccountName
    set dn dc=techdoc,dc=local
    set type regular
    set username administrator@techdoc.local
    set password <your_password>
  next
end

```

Specifying your Collector agents or Novell eDirectory agents

You need to configure the FortiGate unit to access at least one Collector agent or Novell eDirectory agent. You can specify up to five servers on which you have installed a Collector or eDirectory agent. The FortiGate unit accesses these servers in the order that they appear in the list. If a server becomes unavailable, the next one in the list is tried.

To specify Collector agents - web-based manager:

1. Go to **User & Device > Single Sign-On** and select **Create New**.
2. In **Type**, select **Fortinet Single-Sign-On Agent**.
3. Enter a **Name** for the Windows AD server. This name appears in the list of Windows AD servers when you create user groups.
4. Enter the following information for each of up to five collector agents and select **OK**:

Agent IP/Name	<p>Enter the IP address or the name of the server where this agent is installed. Maximum name length is 63 characters.</p> <p>If the TCP port used for FSSO is not the default, 8000, you can change the setting in the CLI using the <code>config user fssso</code> command.</p> <p>See Configuring Collector agent settings on page 523.</p>
Password	<p>Enter the password for the Collector agent or eDirectory agent. For the Collector agent, this is required only if you configured the agent to require authenticated access.</p>

5. For Novell eDirectory or Windows AD with Collector agent in Advanced AD access mode select the **LDAP Server** you configured previously. See [Configuring LDAP server access on page 541](#).
6. In **Users/Groups**, select the **Users** or **Groups** or **Organizational Units** tab and then select the users or groups or OU that you want to monitor.
7. Select **OK**.

To specify the FSSO Collector agent - CLI:

In this example, the SSO server name is techdoc and the LDAP server is LDAP.

```
config user fsso
  edit techdoc
    set ldap-server LDAP
    set password <your_password>
    set server 10.10.20.3
    set port 8000
  end
```

Creating Fortinet Single Sign-On (FSSO) user groups

You cannot use Windows or Novell groups directly in FortiGate security policies. You must create FortiGate user groups of the FSSO type and add Windows or Novell groups to them.

To create a user group for FSSO authentication - web-based manager:

1. Go to **User & Device > User Groups**.
2. Select **Create New**.
The New User Group dialog box opens.
3. In the **Name** box, enter a name for the group, FSSO_Internet_users for example.
4. In **Type**, select **Fortinet Single Sign-On (FSSO)**.
5. In **Members**, select the required **FSSO** groups.
6. Select **OK**.

To create the FSSO_Internet-users user group - CLI :

```
config user group
  edit FSSO_Internet_users
    set group-type fsso-service
    set member CN=Engineering,cn=users,dc=office,dc=example,dc=com
    set member CN=Sales,cn=users,dc=office,dc=example,dc=com
  end
```

Creating security policies

Policies that require FSSO authentication are very similar to other security policies. Using identity-based policies, you can configure access that depends on the FSSO user group. This allows each FSSO user group to have its own level of access to its own group of services.

In this situation, Example.com is a company that has its employees and authentication servers on an internal network. The FortiGate unit intercepts all traffic leaving the internal network and requires FSSO authentication to access network resources on the Internet. The following procedure configures the security policy for FSSO authentication. FSSO is installed and configured including the RADIUS server, FSSO Collector agent, and user groups on the FortiGate.

For the following procedure, the internal interface is `port1` and the external interface connected to the Internet is `port2`. There is an address group for the internal network called `company_network`. The FSSO user group is called `fsso_group`, and the FSSO RADIUS server is `fsso_rad_server`.

To configure an FSSO authentication security policy - web-based manager:

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information.

Incoming Interface	<code>port1</code>
Source Address	<code>company_network</code>
Source User(s)	<code>fsso_group</code>
Outgoing Interface	<code>port2</code>
Destination Address	<code>all</code>
Schedule	<code>always</code>
Service	HTTP, HTTPS, FTP, and Telnet
Action	ACCEPT
NAT	ON
UTM Security Profiles	ON for AntiVirus, IPS, Web Filter, and Email Filter, all using default profiles.
Log Allowed Traffic	ON. Select Security Events .

3. Select **OK**.
4. Ensure the FSSO authentication policy is higher in the policy list than more general policies for the same interfaces.

To create a security policy for FSSO authentication - CLI:

```
config firewall policy
  edit 0
    set srcintf port1
    set dstintf port2
    set srcaddr company_network
```

```
set dstaddr all
set action accept
set groups fsso_group
set schedule always
set service HTTP HTTPS FTP TELNET
set nat enable
end
```

Here is an example of how this FSSO authentication policy is used. Example.com employee on the internal company network logs on to the internal network using their RADIUS username and password. When that user attempts to access the Internet, which requires FSSO authentication, the FortiGate authentication security policy intercepts the session, checks with the FSSO Collector agent to verify the user's identity and credentials, and then if everything is verified the user is allowed access to the Internet.

Users belonging to multiple groups

Before FSSO 4.0 MR3, if a user belonged to multiple user groups, the first security policy to match any group that user belonged too was the only security policy applied. If that specific group did not have access to this protocol or resource where another group did, the user was still denied access. For example, `test_user` belongs to `group1` and `group2`. There are two FSSO authentication policies — one matches `group1` to authenticate FTP traffic and one matches `group2` to authenticate email traffic. The `group1` policy is at the top of the list of policies. If `test_user` wants to access an email server, the first policy encountered for a group `test_user` belongs to is the `group1` policy which does not allow email access and `test_user` is denied access. This is despite the next policy allowing access to email. If the order was reversed in this case, the traffic would be matched and the user's traffic would be allowed through the firewall. However if the policy order was reversed, FTP traffic would not be matched.

As of FSSO 4.0 MR3, if a user belongs to multiple groups multiple then attempts to match the group are attempted if applicable. Using the above example, when the attempt to match the `group1` policy is made and fails, the next policy with a group that `test_user` is a member of is attempted. In this case, the next policy is matched and access is granted to the email server.

When configuring this example the only difference between the policies is the services that are listed and the FSSO user group name.

Authenticating through multiple groups allows administrators to assign groups for specific services, and users who are members of each group have access to those services. For example there could be an FTP group, an email group, and a Telnet group.

Enabling guest access through FSSO security policies

You can enable guest users to access FSSO security policies. Guests are users who are unknown to the Windows AD or Novell network and servers that do not logon to a Windows AD domain.

To enable guest access in your FSSO security policy, add an identity-based policy assigned to the built-in user group `SSO_Guest_Users`. Specify the services, schedule and protection profile that apply to guest users — typically guests receive reduced access to a reduced set of services.

IPv6 support for FSSO

FortiGate FSSO supports connecting to an FSSO agent over IPv6 and collecting and sending IPv6 details about endpoints. This is enforced in the same manner as IPv4 FSSO traffic.

Syntax

```
config user fsso
  edit <fsso agent name>
    set source-ip6 <IPv6 address for source>
  end
```

FortiOS FSSO log messages

There are two types of FortiOS log messages — firewall and event. FSSO-related log messages are generated from authentication events. These include user logon and log off events, and NTLM authentication events. These log messages are central to network accounting policies, and can also be useful in troubleshooting issues. For more information on firewall logging, see "Enabling security logging". For more information on logging, see the FortiOS Handbook Log and Reporting guide.

Enabling authentication event logging

For the FortiGate unit to log events, that specific type of event must be enabled under logging.

When VDOMs are enabled certain options may not be available, such as CPU and memory usage events. You can enable event logs only when you are logged on to a VDOM; you cannot enable event logs globally.

To ensure you log all the events need, set the minimum log level to Notification or Information. Firewall logging requires Notification as a minimum. The closer to Debug level, the more information will be logged. While this extra information is useful, you must

To enable event logging:

1. Go to **Log & Report > Log Settings**.
2. In **Event Logging**, select:

System activity event	All system-related events, such as ping server failure and gateway status.
User activity event	All administration events, such as user logins, resets, and configuration updates.

3. Optionally you can enable any or all of the other logging event options.
4. Select **Apply**.

Authentication log messages

#	Date/Time	Level	Source	Action	Status	Message	Timestamp	
1	06:15:24		TELBAR (10.10.20.7)	FSSO-logout		FSSO-logout event from techdoc: user TELBAR logged off 10.10.20.7	11/12/2015, 6:15:24 AM	
2	11-11 22:22		ADMINISTRATOR (10.10.20.3)	authentication	logout	User ADMINISTRATOR succeeded in logout	11/11/2015, 10:22:15 P	
3	11-11 22:22		ADMINISTRATOR (10.10.20.3)	FSSO-logout		FSSO-logout event from techdoc: user ADMINISTRATOR logged off 10.10.20.3	11/11/2015, 10:22:15 P	
4	11-11 22:17		ADMINISTRATOR (10.10.20.3)	FSSO-logon		FSSO-logon event from techdoc: user ADMINISTRATOR logged on 10.10.20.3	11/11/2015, 10:17:12 P

List of FSSO related log messages

Message ID	Severity	Description
43008	Notification	Authentication was successful
43009	Notification	Authentication session failed
43010	Warning	Authentication locked out
43011	Notification	Authentication timed out
43012	Notification	FSSO authentication was successful
43013	Notification	FSSO authentication failed
43014	Notification	FSSO user logged on
43015	Notification	FSSO user logged off
43016	Notification	NTLM authentication was successful
43017	Notification	NTLM authentication failed

For more information on logging, see the FortiOS Handbook Log and Reporting guide.

Using filters

Logon events are detected by the FSSO CA by monitoring the Security Event logs. Additional logon event filters, such as ServiceName and ServiceID, have been implemented so as to avoid instances of conflicting security events, where existing FSSO logon user information could be overwritten and impact user connectivity.

The problem arises when a scenario such as the following occurs:

1. **User1** logs on to **PC1** on 1.1.1.1, which is logged as a successful Kerberos logon event with an ID of 4769.
2. The FortiGate creates an authenticated FSSO user log entry for **User1/1.1.1.1**.
3. **User1** then maps a network drive and uses credentials for **User2** to logon to the same PC (**PC1**).
4. The FortiGate sees this as a separate logon to **PC1** by a new user, **User2**. As a result, the log entry is updated to **User2/1.1.1.1**.
5. If **User2** is a member of a different user group to **User1** (i.e. has different access permissions), **User1** could lose access to their network resources.

The new filter makes the CA ignore the event log created when **User1** mapped a network drive, meaning that the original entry for **User1** will not be changed.

While this is a useful feature, it is highly recommended to test filters in a redundant test environment.

Testing FSSO

Once FSSO is configured, you can easily test to ensure your configuration is working as expected. For additional FSSO testing, see [Troubleshooting FSSO on page 549](#).

1. Logon to one of the stations on the FSSO domain, and access an Internet resource.
2. Connect to the CLI of the FortiGate unit, and if possible log the output.
3. Enter the following command:

```
diagnose debug authd fsso list
```

4. Check the output. If FSSO is functioning properly you will see something similar to the following:

```
----FSSO logons----
IP: 10.10.20.3 User: ADMINISTRATOR Groups: CN=FORTIOS WRITERS,CN=USERS,DC=TECHDOC,DC=LOCAL
Workstation: WIN2K8R2.TECHDOC.LOCAL MemberOf: FortiOS_Writers
IP: 10.10.20.7 User: TELBAR Groups: CN=FORTIOS WRITERS,CN=USERS,DC=TECHDOC,DC=LOCAL
Workstation: TELBAR-PC7.TECHDOC.LOCAL
Total number of logons listed: 2, filtered: 0
----end of FSSO logons----
```

The exact information will vary based on your installation.

5. Check the FortiGate event log, for FSSO-auth action or other FSSO related events with FSSO information in the message field.
6. To check server connectivity, run the following commands from the CLI:

```
FGT# diagnose debug enable
FGT# diagnose debug authd fsso server-status
FGT# Server Name Connection Status Version
-----
techdoc          connected FSSO 5.0.0241
```

Troubleshooting FSSO

When installing, configuring, and working with FSSO some problems are quite common. A selection of these problems follows including explanations and solutions.

Some common Windows AD problems include:

- [General troubleshooting tips for FSSO](#)
- [Users on a particular computer \(IP address\) cannot access the network](#)
- [Guest users do not have access to network](#)
- [Can't find the DCagent service](#)
- [User logon events not received by FSSO Collector agent](#)
- [Mac OS X users can't access external resources after waking from sleep mode](#)

General troubleshooting tips for FSSO

The following tips are useful in many FSSO troubleshooting situations.

- Ensure all firewalls are allowing the FSSO required ports through.
FSSO has a number of required ports that must be allowed through all firewalls or connections will fail. These include: ports 139, 389 (LDAP), 445, 636 (LDAP) 8000, and 8002.
- Ensure the Collector agent has at least 64kbps bandwidth to the FortiGate unit.
If not the Collector agent does not have this amount of bandwidth, information FSSO information may not reach

the FortiGate unit resulting in outages. The best solution is to configure traffic shaping between the FortiGate unit and the Collector agent to ensure that minimum bandwidth is always available.

Users on a particular computer (IP address) cannot access the network

Windows AD Domain Controller agent gets the username and workstation where the logon attempt is coming from. If there are two computers with the same IP address and the same user trying to logon, it is possible for the authentication system to become confused and believe that the user on computer_1 is actually trying to access computer_2.

Windows AD does not track when a user logs out. It is possible that a user logs out on one computer, and immediately logs onto a second computer while the system still believes the user is logged on the original computer. While this is allowed, information that is intended for the session on one computer may mistakenly end up going to the other computer instead. The result would look similar to a hijacked session.

Solutions

- Ensure each computer has separate IP addresses.
- Encourage users to logout on one machine before logging onto another machine.
- If multiple users have the same username, change the usernames to be unique.
- Shorten timeout timer to flush inactive sessions after a shorter time.

Guest users do not have access to network

A group of guest users was created, but they don't have access.

Solution

The group of the guest users was not included in a policy, so they do not fall under the guest account. To give them access, associate their group with a security policy.

Additionally, there is a default group called `SSO_Guest_Users`. Ensure that group is part of an identity-based security policy to allow traffic.

Can't find the DCagent service

The DCagent service can't be found in the list of regular windows services. This is because it has no associated Windows service.

Instead DCagent is really `dcagent.dll` and is located in the `Windows\system32` folder. This DLL file is loaded when windows boots up and it intercepts all logon events processed by the domain controller to send these events to the Collector agent (CA).

Solution

To verify that the DCagent is installed properly

1. Check that `DCagent.dll` exists in `Windows\system32` folder.
2. Check that the registry key exists: `[HKEY_LOCAL_MACHINE\SOFTWARE\Fortinet\FSAE\dcagent]`

If both exist, the DCagent is properly installed.

User logon events not received by FSSO Collector agent

When a warning dialog is present on the screen on the Collector agent computer, the Collector agent will not receive any logon events. Once the dialog has been closed normal operation will resume.

If polling mode is enabled, it is possible the polling interval is too large. Use a shorter polling interval to ensure the collector agent is capturing all logon events.

The polling interval can only be adjusted using the firewall-embedded agent itself, not on agents deployed to member servers.

If NetAPI polling mode is enabled, consider switching to Event logs or Event Logs using WMI polling as it provides better accuracy.

Mac OS X users can't access external resources after waking from sleep mode

When client computers running Mac OS X (10.6.X and higher) wake up from sleep mode, the user must authenticate again to be able to access external resources. If the user does not re-authenticate, the user will maintain access to internal web sites, but will be unable to access any external resources.

This issue is caused by Mac OS X not providing sufficient information to the FSSO. This results in the FortiGate blocking access to the user because they cannot be authenticated.

Solution

The security settings on client computer(s) must be configured to require that a username and password be entered when exiting sleep mode or screen saver. With this feature enabled in Mac OS X, the FortiGate will receive the authentication information it requires to authenticate the user and allow them access.

Note that if the user reverts their settings to disable the password requirement, this will cause the issue to reappear.

SSO using RADIUS accounting records

A FortiGate unit can authenticate users transparently who have already authenticated on an external RADIUS server. Based on the user group to which the user belongs, the security policy applies the appropriate UTM profiles. RADIUS SSO is relatively simple because the FortiGate unit does not interact with the RADIUS server, it only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user's IP address and user group.

After the initial set-up, changes to the user database, including changes to user group memberships, are made on the external RADIUS server, not on the FortiGate unit.

This section describes:

- [User's view of RADIUS SSO authentication](#)
- [Configuration Overview](#)
- [Configuring the RADIUS server](#)
- [Creating the FortiGate RADIUS SSO agent](#)
- [Defining local user groups for RADIUS SSO](#)
- [Creating security policies](#)
- [Example: webfiltering for student and teacher accounts](#)

User's view of RADIUS SSO authentication

For the user, RADIUS SSO authentication is simple:

- The user connects to the RADIUS server and authenticates.
- The user attempts to connect to a network resource that is reached through a FortiGate unit. Authentication is required for access, but the user connects to the destination without being asked for logon credentials because the FortiGate unit knows that the user is already authenticated. FortiOS applies UTM features appropriate to the user groups that the user belongs to.

Configuration Overview

The general steps to implement RADIUS Single Sign-On are:

1. If necessary, configure your RADIUS server. The user database needs to include user group information and the server needs to send accounting messages.
2. Create the FortiGate RADIUS SSO agent.
3. Define local user groups that map to RADIUS groups.
4. Create a security policy which specifies the user groups that are permitted access.

Configuring the RADIUS server

You can configure FortiGate RSSO to work with most RADIUS-based accounting systems. In most cases, you only need to do the following to your RADIUS accounting system:

- Add a user group name field to customer accounts on the RADIUS server so that the name is added to the RADIUS Start record sent by the accounting system to the FortiOS unit. User group names do not need to be added for all

users, only to the accounts of users who will use RSSO feature on the FortiGate unit.

- Configure your accounting system to send RADIUS Start records to the FortiOS unit. You can send the RADIUS Start records to any FortiGate network interface. If your FortiGate unit is operating with virtual domains (VDMs) enabled, the RADIUS Start records must be sent to a network interface in the management VDOM.

IPv6 RADIUS Support

RADIUS authentication is supported with IPv6, allowing administrators to configure an IPv6 RADIUS server on the FortiGate for IPv6 RADIUS authentication traffic to pass between the server and FortiGate.

Note that while you can set the primary RADIUS server's IPv6 address, the source IP address for communications to the RADIUS server cannot be configured as IPv6.

Syntax

Allow IPv6 access on an interface:

```
config system interface
  edit <name>
    config ipv6
      set ip6-allowaccess {ping | https | ssh | snmp | http | telnet | fgfm | capwap}
      set ip6-address <xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx/xxx>
    next
  next
end
```

Configure the IPv6 RADIUS server:

```
config user radius
  edit <name>
    set server <xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx>
    ...
  next
end
```

Creating the FortiGate RADIUS SSO agent

Once you define a RADIUS SSO (RSSO) agent, the FortiGate unit will accept user logon information from any RADIUS server that has the same shared secret. You can create only one RSSO agent in each VDOM.

Before you create the RSSO agent, you need to allow RADIUS accounting information on the interface that connects to the RADIUS server.

To enable RADIUS access on the interface - web-based manager:

1. Go to **Network > Interfaces** and edit the interface to which the RADIUS server connected.
2. Select **Listen for RADIUS Accounting Messages**.
3. Select **OK**.

To enable RADIUS access on the interface - CLI:

In this example, the port2 interface is used.

```
config system interface
edit port2
set allowaccess radius-acct
end
```

To create a RADIUS SSO agent:

1. Go to **User & Device > Single Sign-On** and select **Create New**.
2. In **Type**, select **RADIUS Single-Sign-On Agent**.
3. Select **Use RADIUS Shared Secret** and enter the RADIUS server shared secret.
4. Select **Send RADIUS Responses**.
5. Select **OK**.

To create a RADIUS SSO agent - CLI

```
config user radius
edit RSSO_Agent
set rso enable
set rso-validate-request-secret enable
set rso-secret <your secret>
set rso-radius-response enable
end
```

Selecting which RADIUS attributes are used for RSSO

For RADIUS SSO to work, FortiOS needs to know the user's endpoint identifier (usually IP address) and RADIUS user group. There are default RADIUS attributes where FortiOS expects this information, but you can change these attributes in the `config user radius` CLI command.

RSSO information and RADIUS attribute defaults

RSSO Information	RADIUS Attribute	CLI field
Endpoint user IP	Framed-IP-Address	<code>rsso-endpoint-attribute</code>
Endpoint identifier	Calling-Station-ID	<code>rsso-endpoint-attribute</code>
Endpoint block attribute	Called-Station-ID	<code>rsso-endpoint-block-attribute</code>
User group	Class	<code>sso-attribute</code>
User	Prefix	<code>delegated-IPv6-prefix</code>
User	Prefix	<code>framed-IPv6-prefix</code>

The Endpoint block attribute can be used to block or allow a user. If the attribute value is set to the name of an attribute that indicates whether to block or allow, FortiOS blocks or allows respectively all traffic from that user's IP address. The RSSO fields are visible only when `rsso` is set to `enable`.

The Prefix attributes allow for RSSO to provide a /56 prefix for DSL customers. All devices connected from the same location (/56 per subscriber) can be mapped to the same profile without the need to create multiple /64 or smaller entries.

Override SSO attribute

Prior to FortiOS 5.4, when receiving a new start message with a different group name for the same user, and a different IP address such as for a roaming mobile device, the original process was to override all group name information to the latest group name received from the latest start message.

You can disable this override when needed. The default behavior keeps the original design.

To enable or disable overriding SSO attribute - CLI

```
config user radius
  edit <name>
    set rso <enable>
    set sso-attribute-value-override {enable | disable} Enable/disable override of old attribute value with new value for the same endpoint.
```

Configuring logging for RSSO

In the `config user radius` CLI command, you can set the following flags in the `rso-log-flags` field to determine which types of RSSO-related events are logged:

- `protocol-error` — A RADIUS protocol error occurred.
- `profile-missing` — FortiOS cannot find a user group name in a RADIUS start message that matches the name of an RSSO user group in FortiOS.
- `accounting-stop-missed` — a user context entry expired without FortiOS receiving a RADIUS Stop message.
- `accounting-event` — FortiOS did not find the expected information in a RADIUS record.
- `endpoint-block` — FortiOS blocked a user because the RADIUS record's endpoint block attribute had the value "Block".
- `radiusd-other` — Other events, described in the log message.

Defining local user groups for RADIUS SSO

You cannot use RADIUS user groups directly in security policies. Instead, you create locally-defined user groups on the FortiGate unit and associate each of them with a RADIUS user group.

To define local user groups for RADIUS SSO:

1. Go to **User & Device > User Groups** and select **Create New**.
2. Enter a Name for the user group.
3. In **Type**, select **RADIUS Single Sign-On (RSSO)**.
4. In **RADIUS Attribute Value**, enter the name of the RADIUS user group this local user group represents.
5. Select **OK**.

To define local user groups for RADIUS SSO:

This example creates an RSSO user group called RSSO-1 that is associated with RADIUS user group "student".

```
config user group
  edit RSSO-1
```

```
set group-type rsoo
set sso-attribute-value student
end
```

Creating security policies

RADIUS SSO uses regular identity-based security policies. The RSSO user group you specify determines which users are permitted to use the policy. You can create multiple policies if user groups can have different UTM features enabled, different permitted services, schedules, and so on.

To create a security policy for RSSO - web-based manager:

1. Go to **Policy & Objects > IPv4 Policy**.
2. Select **Create New**.
3. Enter the following information.

Incoming Interface	as needed
Source Address	as needed
Source User(s)	Select the user groups you created for RSSO. See Defining local user groups for RADIUS SSO on page 555 .
Outgoing Interface	as needed
Destination Address	all
Schedule	as needed
Service	as needed
Action	ACCEPT
Enable NAT	Selected
Security Profiles	Select security profiles appropriate for the user group.

4. Select **OK**.

To ensure an RSSO-related policy is matched first, the policy should be placed higher in the security policy list than more general policies for the same interfaces.

5. Select **OK**.

To create a security policy for RSSO - CLI:

In this example, an internal network to Internet policy enables web access for members of a student group and activates the appropriate UTM profiles.

```
config firewall policy
edit 0
set srcintf internal
set dstintf wan1
set srcaddr all
set dstaddr "all"
```

```

set action accept
set rso enable
set groups "RSSO-student"
set schedule always
set service HTTP HTTPS
set nat enable
set utm-status enable
set av-profile students
set webfilter-profile students
set spamfilter-profile students
set dlp-sensor default
set ips-sensor default
set application-list students
set profile-protocol-options "default"
end

```

Example: webfiltering for student and teacher accounts

The following example uses RADIUS SSO to apply web filtering to students, but not to teachers. Assume that the RADIUS server is already configured to send RADIUS Start and Stop records to the FortiGate unit. There are two RADIUS user groups, **students** and **teachers**, recorded in the default attribute **Class**. The workstations are connected to port1, port2 connects to the RADIUS server, and port3 connects to the Internet.

Configure the student web filter profile:

1. Go to **Security Profiles > Web Filter** and select **Create New** (the “+” button).
2. Enter the following and select **OK**.

Name	student
Inspection Mode	Proxy
FortiGuard Categories	Enable. Right-click the Potentially Liable category and select Block . Repeat for Adult/Mature Content and Security Risk .

Create the RADIUS SSO agent:

1. Go to **User & Device > Single Sign-On** and select **Create New**.
2. In **Type**, select **RADIUS Single-Sign-On**.
3. Select **Use RADIUS Shared Secret** and enter the RADIUS server shared secret.
4. Select **Send RADIUS Responses**.
5. Select **OK**.

Define local user groups associated with the RADIUS SSO user groups:

1. Go to **User & Device > User Groups** and select **Create New**.
2. Enter the following and select **OK**.

Name	RSSO-students
-------------	---------------

Type	RADIUS Single Sign-On (RSSO)
RADIUS Attribute Value	students

3. Select **Create New**, enter the following and select **OK**.

Name	RSSO-teachers
Type	RADIUS Single Sign-On (RSSO)
RADIUS Attribute Value	teachers

Create a security policy for students:

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter

Incoming Interface	port1
Source Address	all
Source User(s)	RSSO-students
Source Device Type	All
Outgoing Interface	port3
Destination Address	all
Schedule	always
Service	HTTP, HTTPS
Action	ACCEPT
NAT	ON
Security Profiles	Enable AntiVirus, Web Filter, IPS. In Web Filter, select the student profile.

3. Select **OK**.

Create a security policy for teachers:

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter

Incoming Interface	port2
Source Address	all

Source User(s)	RSSO-teachers
Source Device Type	All
Outgoing Interface	port3
Destination Address	all
Schedule	always
Service	ALL
Action	ACCEPT
NAT	ON
Security Profiles	Enable AntiVirus and IPS.

3. Select **OK**.

Monitoring authenticated users

This section describes how to view lists of currently logged-in firewall and VPN users. It also describes how to disconnect users.

The following topics are included in this section:

- [Monitoring firewall users](#)
- [Monitoring SSL VPN users](#)
- [Monitoring IPsec VPN users](#)
- [Monitoring users Quarantine](#)

Monitoring firewall users

To monitor firewall users, go to **Monitor > Firewall User Monitor**.

Refresh De-authenticate

User Name	User Group	Policy ID	Duration	IP Address	Traffic Volume	Method
user3	Group1	2	0 day(s) 0 hour(s) 4 minute(s)	10.11.101.20	35 KB	FW-auth
user4	Group1	2	0 day(s) 3 hour(s) 4 minute(s)	10.11.101.101	421 KB	FW-auth

You can de-authenticate a user by selecting the Delete icon for that entry.

You can filter the list of displayed users by selecting the funnel icon for one of the column titles or selecting **Filter Settings**.

Optionally, you can de-authenticate multiple users by selecting them and then selecting **De-authenticate**.

Monitoring SSL VPN users

You can monitor web-mode and tunnel-mode SSL VPN users by username and IP address.

To monitor SSL VPN users, go to **Monitor > SSL-VPN Monitor**. To disconnect a user, select the user and then select the **Delete** icon.

<div> Delete</div>					
<input type="checkbox"/>	No.	User	Source IP	Begin Time	Description
<input type="checkbox"/>	1	user2	172.20.120.51	Wed Mar 17 13:17:32 2010	
<input checked="" type="checkbox"/>			Subsession		Tunnel IP:10.0.0.1

The first line, listing the username and IP address, is present for a user with either a web-mode or tunnel-mode connection. The Subsession line is present only if the user has a tunnel mode connection. The **Description** column displays the virtual IP address assigned to the user's tunnel-mode connection.

For more information about SSL VPN, see the FortiOS Handbook SSL VPN guide.

To monitor SSL VPN users - CLI:

To list all of the SSL VPN sessions and their index numbers:

```
execute vpn sslvpn list
```

The output looks like this:

```
SSL-VPN Login Users:
  Index  User   Auth Type   Timeout   From           HTTPS in/out
  0      user1  1          256      172.20.120.51  0/0

SSL-VPN sessions:
  Index  User   Source IP      Tunnel/Dest IP
  0      user2  172.20.120.51  10.0.0.1
```

You can use the Index value in the following commands to disconnect user sessions:

To disconnect a tunnel-mode user

```
execute vpn sslvpn del-tunnel <index>
```

To disconnect a web-mode user

```
execute vpn sslvpn del-web <index>
```

You can also disconnect multiple users:

To disconnect all tunnel-mode SSL VPN users in this VDOM

```
execute vpn ssl del-all tunnel
```

To disconnect all SSL VPN users in this VDOM

```
execute vpn ssl del-all
```

Monitoring IPsec VPN users

To monitor IPsec VPN tunnels in the web-based manager, go to **Monitor > IPsec Monitor**. user names are available only for users who authenticate with XAuth.

You can close a tunnel by selecting the tunnel and right click to select **Bring Down**.

Type	Name	Remote Gateway	Timeout	Status	Incoming Data	Outgoing Data	Username
Dialup	dialup1_0	172.20.120.51	1116	Bring Down	79233170 B	171639314 B	user2

For more information, see the FortiOS Handbook IPsec VPN guide.

Monitoring users Quarantine

The User Quarantine list shows all IP addresses and interfaces blocked by NAC quarantine. The list also shows all IP addresses, authenticated users, senders, and interfaces blocked by Data Leak Prevention (DLP). The system administrator can selectively release users or interfaces from quarantine or configure quarantine to expire after a selected time period.

All sessions started by users or IP addresses on the User Quarantine list are blocked until the user or IP address is removed from the list. All sessions to an interface on the list are blocked until the interface is removed from the list.

You can configure NAC quarantine to add users or IP addresses to the User Quarantine list under the following conditions:

- **Users or IP addresses that originate attacks detected by IPS** - To quarantine users or IP addresses that originate attacks, enable and configure **Quarantine** in an IPS Filter.
- **Users or IP addresses that are quarantined by Data Leak Prevention** - In a DLP sensor select **Quarantine IP Address** as the action to take.

For more information, see FortiOS Handbook Security Profiles guide.

Users are viewed from **Monitor > Quarantine Monitor**.

Delete	Removes the selected user or IP address from the User Quarantine list.
Remove All	Removes all users and IP addresses from the User Quarantine list.
Search	Search the list for a particular IP address.
Source	The FortiGate function that caused the user or IP address to be added to the User Quarantine list: IPS or Data Leak Prevention.
Created	The date and time the user or IP address was added to the Banned User list.
Expires	The date and time the user or IP address will be automatically removed from the User Quarantine list. If Expires is Indefinite , you must manually remove the user or host from the list.

Examples and Troubleshooting

This chapter provides an example of a FortiGate unit providing authenticated access to the Internet for both Windows network users and local users.

The following topics are included in this section:

- [Firewall authentication example](#)
- [LDAP Dial-in using member-attribute example](#)
- [RADIUS SSO example](#)
- [Troubleshooting](#)

Firewall authentication example

Example configuration

Overview

In this example, there is a Windows network connected to Port 2 on the FortiGate unit and another LAN, Network_1, connected to Port 3.

All Windows network users authenticate when they logon to their network. Members of the Engineering and Sales groups can access the Internet without entering their authentication credentials again. The example assumes that the Fortinet Single Sign On (FSSO) has already been installed and configured on the domain controller.

LAN users who belong to the Internet_users group can access the Internet after entering their username and password to authenticate. This example shows only two users, User1 is authenticated by a password stored on the FortiGate unit, User2 is authenticated on an external authentication server. Both of these users are referred to as local users because the user account is created on the FortiGate unit.

Creating a locally-authenticated user account

User1 is authenticated by a password stored on the FortiGate unit. It is very simple to create this type of account.

To create a local user - web-based manager:

1. Go to **User & Device > User Definition** and select **Create New**.
2. Follow the User Creation Wizard, entering the following information and then select **Create**:

User Type	Local User
User Name	User1
Password	hardtoguess
Email Address SMS	(optional)
Enable	Select.

To create a local user - CLI:

```
config user local
edit user1
set type password
set passwd hardtoguess
end
```

Creating a RADIUS-authenticated user account

To authenticate users using an external authentication server, you must first configure the FortiGate unit to access the server.

To configure the remote authentication server - web-based manager:

1. Go to **User & Device > RADIUS Servers** and select **Create New**.
2. Enter the following information and select **OK**:

Name	OurRADIUSsrv
Primary Server Name/IP	10.11.101.15
Primary Server Secret	OurSecret
Authentication Scheme	Select Use Default Authentication Scheme .

To configure the remote authentication server - CLI:

```
config user radius
edit OurRADIUSsrv
set server 10.11.102.15
set secret OurSecret
set auth-type auto
end
```

Creation of the user account is similar to the locally-authenticated account, except that you specify the RADIUS authentication server instead of the user's password.

To configure a remote user - web-based manager:

1. Go to **User & Device > User Definition** and select **Create New**.
2. Follow the User Creation Wizard, entering the following information and then select **Create**:

User Type	Remote RADIUS User
User Name	User2
RADIUS server	OurRADIUSsrv
Email Address SMS	(optional)
Enable	Select

To configure a remote user - CLI:

```
config user local
  edit User2
    set name User2
    set type radius
    set radius-server OurRADIUSsrv
  end
```

Creating user groups

There are two user groups: an FSSO user group for FSSO users and a firewall user group for other users. It is not possible to combine these two types of users in the same user group.

Creating the FSSO user group

For this example, assume that FSSO has already been set up on the Windows network and that it uses Advanced mode, meaning that it uses LDAP to access user group information. You need to

- configure LDAP access to the Windows AD global catalog
- specify the collector agent that sends user logon information to the FortiGate unit
- select Windows user groups to monitor
- select and add the Engineering and Sales groups to an FSSO user group

To configure LDAP for FSSO - web-based manager:

1. Go to **User & Device > LDAP Servers** and select **Create New**.
2. Enter the following information:

Name	ADserver
Server Name / IP	10.11.101.160
Distinguished Name	dc=office,dc=example,dc=com
Bind Type	Regular

User DN	cn=FSSO_Admin,cn=users,dc=office,dc=example,dc=com
Password	set_a_secure_password

3. Leave other fields at their default values.
4. Select **OK**.

To configure LDAP for FSSO - CLI"

```
config user ldap
  edit "ADserver"
    set server "10.11.101.160"
    set dn "cn=users,dc=office,dc=example,dc=com"
    set type regular
    set username "cn=admin,dc=office,dc=example,dc=com"
    set password set_a_secure_password
  next
end
```

To specify the collector agent for FSSO - web-based manager

1. Go to **User & Device > Single Sign-On** and select **Create New**.
2. Enter the following information:

Type	Fortinet Single Sign-On Agent
Name	WinGroups
Primary Agent IP/Name	10.11.101.160
Password	fortinet_canada
LDAP Server	ADserver

3. Select **Apply & Refresh**.

In a few minutes, the FortiGate unit downloads the list of user groups from the server.

To specify the collector agent for FSSO - CLI:

```
config user fsso
  edit "WinGroups"
    set ldap-server "ADserver"
    set password ENC
      G7QV7NEqilCM9jKmVmJJFVvhQ2+wtNEe9T0iYA5Sa+EqT2J8zhOrbkJFDr0RmY3c4LaoXdsoBczA
      1dONmcGfthTxxwGsigzGpbJdC7lspFlQYtj
    set server "10.11.101.160"
  end
```

To create the FSSO_Internet-users user group - web-based manager:

1. Go to **User & Device > User Groups** and select **Create New**.
2. Enter the following information and then select **OK**:

Name	FSSO_Internet_users
Type	Fortinet Single Sign-On (FSSO)
Members	Engineering, Sales

To create the FSSO_Internet-users user group - CLI:

```
config user group
  edit FSSO_Internet_users
    set group-type fsso-service
    set member CN=Engineering,cn=users,dc=office,dc=example,dc=com
      CN=Sales,cn=users,dc=office,dc=example,dc=com
  end
```

Creating the Firewall user group

The non-FSSO users need a user group too. In this example, only two users are shown, but additional members can be added easily.

To create the firewall user group - web-based manager:

1. Go to **User & Device > User Groups** and select **Create New**.
2. Enter the following information and then select **OK**:

Name	Internet_users
Type	Firewall
Members	User1, User2

To create the firewall user group - CLI:

```
config user group
  edit Internet_users
    set group-type firewall
    set member User1 User2
  end
```

Defining policy addresses

1. Go to **Policy & Objects > Addresses**.
2. Create the following addresses:

Address Name	Internal_net
Type	Subnet
Subnet / IP Range	10.11.102.0/24
Interface	Port 3

Address Name	Windows_net
Type	Subnet
Subnet / IP Range	10.11.101.0/24
Interface	Port 2

Creating security policies

Two security policies are needed: one for firewall group who connect through port3 and one for FSSO group who connect through port2.

To create a security policy for FSSO authentication - web-based manager:

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information:

Incoming Interface	Port2
Source Address	Windows_net
Source User(s)	FSSO_Internet_users
Outgoing Interface	Port1
Destination Address	all
Schedule	always
Service	ALL
NAT	ON
Security Profiles	Optionally, enable security profiles.

3. Select OK.

To create a security policy for FSSO authentication - CLI:

```
config firewall policy
edit 0
set srcintf port2
set dstintf port1
set srcaddr Windows_net
set dstaddr all
set action accept
set groups FSSO_Internet_users
set schedule always
set service ALL
set nat enable
end
```

To create a security policy for local user authentication - web-based manager

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information:

Incoming Interface	Port3
Source Address	Internal_net
Source User(s)	Internet_users
Outgoing Interface	Port1
Destination Address	all
Schedule	always
Service	ALL
NAT	ON
Security Profiles	Optionally, enable security profiles.

3. Select **OK**.

To create a security policy for local user authentication - CLI

```
config firewall policy
edit 0
set srcintf port3
set dstintf port1
set srcaddr internal_net
set dstaddr all
set action accept
set schedule always
set groups Internet_users
set service ALL
set nat enable
end
```

LDAP Dial-in using member-attribute example

In this example, users defined in MicroSoft Windows Active Directory (AD) are allowed to set up a VPN connection simply based on an attribute that is set to TRUE, instead of based on their user group. In AD the "Allow Dialin" property is activated in the user properties, and this sets the `msNPAllowDialin` attribute to "TRUE".

This same procedure can be used for other member attributes, as your system requires.

To accomplish this with a FortiGate unit, member-attribute must be set. This can only be accomplished through the CLI - the option is not available through the web-based manager.

Before configuring the FortiGate unit, ensure the AD server has the `msNPAllowDialin` attribute set to "TRUE" for the users in question. If not, those users will not be able to authenticate.

To configure user LDAP member-attribute settings - CLI:

```
config user ldap
  edit "ldap_server"
    set server "192.168.201.3"
    set cnid "sAMAccountName"
    set dn "DC=fortilabanz,DC=com,DC=au"
    set type regular
    set username "fortigate@sample.com"
    set password *****
    set member-attr "msNPAllowDialin"
  next
end
```

To configure LDAP group settings - CLI:

```
config user group
  edit "ldap_grp"
    set member "ldap"
    config match
      edit 1
        set server-name "ldap"
        set group-name "TRUE"
      next
    end
  next
end
```

Once these settings are in place, users that are a member of the `ldap` user group will be able to authenticate.

To ensure your settings are correct, here is the sample output from a `diag debug` command that shows the authentication process.

When the "Allow Dial-in" attribute is set to "TRUE" the following will likely be in the output:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='TRUE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Passed group matching
```

If the attribute is not set but it is expected, the following will likely be in the output:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='FALSE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Failed group matching
```

The only difference between these two outputs is the last line which is either passed or failed based on if the member-attribute is set to the expected value or not.

RADIUS SSO example

A common RADIUS SSO topology involves a medium sized company network of users connecting to the Internet through the FortiGate unit, and authenticating with a RADIUS server. RADIUS SSO authentication was selected because it is fast and relatively easy to configure.

This section includes:

- [Assumptions](#)
- [Topology](#)
- [Configuring RADIUS](#)
- [Configuring FortiGate regular and RADIUS SSO security policies](#)
- [Testing](#)

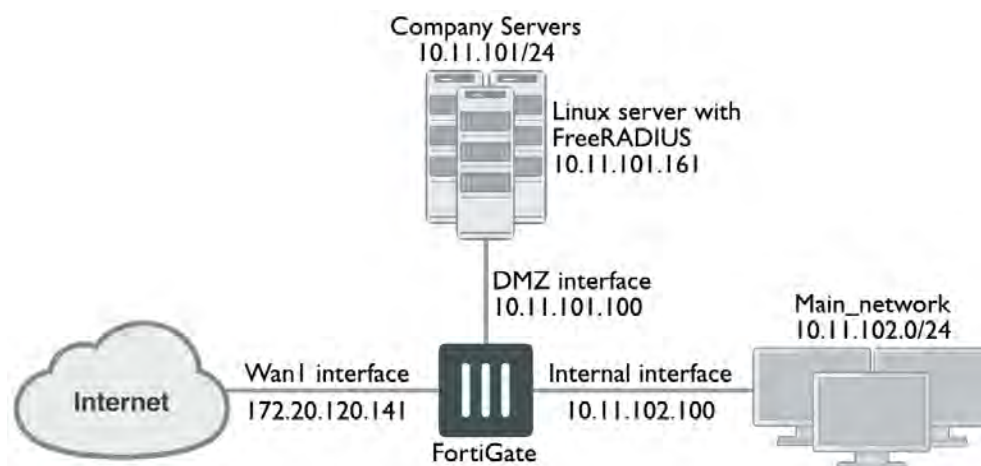

Assumptions

- VDOMs are not enabled
- The admin super_admin administrator account will be used for all FortiGate unit configuration.
- Any other devices on the network do not affect the topology of this example, and therefore are not included.
- Anywhere settings are not described, they are assumed to be default values.
- A RADIUS server is installed on a server or FortiAuthenticator unit and uses default attributes.
- BGP is used for any dynamic routing.
- Authentication event logging under Log&Report has been configured.

Topology

Example.com has an office with 20 users on the internal network. These users need access to the Internet to do their jobs. The office network is protected by a FortiGate-60C unit with access to the Internet through the wan1 interface, the user network on the internal interface, and all the servers are on the DMZ interface. This includes an Ubuntu Linux server running FreeRADIUS. For this example only two users will be configured — Pat Lee with an account name `plee`, or `plee@example.com`, and Kelly Green with an account name `kgreen`, or `kgreen@example.com`.

RADIUS SSO topology

Configuring RADIUS

Configuring RADIUS includes configuring the RADIUS server such as FreeRADIUS, a radius client on user's computers, and configuring users in the system. For this example the two users will be Pat Lee, and Kelly Green. They belong to a group called `example.com_employees`. When it is all configured, the RADIUS daemon needs to be started.

The users have a RADIUS client installed on their PCs that allows them to authenticate through the RADIUS server.

FreeRADIUS can be found on the freeradius.org website. For any problems installing FreeRADIUS, see the FreeRADIUS documentation.

Configuring FortiGate interfaces

Before configuring the RADIUS SSO security policy, configure FortiGate interfaces. This includes defining a DHCP server for the internal network as this type of network typically uses DHCP. The wan1 and dmz interfaces are assigned static IP addresses and do not need a DHCP server.

FortiGate interfaces used in this example

Interface	Subnet	Act as DHCP Server	Devices
wan1	172.20.120.141	No	Internet Service Provider
dmz	10.11.101.100	No	Servers, including RADIUS server
internal	10.11.102.100	Yes: x.x.x.110-.250	Internal user network

To configure FortiGate interfaces - web-based manager:

1. Go to **Network > Interfaces**.
2. Select wan1 to edit.
3. Enter the following information and select **OK**.

Alias	Internet
Addressing Mode	Manual
IP/Network Mask	172.20.120.141/255.255.255.0
Administrative Access	HTTPS, SSH
Enable DHCP Server	Not selected
Comments	Internet
Administrative Status	Up

4. Select dmz to edit.
5. Enter the following information and select **OK**.

Alias	Servers
Addressing Mode	Manual
IP/Network Mask	10.11.101.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING, SNMP
Enable DHCP Server	Not selected
Listen for RADIUS Accounting Messages	Select
Comments	Servers
Administrative Status	Up

6. Select internal to edit.

7. Enter the following information and select **OK**.

Alias	Internal network
Addressing Mode	Manual
IP/Network Mask	10.11.102.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING
Enable DHCP Server	Select
Address Range	10.11.102.110 - 10.11.102.250
Netmask	255.255.255.0
Default Gateway	Same as Interface IP
DNS Server	Same as System DNS
Comments	Internal network
Administrative Status	Up

Configuring a RADIUS SSO Agent on the FortiGate unit

To create a RADIUS SSO agent:

1. Go to **User & Device > Single Sign-On** and select **Create New**.
2. In **Type**, select **RADIUS Single-Sign-On Agent**.
3. Select **Use RADIUS Shared Secret** and enter the RADIUS server shared secret.
4. Select **Send RADIUS Responses**.
5. Select **OK**.

The Single Sign-On agent is named RSSO_Agent.

Creating a RADIUS SSO user group

To define a local user group for RADIUS SSO:

1. Go to **User & Device > User Groups** and select **Create New**.
2. Enter a Name for the user group.
3. In **Type**, select **RADIUS Single Sign-On (RSSO)**.
4. In **RADIUS Attribute Value**, enter the name of the RADIUS user group this local user group represents.
5. Select **OK**.

Configuring FortiGate regular and RADIUS SSO security policies

With the RADIUS server and FortiGate interfaces configured, security policies can be configured. This includes both RADIUS SSO and regular policies, as well as addresses and address groups. All policies require NAT to be enabled.

Security policies required for RADIUS SSO

Seq. No.	From -> To	Type	Schedule	Description
1	internal -> wan1	RADIUS SSO	business hours	Authenticate outgoing user traffic.
2	internal -> wan1	regular	always	Allow essential network services and VoIP.
3	dmz -> wan1	regular	always	Allow servers to access Internet.
4	internal -> dmz	regular	always	Allow users to access servers.
5	any -> any	deny	always	Implicit policy denying all traffic that hasn't been matched.

The RADIUS SSO policy must be placed at the top of the policy list so it is matched first. The only exception to this is if you have a policy to deny access to a list of banned users. In this case, that policy must go at the top so the RADIUS SSO does not mistakenly match a banned user or IP address.

This section includes:

- [Schedules, address groups, and services groups](#)
- [Configuring regular security policies](#)
- [Configuring RADIUS SSO security policy](#)

Schedules, address groups, and services groups

This section lists the lists that need to be configured before security policies are created. Creating these lists is straight forward, so the essential information has been provided here but not step by step instructions. For more

information on firewall related details, see

Schedules

Only one schedule needs to be configured — `business_hours`. This is a fairly standard Monday to Friday 8am to 5pm schedule, or whatever days and hours covers standard work hours at the company.

Address groups

The following address groups need to be configured before the security policies.

Address Group Name	Interface	Address range included
internal_network	internal	10.11.102.110 to 10.11.102.250
company_servers	dmz	10.11.101.110 to 10.11.101.250

Service groups

The following service groups need to be configured before the security policies. Note that the services listed are suggestions and may include more or less as required.

Service Group Name	Interface	Description of services to be included
essential_network_services	internal	Any network protocols required for normal network operation such as DNS, NTP, BGP.
essential_server_services	dmz	All the protocols required by the company servers such as BGP, HTTP, HTTPS, FTP, IMAP, POP3, SMTP, IKE, SQL, MYSQL, NTP, TRACEROUTE, SOCKs, and SNMP.
user_services	internal	Any protocols required by users HTTP, HTTP, FTP,

The following security policy configurations are basic and only include logging, and default AV and IPS.

Configuring regular security policies

Regular security policies allow or deny access for non-RADIUS SSO traffic. This is essential as there are network services—such as DNS, NTP, and FortiGuard—that require access to the Internet.

To configure regular security policies - web-based manager:

1. Go to **Policy & Objects > IPv4 Policy**, and select **Create New**.
2. Enter the following information, and select **OK**.

Incoming Interface	Internal
---------------------------	----------

Source Address	internal_network
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_network_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	ON
Comments	Essential network services

3. Select **Create New**, enter the following information, and select **OK**.

Incoming Interface	dmz
Source Address	company_servers
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_server_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Company servers accessing the Internet

4. Select **Create New**, enter the following information, and select **OK**.

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	dmz
Destination Address	company_servers

Schedule	always
Service	all
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Access company servers

Configuring RADIUS SSO security policy

The RADIUS SSO policy allows access for members of specific RADIUS groups.

To configure RADIUS SSO security policy:

1. Go to **Policy & Objects > IPv4 Policy**.
2. Select **Create New**.
3. Enter the following information:

Incoming Interface	Internal
Source Address	internal_network
Source User(s)	Select the user groups you created for RSSO.
Outgoing Interface	wan1
Destination Address	all
Schedule	business_hours
Service	ALL
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, WebFilter, IPS, and Email Filter. In each case, select the default profile.

4. Select **OK**.
5. To ensure an RSSO-related policy is matched first, the policy should be placed higher in the security policy list than more general policies for the same interfaces.
6. Select **OK**.

Testing

Once configured, a user only needs to log on to their PC using their RADIUS account. After that when they attempt to access an Internet website, the FortiGate unit will use their session information to get their RADIUS information. Once the user is verified, they are allowed access to the website.

To test the configuration perform the following steps:

1. Have user 'plee' logon to their PC, and try to access an Internet website.
2. The FortiGate unit will contact the RADIUS server for user plee's information. Once confirmed, plee will have access to the website. Each step generates log entries that enable you to verify that each step was successful.
3. If a step is unsuccessful, confirm that your configuration is correct.

RADIUS SSO test

Troubleshooting

In the web-based manager, a good tool for troubleshooting is the packet counter column on the security policy page at **Policy & Objects > IPv4 Policy**. This column displays the number of packets that have passed through this security policy. Its value when you are troubleshooting is that when you are testing your configuration (end to end connectivity, user authentication, policy use) watching the packet count for an increase confirms any other methods you may be using for troubleshooting. It provides the key of which policy is allowing the traffic, useful information if you expect a user to require authentication and it never happens.

This section addresses how to get more information from the CLI about users and user authentication attempts to help troubleshoot failed authentication attempts.

```
diag firewall iprope list
```

Shows the IP that the computer connected from. This is useful to confirm authorization and VPN settings.

```
diag firewall iprope clear
```

Clear all authorized users from the current list. Useful to force users to re-authenticate after system or group changes. However, this command may easily result in many users having to re-authenticate, so use carefully.

```
diag rso query ip  
diag rso query rso-key
```

Queries the RSSO database.

Chapter 4 - Best Practices

Best practices

This FortiGate Best Practices document is a collection of guidelines to ensure the most secure and reliable operation of FortiGate units in a customer environment. It is updated periodically as new issues are identified.

General Considerations

1. For security purposes, NAT mode is preferred because all of the internal or DMZ networks can have secure private addresses. NAT mode policies use network address translation to hide the addresses in a more secure zone from users in a less secure zone.
2. Use virtual domains (VDOMs) to group related interfaces or VLAN subinterfaces. Using VDOMs will partition networks and create added security by limiting the scope of threats.
3. Use Transparent mode when a network is complex and does not allow for changes in the IP addressing scheme.

Customer service and technical support

For antivirus and attack definition updates, firmware updates, updated product documentation, technical support information, and other resources, please visit the Fortinet Technical Support web site at <http://support.fortinet.com>.

You can also register Fortinet products and service contracts from <http://support.fortinet.com> and change your registration information at any time.

For information about our priority support hotline (live support), see <http://support.fortinet.com>.

When requesting technical support, please provide the following information:

- Your name, and your company's name and location
- Your email address and/or telephone number
- Your support contract number (if applicable)
- The product name and model number
- The product serial number (if applicable)
- The software or firmware version number
- A detailed description of the problem

Fortinet Knowledge Base

The most recent Fortinet technical documentation is available from the Fortinet Knowledge Base. The knowledge base contains short how-to articles, FAQs, technical notes, product and feature guides, and much more. Visit the Fortinet Knowledge Base at <http://kb.fortinet.com>.

Comments on Fortinet technical documentation

Please send information about any errors or omissions in this document, or any Fortinet technical documentation, to techdoc@fortinet.com.

System and performance

By implementing the following best practices for system and performance, you will ensure maximum efficiency of your FortiGate device. Be sure to read everything carefully, particularly the section that concerns shutting down the FortiGate system, in order to avoid potential hardware issues.

Performance

- Disable any management features you do not need. If you don't need SSH or SNMP, disable them. SSH also provides another possibility for would-be hackers to infiltrate your FortiGate unit.
- Put the most used firewall rules to the top of the interface list.
- Log only necessary traffic. The writing of logs, especially if to an internal hard disk, slows down performance.
- Enable only the required application inspections.
- Keep alert systems to a minimum. If you send logs to a syslog server, you may not need SNMP or email alerts, making for redundant processing.
- Establish scheduled FortiGuard updates at a reasonable rate. Daily updates occurring every 4-5 hours are sufficient for most situations. In more heavy-traffic situations, schedule updates for the evening when more bandwidth can be available.
- Keep security profiles to a minimum. If you do not need a profile on a firewall rule, do not include it.
- Keep VDOMs to a minimum. On low-end FortiGate units, avoid using them if possible.
- Avoid traffic shaping if you need maximum performance. Traffic shaping, by definition, slows down traffic.

Shutting down

Always shut down the FortiGate operating system properly before turning off the power switch to avoid potentially catastrophic hardware problems.

To power off the FortiGate unit - web-based manager:

1. Go to **Dashboard**.
2. In the **System Resources** widget, select **Shutdown**.

To power off the FortiGate unit – CLI:

```
execute shutdown
```

Once this has been done, you can safely turn off the power switch or disconnect the power cables from the power supply.

Migration

Network administrators are often reluctant to change firewall vendors due to the perception that the migration process is difficult. Indeed, there is no point hiding the fact that moving to a new vendor requires careful consideration. But concern over the potential pain of migration should not stand in the way of adopting new security technologies. The purpose of this chapter is to describe the best practices for performing such migrations and ultimately to ease the migration process itself.

Information gathering

It is always best practice to perform a full network audit prior to any migration. This should include:

- Full back up of all security systems (including switches, routers) in case a back-out needs to be performed.
- Physical and logical network diagram with visual audit

Understanding exactly where cables run in the network and verifying they are all correctly labeled is essential to avoid mistakes and unnecessary downtime during the upgrade. Don't overlook simple things such as:

- Do I have enough spare interfaces on my switches?
- Do I have the right fiber (single/multi mode) and right connectors (LC, FC, MTRJ, SC, ST)?
- Do I have spare cables? (in the heat of the moment, it is a simple mistake to break an RJ-45 connector or damage a fiber)
- Do I have space in the rack for the new equipment?
- Do I have enough power sockets?

No matter how securely a FortiGate is configured in the network, it cannot help if it has been bypassed; visually checking where the device sits in the network in relation to other devices will ensure you are maintaining security and verify the network diagram is 'as built'. Details of all networks including subnet masks should be documented at this point to ensure that the replacement device is configured with the correct information.

Object and policy migration

Whilst we have suggested some level of manual review is included in the policy migration, it can be useful to be able to automatically migrate simply between another vendor's format and the FortiGate format. The FortiGate policy format is text based and can easily be cut and pasted into from other vendor formats however, responding to the high customer demand to migrate away from other vendors, Fortinet have released an automatic configuration migration tool at <http://convert.fortinet.com> to simplify this process. Supporting Cisco ACLs, PIX, ASA, Check Point, and Juniper, the Converter can securely upload and convert the policy into the Fortinet format.

Testing and validation

This is an important process and should be tested offline first wherever possible i.e. configure the policy in the lab or on a test network and verify that the required access permissions are being implemented. To really test the solution out, the FortiGate can be implemented on the live network with a different gateway IP and the selected user pointed to the new gateway. This allows a staged approach to migrating the new platform into the network ensuring that the process does not interrupt day to day operations.

Going live and obtaining feedback

If testing and validation is successful at this point, you can migrate to the new firewall either by switching IP's and removing the old devices or by changing the default gateway in DHCP. Once the firewall is in place, acceptance testing will of course need to be carried out and an iterative process of tuning undertaken to finalize the configuration.

Adding new services

The Fortinet solution will have a plethora of additional features compared to your previous vendor and it is very tempting to start switching them on but it is a good idea to wait and validate the new firewall as was previously configured before adding new functions as this simplifies testing and problem diagnosis. Finally complete the migration (don't forget about the Plan Do Check Act Cycle) by adding any new services that were requested and learn about the multiple features you have available with the FortiGate appliance.

Environmental specifications

Keep the following environmental specifications in mind when installing and setting up your FortiGate unit.

- Operating temperature: 32 to 104°F (0 to 40°C). Temperatures may vary, depending on the FortiGate model.
- If you install the FortiGate unit in a closed or multi-unit rack assembly, the operating ambient temperature of the rack environment may be greater than room ambient temperature.
Therefore, make sure to install the equipment in an environment compatible with the manufacturer's maximum rated ambient temperature.
- Storage temperature: -13 to 158°F (-25 to 70°C). Temperatures may vary, depending on the FortiGate model.
- Humidity: 5 to 90% non-condensing.
- Air flow - For rack installation, make sure that the amount of air flow required for safe operation of the equipment is not compromised.
- For free-standing installation, make sure that the appliance has at least 1.5 in. (3.75 cm) of clearance on each side to allow for adequate air flow and cooling.

Depending on your device, the FortiGate may generate, use, and even radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If the equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Explosion is a serious risk if the battery is replaced by an incorrect type. Dispose of used batteries according to the instructions. To reduce the risk of fire, use only No. 26 AWG or larger UL Listed or CSA Certified Telecommunication Line Cord.

Grounding

- Ensure the FortiGate unit is connected and properly grounded to a lightning and surge protector. WAN or LAN connections that enter the premises from outside the building should be connected to an Ethernet CAT5 (10/100 Mb/s) surge protector.
- Shielded Twisted Pair (STP) Ethernet cables should be used whenever possible rather than Unshielded Twisted Pair (UTP).
- Do not connect or disconnect cables during lightning activity to avoid damage to the FortiGate unit or personal injury.

Rack mounting

- **Elevated Operating Ambient** - If installed in a closed or multi-unit rack assembly, the operating ambient temperature of the rack environment may be greater than room ambient.
Therefore, consideration should be given to installing the equipment in an environment compatible with the maximum ambient temperature (Tmax) specified by the manufacturer.

- **Reduced Air Flow** - Installation of the equipment in a rack should be such that the amount of air flow required for safe operation of the equipment is not compromised.
- **Mechanical Loading** - Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.
- **Circuit Overloading** - Consideration should be given to the connection of the equipment to the supply circuit and the effect that overloading of the circuits might have on overcurrent protection and supply wiring. Appropriate consideration of equipment nameplate ratings should be used when addressing this concern.
- **Reliable Earthing** - Reliable earthing of rack-mounted equipment should be maintained.

Particular attention should be given to supply connections other than direct connections to the branch circuit (e.g. use of power strips).

Firmware

Firmware upgrading and downgrading sounds pretty simple, anyone can do it, right? The mark of a professional is not that they can do something correctly, or even do it correctly over and over again. A professional works in such a way that, if anything goes wrong they are prepared and able to quickly get things back to normal. Firmware updates can go wrong just like anything else. So a real professional does things in a way that minimizes their risk and follows some best practices, as listed below.

Firmware change management

Consider the following five points when performing firmware upgrades, not only in FortiOS but in general. This applies to pretty much any change you have to do in a production environment.

Understanding the new version first

Before attempting any changes in production, first make sure you set up a laboratory where you can freely play with the new features, and understand them with enough time and no pressure. Read the Release Notes, Manuals, and other documentation like presentations, videos, or podcasts about the new version.

You are ready to explain the need for an upgrade once you understand:

- The differences and the enhancements between the new version and the previous version(s).
- The impact of the upgrade on customers and the users of the operating platform.
- The known limitations that might affect your environment.
- The potential risks when performing the upgrade.
- The licensing changes that may apply.

Never attempt to upgrade to a version you don't fully understand (both on features and known limitations), and on which you have no operational experience.

Have a valid reason to upgrade

The reason can NOT be "Because I want to have the latest version". The reason has to be explained in terms of business, technical, and/or operational improvement.

Affirmative answers to the following questions are valid reasons to upgrade:

- Does the new version have a feature that helps to ensure compliance?
- Does the new version have an enhancement that allows 40% decrease (40% improvement) on the time to perform a certain operation?
- Does the new feature correct a known defect/bug found on a previous version that affects the company business/operations?
- Will the new version allow your organization to deploy new services that will help to gain new customers or increase loyalty of existing ones?
- Is the vendor cutting support for the version your organization is currently using?

If the best reason to upgrade is “Because the new features seem to be cool” or “Because I want to have the latest version”, a little more understanding and planning may be necessary.

Prepare an upgrade plan

If you choose to upgrade because you found a valid reason to do so, make sure you create a plan that covers business, technical, and operational aspects of the upgrade:

Business:

Proper planning and justification for an upgrade should be proportional to how critical the system is to the business.

- Make sure you can clearly articulate the benefits of the upgrade in business terms (time, money, and efficiency).
- Understand the business processes that will be affected by the change.
- Make sure the upgrade maintenance window is not close to a business-critical process (such as quarterly or monthly business closure).
- Obtain executive and operational approval for the maintenance window. The approval must come from the owners of ALL the systems/information affected by the upgrade, not only from those that own the system being upgraded. The approval must be done in a formal (written or e-mail) form.

Technical and operational:

- Re-read the Release Notes for the technology you are upgrading. Supported hardware models, upgrade paths, and known limitations should be clearly understood.
- Make sure your upgrade maintenance window does not overlap with any other maintenance window on your infrastructure.
- If you have any premium support offer (such as TAM, Premium Support), do a capacity planning exercise to ensure the new firmware/software version does not take more hardware resources than you currently have.
- Create a backup, whether or not you have scheduled backups. Create a new fresh backup.
- Obtain offline copies of both the currently installed firmware and the new version.
- Create a list of systems with inter-dependencies to the system you are upgrading. For example, if you are upgrading a FortiGate; understand the impact on any FortiAP, FortiAuthenticator, FortiToken, FortiManager, or FortiAnalyzer you have on your environment.
- Ensure you have a list of adjacent devices to the upgrading platform and have administrative access to them, just in case you need to do some troubleshooting. Are you upgrading FortiWeb? Make sure you can administratively access the Web Applications. Are you upgrading a FortiGate? Make sure you can administratively access the surrounding switches and routers.
- Have a step-by-step plan on how to perform and test the upgrade. You want to make sure you think of the worst situation before it happens, and have predefined courses of action, instead of thinking under pressure when something already went wrong.
- Define a set of tests (that include critical business applications that should be working) to make sure the upgrade went fine. If any test does not go well, define which ones mandate a rollback and which ones can be tolerated for further troubleshooting. This set of tests should be run before and after the upgrade to compare results, and they should be the same.
- Define a clear rollback plan. If something goes wrong with the upgrade or the tests, the rollback plan will help you get your environment back to a known and operational status. The plan must clearly state the conditions under which the rollback will be started.

- Declare configuration freezes. A little bit before and after the upgrade. The idea is to reduce the amount of variables to take into consideration if something goes wrong.
- Perform a “Quality Assurance” upgrade. Grab a copy of the production configuration, load it on a non-production box and execute the upgrade there to see if there are any issues on the process. Then adjust your plan according to the results you obtained.
- Have a list of information elements to be gathered if something goes wrong. This ensures that, even if the upgrade fails, you will collect enough information so you can troubleshoot the issue without needing to repeat the problem. Get help from TAC/Support departments if you need to check what else could be missing on your list.
- Define a test monitoring period after the change was completed. Even if the upgrade went smoothly, something could still go wrong. Make sure you monitor the upgraded system for at least one business cycle. Business cycles may be a week, a month, or a quarter, depending on your organization’s business priorities.

Execute the upgrade plan

Execution of an upgrade is just as key as planning.

Once you are performing the upgrade, the pressure will rise and stress might peak. This is why you should stick to the plan you created with a cool head.

Resist the temptation to take decisions while performing the upgrade, as your judgment will be clouded by the stress of the moment, even if a new decision seems to be “obvious” at such time. If your plan says you should rollback, then execute the rollback despite the potential “We-can-fix-this-very-quickly” mentality.

While performing the upgrade, make sure all the involved components are permanently monitored before, during, and after the upgrade, either via monitoring systems, SNMP alerts, or at least with tools like a ping. Critical resources like CPU, memory, network, and/or disk utilization must also be constantly monitored.

To avoid misunderstandings, when performing the tests for each critical application defined on the planning, make sure there are formal notifications on the results for each user area, service, system, and/or application tested.

Regardless if you have to rollback or not, if a problem occurs, make sure you gather as much information about the problem as possible, so you can later place a support ticket to find a solution.

Last but not least, document the upgrade:

- Enable your terminal emulation program to leave trace of all the commands executed and all the output generated. If you are performing steps via GUI, consider using a video capture tool to document it.
- Document any command or change performed over the adjacent/interdependent systems. Make sure they are acknowledged by the relevant administrators
- Document any deviations performed over the upgrade plan. This is planned-versus-actual.

Learn more about change management

Change Management and Change Control are huge knowledge areas in the field of Information Systems and Computer/Network Security.

This document is by no means a comprehensive list on what you should do when performing an upgrade, with either Fortinet or any other technology. It is merely a list of important things you should take into consideration when performing upgrades which are the result of years of experience dealing with changes on critical environments, as it is common that security devices are protecting critical applications and processes.

There are vast resources on the topic: books, public white papers, blog entries, etc. If you search the Internet for the “Change Control Best Practices” or “Change Management Best Practices” you will get many interesting documents.

Changes on production IT infrastructure are critical to the business. Make sure they play in your favor and not against you.

Performing a firmware upgrade

Upgrading a firewall is something that should be compared to upgrading the operating system on your computer. It's not to be taken lightly! You want to make sure everything is backed up and you have some options available if things go awry. Assuming it all seems to work you also want a list of things to do in order to confirm everything is working properly. Finally, you need enough time to do it. All really simple stuff, but what does this mean in relation to upgrading your FortiGate? It means, you follow these simple steps:

- 1. Backup and store old configuration (full configuration backup from CLI).**

Digging into this a little, step 1 is easy to understand. Do a full backup of your old configuration. This is all part of your disaster recovery plan. If the upgrade fails in some way you need to make sure you can get the Firewall back up and running. The best way to do this is to get it back to a state where you know what the behavior was. For more information, refer to ["Performing a configuration backup" on page 591](#).

- 2. Have copy of old firmware available.**

Step 2, is also part of your disaster recovery. If the upgrade fails you might be able to switch the active partition. But as a Professional, you need to be prepared for the worst case scenario where you can't do that. Which means you'll need your old firmware.

- 3. Have disaster recovery option on standby – especially if remote.**

Step 3, is your plan for what to do in the event of a critical failure. As we're talking FortiGate this means that your firewall doesn't come back after the upgrade. What this means is that you need to be able to get to the console port in order to find out why. Maybe it's DHCP and the IP changed, maybe the OS is corrupt, who knows? Get to the console and find out.

There could be a simple fix. If there's not, then be prepared for a format and TFTP reload.

- 4. Read the release notes, including the upgrade path and bug information.**

Step 4, READ THE RELEASE NOTES. They contain all kinds of information, known bugs, fixed bugs even upgrade issues like lost configuration settings. Not all upgrade information is ever contained in any products release notes. That does not mean they are devoid of good/useful information. Read them, digest them, then a few days later read them again.

- 5. Double check everything.**

Step 5, do a double check of everything. Is your TFTP server working, does your console connection function, is there anything in the release notes that could impact your upgrade procedure, do you have your configuration backed up? Make sure you've done everything.

- 6. Upgrade.**

Step 6, do the upgrade. Doing an upgrade doesn't take very long, a few minutes (less a lot of times) but make sure you schedule enough time for it. At the end of the day an upgrade can succeed or fail. If it succeeds you want some time to check/confirm that any important features you have are working (VPNs etc). If it fails you'll need time to sort things out.

Performing a firmware downgrade

Just like upgrading, you need to make sure it's done properly. While similar, the steps are somewhat different since there are other pitfalls in this case.

- 1. Locate pre-upgrade configuration file.**

Step 1 is very important. This is why, when you upgrade you make a backup of your old configuration and save it. If you don't, then you'll need to rebuild manually.

- 2. Have copy of old firmware available.**

Step 2 is fairly obvious. Even with devices that have multiple partitions and your downgrade process is simply going to be to switch the active partition, this could go wrong. In which case, you may be without Internet access. A professional has a plan for when things go wrong.

- 3. Have disaster recovery option on standby – especially if remote.**

Step 3 is no different from before. Hopefully you don't need to format the unit, but be prepared for that, just in case.

- 4. Read the release notes – is a downgrade possible, or necessary?**

Step 4, once again, is to READ THE RELEASE NOTES. In this case, you will need to do this for the version you are on, and the version you are downgrading too, and everything in between (if you are going back multiple major releases or patches). Maybe the OS switched from 32 to 64 bits somewhere between the two firmware releases. In order to make sure you don't get nailed by something like that you need to check the upgrade and downgrade information in every major release and patch, as it may have a direct impact on your options.

- 5. Double check everything.**

- 6. Downgrade – all settings, except those needed for access, are lost.**

Step 5 and 6 are the same as before. Double check everything, then downgrade.

- 7. Restore pre-upgrade configuration.**

Step 7 is new. Obviously most settings are lost when you downgrade so in order to get back up and running you will need to restore your old configuration file.

Performing a configuration backup

Once you configure the FortiGate unit and it is working correctly, it is extremely important that you backup the configuration. In some cases, you may need to reset the FortiGate unit to factory defaults or perform a TFTP upload of the firmware, which will erase the existing configuration. In these instances, the configuration on the device will have to be recreated, unless a backup can be used to restore it.

It is also recommended that once any further changes are made that you backup the configuration immediately, to ensure you have the most current configuration available. Also, ensure you backup the configuration before upgrading the FortiGate unit's firmware. Should anything happen during the upgrade that changes the configuration, you can easily restore the saved configuration.

Always backup the configuration and store it on the management computer or off-site. You have the option to save the configuration file to various locations including the local PC, USB key, FTP and TFTP site. The latter two are configurable through the CLI only.

If you have VDOMs, you can back up the configuration of the entire FortiGate unit or only a specific VDOM. Note that if you are using FortiManager or FortiCloud, full backups are performed and the option to backup individual VDOMs will not appear.

To back up the FortiGate configuration - web-based manager:

1. Go to **Dashboard**.
2. On the **System Information** widget, select **Backup** next to **System Configuration**.
3. Select to backup to your **Local PC** or to a **USB Disk**.
The **USB Disk** option will be grayed out if no USB drive is inserted in the USB port. You can also backup to the FortiManager using the CLI.
4. If VDOMs are enabled, select to backup the entire FortiGate configuration (**Full Config**) or only a specific VDOM configuration (**VDOM Config**).
5. If backing up a VDOM configuration, select the VDOM name from the list.
6. Select **Encrypt configuration file**.
Encryption must be enabled on the backup file to back up VPN certificates.
7. Enter a password and enter it again to confirm it. You will need this password to restore the file.
8. Select **Backup**.
9. The web browser will prompt you for a location to save the configuration file. The configuration file will have a .conf extension.

To back up the FortiGate configuration - CLI:

```
execute backup config management-station <comment>
```

... or ...

```
execute backup config usb <backup_filename> [<backup_password>]
```

... or for FTP (note that port number, username are optional depending on the FTP site)...

```
execute backup config ftp <backup_filename> <ftp_server> [<port>] [<user_name>]  
[<password>]
```

... or for TFTP ...

```
execute backup config tftp <backup_filename> <tftp_servers> <password>
```

Use the same commands to backup a VDOM configuration by first entering the commands:

```
config vdom  
edit <vdom_name>
```

Backing up a configuration file using SCP

You can use secure copy protocol (SCP) to download the configuration file from the FortiGate unit as an alternative method of backing up the configuration file or an individual VDOM configuration file. This is done by enabling SCP for an administrator account and enabling SSH on a port used by the SCP client application to connect to the FortiGate unit. SCP is enabled using the CLI commands:

```
config system global  
set admin-scp enable  
end
```

Use the same commands to backup a VDOM configuration by first entering the commands:

```
config global  
set admin-scp enable  
end
```

```
config vdom
  edit <vdom_name>
```

Security Profiles (AV, Web Filtering etc.)

Infection can come from many sources and have many different effects. Because of this, there is no single means to effectively protect your network. Instead, you can best protect your network with the various UTM tools your FortiGate unit offers.

Firewall

- Be careful when disabling or deleting firewall settings. Changes that you make to the firewall configuration using the GUI or CLI are saved and activated immediately.
- Arrange firewall policies in the policy list from more specific to more general. The firewall searches for a matching policy starting from the top of the policy list and working down. For example, a very general policy matches all connection attempts. When you create exceptions to a general policy, you must add them to the policy list above the general policy.
- Avoid using the All selection for the source and destination addresses. Use addresses or address groups.
- If you remove all policies from the firewall, there are no policy matches and all connections are dropped.
- If possible, avoid port ranges on services for security reasons.
- The settings for a firewall policy should be as specific as possible. Do not use 0.0.0.0 as an address. Do not use Any as a service. Use subnets or specific IP addresses for source and destination addresses and use individual services or service groups.
- Use a 32-bit subnet mask when creating a single host address (for example, 255.255.255.255).
- Use logging on a policy only when necessary and be aware of the performance impact. For example, you may want to log all dropped connections but can choose to use this sparingly by sampling traffic data rather than have it continually storing log information you may not use.
- It is possible to use security policies based on 'any' interface. However, for better granularity and stricter security, explicit interfaces are recommended.
- Use the comment field to input management data, for example: who requested the rule, who authorized it, etc.
- Avoid FQDN addresses if possible, unless they are internal. It can cause a performance impact on DNS queries and security impact from DNS spoofing.
- For non vlan interfaces, use zones (even if you have only one single interface for members) to allow:
 - An explicit name of the interface to use in security policies ('internal' is more explicit than 'port10').
 - A split between the physical port and its function to allow port remapping (for instance moving from a 1G interface to a 10G interface) or to facilitate configuration translation, as performed during hardware upgrades.

Security

- Use NTP to synchronize time on the FortiGate and the core network systems, such as email servers, web servers, and logging services.
- Enable log rules to match corporate policy. For example, log administration authentication events and access to systems from untrusted interfaces.
- Minimize adhoc changes to live systems, if possible, to minimize interruptions to the network. When not possible, create backup configurations and implement sound audit systems using FortiAnalyzer and FortiManager.
- If you only need to allow access to a system on a specific port, limit the access by creating the strictest rule possible.

Authentication

- You must add a valid user group to activate the Authentication check box on the firewall policy configuration page.
- Users can authenticate with the firewall using HTTP or FTP. For users to be able to authenticate, you must add an HTTP or FTP policy that is configured for authentication.

Antivirus

- Enable antivirus scanning at the network edge for all services.
- Use FortiClient endpoint antivirus scanning for protection against threats that get into your network.
- Subscribe to FortiGuard AntiVirus Updates and configure your FortiGate unit to receive push updates. This will ensure you receive antivirus signature updates as soon as they are available.
- To ensure that all AV push updates occur, ensure you have an AV profile enabled in a security policy.
- Enable only the protocols you need to scan. If you have antivirus scans occurring on the SMTP server, or use FortiMail, it is redundant to have scanning occur on the FortiGate unit as well.
- Reduce the maximum file size to be scanned. Viruses usually travel in small files of around 1 to 2 megabytes.
- Do not quarantine files unless you regularly monitor and review them. This is otherwise a waste of space and impacts performance.
- Examine antivirus reports and log messages periodically. Take particular notice of repeated detections. For example, repeated virus detection in SMTP traffic could indicate a system on your network is infected and is attempting to contact other systems to spread the infection using a mass mailer.

Antispam

- If possible use, a FortiMail unit. The antispam engines are more robust.
- Use fast DNS servers.
- Use specific security profiles for the rule that will use antispam.
- DNS checks may cause false positive with HELO DNS lookup.
- Content analysis (banned words) may impose performance overhead.

Intrusion Prevention System (IPS)

Your FortiGate's IPS system can detect traffic attempting to exploit this vulnerability. IPS may also detect when infected systems communicate with servers to receive instructions. Refer to the following list of best practices regarding IPS.

- Enable IPS scanning at the network edge for all services.
- Use FortiClient endpoint IPS scanning for protection against threats that get into your network.
- Subscribe to FortiGuard IPS Updates and configure your FortiGate unit to receive push updates. This will ensure you receive IPS signature updates as soon as they are available.
- Because it is critical to guard against attacks on services that you make available to the public, configure IPS signatures to block matching signatures. For example, if you have a web server, configure the action of web server signatures to Block.
- Create and use security profiles with specific signatures and anomalies you need per-interface and per-rule.
- Do not use predefined or generic profiles. While these profiles are convenient to supply immediate protection, you should create profiles to suit your network environment.

- If you do use the default profiles, reduce the IPS signatures/anomalies enabled in the profile to conserve processing time and memory.
- If you are going to enable anomalies, make sure you tune thresholds according to your environment.
- If you need protection, but not audit information, disable the logging option.
- Tune the IP-protocol parameter accordingly.

Blocking Skype using CLI options for improved detection

If you want to identify or block Skype sessions, use the following CLI command with your FortiGate's public IP address to improve detection (FortiOS 4.3.12+ and 5.0.2+):

```
config ips global
    set skype-client-public-ipaddr 198.51.100.0,203.0.113.0
end
```

Note that the above syntax is configured using multiple public IP addresses, where a single public IP address may suffice depending on your network configuration.

Email filter

Spam is a common means by which attacks are delivered. Users often open email attachments they should not, and infect their own machine.

- Enable email filtering at the network edge for all types of email traffic.
- Use FortiClient endpoint IPS scanning for protection against threats that get into your network.
- Subscribe to the FortiGuard AntiSpam Service.

amURL filtering

Best practices for URL filtering can be divided into four categories: flow-based versus proxy based filtering; local category/rating feature; URL filter 'Exempt' action; and Deep Scan.

Flow-based versus proxy-based

Try to avoid mixing flow-based and proxy-based features in the same profile if you are not using IPS or Application Control.

Local category/rating feature

Local categories and local rating features consume a large amount of CPU resources, so use these features as little as possible. It is better to use Local categories instead of using the 'override' feature, since the 'override' feature is more complicated and more difficult to troubleshoot.

URL filter 'Exempt' action

When using the URL filter 'Exempt' option, webfilter, antivirus and dlp scans are bypassed by default, so use this option only for trusted sites.

Configuration notes: You need to configure 'Exempt' actions in the URL filter if you want to bypass the FortiGuard Web Filter. You can configure which particular inspection(s) you want to bypass using the `set exempt` command in `config webfilter urlfilter`.

Deep Scan

The 'Deep Scan' feature is much heavier on resources than 'HTTPS URL Scan Only'. Deep Scan is much more accurate, since many sites (such as various Google applications) cannot be scanned separately without deep scanning enabled.

Note: If you configure Deep Scan in the SSL profile and then configure 'Enable HTTPS URL Scan Only' in the web filter profile, then Deep Scan is not performed.

Web filtering

FortiGuard Web Filtering can help stop infections from malware sites and help prevent communication if an infection occurs.

- Enable FortiGuard Web Filtering at the network edge.
- Install the FortiClient application and use FortiGuard Web Filtering on any systems that bypass your FortiGate unit.
- Block categories such as Pornography, Malware, Spyware, and Phishing. These categories are more likely to be dangerous

Patch management

When vulnerabilities are discovered in software, the software vendors release updates that fix these problems. Keeping your software and operating system up-to-date is a vital step to prevent infection and defend against attacks.

- Follow the latest advisories and reports on the FortiGuard webpage.
- Apply updates to all software as the updates become available.
- FortiGuard Vulnerability Management can help identify security weaknesses in your network. This subscription service is available through FortiScan and FortiAnalyzer units.
- Apply firmware updates to your FortiGate unit as they are released.
- Subscribe to FortiGuard AntiVirus and IPS services, so that AntiVirus and IPS scanning engines are automatically updated when new version are released.

Policy configuration

Configuring the FortiGate unit with an 'allow all' traffic policy is very undesirable. While this does greatly simplify the configuration, it is less secure. As a security measure, it is best practice for the policy rulebase to 'deny' by default, and not the other way around.

Policy configuration changes

On a heavy-loaded system, plan configuration changes during low usage periods in order to minimize impact on CPU usage and established sessions. In this scenario, it is considered a best practice to de-accelerate the hardware-accelerated sessions.

You can configure de-accelerated behaviour on hardware-accelerated sessions using CLI commands to control how the processor manages policy configuration changes. The following CLI commands are to be used:

```
config system settings
    set firewall-session-dirty { check-all | check-new | check-policy-option }
end
```

where you want the following to be true:

<code>check-all</code>	CPU flushes all current sessions and re-evaluates them. This is the default option.
<code>check-new</code>	CPU keeps existing sessions and applies policy changes to new sessions only. This reduces CPU load and the possibility of packet loss.
<code>check-policy-option</code>	Use the option selected in the <code>firewall-session-dirty</code> field of the firewall policy (<code>check-all</code> or <code>check-new</code> , as above, but per policy).

Policy whitelisting

- Allow only the necessary inbound and outbound traffic.
- If possible, limit traffic to specific addresses or subnets. This allows the FortiGate unit to drop traffic to and from unexpected addresses.

IPS and DoS policies

- Because it is critical to guard against attacks on services that you make available to the public, configure IPS signatures to block matching signatures. For example, if you have a web server, configure the action of web server signatures to Block.
- Your FortiGate unit includes IPS signatures written to protect specific software titles from DoS attacks. Enable the signatures for the software you have installed and set the signature action to Block.
- DoS attacks are launched against vulnerabilities. Maintain a FortiGuard IPS subscription to ensure your FortiGate unit automatically receives new and updated IPS signatures as they are released.
- Use and configure DoS policies to appropriate levels based on your network traffic and topology. This will help drop traffic if an abnormal amount is received. The key is to set a good threshold. The threshold defines the maximum number of sessions/packets per second of normal traffic. If the threshold is exceeded, the action is triggered. Threshold defaults are general recommendations, but your network may require very different values. One way to find the correct values for your environment is to set the action to Pass and enable logging. Observe the logs and adjust the threshold values until you can determine the value at which normal traffic begins to generate attack reports. Set the threshold above this value with the margin you want. Note that the smaller the margin, the more protected your system will be from DoS attacks, but your system will also be more likely to generate false alarms.

Networking

When configuring your network, ensure that there is no 'back door' access to the protected network. For example, if there is a wireless access point, it must be appropriately protected with password and encryption.

Be sure to also maintain an up-to-date network diagram which includes IP addressing, cabling, and network elements.

Routing configuration

- Always configure a default route.
- Add blackhole routes for subnets reachable using VPN tunnels. This ensures that if a VPN tunnel goes down, traffic is not mistakenly routed to the Internet unencrypted.

Policy routing

Keep the number of policy routes to a minimum to optimize performance in route lookup and to simplify troubleshooting.

Dynamic routing

- Select a Router ID that matches an IP assigned to an interface. This avoids the likelihood of having two devices with the same router ID.
- For routing over an IPsec tunnel, assign IP addresses to both ends of the tunnel.

Advanced routing

Use the following best practices for advanced routing when dealing with Border Gateway Protocol (BGP) and Open Shortest Path First (OSPF).

Border Gateway Protocol (BGP)

If you are using BGP, it is recommended that you enable soft-reconfiguration. This has two benefits:

- It allows you to perform 'soft clear' of peers after a change is made to a BGP policy.
- It provides greater visibility into the specific prefixes learned from each neighbor.

Leave soft-reconfiguration disabled if your FortiGate does not have much unused memory. Soft-reconfiguration requires keeping separate copies of prefixes received and advertised, in addition to the local BGP database.

Open Shortest Path First (OSPF)

- Avoid use of passive interfaces wherever possible.
- Avoid use of virtual links to connect areas. All areas should be designed to connect directly to the backbone area.
- Ensure that all backbone routers have a minimum of two peering connections to other backbone neighbors.
- An entire OSPF domain should be under common administration.

Network Address Translation (NAT)

- Beware of misconfiguring the IP Pool range. Double-check the start and end IPs of each IP pool. The IP pool should not overlap with addresses assigned to FortiGate interfaces or to any hosts on directly connected networks.
- If you have internal and external users accessing the same servers, use split DNS to offer an internal IP to internal users so that they don't have to use the external-facing VIP.

Configuring NAT

Do not enable NAT for inbound traffic unless it is required by an application. If, for example, NAT is enabled for inbound SMTP traffic, the SMTP server might act as an open relay.

Transparent Mode

- Do not connect two ports to the same VLAN on a switch or to the same hub. Some Layer 2 switches become unstable when they detect the same MAC address originating on more than one switch interface or from more than one VLAN.
- If you operate multiple VLANs on your FortiGate unit, assign each VLAN id to its own forwarding domain to ensure that the scope of the broadcast does not extend beyond the VLAN it originated in.

To protect against Layer 2 loops:

- Enable `stpforward` on all interfaces.
- Use separate VDOMs for production traffic (TP mode VDOM) and management traffic (NAT mode VDOM).
- Only place those interfaces used for production in the TP mode VDOM. Place all other interfaces in the NAT mode VDOM. This protects against potential Layer 2 loops.

Using Virtual IPs (VIPs)

- Use the external IP of 0.0.0.0 when creating a VIP for a FortiGate unit where the external interface IP address is dynamically assigned.
- Be sure to select the correct external interface when creating a new virtual IP (VIP). The external interface should be set to the interface at which the FortiGate unit receives connection requests from external networks.

FGCP High Availability

Fortinet suggests the following practices related to high availability:

- Use Active-Active HA to distribute TCP and UTM sessions among multiple cluster units. An active-active cluster may have higher throughput than a standalone FortiGate unit or than an active-passive cluster.
- Use a different host name on each FortiGate unit when configuring an HA cluster. Fewer steps are required to add host names to each cluster unit before configuring HA and forming a cluster.
- Consider adding an Alias to the interfaces used for the HA heartbeat so that you always get a reminder about what these interfaces are being used for.
- Enabling `load-balance-all` can increase device and network load since more traffic is load-balanced. This may be appropriate for use in a deployment using the firewall capabilities of the FortiGate unit and IPS but no other content inspection.
- An advantage of using session pickup is that non-content inspection sessions will be picked up by the new primary unit after a failover. The disadvantage is that the cluster generates more heartbeat traffic to support session pickup as a larger portion of the session table must be synchronized. Session pickup should be configured only when required and is not recommended for use with SOHO FortiGate models. Session pickup should only be used if the primary heartbeat link is dedicated (otherwise the additional HA heartbeat traffic could affect network performance).
- If session pickup is not selected, after a device or link failover all sessions are briefly interrupted and must be re-established at the application level after the cluster renegotiates. For example, after a failover, users browsing the web can just refresh their browsers to resume browsing. Users downloading large files may have to restart their download after a failover. Other protocols may experience data loss and some protocols may require sessions to be manually restarted. For example, a user downloading files with FTP may have to either restart downloads or restart their FTP client.
- If you need to enable session pickup, consider enabling `session-pickup-delay` to improve performance by reducing the number of sessions that are synchronized. See [Improving session synchronization performance on page 1954](#).
- Consider using the `session-sync-dev` option to move session synchronization traffic off the HA heartbeat link to one or more dedicated session synchronization interfaces. See [Improving session synchronization performance on page 1954](#).
- To avoid unpredictable results, when you connect a switch to multiple redundant or aggregate interfaces in an active-passive cluster you should configure separate redundant or aggregate interfaces on the switch; one for each cluster unit.
- Use SNMP, syslog, or email alerts to monitor a cluster for failover messages. Alert messages about cluster failovers may help find and diagnose network problems quickly and efficiently.

Heartbeat interfaces

Fortinet suggests the following practices related to heartbeat interfaces:

Do not use a FortiGate switch port for the HA heartbeat traffic. This configuration is not supported.

- Configure at least two heartbeat interfaces and set these interfaces to have different priorities.
- For clusters of two FortiGate units, as much as possible, heartbeat interfaces should be directly connected using patch cables (without involving other network equipment such as switches). If switches have to be used they should not be used for other network traffic that could flood the switches and cause heartbeat delays.
 - If you cannot use a dedicated switch, the use of a dedicated VLAN can help limit the broadcast domain to protect the heartbeat traffic and the bandwidth it creates.
- For clusters of three or four FortiGate units, use switches to connect heartbeat interfaces. The corresponding heartbeat interface of each FortiGate unit in the cluster must be connected to the same switch. For improved redundancy use a different switch for each heartbeat interface. In that way if the switch connecting one of the heartbeat interfaces fails or is unplugged, heartbeat traffic can continue on the other heartbeat interfaces and switch.
- Isolate heartbeat interfaces from user networks. Heartbeat packets contain sensitive cluster configuration information and can consume a considerable amount of network bandwidth. If the cluster consists of two FortiGate units, connect the heartbeat interfaces directly using a crossover cable or a regular Ethernet cable. For clusters with more than two units, connect heartbeat interfaces to a separate switch that is not connected to any network.
- If heartbeat traffic cannot be isolated from user networks, enable heartbeat message encryption and authentication to protect cluster information. See [Enabling or disabling HA heartbeat encryption and authentication on page 1917](#).
- Configure and connect redundant heartbeat interfaces so that if one heartbeat interface fails or becomes disconnected, HA heartbeat traffic can continue to be transmitted using the backup heartbeat interface. If heartbeat communication fails, all cluster members will think they are the primary unit resulting in multiple devices on the network with the same IP addresses and MAC addresses (condition referred to as *Split Brain*) and communication will be disrupted until heartbeat communication can be reestablished.
- Do not monitor dedicated heartbeat interfaces; monitor those interfaces whose failure should trigger a device failover.
- Where possible at least one heartbeat interface should not be connected to an NP4 or NP6 processor to avoid NP4 or NP6-related problems from affecting heartbeat traffic.
- Where possible, the heartbeat interfaces should not be connected to an NP4 or NP6 processor that is also processing network traffic.
- Where possible, each heartbeat interface should be connected to a different NP4 or NP6 processor.
- Any FortiGate interface can be used as a heartbeat interface including 10/100/1000Base-T, SFP, QSFP fiber and copper, and so on. If you set up two or more interfaces as heartbeat interfaces each interface can be a different type and speed.

Interface monitoring (port monitoring)

Fortinet suggests the following practices related to interface monitoring (also called port monitoring):

- Wait until a cluster is up and running and all interfaces are connected before enabling interface monitoring. A monitored interface can easily become disconnected during initial setup and cause failovers to occur before the cluster is fully configured and tested.
- Monitor interfaces connected to networks that process high priority traffic so that the cluster maintains connections to these networks if a failure occurs.
- Avoid configuring interface monitoring for all interfaces.
- Supplement interface monitoring with remote link failover. Configure remote link failover to maintain packet flow if a link not directly connected to a cluster unit (for example, between a switch connected to a cluster interface and the network) fails. See [Remote link failover \(remote IP monitoring\) on page 1943](#).

WAN Optimization

WAN Optimization features require significant memory resources and generate a high amount of I/O on disk. Before enabling WAN Optimization, ensure that the memory usage is not too high. If possible, avoid other disk-intensive features such as heavy traffic logging on the same disk as the one configured for WAN Optimization needs.

In general, it is preferable to enable the Transparent Mode checkbox and ensure that routing between the two endpoints is acceptable. Some protocols may not work well without enabling Transparent Mode.

Other best practices for utilizing the WAN Optimization feature follow.

Sharing the WAN Opt. tunnel for traffic of the same nature

WAN optimization tunnel sharing is recommended for similar types of WAN optimization traffic (such as CIFS traffic from different servers). However, tunnel sharing for different types of traffic is not recommended. For example, aggressive and non-aggressive protocols should not share the same tunnel.

Ordering WAN Opt. rules appropriately

- Precise, port specific WAN Optimization rules should be at the top of the list.
- Generic rules, such as overall TCP, should be at the bottom of the list.

Avoiding mixing protocols in a WAN Opt. tunnel

Different protocols may be more or less talkative or interactive. Mixing protocols in a tunnel may result in a delay for some of them. It is recommended to define protocol specific wan-optimization rules and restrict the ports to the necessary ones only for performance reasons.

Setting correct configuration options for CIFS WAN Opt.

Ensure that the WAN Optimization rules cover TCP ports 139 and 445 (on the same or two different rules). Also ensure that Transparent Mode is selected.

Setting correct configuration options for MAPI WAN Opt.

For MAPI WAN Optimization, only specify a rule with TCP port 135 (unless the MAPI control port is configured differently). Derived data sessions using other random ports will be handled by the CIFS wan-optimization daemon even with only the control port configured.

Testing WAN Opt. in a lab

- Ensure that WAN emulators are used to simulate the WAN. If no WAN emulator is used, it is expected to have better results without WAN Optimization than with WAN Optimization.
- To test the difference between cold transfers (first-time transfers) and warm transfers, it is recommended to generate a random file of the cold transfer to ensure that the test is the first time that the file has been seen.

Regarding byte compression and type of file

Enabling byte compression on file transfers already compressed (.jpeg files, compressed archive, etc.) won't provide any performance increase and could be seen as a misuse of CPU resources.

Regarding network address translation (NAT)

Selecting the NAT feature in a security policy does not have any influence on WAN Optimization traffic.

High Availability

There is no benefit to using active-active mode, so for pure WAN Optimization needs, use active-passive mode. Refer to the [FGCP High Availability](#) section for other best practices related to HA.

Authentication with specific peers

Configure WAN optimization authentication with specific peers. Accepting any peer is not recommended as this can be less secure.

Virtual Domains (VDOMs)

VDOMs can provide separate firewall policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network or organization. This section provides a list of best practices for configuring VDOMs.

Per-VDOM resource settings

While Global resources apply to resources shared by the whole FortiGate unit, per-VDOM resources are specific to only one Virtual Domain.

By default all the per-VDOM resource settings are set to no limits. This means that any single VDOM can use up all the resources of the entire FortiGate unit if it needs to do so. This would starve the other VDOMs for resources to the point where they would be unable to function. For this reason, it is recommended that you set some maximums on resources that are most vital to your customers.

Virtual domains in NAT mode

Once you have enabled virtual domains and created one or more VDOMs, you need to configure them. It is recommended that you perform the following tasks in the order given (while you may not require all for your network topology):

1. Change the management virtual domain.
2. Configure FortiGate interfaces in a NAT VDOM.
3. Configure VDOM routing.
4. Configure security policies for NAT VDOMs.
5. Configure UTM profiles for NAT VDOMs.
6. Test the configuration.

Virtual clustering

If you decide to disable override for clustering, as a result of persistent renegotiating, you should disable it for both cluster units.

Explicit proxy

- For explicit proxies, when configuring limits on the number of concurrent users, you need to allow for the number of users based on their authentication method. Otherwise you may run out of user resources prematurely.
- Each session-based authenticated user is counted as a single user using their authentication membership (RADIUS, LDAP, FSSO, local database etc.) to match users in other sessions. So one authenticated user in multiple sessions is still one user.
- For all other situations, the source IP address is used to determine a user. All sessions from a single source address are assumed to be from the same user.
- Set the explicit web proxy and explicit FTP proxy Default Firewall Policy Action to Deny. This means that a firewall policy is required to use these explicit proxies, allowing you to control access and impose security features.
- Do not enable the explicit web or FTP proxy on an interface connected to the Internet. This is a security risk because anyone on the Internet who finds the proxy could use it to hide their source address. If you must enable the proxy on such an interface make sure authentication is required to use the proxy.

Wireless

The following section contains a list of best practices for wireless network configurations with regard to encryption and authentication, geographic location, network planning, power usage, client load balancing, local bridging, SSIDs, and the use of static IPs.

Encryption and authentication

It is best practice to always enable the strongest user authentication and encryption method that your client supports. Fortinet recommends the following security, in order of strongest to weakest:

- WPA2 - Enterprise 802.1x/EAP - Personal pre-shared key (8-63 characters)
- WPA - Enterprise 802.1x/EAP - Personal pre-shared key (8-63 characters)
- WEP128 - 26 Hexadecimal digit key
- WEP64 - 10 Hexadecimal digit key
- None - Open system

Geographic location

Ensure that the FortiGate wireless controller is configured for your geographic location. This ensures that the available radio channels and radio power are in compliance with the regulations in your region.

The maximum allowed transmitter power and permitted radio channels for Wi-Fi networks depend on the region in which the network is located. By default, the WiFi controller is configured for the United States. If you are located in any other region, you need to set your location before you begin configuring wireless networks.

The location setting can only be changed from CLI. To change the country to France, for example, enter the following:

```
config wireless-controller setting
  set country FR
end
```

To see the list of country codes, enter a question mark ('?') in place of the country code.

Using an incorrect geographic location is a common error that can lead to unpredictable results on the client side.

Network planning

It is recommended that you perform a proper site survey prior positioning the wireless access point. In order to evaluate the coverage area environment, the following criteria must be taken into account:

- Size of coverage area
- Bandwidth required
- Client wireless capabilities

After completing a RF site survey, you'll have a good idea of the number and location of access points needed to provide users with adequate coverage and performance.

However, prior to installing the access points, be sure to determine the RF channel(s) you plan to use. This will ensure that users can roam throughout the facility with substantial performance.

To avoid co-channel interference, adjacent Wi-Fi APs must be configured to use non-overlapping channels. Otherwise, you'll find poor performance will degrade because of interference between access points.

It is recommended to statically configure the non-overlapping channels on every access point, using one Custom AP profile per AP (or group of APs). If static configuration cannot be used, the FortiOS Wi-Fi Controller includes the Automatic Radio Resource Provisioning (ARRP) feature.

Lowering the power level to reduce RF interference

Relevant Product(s): FortiAP

Reducing power reduces unwanted coverage and potential interference to other WLANs. Areas of unwanted coverage are a potential security risk. If possible, reduce the transmitter power of your wireless access point so that the signal is not available beyond the areas where it is needed. Auto Tx Power Control can be enabled to automatically adjust the transmit power.

In cases where customers complain about slow wireless traffic through a FortiAP, it might be necessary to try to reduce the possibility of RF interference. It is best practice not to locate FortiAPs near steel beams or other interfering materials. You can try using a wireless sniffer tool to collect the wireless packets and then analyze the extent of air interference.

A common mistake is spacing FortiAPs based upon the 5Ghz radio frequency. The 2.4Ghz signal travels further.

You have two options when confronted with slow wireless traffic through a FortiAP:

Option #1: Reducing transmit power

Perform a speed test and record the results. Set one of the radios on a FortiAP to be in dedicated monitoring mode. Then observe how many APs are detected. If the number of APs is too high (i.e., greater than 20), try reducing the transmit power in the WTP profile for the FortiAPs until the number of detected APs has dropped significantly.

Repeat the speed test.

Option #2: Ensuring that VAPs are distributed over the available channels

No built-in tools are available to measure RF interference directly. However, FortiOS 5.0 does allow for automatic power adjustment, which should minimize the occurrence of RF interference.

Wireless client load balancing

Wireless load balancing allows your wireless network to more efficiently distribute wireless traffic among wireless access points and available frequency bands. FortiGate wireless controllers support the following types of client load balancing:

- **Access Point Hand-off** - The wireless controller signals a client to switch to another access point.
- **Frequency Hand-off** - The wireless controller monitors the usage of 2.4GHz and 5GHz bands, and signals clients to switch to the lesser-used frequency.

Local bridging

Whenever possible, use local bridging to offload the CAPWAP tunnel. Note that in this case, Wi-Fi client devices obtain IP addresses from the same DHCP server as wired devices on the LAN. The vlan ID can only be configured

from the CLI:

```
config wireless-controller vap
  edit "vaplocalbridge"
    set vdom "root"
    set ssid "testvaplocalbridge"
    set local-bridging enable
    set vlanid 40 ---> only available in CLI
  next
end
```

Advertising SSIDs

- It is highly recommended to advertise the SSID. It makes it easier for customers and wireless clients. Also, if you 'hide' the SSID (known as 'network cloaking'), then clients will always look for it when they're outside the coverage area, which searches for known SSIDs, in effect leaking the SSID anyway. Refer to [RFC 3370](#). Furthermore, many of the latest Broadcom drivers do not support hidden SSID for WPA2.
- For security reason, you might want to prevent direct communication between your wireless clients. In this case, enable Block Intra-SSID Traffic (in the SSID configuration).
- In a network with multiple wireless controllers, you need to change the mesh SSID so that each mesh root has a unique SSID. Other controllers using the same mesh root SSID might be detected as fake or rogue APs. Go to **WiFi & Switch Controller > SSID** to change the SSID. Fortinet also recommends that you create a new preshared key instead of using the default.

Using static IPs in a CAPWAP configuration

In a large FortiAP deployment with more than 20 FortiAPs connecting to a Fortigate Wireless Controller (AC), it is recommended to use static IPs on the access points instead of DHCP, setting the AC IP statically and the AC discovery type to static (Type 1), instead of learning it through broadcast, multicast, or DHCP.

This makes management of the APs easier since you know the exact IP of each access point. Troubleshooting also becomes easier as the debug of the AC controller won't continuously attempt the different discovery methods in sequence (broadcast > multicast > static).

Logging and reporting

The default log device settings must be modified so that system performance is not compromised. The FortiGate unit, by default, has all logging of FortiGate features enabled, except for traffic logging. The default logging location will be either the FortiGate unit's system memory or hard disk, depending on the model. Units with a flash disk are not recommended for disk logging.

Log management

When the FortiGate unit records FortiGate activity, valuable information is collected that provides insight into how to better protect network traffic against attacks, including misuse and abuse. There is a lot to consider before enabling logging on a FortiGate unit, such as what FortiGate activities to enable and which log device is best suited for your network's logging needs. A plan can help you in deciding the FortiGate activities to log, a log device, as well as a backup solution in the event the log device fails.

This plan should provide you with an outline, similar to the following:

- What FortiGate activities you want and/or need logged (for example, security features).
- The logging device best suited for your network structure.
- If you want or require archiving of log files.
- Ensuring logs are not lost in the event a failure occurs.

After the plan is implemented, you need to manage the logs and be prepared to expand on your log setup when the current logging requirements are outgrown. Good log management practices help you with these tasks.

Log management practices help you to improve and manage logging requirements. Logging is an ever-expanding tool that can seem to be a daunting task to manage. The following management practices will help you when issues arise, or your logging setup needs to be expanded.

- Revisit your plan on a yearly basis to verify that your logging needs are being met by your current log setup. For example, your company or organization may require archival logging, but not at the beginning of your network's lifespan. Archival logs are stored on a FortiGate unit's local hard drive, a FortiAnalyzer unit, or a FortiCloud server, in increasing order of size.
- Configure an alert message that will notify you of activities that are important to be aware about. For example: if a branch office does not have a FortiGate administrator, you will need to know at all times that the IPsec VPN tunnel is still up and running. An alert email notification message can be configured to send only if IPsec tunnel errors occur.
- If your organization or company uses peer-to-peer programs such as Skype or other instant messaging software, use the IM usage dashboard widget or the Executive Summary's report widget (Top 10 Application Bandwidth Usage Per Hour Summary) to help you monitor the usage of these types of instant messaging software. These widgets can help you in determining how these applications are being used, including if there is any misuse and abuse. Their information is taken from application log messages; however, application log messages should be viewed as well since they contain the most detailed information.
- Ensure that your backup solution is up-to-date. If you have recently expanded your log setup, you should also review your backup solution. The backup solution provides a way to ensure that all logs are not lost in the event that the log device fails or issues arise with the log device itself.

- When downloading log messages and viewing them on a computer, the log file will be downloaded like any other file. Log file names contain their log type and date in the name, so it is recommended to create a folder in which to archive your log messages, as they can be sorted easily.

System memory and hard disks

If the FortiGate unit has a hard disk, it is enabled by default to store logs. This also means that you do not have to enable this and configure the settings for logging to the hard disk, but modify these settings so that it is configured for your network logging requirements.

If the FortiGate unit has only flash memory, disk logging is disabled by default, as it is not recommended. Constant rewrites to flash drives can reduce the lifetime and efficiency of the memory. It must be enabled in the CLI under config log disk setting.

For some low-end models, disk logging is unavailable. Check a product's Feature Matrix for more information. In either case, Fortinet recommends using either a FortiAnalyzer unit or the FortiCloud service.

Chapter 5 - FortiGate-6000

What's new for FortiGate-6000 5.6.7

The following new features have been added to FortiGate-6000 and v5.6.7 build 4214:

- Policy learning mode is now supported.
- The FortiGate-6000 supports 64000 explicit proxy web proxy users.
- The HA group ID range is now from 0 to 31 (was 0 to 15).

What's new for FortiGate-6000 5.6.6

The following new features have been added to FortiGate-6000 v5.6.6 build 4148:

- Support for FortiOS 5.6.6 and most 5.6.6 features including FortiOS 5.6.6 GUI features.
- You can configure new Resource Usage dashboard widgets to show CPU use, log rate, memory use, session creation rate, and the number of active sessions for the management board and for individual FPCs.
- The Security Fabric dashboard widget shows high level status and configuration information for all of the FPCs.
- The Sensor Information dashboard widget displays temperature, power supply (PSU), and fan speed information and allows you to drill down for more details, including information about individual temperature sensors, PSUs and fans.
- DP3 firmware upgrade
- VRRP support
- The following FortiOS 5.6.6 features are not supported:
 - SD-WAN
 - Some IPsec VPN features
 - Policy learning mode
 - HA dedicated management interfaces

New IPsec VPN features

FortiOS 5.6.6 includes the following IPsec VPN improvements:

- Including a phase 2 selector is no longer mandatory.
- Dynamic routing (RIP, OSPF, BGP) is supported over IPsec VPN tunnels.

IPsec VPN features supported by FortiOS 5.6.6 for FortiGate-6000

FortiOS 5.6.6 for FortiGate-6000 supports the following IPsec VPN features.

- Interface-based IPsec VPN (also called route-based IPsec VPN).
- Static routes can point IPsec VPN interfaces.
- Dynamic routing (RIP, OSPF, BGP) over IPsec VPN tunnels.
- Remote networks with 16- to 32-bit netmasks.
- IPsec VPN tunnels must terminate on the primary FPM (the ELBC master).
- Site-to-Site IPsec VPN.
- Dialup IPsec VPN. The FortiGate-6000 can be the dialup server or client.
- IPv4 clear-text traffic (IPv4 over IPv4 or IPv4 over IPv6)

IPsec VPN features not supported by FortiOS 5.6.6 for FortiGate-6000

FortiOS 5.6.6 for FortiGate-6000 does not support the following IPsec VPN features.

- Policy-based IPsec VPN.
- Policy routes for VPN traffic.
- Remote networks with 0- to 15-bit netmasks.

- IPv6 clear-text traffic (IPv6 over IPv4 or IPv6 over IPv6).
- Load-balancing IPsec VPN tunnels to multiple FPMs.
- IPsec SA synchronization between both FortiGate-6000s in an HA configuration.

FortiGate-6000 overview

The FortiGate-6000 series is a collection of 3U 19-inch rackmount appliances that all include twenty-four 25GigE SFP28 and four 100GigE QSFP28 data network interfaces, as well as NP6 and CP9 processors to deliver high IPS/threat prevention performance.

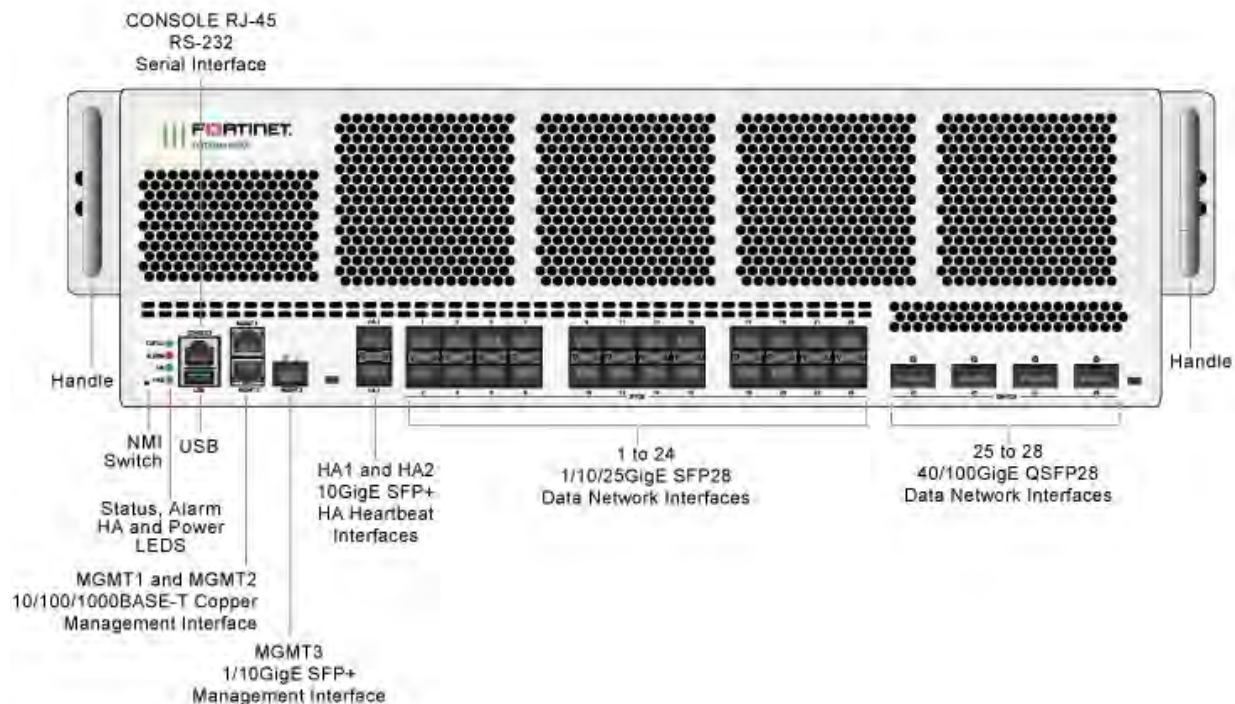

Currently, four FortiGate-6000 models are available:

- FortiGate-6500F
- FortiGate-6501F
- FortiGate-6300F
- FortiGate-6301F

All FortiGate-6000 models have the same front and back panel configuration including the same network interfaces. The differences are the processing capacity of the individual models. All FortiGate-6000 models include internal Fortinet Processor Cards (FPCs) that contain NP6 and CP9 security processors. The FortiGate-6000 uses session-aware load balancing to distribute sessions to the FPCs. The FortiGate-6500F includes ten FPCs and the FortiGate-6300F includes six FPCs.

Also the FortiGate-6501F and 6301F models are the same as their related models with the addition of two internal 1 TByte log disks.

FortiGate-6000 front panel (FortiGate-6500F shown)

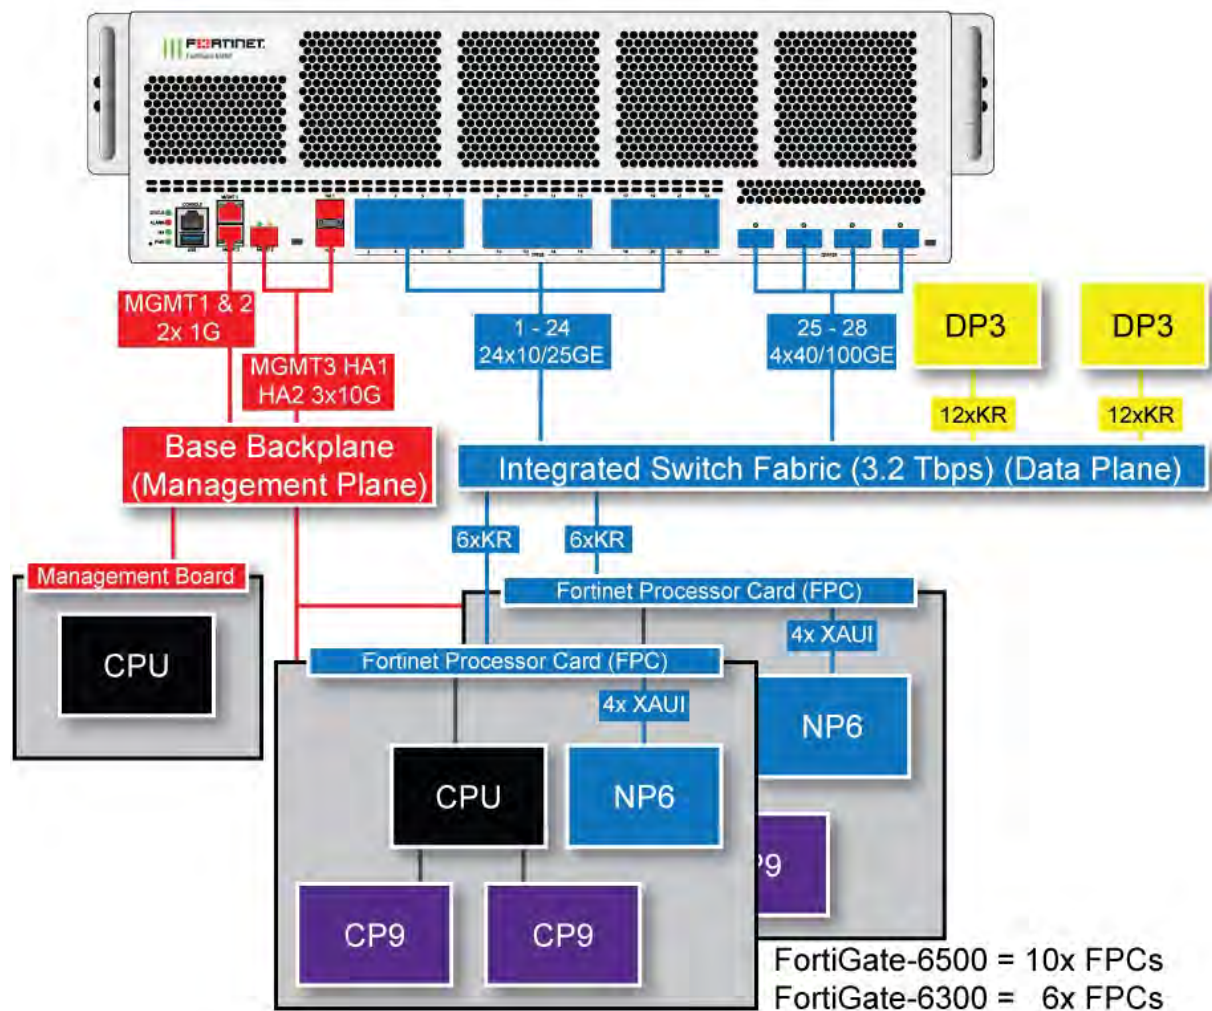

Front panel interfaces

All FortiGate-6000 models have the following front panel interfaces:

- Twenty-four 1/10/25GigE SFP28 data network interfaces (1 to 24). The default speed of these interfaces is 10Gbps.
- Four 40/100GigE QSFP28 data network interfaces (25 to 28). The default speed of these interfaces is 40Gbps.
- Two front panel 1/10GigE SFP+ HA interfaces (HA1 and HA2) used for heartbeat, session sync, and management communication between two and only two FortiGate-6000s in an HA cluster. The default speed of these interfaces is 10Gbps. Operating them at 1Gbps is not recommended. A FortiGate-6000 cluster consists of two (and only two) FortiGate-6000s of the same model. To set up HA, you can use a direct cable connection between the FortiGate-6000s HA1 interfaces and a second direct cable connection between the HA2 interfaces. For more information about FortiGate-6000 HA, see [FortiGate-6000 high availability \(FGCP\) on page 651](#).
- Two 10/100/1000BASE-T out of band management Ethernet interfaces (MGMT1 and MGMT2).
- One front panel 1/10GigE SFP+ out of band management interface (MGMT3). You can use the 10Gbps MGMT3 interface for additional bandwidth management traffic that might be useful for high bandwidth activities such as remote logging.
- One RJ-45 RS-232 serial console connection.
- One USB connector.

FortiGate-6000 schematic

The FortiGate-6000 has separate data and management planes. The data plane handles all traffic and security processing functionality. The management plane handles management functions such as administrator logins, configuration and session synchronization, SNMP and other monitoring, HA heartbeat communication, and remote and (if supported) local disk logging. Separating these two planes means that resources used for traffic and security processing are not compromised by management activities.

FortiGate-6000 schematic

In the data plane, two DP3 load balancers use session-aware load balancing to distribute sessions from the front panel interfaces (port1 to 28) to Fortinet Processor Cards (FPCs). The DP3 processors communicate with the FPCs across the 3.2Tbps integrated switch fabric. Each FPC processes sessions load balanced to it. The FPCs send outgoing sessions back to the integrated switch fabric and then out the network interfaces to their destinations.

The NP6 processor in each FPC enhances network performance with fastpath acceleration that offloads communication sessions from the FPC CPU. The NP6 processor can also handle some CPU intensive tasks, like IPsec VPN encryption/decryption.

The CP9 processors in each FPC accelerate many common resource intensive security related processes such as SSL VPN, Antivirus, Application Control, and IPS.

The management plane includes the management board, base backplane, management interfaces, and HA heartbeat interfaces. Configuration and session synchronization between FPCs in a FortiGate-6000F occurs over the base backplane. In an HA configuration, configuration and session synchronization between the FortiGate-6000s in the cluster takes place over the HA1 and HA2 interfaces. Administrator logins, SNMP monitoring,

remote logging to one or more FortiAnalyzers or syslog servers, and other management functions use the MGMT1, MGMT2, and MGMT3 interfaces. You can use the 10Gbps MGMT3 interface for additional bandwidth that might be useful for high bandwidth activities such as remote logging.

Getting started with FortiGate-6000

Once you have installed your FortiGate-6000 in a rack and connected it to power you should review the front and back panel LEDs to verify that everything is operating normally. Wait until the FortiGate-6000 has completely started up and synchronized before making configuration changes. You can use the `diagnose sys ha status` command to confirm that the FortiGate-6000 is completely initialized. If the output from entering this command hasn't changed after checking for a few minutes you can assume that the system has initialized. You don't normally have to confirm that the system has initialized, but this diagnose command is available if needed.

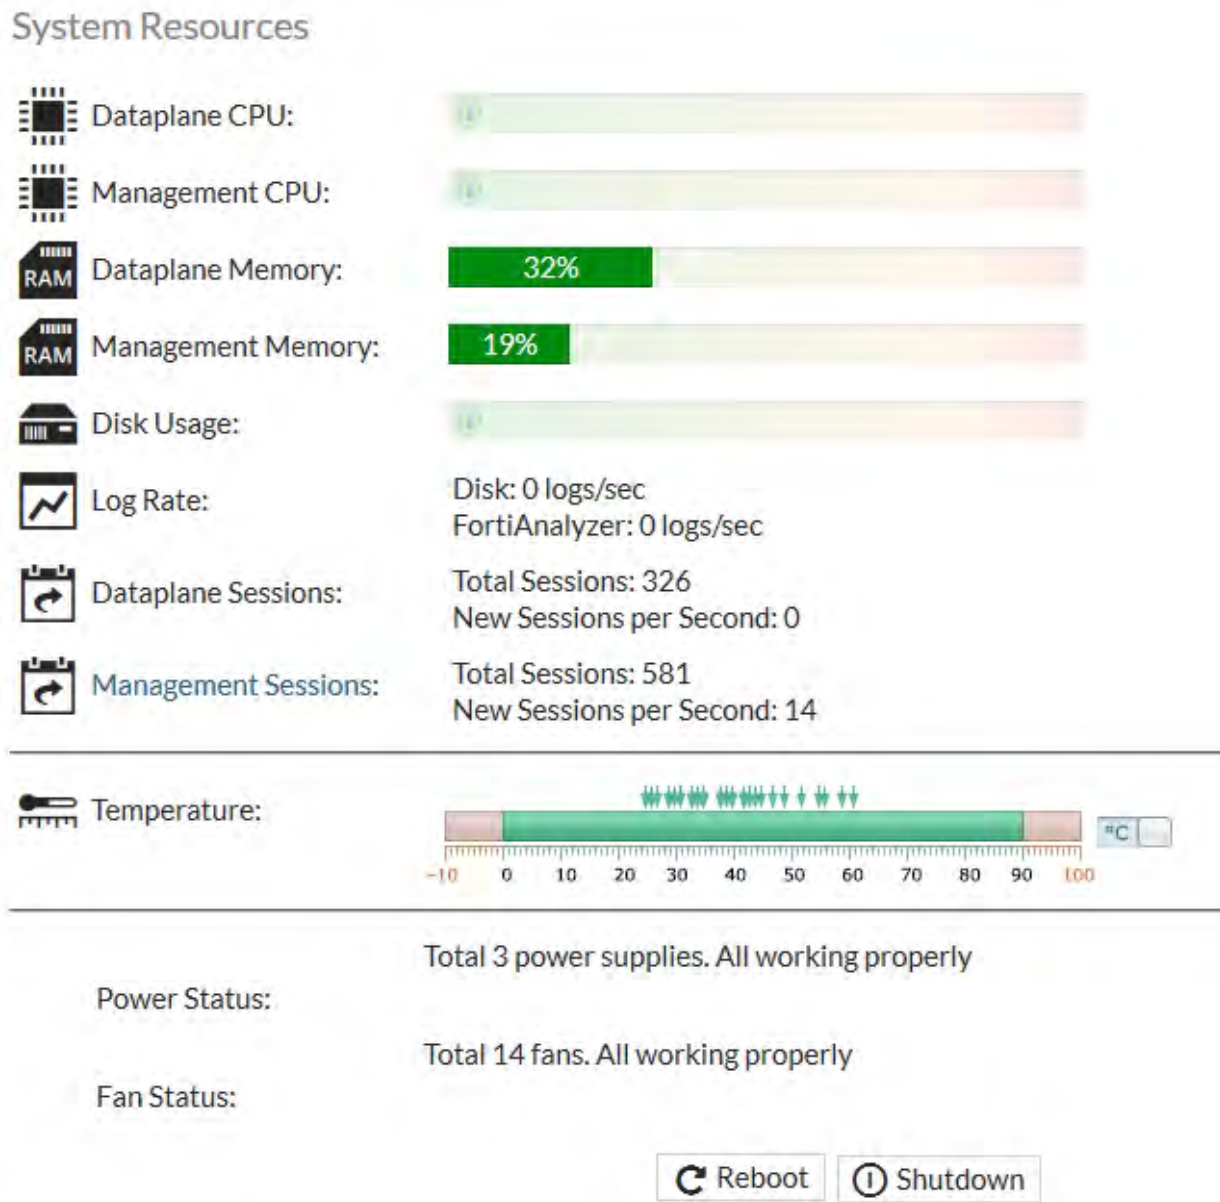

You can connect to the MGMT1 Ethernet interface to log into the GUI or CLI. Connect to the GUI by browsing to <https://192.168.1.99>. Connect to the CLI by using SSH to connect to 192.168.1.99. Log into the GUI or CLI using the admin account with no password. You may have to enable SSH administrative access for the mgmt1 interface before you can connect to the CLI.

You can also connect to the CLI using the front panel Console port using the console cable shipped with your product. For the console connection, use the following settings: Baud Rate (bps) 9600, Data bits 8, Parity None, Stop bits 1, and Flow Control None.

For security reasons you should add a password to the admin account before connecting the FortiGate-6000 to your network.

Once you have logged into the GUI or CLI you can view and change the configuration of your FortiGate-6000 just like any FortiGate. For example, you can configure firewall policies between any two interfaces. You can also configure aggregates of the front panel interfaces.

Example FortiGate-6301F System Resources widget**Interface groups and changing data interface speeds**

Depending on the networks that you want to connect your FortiGate-6000 to, you may have to manually change the data interface speeds. The port1 to port24 data interfaces are divided into the following groups:

- port1 - port4
- port5 - port8
- port9 - port12
- port13 - port16

- port17 - port20
- port21 - port24

All of the interfaces in a group operate at the same speed. Changing the speed of an interface changes the speeds of all of the interfaces in the same group. For example, if you change the speed of port18 from 10Gbps to 25Gbps the speeds of port17 to port20 are also changed to 25Gbps.

Another example, the default speed of the port1 to port24 interfaces is 10Gbps. If you want to install 25GigE transceivers in port1 to port24 to convert these data interfaces to connect to 25Gbps networks, you must enter the following from the CLI:

```
config system interface
  edit port1
    set speed 25000full
  next
  edit port5
    set speed 25000full
  next
  edit port9
    set speed 25000full
  next
  edit port13
    set speed 25000full
  next
  edit port17
    set speed 25000full
  next
  edit port21
    set speed 25000full
end
```

Every time you change a data interface speed, when you enter the `end` command, the CLI confirms the range of interfaces affected by the change. For example, if you change the speed of port5 the following message appears:

```
config system interface
  edit port5
end
port5-port8 speed will be changed to 25000full due to hardware limit.
Do you want to continue? (y/n)
```

Configuring the management interfaces

The default FortiGate-6000 configuration includes a management VDOM named `mgmt-vdom`. The management interfaces `mgmt1`, `mgmt2`, and `mgmt3` are all in this VDOM. The `ha1` and `ha2` interfaces are also in this VDOM. This `mgmt-vdom` cannot be removed or renamed and interfaces cannot be removed from it or added to it. Fortinet recommends managing the FortiGate-6000 from the `mgmt1`, `mgmt2`, and `mgmt3` out-of-band management interfaces and not from a data interface.

You can change the IP address of the management interfaces and configure routing for the management VDOM as required. For example, from the GUI, select the **mgmt-vdom** then go to **Network > Interfaces** to configure the `mgmt1`, `mgmt2`, or `mgmt3` interfaces.

From the CLI:

```
config system interface
  edit mgmt1
    set ip <ip-address> <netmask>
  ...
```

Using data interfaces for management traffic

Normally, all management traffic connects with the FortiGate-6000 through the MGMT1, MGMT2, and MGMT3 interfaces. The FortiGate-6000 does also support management traffic connections to the FortiGate-6000 data interfaces (port1 to port28). To enable management connections to these interfaces you must configure the VDOM that the data interfaces are included in to allow traffic forwarding to the management board. By default, the root VDOM includes all of the data interfaces. To allow management communication between the root VDOM and the management board, edit the root VDOM from the CLI and use the following command:

```
config vdom
  edit root
    config system settings
      set motherboard-traffic-forwarding {icmp | admin}
    end
```

The `icmp` option, enabled by default, allows you to log into the management board from one of the MGMT interfaces and use the `execute ping` command to ping an address through one of the data interfaces. The interface used depends on the routing configuration.

The `admin` option allows Telnet, SSH, HTTP, and HTTPS administrator connections from a management PC to a data interface. You cannot configure data interfaces to accept management connections using non-standard ports.

Currently, the `admin` setting is in development and not recommended.

FortiGate-6000 dashboard widgets

The FortiGate-6000 includes a number of custom dashboard widgets that provide extra or custom information for FortiGate-6000 systems.

Security Fabric

The Security Fabric dashboard widget shows the components in your FortiGate-6000 system including the management board and FPCs. You can hover over the components in the Security Fabric dashboard widget to see details about each components host name, serial number, model, firmware version, and management IP address.

Interface Bandwidth

You can add Interface Bandwidth dashboard widgets to view traffic in and out of any FortiGate-6000 interface. You can add an Interface Bandwidth widget to the dashboard for:

- Any physical interface
- Any link aggregation (LAG) interface
- Any member of a LAG
- Any VLAN interface
- Any IPsec VPN tunnel interface
- Any redundant interface

The displayed data includes all of the traffic processed by the interface, independent of how the traffic is load balanced.

You can add individual Interface Bandwidth widgets for each interface that you want to monitor. After you have added the widget you can choose to display traffic for the last hour, 24 hours or week. The data displayed on the widget updates in real time.

From the CLI, for physical interfaces, you can use the `diagnose hardware deviceinfo nic <interface-name>` command to view transmitted and received packets.

For LAG and VLAN interfaces you can display transmitted and received packets using the `diagnose netlink interface list <interface-name>` command.

Resource Usage

You can create multiple Resource Usage dashboard widgets to show CPU use, log rate, memory use, session creation rate, and the number of active sessions for the management board and for individual FPCs. After you have added the widget you can choose to display data for times ranging between 1 minute to 24 hours. The data displayed on the widget updates in real time.

Sensor Information

The Sensor Information dashboard widget displays temperature, power supply (PSU), and fan speed information for the FortiGate-7000 hardware and allows you to drill down for more details, including information about individual temperature sensors, PSUs and fans.

Changing the FortiGate-6301F and 6501F log disk and RAID configuration

The FortiGate-6301F and FortiGate-6501F both include two internal 1-TByte log disks. By default the disks are in a RAID-1 configuration. In the RAID-1 configuration you can use the disks for disk logging only. You can use the `execute disk raid` command to disable RAID and use one of the disks for disk logging and the other for other purposes such as disk caching. You can also change the RAID level to RAID-0. Changing the RAID configuration deletes all data from the disks and can disrupt disk logging so a best practice is set the RAID configuration when initially setting up the FortiGate-6301F or 6501F.

From the CLI you can use the following command to show disk status:

```
execute disk list
```

Use the following command to disable RAID:

```
execute disk raid disable
```

RAID is disabled, the disks are separated and formatted.

Use the following command to change the RAID level to RAID-0:

```
execute disk raid rebuild-level 0
```

The disks are formatted for RAID-0.

Use the following command to rebuild the current RAID partition:

```
execute disk raid rebuild
```

The RAID is rebuilt at the current RAID level.

Use the following command to show RAID status. The following command output shows the disks configured for RAID-1.

```
execute disk raid status
RAID Level: Raid-1
RAID Status: OK
RAID Size: 1000GB
```

```
Disk 1: OK Used 953GB
Disk 2: OK Used 953GB
```

Managing individual FPCs

When you log into the GUI or CLI using the MGMT1 interface IP address you are actually connecting to the FortiGate-6000F management board (called slot 0 or MBD on the CLI). This is normally how you would connect to a FortiGate-6000F for administration.

In some cases you may want to connect to the individual Fortinet Processor Cards (FPCs) in your FortiGate-6000F. For example, you may want to view the traffic being processed by a specific FPC. You can connect to the GUI or CLI of individual FPCs in the chassis using the system management IP address with a special port number.

For example, if the system management IP address is 192.168.1.99 you can connect to the GUI of the first FPC using the system management IP address followed by the special port number: <https://192.168.1.99:44301>.

The special port number (in this case 44301) is a combination of the service port (for HTTPS the service port is 443) and the FPC slot number (in this example, 01). The following table lists the special ports to use to connect to each FPC slot using common admin protocols. The FortiGate-6300F and 6301F have 7 slots (0 to 6) and the FortiGate-6500 and 6501 have 11 slots (0 to 10).

FortiGate-6000 special administration port numbers

Slot Address	HTTP (80)	HTTPS (443)	Telnet (23)	SSH (22)
Chassis 1, Slot 0, (MBD)	8000	44300	2300	2200
Chassis 1, Slot 1 (FPC01)	8001	44301	2301	2201
Chassis 1, Slot 2 (FPC02)	8002	44302	2302	2202
Chassis 1, Slot 3 (FPC03)	8003	44303	2303	2203
Chassis 1, Slot 4 (FPC04)	8004	44304	2304	2204
Chassis 1, Slot 5 (FPC05)	8005	44305	2305	2205
Chassis 1, Slot 6 (FPC06)	8006	44306	2306	2206
Chassis 1, Slot 7 (FPC07)	8007	44307	2307	2207
Chassis 1, Slot 8 (FPC08)	8008	44308	2308	2208
Chassis 1, Slot 9 (FPC09)	8009	44309	2309	2209

Slot Address	HTTP (80)	HTTPS (443)	Telnet (23)	SSH (22)
Chassis 1, Slot 10 (FPC10)	8010	44310	2310	2210

For example:

- To connect to the GUI of the FPC slot 3 using HTTPS you would browse to `https://192.168.1.99:44303`.

The configuration is the same no matter whether you log into the management board or an FPC. Logging into different FPCs allows you to use the FortiView or Monitor GUI pages to view the activity on that FPC. Even though you can log into different FPCs, you should only make configuration changes from the management board (slot 0 or MBD).

Connecting to individual FPC consoles

From the management board CLI, the `execute system console-server` command provides access to individual FPC consoles in your FortiGate-6000. Console access can be useful for troubleshooting. For example, if an FPC does not boot properly you can use console access to view the state of the FPC and enter commands to fix the problem or restart the FPC.

From the console you can also restart the FPC and perform BIOS operations such as interrupting the boot to install new firmware from the FortiGate-6000 internal TFTP server.

For example, from the management board CLI, use the following command to log into the console of the FPC in slot 3:

```
execute system console-server connect 3
```

Authenticate to log into the console and use CLI commands to view information, make changes, or restart the FPC. When you are done, use **Ctrl-X** to exit from the console back to the management board CLI.

Also from the management board CLI you can use the `execute system console-server showline` command to list any active console server sessions. Only one console session can be active for each FPC, so before connecting to an FPC console, you can use this command to verify whether or not there is an active console session.

The following command output shows an active console session with the FPC in slot 4:

```
execute system console-server showline
MB console line connected - 1
Telnet-to-console line connected - 4
```

You can use the `execute system console-server clearline` command to clear an active console session. For example, the clear an active console session with the FPC in slot 4, enter:

```
execute system console-server clearline 4
```

The `execute system console-server` commands only allow access to FPCs in the FortiGate-6000 that you are logged into. You can't use this command to access FPCs in the other FortiGate-6000 in an HA configuration.

Connecting to individual FPC CLIs

From the management board CLI you can use the following command to switch between FPCs and perform different operations on the FPC in each slot:

```
execute load-balance slot {manage | nmi-reset | power-off | power-on | reboot} <chassis-  
number>.<slot-number>
```

Use `manage` to connect to the CLI of a different FPC, use the other options to perform an action on an individual FPC.

For example, to connect to the NPC in chassis 1 slot 4 enter:

```
execute load-balance slot manage 1.4
```

For example, to reboot the NPC in chassis 1 slot 3 enter:

```
execute load-balance slot reboot 1.3
```

From the CLI you can also use the `execute load-balance slot manage [<chassis>.]<slot>` command to log into the CLI of different components. You can use this command to view the status or configuration of the FPC, restart the FPC, or perform other operations. You should not change the configuration of individual FPCs because this can cause configuration synchronization errors.

`<chassis>` is the HA chassis ID and can be 1 or 2. The chassis ID is only required in an HA configuration where you are attempting to log into the other chassis. In HA mode, if you skip the chassis ID you can log into another component in the same chassis.

`<slot>` is the slot number of the component that you want to log into. The management board is in slot 0 and the FPC slot numbers start at 1.

For example, in a FortiGate-6000 standalone configuration, if you have logged into the CLI of the management board, enter the following command to log into the FPC in slot 5:

```
execute load-balance slot manage 5
```

In a FortiGate-6000 HA configuration, if you have logged into the CLI of the management board in chassis 1, enter the following command to log into the FPC in chassis 2 slot 5:

```
execute load-balance slot manage 2.5
```

In a FortiGate-6000 HA configuration, if you have logged into the CLI of the management board in chassis 2, enter the following command to log into the FPC in chassis 1 slot 3:

```
execute load-balance slot manage 1.3
```

In a FortiGate-6000 HA configuration, if you have logged into the CLI of the management board in chassis 1, enter the following command to log into the FPC in slot 3 of the same chassis:

```
execute load-balance slot manage 3
```

After logging into a different component in this way, you can't use the `execute load-balance slot manage` command to log into another component. Instead you need to use the `exit` command to revert back to the CLI of the component that you originally logged into. Then you can use the `execute load-balance slot manage` command to log into another component.

Connecting to FPC CLIs using the console port

You can use the front panel console port to connect to the CLI of the management board and individual FPCs.

By default when the FortiGate-6000 first starts up the console port is connected to the management board. The default settings for connecting to the console port are:

Baud Rate (bps) 9600, Data bits 8, Parity None, Stop bits 1, and Flow Control None.

If you connect a PC to the console port with a serial cable and open a terminal session you can press Ctrl-T to enable console switching mode. Press Ctrl-T multiple times to cycle through the management board (MBD) and FPC CLIs (the new destination is displayed in the terminal window).

Once the console port connects to the CLI that you want to use, press Enter to enable the CLI and login.

When your session is complete you can press Ctrl-T to connect to another CLI.

Connecting the CLI of an individual FPC

Use the following steps to connect to the CLI of the FPC in slot 4: (FPC04)

1. Connect the console cable supplied with your FortiGate-6000 to the console port and to your PC or other device RS-232 console port.
2. Start a terminal emulation program on the PC. Use these settings:
Baud Rate (bps) 9600, Data bits 8, Parity None, Stop bits 1, and Flow Control None.
3. Press Ctrl-T to enter console switch mode.
4. Repeat pressing Ctrl-T until you have connected to FPC04. Example prompt:
`<Switching to Console: FPC04 (9600)>`
5. Login with an administrator name and password.
The default is admin with no password. For security reasons, it is strongly recommended that you change the password.
6. When your session is complete, enter the `exit` command to log out.

Default VDOM and management VDOM configuration

By default when the FortiGate-6000 first starts up it is operating in multiple VDOM mode. The system has a management VDOM (named mgmt-vmom) and the root VDOM. The ha1, ha2, mgmt1, mgmt2, and mgmt3 interfaces are in mgmt-vmom and all of the data interfaces (port1 to port28) are in the root VDOM.

For the FortiGate-6000 system to operate normally you should not change the configuration of the mgmt-vmom VDOM and this VDOM should always be the management VDOM. You should also not add or remove interfaces from this VDOM. You can change the IP addresses of the mgmt1, mgmt2, and mgmt3 interfaces and you can add routes to the mgmt-vmom VDOM.

You have full control over the configurations of other FortiGate-6000 VDOMs.

Firmware upgrades

The management board and the FPCs in your FortiGate-6000 system run the same firmware image. You upgrade the firmware from the management board GUI or CLI just as you would any FortiGate product. During the upgrade process, the firmware running on the management board and all of the FPCs upgrades in one step. Firmware upgrades should be done during a quiet time because traffic will briefly be interrupted during the upgrade process. The entire firmware upgrade will take a few minutes depending on the number of FPCs in your FortiGate-6000 system. Also, some firmware upgrades may take longer depending on factors such as the size of the configuration and whether the an upgrade of the DP processor is included.

Before beginning a firmware upgrade, Fortinet recommends the following:

- Review the latest release notes for the firmware version that you are upgrading to.
- Verify the recommended upgrade path as documented in the release notes.

- Backup your FortiGate-6000 configuration.

Fortinet recommends that you review the services provided by your FortiGate-6000 before a firmware upgrade and then again after the upgrade to make sure everything continues to operate normally. For example, you might want to verify that you can successfully access an important server used by your organization before the upgrade and make sure after the upgrade that you can still reach the server and that performance is comparable. You could also take a snapshot of key performance indicators (number of sessions, CPU usage, and memory usage) before the upgrade and verify that you see comparable performance after the upgrade.

If you are operating two FortiGate-6000s in HA mode with `uninterruptable-upgrade` and `session-pickup` enabled, firmware upgrades should only cause a minimal traffic interruption. Use the following command to enable these settings. These settings are synchronized to all FPCs.

```
config system ha
  set uninterruptable-upgrade enable
  set session-pickup enable
end
```

Restarting the FortiGate-6000

To restart the FortiGate-6000, connect to the management board CLI and enter the command `execute reboot`. When you enter this command the management board and all of the FPCs reboot.

You can restart individual FPCs by logging into that FPC's CLI and entering the `execute reboot` command.

NMI switch and NMI reset commands

When working with Fortinet Support to troubleshoot problems with your FortiGate-6000 you can use the front panel non-maskable interrupt (NMI) switch to assist with troubleshooting. Pressing this switch causes the software to dump management board registers and backtraces to the console. After the data is dumped, the management board reboots. While the management board restarts, traffic is temporarily blocked. The management board should restart normally and traffic can resume once the management board is up and running.

You can use the following command to dump registers and backtraces of one or more FPCs to the console. After the data is dumped, the FPCs reboot. While the FPCs are rebooting, traffic is distributed to the remaining FPCs. The FPCs should restart normally and traffic can resume once they are up and running.

```
execute load-balance slot nmi-reset <slot-number(s)>
```

Where `<slot-number(s)>` can be one or more FPC slot numbers or slot number ranges with no space and separated by commas. For example:

```
execute load-balance slot nmi-reset 1,3-4
```

Configuration synchronization

When you make configuration changes from the management board, FortiGate-6000 synchronizes these configuration changes to the FPCs. To support configuration synchronization, the management board becomes the config-sync master and makes sure the configurations of all FPCs are synchronized. Every time you make a configuration change you must be logged in using the management address, which logs you into the management board.

You can use the `diagnose sys confsync status | grep in_sy` command to view the synchronization status of the management board and FPCs. The following example just shows a few output lines:

```
diagnose sys confsync status | grep in_sy
FPC6KF3E17900200, Slave, uptime=5385.45, priority=119, slot_id=2:1, idx=2, flag=0x4, in_sync=1
F6KF313E17900031, Slave, uptime=5484.74, priority=2, slot_id=1:0, idx=0, flag=0x10, in_sync=1
F6KF313E17900032, Master, uptime=5488.57, priority=1, slot_id=2:0, idx=1, flag=0x10, in_sync=1
FPC6KF3E17900201, Slave, uptime=5388.78, priority=120, slot_id=2:2, idx=2, flag=0x4, in_sync=1
F6KF313E17900031, Slave, uptime=5484.74, priority=2, slot_id=1:0, idx=0, flag=0x10, in_sync=1
...
```

The `in_sync=1` field indicates that the FPC is synchronized.

Failover in a standalone FortiGate-6000

A FortiGate-6000 will continue to operate even if one of the FPCs fails. If an FPC fails, sessions being processed by that FPC fail. All sessions are then load balanced to the remaining FPCs. Sessions that were being processed by the failed FPC are restarted and load balanced to the remaining FPCs.

An FPC can fail due to a hardware malfunction, a software problem, or a power supply failure. The FortiGate-6000 includes three hot-swappable power supplies in a 2+1 redundant configuration. At least two of the power supplies must be operating to provide power to the FortiGate-6000. If only one power supply is operating then some of the FPCs will be shut down. The FortiGate-6000 will continue to operate but with reduced performance because fewer FPCs are operating.

If FPCs fail due to a hardware failure, they are not customer replaceable. Instead you should RMA the FortiGate-6000.

You can use the `diagnose load-balance status` command to show the status of the FPCs. In the command output, if `Status Message is Running` the FPC is operating normally. For example, for a FortiGate-6301F:

```
diagnose load-balance status
=====
MBD SN: F6KF313E17900032
  Master FPC Blade: slot-2

Slot 1: FPC6KF3E17900200

  Status Message:"Running"

```

Installing firmware on an individual FPC

You might want to install firmware on an individual FPC to resolve a software-related problem with the FPC or if the FPC is not running the same firmware version as the management board. The following procedure describes how to transfer a new firmware image file to the FortiGate-6000 internal TFTP server and then install the firmware onto an FPC.

To install firmware on an individual FPC:

1. Copy the firmware image file onto a TFTP or FTP server, or USB key.
2. From the management board CLI, enter one of the following commands to upload the firmware image file onto the FortiGate-6000 internal TFTP server. The command you use depends on whether the firmware image is on a FTP server, TFTP server, or USB key.

```

execute upload image ftp <image-file-and-path> <comment> <ftp-server-address> <username>
  <password>
execute upload image tftp <image-file> <comment> <tftp-server-address>
execute upload image usb <image-file-and path> <comment>

```

3. Enter the following command to install the firmware image file onto an FPC:

```
execute load-balance update image <slot-number>
```

Where `<slot-number>` is the FPC slot number.

This command uploads the firmware image to the FPC which then reboots. When the FPC starts up, the configuration is reset to factory defaults and then synchronized by the management board. The FPC reboots again, rejoins the cluster, and can start processing traffic.

4. Enter the following command to verify that the configuration of the FPC has been synchronized. The command output below shows the sync status of some of the FPCs in an HA cluster of two FortiGate-6301Fs. The field `in_sync=1` indicates that the configuration of the FPC is synchronized.

```

FPC6KFT018901327, Slave, uptime=615368.33, priority=19, slot_id=1:1, idx=1, flag=0x4, in_sync=1
F6KF31T018900143, Master, uptime=615425.84, priority=1, slot_id=1:0, idx=0, flag=0x10, in_sync=1
FPC6KFT018901372, Slave, uptime=615319.63, priority=20, slot_id=1:2, idx=1, flag=0x4, in_sync=1
F6KF31T018900143, Master, uptime=615425.84, priority=1, slot_id=1:0, idx=0, flag=0x10, in_sync=1
FPC6KFT018901346, Slave, uptime=423.91, priority=21, slot_id=1:3, idx=1, flag=0x4, in_sync=1

```

If `in_sync` is not equal to 1 or if an FPC is missing in the command output you can try restarting the

FPC by entering `execute reboot` from the CL of the out of synch FPC.

The command output also shows that the uptime of the FPC in slot 3 is lower than the uptime of the other FPCs, indicating that the FPC in slot 3 has recently restarted.

Installing FortiGate-6000 firmware from the BIOS after a reboot

A common method for resetting the configuration of a FortiGate involves installing firmware by restarting the FortiGate, interrupting the boot process, and using BIOS prompts to download a firmware image from a TFTP server. This process is also considered the best way to reset the configuration of your FortiGate.

Installing or upgrading FortiGate-6000 firmware from the BIOS after a reboot installs firmware on and resets the configuration of the management board only. The FPCs will continue to operate with their current configuration and firmware build. The FortiGate-6000 system does not synchronize firmware upgrades performed from the BIOS. Once you have installed firmware on the management board from the BIOS after a reboot you must synchronize the new firmware build and configuration to the FPCs.

Use the following steps to upload firmware from a TFTP server to the management board. The procedure involves creating a connection between the TFTP server and one of the FortiGate-6000 MGMT interfaces (in the example, mgmt1).

This procedure also involves connecting to the management board CLI using the FortiGate-6000 console port, rebooting the management board, interrupting the boot from the console session, and following management BIOS prompts to install the firmware. During this procedure, the FortiGate-6000 will not be able to process traffic.

1. Set up a TFTP server and copy the firmware file to the TFTP server default folder.
2. Set up your network to allow traffic between the TFTP server and one of the MGMT interfaces.
3. Connect the console cable supplied with your FortiGate-6000 to the front panel Console port and to your management computer's RS-232 console port.
4. Start a terminal emulation program on the management computer. Use these settings: Baud Rate (bps) 9600, Data bits 8, Parity None, Stop bits 1, and Flow Control None.
5. Log into the management board CLI.
6. Enter the `config global` command to enter the global configuration.
7. Enter `execute reboot` to restart the management board.
8. When the management board starts up, follow the boot process in the terminal session and press any key when prompted to interrupt the boot process.
9. Press C to set up the TFTP configuration.
10. Use the BIOS menu to set the following. Only change settings if required.

```
[P]: Set image download port: MGMT1
```

```
[D]: Set DHCP mode: Disabled
```

```
[I]: Set local IP address: The IP address of the MGMT interface, to be used to connect to the TFTP server. This address can be the same as the FortiGate-6000 management IP address and cannot conflict with other addresses on your network.
```

```
[S]: Set local Subnet Mask: Set as required for your network.
```

```
[G]: Set local gateway: Set as required for your network.
```

[V]: Local VLAN ID: Should be set to <none>. Use -1 to set the Local VLAN ID to <none>.

[T]: Set remote TFTP server IP address: The IP address of the TFTP server.

[F]: Set firmware image file name: The name of the firmware file to be installed.

11. Press Q to quit this menu.
12. Press R to review the configuration.
If you need to make any corrections, press C and make the changes as required. When the configuration is correct, proceed to the next step.
13. Press T to start the TFTP transfer.
The management board downloads the firmware image from the TFTP server and installs on the management board. The management board then restarts with the configuration reset to factory defaults.
14. Once the management restarts, verify that the correct firmware has been installed.
You can do this from the management board GUI dashboard or from the CLI using the `get system status` command.
15. Continue by using the following procedure to synchronize all of the FPCs with the management board.

Synchronizing the FPCs with the management board

After installing firmware on the management board from the BIOS after a reboot, the firmware version and configuration of the management board will most likely be out of synch with the FPCs. You can verify this from the management board CLI using the `diagnose sys confsync status | grep in_sy` command. The `in_sync=0` entries in the following output for a FortiGate-6301F show that the management board (serial number ending in 143) is out of sync with all of the FPCs.

```
diagnose sys confsync status | grep in_sy
FPC6KFT018901327, Slave, uptime=59.44, priority=19, slot_id=1:1, idx=1, flag=0x4, in_sync=0
F6KF31T018900143, Master, uptime=119.72, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901372, Slave, uptime=58.48, priority=20, slot_id=1:2, idx=1, flag=0x4, in_sync=0
F6KF31T018900143, Master, uptime=119.72, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901346, Slave, uptime=58.44, priority=21, slot_id=1:3, idx=1, flag=0x4, in_sync=0
F6KF31T018900143, Master, uptime=119.72, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901574, Slave, uptime=58.43, priority=22, slot_id=1:4, idx=1, flag=0x4, in_sync=0
F6KF31T018900143, Master, uptime=119.72, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901345, Slave, uptime=57.40, priority=23, slot_id=1:5, idx=1, flag=0x4, in_sync=0
F6KF31T018900143, Master, uptime=119.72, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901556, Slave, uptime=58.43, priority=24, slot_id=1:6, idx=1, flag=0x4, in_sync=0
F6KF31T018900143, Master, uptime=119.72, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
F6KF31T018900143, Master, uptime=119.72, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901327, Slave, uptime=59.44, priority=19, slot_id=1:1, idx=1, flag=0x4, in_sync=0
FPC6KFT018901345, Slave, uptime=57.40, priority=23, slot_id=1:5, idx=2, flag=0x4, in_sync=0
FPC6KFT018901346, Slave, uptime=58.44, priority=21, slot_id=1:3, idx=3, flag=0x4, in_sync=0
FPC6KFT018901372, Slave, uptime=58.48, priority=20, slot_id=1:2, idx=4, flag=0x4, in_sync=0
FPC6KFT018901556, Slave, uptime=58.43, priority=24, slot_id=1:6, idx=5, flag=0x4, in_sync=0
FPC6KFT018901574, Slave, uptime=58.43, priority=22, slot_id=1:4, idx=6, flag=0x4, in_sync=0
```

You can also verify synchronization status from management board **Security Fabric** dashboard widget.

To re-synchronize the FortiGate-6000 (which has the effect of resetting all of the FPCs), you can install firmware on the management board using a normal firmware install processes.

You could also manually install firmware on each individual FPC from the BIOS after a reboot. This manual process is just as effective as installing the firmware for a second time on the management board to trigger synchronization to the FPCs, but takes much longer.

1. Log into the management board GUI.
2. Click the **System Information** dashboard widget select **Update firmware in System > Firmware**.
You can also connect to the management board CLI and use the `execute restore image` command. Either operation synchronizes the firmware build and configuration from the management board to the FPCs. The firmware build you install on the management board can either be the same firmware build or a different one.
3. Once you have installed or re-installed firmware on the management board, check the synchronization status from the Security Fabric dashboard widget or by using the `diagnose sys confsync status | grep in_sy` command. The output should be similar to the following (shown for a FortiGate-6301F):

```
diagnose sys confsync status | grep in_sy
FPC6KFT018901327, Slave, uptime=3773.96, priority=19, slot_id=1:1, idx=1, flag=0x4, in_sync=1
F6KF31T018900143, Master, uptime=3837.25, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901372, Slave, uptime=3774.26, priority=20, slot_id=1:2, idx=1, flag=0x4, in_sync=1
F6KF31T018900143, Master, uptime=3837.25, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901346, Slave, uptime=3774.68, priority=21, slot_id=1:3, idx=1, flag=0x4, in_sync=1
F6KF31T018900143, Master, uptime=3837.25, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901574, Slave, uptime=3774.19, priority=22, slot_id=1:4, idx=1, flag=0x4, in_sync=1
F6KF31T018900143, Master, uptime=3837.25, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901345, Slave, uptime=3773.59, priority=23, slot_id=1:5, idx=1, flag=0x4, in_sync=1
F6KF31T018900143, Master, uptime=3837.25, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901556, Slave, uptime=3774.82, priority=24, slot_id=1:6, idx=1, flag=0x4, in_sync=1
F6KF31T018900143, Master, uptime=3837.25, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
F6KF31T018900143, Master, uptime=3837.25, priority=1, slot_id=1:0, idx=0, flag=0x0, in_sync=1
FPC6KFT018901327, Slave, uptime=3773.96, priority=19, slot_id=1:1, idx=1, flag=0x24, in_sync=1

FPC6KFT018901556, Slave, uptime=3774.82, priority=24, slot_id=1:6, idx=5, flag=0x24, in_sync=1
FPC6KFT018901574, Slave, uptime=3774.19, priority=22, slot_id=1:4, idx=6, flag=0x24, in_sync=1
```

Packet sniffing for FPC and management board packets

From the management board CLI, you can use the `diagnose sniffer packet` command to view or sniff packets processed by the FPCs. To use this command log into the management board and edit a VDOM. This command includes a `<slot>` option to allow you to view packets processed by individual FPCs.

You can the `diagnose sniffer packet` command from an individual FPC CLO to view packets processed by that FPC.

From the management board the command syntax is:

```
diagnose sniffer packet <interface> <protocol-filter> <verbose> <count> <timestamp> <slot>
```

Where:

`<interface>` the name of one or more interfaces on which to sniff for packets. Use `any` to sniff packets for all interfaces.

`<protocol-filter>` a filter to select the protocol for which to view traffic. This can be simple, such as entering `udp` to view UDP traffic or complex to specify a protocol, port, and source and destination interface and so on.

`<verbose>` the amount of detail in the output, and can be:

- 1 display packet headers only.
- 2 display packet headers and IP data.
- 3 display packet headers and Ethernet data (if available).
- 4 display packet headers and interface names.
- 5 display packet headers, IP data, and interface names.
- 6 display packet headers, Ethernet data (if available), and interface names.

`<count>` the number of packets to view. You can enter Ctrl-C to stop the sniffer before the count is reached.

`<timestamp>` the timestamp format, `a` for UTC time and `l` for local time.

`<slot>` the FPC(s) for which to view packets.

- To view packets for one FPC enter the FPC's slot number.
- To view packets for more than one FPC, enter the slot numbers separated by commas. You can also include a range. For example, to view packets for the FPCs in slots 1, 2, 3, and 6 you can enter `1, 2, 3, 6` or `1-3, 6`.
- To view packets for all FPCs, enter `all`.
- If you leave out the `<slot>` option, you can use the `diagnose sniffer options slot` command to set whether management board packets appear or whether management board and FPC packets appear.

Using the diagnose sniffer options slot command

You can use the `diagnose sniffer options slot` command to control what the `diagnose sniffer packet` command displays if you don't include the `<slot>` option. The default `diagnose sniffer options slot` setting causes the `diagnose sniffer packet` command to display packets processed by all FPCs and by the management board.

You can use the following command to only display packets processed by the management board:

```
diagnose sniffer options slot current
```

Then the next time you enter the `diagnose sniffer packet` command and leave out the `<slot>` option, only packets from the management board appear in the command output.

Filtering out internal management traffic

The FortiGate-6000 includes internal interfaces that process internal management and synchronization communication between FortiGate-6000 components. Because this traffic uses internal interfaces, if you specify one or more interface names in the `diagnose sniffer packet` command this traffic is filtered out. However, if you sniff traffic on `any` interface, internal management traffic can appear in the `diagnose sniffer packet` command output.

The `diagnose sniffer options filter-out-internal-pkts` option if enabled (the default), filters out this internal management traffic. You can disable this option if you want to see the internal management traffic in the `diagnose sniffer packet` output.

Load balancing and flow rules

This chapter provides an overview of how FortiGate-6000 Session-Aware Load Balancing (SLBC) works and then breaks down the details and explains why you might want to change some load balancing settings.

For information about IPsec load balancing, see [FortiGate-6000 IPsec VPN on page 645](#).

FortiGate-6000 SLBC works as follows.

1. SLBC attempts to match all incoming sessions with a configured flow rule (see [Load balancing and flow rules on page 636](#)). If a session matches a flow rule, the session is directed according to the action setting of the flow rule. Usually flow rules send traffic that can't be load balanced to a specific FPC.
2. TCP, UDP, SCTP, ICMP (IPv4 only) and ESP (IPv4 only) sessions that do not match a flow rule are directed to the DP3 processors.
The DP3 processors distribute sessions to the FPCs according to the load balancing method set by the `dp-load-distribution-method` option of the `config load-balance` setting command.
3. All other sessions are sent to the primary (or master) FPC.

Setting the load balancing method

The FortiGate-6000 load balances or distributes sessions based on the load balancing method set by the following command:

```
config load-balance setting
    set dp-load-distribution-method {to-master | src-ip | dst-ip | src-dst-ip | src-ip-
        sport | dst-ip-dport | src-dst-ip-sport-dport}
end
```

Where:

`to-master` directs all session to the primary FPC. For troubleshooting only and should not be used for normal operation. Directing all sessions to the primary FPC has a negative impact on performance.

`src-ip` distribute sessions across all FPCs according to their source IP address.

`dst-ip` distribute sessions statically distributed across all FPCs according to their destination IP address.

`src-dst-ip` distribute sessions across all FPCs according to their source and destination IP addresses.

`src-ip-sport` distribute sessions across all FPCs according to their source IP address and source port.

`dst-ip-dport` distribute sessions across all FPCs according to their destination IP address and destination port.

`src-dst-ip-sport-dport` distribute sessions across all FPCs according to their source and destination IP address, source port, and destination port. This is the default load balance algorithm and represents true session-aware load balancing. Session aware load balancing takes all session information into account when deciding where to send new sessions and where to send additional packets that are part of an already established session.

The `src-ip` and `dst-ip` load balancing methods use layer 3 information (IP addresses) to identify and load balance sessions. All of the other load balancing methods (except for `to-master`) use both layer 3 and layer 4 information (IP addresses and port numbers) to identify a TCP and UDP session. The layer 3 and layer 4 load balancing methods only use layer 3 information for other types of traffic (SCTP, ICMP, and ESP). If you enable GTP load balancing, the FortiGate-6000 uses Tunnel Endpoint Identifiers (TEIDs) to identify GTP sessions.

Flow rules for sessions that cannot be load balanced

Some traffic types cannot be load balanced. Sessions for traffic types that cannot be load balanced should normally be sent to the primary (or master) FPC by configuring flow rules for that traffic. You can also configure flow rules to send traffic that cannot be load balanced to specific FPCs.

Create flow rules using the `config loadbalance flow-rule` command. The default configuration uses this command to send IKE, GRE, session helper, Kerberos, BGP, RIP, IPv4 and IPv6 DHCP, PPTP, BFD, IPv4 multicast and IPv6 multicast to the primary FPC. You can view the default configuration of the `config loadbalance flow-rule` command to see how this is all configured. For example, the following configuration sends all IKE sessions to the primary FPC:

```
config load-balance flow-rule
  edit 1
    set status enable
    set vlan 0
    set ether-type ip
    set protocol udp
    set src-l4port 500-500
    set dst-l4port 500-500
    set action forward
    set forward-slot master
    set priority 5
    set comment "ike"
  next
  edit 2
    set status disable
    set vlan 0
    set ether-type ip
    set protocol udp
    set src-l4port 4500-4500
    set dst-l4port 0-0
    set action forward
    set forward-slot master
    set priority 5
    set comment "ike-natt src"
  next
  edit 3
    set status disable
    set vlan 0
    set ether-type ip
    set protocol udp
    set src-l4port 0-0
    set dst-l4port 4500-4500
    set action forward
    set forward-slot master
    set priority 5
    set comment "ike-natt dst"
  next
```

See [Default configuration for traffic that cannot be load balanced on page 640](#) for a listing of all of the default flow rules.

Here is a list of protocols that are not load balanced, but sent to the primary FPC. You can create flow rules to change this behavior:

- IPv4 over IPv6
- IPv6 over IPv4
- IP over IP
- L2TP

Determining which FPC is operating as the primary FPC

You can use the `diagnose load-balance status` command to determine which FPC is operating as the primary FPC. The primary FPC is also responsible for dynamic routing.

The following example `diagnose load-balance status` output for a FortiGate-6300F shows that the FPC in slot 1 is the primary (master) FPC. The command output also shows the status of all of the FPCs in the FortiGate-6300F.

```
diagnose load-balance status
=====

SSL VPN load balancing

FortiGate-6000s do not support load balancing SSL VPN sessions terminated by the FortiGate-6000. The recommended configuration is to direct SSL VPN sessions terminated by the FortiGate-6000 to the primary FPC.

SSL VPN sessions are sessions from an SSL VPN client to your configured SSL VPN server listening port.

Using a FortiGate-6000 as an SSL VPN server requires you to manually add an SSL VPN load balance flow rule to configure the FortiGate-6000 to send all SSL VPN sessions to the primary (master) FPC. To match with the SSL VPN server traffic, the rule should include a destination port that matches the destination port of the SSL VPN server. A basic rule to allow SSL VPN traffic could be:

```
config load-balance flow-rule
  edit 0
    set status enable
    set ether-type ipv4
    set protocol tcp
    set dst-l4port 10443-10443
    set forward-slot master
    set comment "ssl vpn server to primary FPC"
  next
end
```

This flow rule matches all sessions sent to port 10443 (the default SSL VPN server listening port) and sends these sessions to the primary FPC. This should match all of your SSL VPN traffic if you are using the default SSL VPN server listening port (10443). This flow rule also matches all other sessions using 10443 as the destination port so all of this traffic is also sent to the primary FPC.

Adding the SSL VPN server IP address

You can add the IP address of the FortiGate-6000 interface that receives SSL VPN traffic to the SSL VPN flow rule to make sure that the flow rule only matches SSL VPN server settings. For example, if the IP address of the interface is 172.25.176.32 and the SSL VPN flow rule ID is 26:

```
config load-balance flow-rule
  edit 26
    set status enable
    set ether-type ipv4
    set protocol tcp
    set dst-addr-ipv4 172.25.176.32 255.255.255.0
    set dst-l4port 10443-10443
    set forward-slot master
    set comment "ssl vpn server to primary FPC"
  next
end
```

This flow rule will now only match SSL VPN sessions with 172.25.176.32 as the destination address and send all of these sessions to the primary FPC.

If you change the SSL VPN server listening port

If you have changed the SSL VPN server listening port to 20443, you can change the SSL VPN flow rule as follows. This example also sets the source interface to port12, which is the SSL VPN server interfaces, instead of adding the IP address of port12 to the configuration:

```
config load-balance flow-rule
  edit 26
    set status enable
    set ether-type ipv4
    set protocol tcp
    set src-interface port12
    set dst-l4port 20443-20443
    set forward-slot master
    set comment "ssl vpn server to primary FPC"
  next
end
```

GTP load balancing

You can use the following command to enable or disable GTP load balancing.

```
config load-balance setting
  set gtp-load-balance {disable | enable}
end
```

By default, this option is disabled and GTP load balancing is disabled. Instead, the following flow rule is enabled and GTP traffic is directed to the primary (master) FPC.

```
config load-balance flow-rule
  edit 17
    set status enable
    set ether-type ipv4
    set protocol udp
    set dst-l4port 546-546
    set dst-l4port 2123-2123
    set comment "gtp-c to master blade"
  next
end
```

When the `gtp-load-balance` option is enabled, the GTP load balancing is flow rule is disabled and the FortiGate-6000 directs GTP sessions to the DP3 processors where they are load balanced to the FPCs.

Default configuration for traffic that cannot be load balanced

The default FortiGate-6000 `configure load-balance flow-rule` command contains the recommended default rules for how the FortiGate-6000 handles traffic types that cannot be load balanced. All of these flow rules identify the traffic type using the options available in the command and direct the traffic to the primary (or master) FPC. The rules also include a comment that identifies the traffic type.

Most of the flow rules are enabled (`status` set to `enable`) and they will direct matching traffic to the primary FPC. However, the configuration does include some disabled flow rules. You can enable these flow rules if required for your network.

The CLI syntax below was created with the `show` command and just shows the configuration changes. All other options are set to their defaults. Flow rules with no `status` option are disabled by default. Also the default `forward-slot` setting is `master`, which directs matching traffic to the primary FPC.

```
show load-balance flow-rule
config load-balance flow-rule
  edit 1

FortiGate-6000 IPsec VPN

This chapter highlights special FortiGate-6000 VPN features and configurations.

New IPsec VPN features

FortiOS 5.6 includes the following IPsec VPN improvements:

- Including a phase 2 selector is no longer mandatory.
- Dynamic routing (RIP, OSPF, BGP) is supported over IPsec VPN tunnels.

IPsec VPN features supported by FortiOS 5.6 for FortiGate-6000

FortiOS 5.6 for FortiGate-7000 supports the following IPsec VPN features.

- Interface-based IPsec VPN (also called route-based IPsec VPN).
- Static routes can point IPsec VPN interfaces.
- Dynamic routing (RIP, OSPF, BGP) over IPsec VPN tunnels.
- Remote networks with 16- to 32-bit netmasks.
- IPsec VPN tunnels must terminate on the primary FPM (the ELBC master).
- Site-to-Site IPsec VPN.
- Dialup IPsec VPN. The FortiGate-7000 can be the dialup server or client.
- IPv4 clear-text traffic (IPv4 over IPv4 or IPv4 over IPv6)

IPsec VPN features not supported by FortiOS 5.6 for FortiGate-6000

FortiOS 5.6 for FortiGate-7000 does not support the following IPsec VPN features.

- Policy-based IPsec VPN.
- Policy routes for VPN traffic.
- Remote networks with 0- to 15-bit netmasks.
- IPv6 clear-text traffic (IPv6 over IPv4 or IPv6 over IPv6).
- Load-balancing IPsec VPN tunnels to multiple FPMs.
- IPsec SA synchronization between both FortiGate-7000s in an HA configuration.

IPsec VPN load balancing

You can use the following command to enable or disable IPsec VPN load balancing:

```
config load-balance setting
    config ipsec-load-balance {disable | enable}
end
```

By default IPsec VPN load balancing is enabled and the flow rules listed below are disabled. The FortiGate-6000 directs IPsec VPN sessions to the DP3 processors which load balances them among the FPCs.

However, with IPsec VPN load balancing enabled, the FortiGate-6000 will drop IPsec VPN sessions traveling between two IPsec tunnels because the two IPsec tunnels may be terminated on different FPCs. So if you have

traffic entering the FortiGate-6000 from one IPsec VPN tunnel and leaving the FortiGate-6000 out another IPsec VPN tunnel you need to disable IPsec load balancing:

```
config load-balance setting
    config ipsec-load-balance disable
end
```

Disabling IPsec VPN load balancing in this way enables the following flow rules:

```
config load-balance flow-rule
    edit 21
        set ether-type ipv4
        set protocol udp
        set dst-l4port 500-500
        set comment "ipv4 ike"
    next
    edit 24
        set ether-type ipv4
        set protocol udp
        set dst-l4port 4500-4500
        set comment "ipv4 ike-natt dst"
    next
    edit 25
        set ether-type ipv4
        set protocol esp
        set comment "ipv4 esp"
    next
end
```

These flow rules should generally handle all IPsec VPN traffic. You can also adjust them or add your own flow rules if you have an IPsec VPN setup that is not compatible with the default flow rules.

Adding source and destination subnets to IPsec VPN phase 2 configurations

If your FortiGate-6000 configuration includes IPsec VPNs you should enhance your IPsec VPN Phase 2 configurations as described in this section. Because the FortiGate-6000 only allows 16-bit to 32-bit routes, you must add one or more destination subnets to your IPsec VPN phase 2 configuration for FortiGate-6000 using the following command:

```
config vpn ipsec phase2-interface
    edit "to_fgt2"
        set phaselname <name>
        set src-subnet <IP> <netmask>
        set dst-subnet <IP> <netmask>
    end
```

Where

`src-subnet` is the subnet protected by the FortiGate-6000 that you are configuring and from which users connect to the destination subnet. Configuring the source subnet is optional but recommended.

`dst-subnet` is the destination subnet behind the remote IPsec VPN endpoint. Configuring the destination subnet is required.

Example basic IPsec VPN Phase 2 configuration

In a simple configuration such as the one below with an IPsec VPN between two remote subnets you can just add the subnets to the phase 2 configuration.

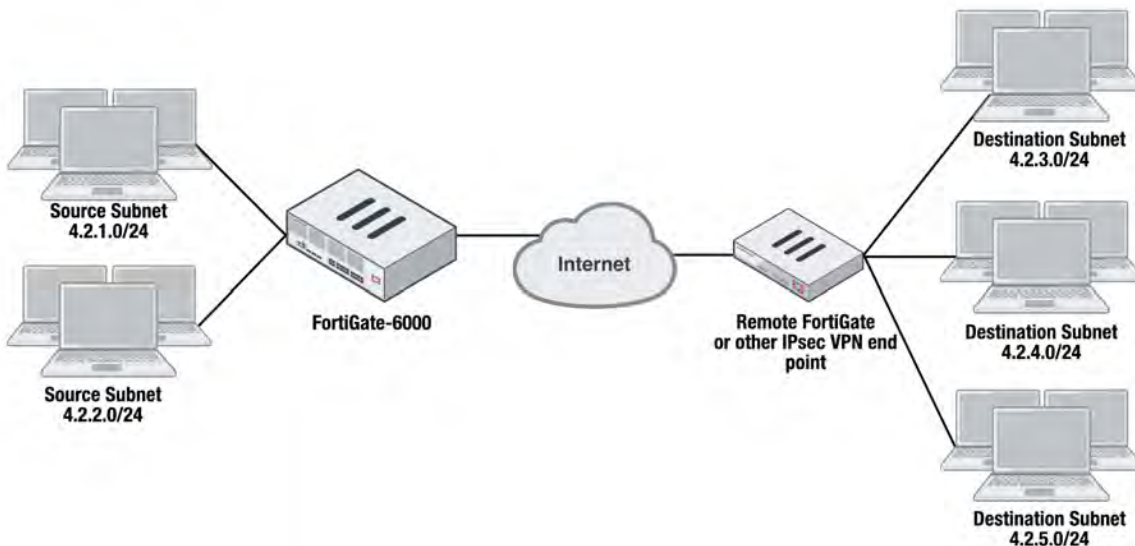

Enter the following command to add the source and destination subnets to the FortiGate-6000 IPsec VPN Phase 2 configuration.

```
config vpn ipsec phase2-interface
edit "to_fgt2"
set phase1name "to_fgt2"
set src-subnet 172.16.1.0 255.255.255.0
set dst-subnet 172.16.2.0 255.255.255.0
end
```

Example multiple subnet IPsec VPN Phase 2 configuration

In a more complex configuration, such as the one below with a total of 5 subnets you still need to add all of the subnets to the Phase 2 configuration. In this case you can create a firewall address for each subnet and the addresses to address groups and add the address groups to the Phase 2 configuration.

Enter the following commands to create firewall addresses for each subnet.

```
config firewall address
edit "local_subnet_1"
```

```
set subnet 4.2.1.0 255.255.255.0
next
edit "local_subnet_2"
set subnet 4.2.2.0 255.255.255.0
next
edit "remote_subnet_3"
set subnet 4.2.3.0 255.255.255.0
next
edit "remote_subnet_4"
set subnet 4.2.4.0 255.255.255.0
next
edit "remote_subnet_5"
set subnet 4.2.5.0 255.255.255.0
end
```

And then put the five firewall addresses into two firewall address groups.

```
config firewall addrgrp
edit "local_group"
set member "local_subnet_1" "local_subnet_2"
next
edit "remote_group"
set member "remote_subnet_3" "remote_subnet_4" "remote_subnet_5"
end
```

Now, use the firewall address groups in the Phase 2 configuration:

```
config vpn ipsec phase2-interface
edit "to-fgt2"
set phase1name "to-fgt2"
set src-addr-type name
set dst-addr-type name
set src-name "local_group"
set dst-name "remote_group"
end
```

Configuring the FortiGate-6000 as a dialup IPsec VPN server

FortiGate-6000s can be configured as dialup IPsec VPN servers.

Example dialup IPsec VPN configuration

The following shows how to setup a dialup IPsec VPN configuration where the FortiGate-6000 acts as a dialup IPsec VPN server.

To configure the FortiGate-6000 as a dialup IPsec VPN server

Configure the phase1, set type to dynamic.

```

config vpn ipsec phase1-interface
edit dialup-server
set type dynamic
set interface "v0020"
set peertype any
set psksecret <password>
end

```

Configure the phase 2, to support dialup IPsec VPN, set the destination subnet to 0.0.0.0 0.0.0.0.

```

config vpn ipsec phase2-interface
edit dialup-server
set phase1name dialup-server
set src-subnet 4.2.0.0 255.255.0.0
set dst-subnet 0.0.0.0 0.0.0.0
end

```

To configure the remote FortiGate as a dialup IPsec VPN client

The dialup IPsec VPN client should advertise its local subnet(s) using the phase 2 src-subnet option.

If there are multiple local subnets, create a phase 2 for each one. Each phase 2 only advertises one local subnet to the dialup IPsec VPN server. If more than one local subnet is added to the phase 2, only the first one is advertised to the server.

Dialup client configuration:

```

config vpn ipsec phase1-interface
edit "to-fgt6k"
set interface "v0020"
set peertype any
set remote-gw 1.2.0.1
set psksecret <password>
end
config vpn ipsec phase2-interface
edit "to-fgt6k"
set phase1name "to-fgt6k"

```

```
        set src-subnet 4.2.6.0 255.255.255.0
        set dst-subnet 4.2.0.0 255.255.0.0
    next
    edit "to-fgt6k-2"
        set phase1name "to-fgt6k"
        set src-subnet 4.2.7.0 255.255.255.0
        set dst-subnet 4.2.0.0 255.255.0.0
    end
```

FortiGate-6000 high availability (FGCP)

FortiGate-6000 supports FortiGate Clustering Protocol (FGCP) HA between two (and only two) identical FortiGate-6000 models. You can configure FortiGate-6000 HA in much the same way as any FortiGate HA setup except that you must use the HA1 and HA2 interfaces for HA heartbeat communication. Also, the heartbeat packets are VLAN-tagged and you can configure the VLANs used. Also, FortiGate-6000 HA only supports Active-Passive HA and even though the FortiGate-6000s are configured with multiple VDOMs they do not support virtual clustering.

During the FortiGate-6000 HA configuration you assign each of the FortiGate-6000s in the HA cluster a chassis ID of 1 or 2. The chassis IDs just allow you to identify individual FortiGate-6000s and do not influence primary unit selection.

Example FortiGate-6000 HA configuration

In a FortiGate-6000 FGCP HA configuration, the primary (or master) FortiGate-6000 processes all traffic. The backup FortiGate-6000 operates in hot standby mode. The FGCP synchronizes the configuration, active sessions, routing information, and so on to the backup FortiGate-6000. If the primary FortiGate-6000 fails, traffic automatically fails over to the backup.

The FGCP selects the primary FortiGate-6000 based on standard FGCP primary unit selection:

- Connected monitored interfaces
- Age
- Device Priority
- Serial Number

In most cases, if everything is connected and operating normally, the FortiGate-6000 with the highest serial number becomes the primary FortiGate-6000. You can set the device priority higher on one of the FortiGate-6000s if you want it to become the primary unit. You can also enable override along with setting a higher device priority to make sure the same FortiGate-6000 always becomes the primary FortiGate-6000.

Sessions terminated by the cluster include management sessions (such as HTTPS connections to the FortiGate GUI or SSH connection to the CLI as well as SNMP and logging and so on). Also included in this category are IPsec VPN, SSL VPN, sessions terminated by the cluster, and explicit proxy sessions. In general, whether or not session-pickup is enabled, these sessions do not failover and have to be restarted.

Before you begin configuring HA

Before you begin, the FortiGate-6000s should be running the same FortiOS firmware version and interfaces should not be configured to get their addresses from DHCP or PPPoE. Register and apply licenses to each FortiGate-6000 before setting up the HA cluster. This includes licensing for FortiCare, IPS, AntiVirus, Web Filtering, Mobile Malware, FortiClient, FortiCloud, and additional virtual domains (VDOMs). Both FortiGate-6000s in the cluster must have the same level of licensing for FortiGuard, FortiCloud, FortiClient, and VDOMs. FortiToken licenses can be added at any time because they are synchronized to all cluster members.

On each FortiGate-6000, make sure the configurations of the FPCs are synchronized before starting to configure HA. You can use the following command to verify the configuration status of the FPCs. The following example shows the results from a FortiGate-6300F.

```
diagnose sys confsync showchecksum | grep all
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
```

If the FPCs are synchronized, the listed checksums should all be the same.

You can also use the following command to list the FPCs that are synchronized. The example output, for a FortiGate-6300F, shows all six FPCs have been configured for HA and added to the cluster.

```
diagnose sys confsync status | grep in_sync
F6KF313E17900031, Slave, uptime=232441.23, priority=2, slot_id=1:0, idx=0, flag=0x10, in_sync=1
F6KF313E17900031, Slave, uptime=232441.23, priority=2, slot_id=1:0, idx=0, flag=0x10, in_sync=1
F6KF313E17900031, Slave, uptime=232441.23, priority=2, slot_id=1:0, idx=0, flag=0x10, in_sync=1
F6KF313E17900031, Slave, uptime=232441.23, priority=2, slot_id=1:0, idx=0, flag=0x10, in_sync=1
F6KF313E17900031, Slave, uptime=232441.23, priority=2, slot_id=1:0, idx=0, flag=0x10, in_sync=1
F6KF313E17900031, Master, uptime=232441.23, priority=1, slot_id=1:0, idx=0, flag=0x10, in_sync=1
F6KF313E17900031, Slave, uptime=232441.23, priority=2, slot_id=1:0, idx=0, flag=0x10, in_sync=1
FPC6KF3E17900209, Slave, uptime=231561.99, priority=24, slot_id=1:6, idx=6, flag=0x24, in_sync=1
FPC6KF3E17900215, Slave, uptime=231524.81, priority=22, slot_id=1:4, idx=7, flag=0x24, in_sync=1
FPC6KF3E17900217, Slave, uptime=232289.83, priority=120, slot_id=1:5, idx=8, flag=0x24, in_sync=1
FPC6KF3E17900229, Slave, uptime=232271.59, priority=118, slot_id=1:3, idx=10, flag=0x24, in_sync=1
FPC6KF3E17900230, Slave, uptime=232330.19, priority=116, slot_id=1:1, idx=11, flag=0x24, in_sync=1
FPC6KF3E17900291, Slave, uptime=232314.29, priority=117, slot_id=1:2, idx=13, flag=0x24, in_sync=1
```

In this command output `in_sync=1` means the FPC is synchronized with the management board and `in_sync=0` means the FPC is not synchronized.

Connect the HA1 and HA2 interfaces for HA heartbeat communication

HA heartbeat communication between FortiGate-6000s happens over the 10Gbit HA1 and HA2 interfaces. To set up HA heartbeat connections:

- Connect the HA1 interfaces of the two FortiGate-6000s together either with a direct cable connection, or using a switch.
- Connect the HA2 interfaces in the same way.

Heartbeat packets are VLAN packets with VLAN ID 999 and ethertype 9890. The MTU value for the HA1 and HA2 interfaces is 1500. You can use the following commands to change the HA heartbeat packet VLAN ID and ethertype values if required for your switches. You must change these settings on each FortiGate-6000. By default the HA1 and HA2 interface heartbeat packets use the same VLAN IDs.

```
config system ha
  set hbdev-vlan-id <vlan>
  set hbdev-second-vlan-id <vlan>
  set ha-eth-type <eth-type>
end
```

Using separate connections for HA1 and HA2 is recommended for redundancy. If you are using switches, it is also recommended that these switches be dedicated to HA heartbeat communication and not used for other traffic.

If you use the same switch for both HA1 and HA2, separate the HA1 and HA2 traffic on the switch and set the heartbeat traffic on the HA1 and HA2 Interfaces to have different VLAN IDs. For example, use the following command to set the heartbeat traffic on HA1 to use VLAN ID 4091 and the heartbeat traffic on HA2 to use VLAN ID 4092:

```
config system ha
  set hbdev-vlan-id 4091
  set hbdev-second-vlan-id 4092
end
```

If you don't set different VLAN IDs for the HA1 and HA2 heartbeat packets, q-in-q must be enabled on the switch.

Example FortiGate-6000 switch configuration

The switch that you use for connecting HA heartbeat interfaces does not have to support IEEE 802.1ad (also known as Q-in-Q, double-tagging). But the switch should be able to forward the double-tagged frames. Some switches will strip out the inner tag and Fortinet recommends avoiding these switches. FortiSwitch D and E series can correctly forward double-tagged frames.

This configuration is not required for FortiGate-6000 HA configurations if you have set up direct connections between the HA heartbeat interfaces.

This example shows how to configure a FortiGate-6000 to use different VLAN IDs for the HA1 and HA2 HA heartbeat interfaces and then how to configure two ports on a Cisco switch to allow HA heartbeat packets.

This example sets the native VLAN ID for both switch ports to 777. You can use any VLAN ID as the native VLAN ID as long as the native VLAN ID is not the same as the allowed VLAN ID.

1. On both FortiGate-6000s in the HA configuration, enter the following command to use different VLAN IDs for the HA1 and HA2 interfaces. The command sets the ha1 VLAN ID to 4091 and the ha2 VLAN ID to 4092:

```
config system ha
    set hbdev ha1 50 ha2 100
    set hbdev-vlan-id 4091
    set hbdev-second-vlan-id 4092
end
```

2. Use the `get system ha status` command to confirm the VLAN IDs.

```
get system ha status
...
HBDEV stats:
F6KF51T018900026(updated 4 seconds ago):
    ha1: physical/10000full, up, rx-bytes/packets/dropped/errors=54995955/230020/0/0,

    ha2: physical/10000full, up, rx-bytes/packets/dropped/errors=54995955/230020/0/0,
tx=63988021/225267/0/0, vlan-id=4092
F6KF51T018900022(updated 3 seconds ago):
    ha1: physical/10000full, up, rx-bytes/packets/dropped/errors=61237440/230023/0/0,
tx=57746989/225271/0/0, vlan-id=4091
    ha2: physical/10000full, up, rx-bytes/packets/dropped/errors=61238907/230023/0/0,
tx=57746989/225271/0/0, vlan-id=4092
...
```

3. Configure the Cisco switch port that connects the HA1 interfaces to allow packets with a VLAN ID of 4091:

```
interface <name>
    switchport mode trunk
    switchport trunk native vlan 777
    switchport trunk allowed vlan 4091
```

4. Configure the Cisco switch port that connects the HA2 interfaces to allow packets with a VLAN ID of 4092:

```
interface <name>
    switchport mode trunk
    switchport trunk native vlan 777
    switchport trunk allowed vlan 4092
```

Basic FortiGate-6000 HA configuration

Use the following steps to set up HA between two FortiGate-6000s. To configure HA, you assign a chassis ID (1 and 2) to each of the FortiGate-6000s. These IDs allow the FGCP to identify the chassis and do not influence primary FortiGate-7000 selection. Before you start, determine which FortiGate-6000 should be chassis 1 and which should be chassis 2.

1. Set up HA heartbeat communication as described in [Connect the HA1 and HA2 interfaces for HA heartbeat communication on page 653](#).
2. Log into the GUI or CLI of the FortiGate-6000 that will become chassis 1.

3. Use the following CLI command to change the host name. This step is optional, but setting a host name makes the FortiGate-6000 easier to identify after the cluster has formed.

```
config system global
  set hostname 6K-Chassis-1
end
```

From the GUI you can configure the host name by going to **System > Settings** and changing the **Host name**.

4. Enter the following command to configure basic HA settings for the chassis 1 FortiGate-6000:

```
config system ha
  set group-id 6
  set group-name My-6K-cluster
  set mode a-p
  set hbdev ha1 50 ha2 100
  set chassis-id 1
  set hbdev-vlan-id 4091
  set hbdev-second-vlan-id 4092
  set password <password>
end
```

From the GUI you can configure HA by going to **System > HA**. Set the **Mode** to **Active-Passive**, set the **Group Name**, add a **Password**, and set the **Heartbeat Interface Priority** for the heartbeat interfaces (1-M1, 1-M2, 2-M1, and 2-M2). You must configure the chassis ID and group ID from the CLI.

5. Log into the chassis 2 FortiGate-6000 and configure its host name, for example:

```
config system global
  set hostname 6K-Chassis-2
end
```

From the GUI you can configure the host name by going to **System > Settings** and changing the **Host name**.

6. Enter the following command to configure basic HA settings. The configuration must be the same as the chassis 1 configuration, except for the chassis ID.

```
config system ha
  set group-id 6
  set group-name My-6K-cluster
  set mode a-p
  set hbdev ha1 50 ha2 100
  set chassis-id 2
  set hbdev-vlan-id 4091
  set hbdev-second-vlan-id 4092
  set password <password>
end
```

From the GUI you can configure HA by going to **System > HA**. Set the **Mode** to **Active-Passive**, set the **Group Name**, add a **Password**, and set the **Heartbeat Interface Priority** for the heartbeat interfaces (1-M1, 1-M2, 2-M1, and 2-M2). You must configure the chassis ID and group ID from the CLI.

Once you save your configuration changes, if the HA heartbeat interfaces are connected, the FortiGate-6000s negotiate to establish a cluster. You may temporarily lose connectivity with the FortiGate-6000s as the cluster negotiates and the FGCP changes the MAC addresses of the FortiGate-6000 interfaces. To be able to reconnect sooner, you can update the ARP table of your management PC by deleting the ARP table entry for the FortiGate (or just deleting all ARP table entries). You may be able to delete the ARP table of your management PC from a command prompt using a command similar to `arp -d`. When the cluster has completed negotiating, you can log into it using the management IP address of the primary FortiGate-6000.

7. Log into the cluster and view the HA Status dashboard widget or enter the `get system ha status` command to confirm that the cluster has formed and is operating normally.

If the cluster is operating normally, you can connect network equipment, add your configuration, and start operating the cluster.

Verifying that the cluster is operating normally

You view the cluster status from the HA Status dashboard widget or by using the `get system ha status` command.

If the HA Status widget or the `get system ha status` command shows a cluster has not formed, check the HA heartbeat connections. They should be configured as described in [Connect the HA1 and HA2 interfaces for HA heartbeat communication on page 653](#).

You should also review the HA configurations of the FortiGate-6000s. When checking the configurations, make sure both FortiGate-6000s have the same HA configuration, including identical HA group IDs, group names, passwords, and HA heartbeat VLAN IDs.

The following example FortiGate-6000 `get system ha status` output shows a FortiGate-6000 cluster that is operating normally. The output shows which FortiGate-6000 has become the primary (master) FortiGate-6000 and how it was chosen. You can also see CPU and memory use data, HA heartbeat VLAN IDs, and so on.

```

Managing individual management boards and FPCs in HA mode

In some cases, you may want to connect to an individual FPC in one of the FortiGate-6000s in the HA cluster. For example, you may want to view the traffic being processed by the FPC in slot 3 of chassis 2. You can connect to the GUI or CLI of individual FPCs in the FortiGate-6000 using the management IP address with a special port number.

For example, if the management IP address is 1.1.1.1 you can browse to <https://1.1.1.1:44323> to connect to the FPC in chassis 2 slot 3. The special port number (in this case 44323) is a combination of the service port, chassis ID, and slot number. The special port numbers are the same as those listed under [Getting started with FortiGate-6000 on page 619](#) with the addition of the number 2 for FPCs in the FortiGate-6000 with chassis ID 2.

For example:

- To connect to the GUI of the FPC in chassis 2 slot 6 using HTTPS you would browse to <https://1.1.1.1:44326>.

The formula for calculating the special port number is based on Chassis ID. CH1 = Chassis ID1, CH2 = Chassis ID2. The formula is: $\text{service_port} \times 100 + (\text{chassis_id} - 1) \times 20 + \text{slot_id}$.

Firmware upgrade

Both management boards and all of the FPCs in a FortiGate-6000 HA cluster run the same firmware image. You upgrade the firmware from the GUI or CLI by logging into the primary FortiGate-6000 and installing the firmware image.

If `uninterruptable-upgrade` and `session-pickup` are enabled, firmware upgrades should only cause a minimal traffic interruption. Use the following command to enable these settings (they should be enabled by default). These settings are synchronized.

```

config system ha
    set uninterruptable-upgrade enable
    set session-pickup enable
end

```

When these settings are enabled, the primary FortiGate-6000 management board uploads firmware to the backup FortiGate-6000 management board. The backup management board uploads the firmware to all of the

FPCs in the backup FortiGate-6000. Then the management board and all of the FPCs in the backup FortiGate-6000 upgrade their firmware and reboot and resynchronize.

Then all traffic fails over to the backup FortiGate-6000 which becomes the new primary FortiGate-6000. Then the management board and the FPCs in the new backup FortiGate-6000 upgrade their firmware and rejoin the cluster. Unless override is enabled, the new primary FortiGate-6000 continues to operate as the primary FortiGate-6000.

Normally you would want to enable `uninterruptable-upgrade` to minimize traffic interruptions. But `uninterruptable-upgrade` does not have to be enabled. In fact, if a traffic interruption is not going to cause any problems you can disable `uninterruptable-upgrade` so that the firmware upgrade process takes less time.

Distributed clustering

FortiGate-6000 HA supports separating the FortiGate-6000s in different physical locations. Distributed FortiGate-6000 HA clustering (or geographically distributed FortiGate-6000 HA or geo clustering) can involve two FortiGate-6000s in different rooms in the same building, different buildings in the same location, or even different geographical sites such as different cities, countries or continents.

Just like any FortiGate-6000 HA configuration, distributed FortiGate-6000 HA requires heartbeat communication between the FortiGate-6000s over the HA1 and HA2 interfaces. In a distributed FortiGate-6000 HA configuration this heartbeat communication can take place over the Internet or over other transmission methods including satellite linkups.

Most Data Center Interconnect (DCI) or MPLS-based solutions that support layer 2 extensions and VLAN tags between the remote data centers should also support HA heartbeat communication between the FortiGates in the distributed locations. Using VLANs and switches in promiscuous mode to pass all traffic between the locations can also be helpful.

You cannot change HA heartbeat IP addresses, so the heartbeat interfaces have to be able to communicate over the same subnet.

The HA1 and HA2 interface traffic must be separated. You can do this by using separate channels for each interface or by configuring the HA1 and HA2 interfaces to use different VLANs.

Example FortiGate-6000 distributed clustering configuration

Because of the possible distance between sites, it may take a relatively long time for heartbeat packets to be transmitted between the FortiGate-6000s. This could lead to a split brain scenario. To avoid a split brain scenario you can modify heartbeat timing so that the cluster expects extra time between heartbeat packets. As a general rule, set the heartbeat failover time (`hb-interval`) to be longer than the max latency or round trip time (RTT). You could also increase the `hb-lost-threshold` to tolerate losing heartbeat packets if the network connection is less reliable.

In addition you could use different link paths for heartbeat packets to optimize HA heartbeat communication. You could also configure QoS on the links used for HA heartbeat traffic to make sure heartbeat communication has the highest priority.

Modifying heartbeat timing

If the FortiGate-6000s in the HA cluster do not receive heartbeat packets on time, the FortiGate-6000s in the HA configuration may each determine that the other FortiGate-6000 has failed. HA heartbeat packets may not be sent on time because of network issues. For example, if the HA1 and HA2 communications links between the FortiGate-6000s become too busy to handle the heartbeat traffic. Also, in a distributed clustering configuration the round trip time (RTT) between the FortiGate-6000s may be longer the expected time between heartbeat packets.

In addition, if the FortiGate-6000s becomes excessively busy, they may delay sending heartbeat packets.

Even with these delays, the FortiGate-6000 HA cluster can continue to function normally as long as the HA heartbeat configuration supports longer delays between heartbeat packets and more missed heartbeat packets.

You can use the following commands to configure heartbeat timing:

```
config system ha
  set hb-interval <interval_integer>
  set hb-lost-threshold <threshold_integer>
  set hello-holddown <holddown_integer>
end
```

Changing the heartbeat interval

The heartbeat interval is the time between sending HA heartbeat packets. The heartbeat interval range is 1 to 20 (100*ms). The heartbeat interval default is 2 (200 ms).

A heartbeat interval of 2 means the time between heartbeat packets is 200 ms. Changing the heartbeat interval to 5 changes the time between heartbeat packets to 500 ms ($5 * 100\text{ms} = 500\text{ms}$).

Use the following CLI command to increase the heartbeat interval to 10:

```
config system ha
  set hb-interval 10
end
```

Changing the lost heartbeat threshold

The lost heartbeat threshold is the number of consecutive heartbeat packets that a FortiGate does not receive before assuming that a failure has occurred. The default value of 6 means that if a FortiGate-6000 does not receive 6 heartbeat packets it determines that the other FortiGate-6000 in the cluster has failed. The range is 1 to 60 packets.

The lower the `hb-lost-threshold`, the faster a FortiGate-6000 HA configuration responds when a failure occurs. However, sometimes heartbeat packets may not be received because the other FortiGate-6000 is very busy or because of network conditions. This can lead to a false positive failure detection. To reduce these false positives you can increase the `hb-lost-threshold`.

Use the following command to increase the lost heartbeat threshold to 12:

```
config system ha
  set hb-lost-threshold 12
end
```

Adjusting the heartbeat interval and lost heartbeat threshold

The heartbeat interval combines with the lost heartbeat threshold to set how long a FortiGate-6000 waits before assuming that the other FortiGate-6000 has failed and is no longer sending heartbeat packets. By default, if a FortiGate-6000 does not receive a heartbeat packet from a cluster unit for $6 * 200 = 1200$ milliseconds or 1.2 seconds the FortiGate-6000 assumes that the other FortiGate-6000 has failed.

You can increase both the heartbeat interval and the lost heartbeat threshold to reduce false positives. For example, increasing the heartbeat interval to 20 and the lost heartbeat threshold to 30 means a failure will be assumed if no heartbeat packets are received after $30 * 2000$ milliseconds = 60,000 milliseconds, or 60 seconds.

Use the following command to increase the heartbeat interval to 20 and the lost heartbeat threshold to 30:

```
config system ha
```

```
set hb-lost-threshold 20
set hb-interval 30
end
```

Changing the time to wait in the hello state

The hello state hold-down time is the number of seconds that a FortiGate-6000 waits before changing from hello state to work state. After a failure or when starting up, FortiGate-6000s in HA mode operate in the hello state to send and receive heartbeat packets to find each other and form a cluster. A FortiGate-6000 should change from the hello state to work state after it finds the FortiGate-6000 to form a cluster with. If for some reason the FortiGate-6000s cannot find each other during the hello state both FortiGate-6000s may assume that the other one has failed and each could form separate clusters of one FortiGate-6000. The FortiGate-6000s could eventually find each other and negotiate to form a cluster, possibly causing a network interruption as they re-negotiate.

One reason for a delay of the FortiGate-6000s finding each other could be the FortiGate-6000s are located at different sites or for some other reason communication is delayed between the heartbeat interfaces. If you find that your FortiGate-6000s leave the hello state before finding each other you can increase the time that they wait in the hello state. The hello state hold-down time range is 5 to 300 seconds. The hello state hold-down time default is 20 seconds.

Use the following command to increase the time to wait in the hello state to 1 minute (60 seconds):

```
config system ha
    set hello-holddown 60
end
```

Session failover (session-pickup)

Session failover means that after a failover, communication sessions resume on the new primary FortiGate-6000 with minimal or no interruption. Two categories of sessions need to be resumed after a failover:

- Sessions passing through the cluster
- Sessions terminated by the cluster

If sessions pickup is enabled, during cluster operation the primary FortiGate-6000 informs the backup FortiGate-6000 of changes to the primary FortiGate-6000 connection and state tables for TCP and UDP sessions passing through the cluster, keeping the backup FortiGate-6000 up-to-date with the traffic currently being processed by the cluster.

After a failover, the new primary FortiGate-6000 recognizes open sessions that were being handled by the cluster. The sessions continue to be processed by the new primary FortiGate-6000 and are handled according to their last known state.

Session-pickup has some limitations. For example, the FGCP does not support session failover for sessions being scanned by proxy-based security profiles. Session failover is supported for sessions being scanned by flow-based security profiles; however, flow-based sessions that fail over are not inspected after they fail over.

Sessions terminated by the cluster include management sessions (such as HTTPS connections to the FortiGate GUI or SSH connection to the CLI as well as SNMP and logging, and so on). Also included in this category are IPsec and SSL VPN sessions terminated by the cluster and explicit proxy sessions. In general, whether or not session-pickup is enabled, these sessions do not failover and have to be restarted.

Enabling session pickup for TCP and UDP sessions

To enable session-pickup, from the CLI enter:

```
config system ha
    set session-pickup enable
end
```

When session-pickup is enabled, sessions in the primary FortiGate-6000 TCP and UDP session tables are synchronized to the backup FortiGate-6000. As soon as a new TCP or UDP session is added to the primary FortiGate-6000 session table, that session is synchronized to the backup FortiGate-6000. This synchronization happens as quickly as possible to keep the session tables synchronized.

If the primary FortiGate-6000 fails, the new primary FortiGate-6000 uses its synchronized session tables to resume all TCP and UDP sessions that were being processed by the former primary FortiGate-6000 with only minimal interruption. Under ideal conditions all TCP and UDP sessions should be resumed. This is not guaranteed though and under less than ideal conditions some sessions may need to be restarted.

If session pickup is disabled

If you disable session pickup, the FortiGate-6000 HA cluster does not keep track of sessions and after a failover, active sessions have to be restarted or resumed. Most session can be resumed as a normal result of how TCP and UDP resumes communication after any routine network interruption.

The session-pickup setting does not affect session failover for sessions terminated by the cluster.

If you do not require session failover protection, leaving session pickup disabled may reduce CPU usage and reduce HA heartbeat network bandwidth usage. Also, if your FortiGate-6000 HA cluster is mainly being used for traffic that is not synchronized (for example, for proxy-based security profile processing) enabling session pickup is not recommended since most sessions will not be failed over anyway.

FortiGate-6000 support for VRRP

The FortiGate-6000 platform supports the Virtual Router Redundancy Protocol (VRRP), allowing you to configure VRRP HA between FortiGate-6000 devices. You can also add a FortiGate-6000 to a VRRP group with other VRRP routers.

Configure VRRP on the FortiGate-6000 by creating a VRRP group and adding one or more front panel interfaces to the group.

During normal operation, the primary FortiGate-6000 sends outgoing VRRP routing advertisements. Both the primary and backup FortiGate-6000s listen for incoming VRRP advertisements from other routers in the VRRP group. If the primary FortiGate-6000 fails, the new primary FortiGate-6000 takes over the role of both sending and receiving VRRP advertisements, maintaining the FortiGate-6000 within the VRRP group.

FortiGate-6000 v5.6.7 special features and limitations

This section describes special features and limitations for FortiGate-6000 v5.6.7.

Remote console limitations

Some console input may not function as expected. For example, when remotely connecting to an FPC console using Telnet, when viewing the BIOS menu, pressing the H key to display BIOS menu help does not always work as expected.

Default management VDOM

By default the FortiGate-6000 configuration includes a management VDOM named mgmt-vdom. The ha1, ha2, mgmt1, mgmt2, and mgmt3 interfaces are in mgmt-vdom and all other interfaces are in the root VDOM. For the FortiGate-6000 system to operate normally, mgmt-vdom must always be the management VDOM. You also must not remove interfaces from this VDOM. You can change the IP addresses of the interfaces in mgmt-vdom, allow the required management services, and add routes as required for management traffic.

You have full control over the configurations of other FortiGate-6000 VDOMs.

Maximum number of LAGs

FortiGate-6000 systems support up to 16 link aggregation groups (LAGs). This includes both normal link aggregation groups and redundant interfaces.

Firewall

TCP or UDP sessions with NAT enabled that are expected to be idle for more than the distributed processing normal TCP timer (which is 3605 seconds) will timeout. If you encounter this problem you can use the following command to increase the TCP timer:

```
config system global
    set dp-tcp-normal-timer <timer>
end
```

IP Multicast

IPv4 and IPv6 Multicast traffic is only sent to the primary FPC. This is controlled by the following configuration:

```
config load-balance flow-rule
    edit 15
        set status enable
        set vlan 0
        set ether-type ipv4
        set src-addr-ipv4 0.0.0.0 0.0.0.0
        set dst-addr-ipv4 224.0.0.0 240.0.0.0
        set protocol any
        set action forward
        set forward-slot master
        set priority 5
        set comment "ipv4 multicast"
    next
    edit 16
        set status enable
        set vlan 0
        set ether-type ipv6
        set src-addr-ipv6 ::/0
```

```
set dst-addr-ipv6 ff00::/8
set protocol any
set action forward
set forward-slot master
set priority 5
set comment "ipv6 multicast"
end
```

High Availability

Only the HA1 and HA2 interfaces are used for the HA heartbeat communication. For information on how to set up HA heartbeat communication using the HA1 and HA2 interfaces, see [Connect the HA1 and HA2 interfaces for HA heartbeat communication on page 653](#).

The following FortiOS HA features are not supported or are supported differently by FortiGate-6000 v5.6.7:

- Active-active HA is not supported.
- The range for the HA `group-id` is 0 to 31.
- Failover logic for FortiGate-6000 v5.6.7 HA is the same as FGCP for other FortiGate clusters.
- HA heartbeat configuration is specific to FortiGate-6000 systems and differs from standard HA.
- FortiGate Session Life Support Protocol (FGSP) HA (also called standalone session synchronization) is not supported.

FortiOS features that are not supported by FortiGate-6000 v5.6.7

The following mainstream FortiOS 5.6.7 features are not supported by the FortiGate-6000 v5.6.7:

- SD-WAN (because of known issues)
- HA dedicated management interfaces
- Hardware switch
- Switch controller
- WiFi controller
- IPv4 over IPv6, IPv6 over IPv4, IPv6 over IPv6 features
- GRE tunneling is only supported after creating a load balance flow rule, for example:

```
config load-balance flow-rule
edit 0
set status enable
set vlan 0
set ether-type ip
set protocol gre
set action forward
set forward-slot master
set priority 3
end
```

- Only the FortiGate-6301F and the FortiGate-6501F support hard disk features such as WAN optimization, web caching, explicit proxy content caching, disk logging, and GUI-based packet sniffing.
- The FortiGate-6000 platform, including the FortiGate-6301F and the FortiGate-6501F does not support quarantining files to the internal hard disks. Instead you must set the quarantine function to quarantine files to FortiAnalyzer.
- The management interfaces (mgmt1-3) do not support device detection for the networks they are connected to.

IPsec VPN tunnels terminated by the FortiGate-6000

For a list of new FortiOS 5.6 FortiGate-6000 IPsec VPN features and a list of IPsec VPN features not supported by FortiOS 5.6 FortiGate-6000 IPsec VPN, see [New IPsec VPN features on page 645](#).

SSL VPN

Sending all SSL VPN sessions to the primary (master) FPC is recommended. You can do this by:

- Creating a flow rule that sends all sessions that use the SSL VPN destination port and IP address to the primary FPC.
- Creating flow rules that send all sessions that use the SSL VPN IP pool addresses to the primary FPC.

Traffic shaping

You can only configure traffic shaping from the CLI. Each FPC applies traffic shaping quotas independently. Traffic is first load balanced to the FPCs and then traffic shaping is applied by the FPC to the traffic load balanced to it. This may result in traffic shaping allowing more traffic than expected.

DDoS quotas

Each FPC applies DDoS quotas independently. Traffic is first load balanced to the FPCs and then DDoS quotas are applied by the FPC to the traffic load balanced to it. This may result in DDoS quotas being less effective than expected.

Sniffer mode (one-arm sniffer)

One-arm sniffer mode is only supported after creating a load balance flow rule to direct sniffer traffic to a specific FPC.

FortiGuard Web filtering and Spam filtering

The FortiGate-6000 sends all FortiGuard web filtering and spam filtering rating queries through a management interface from the management VDOM.

Log messages include a slot field

An additional "slot" field has been added to log messages to identify the FPC that generated the log.

Special notice for new deployment connectivity testing

Only the management board can successfully ping external IP addresses. During a new deployment, while performing connectivity testing from the Fortigate-6000, make sure to run `execute ping` tests from the management board and not from an FPC. See [Using data interfaces for management traffic on page 622](#) for information about changes to this limitation.

Dedicated management interfaces not supported

The FortiGate-6000 does not support configuring dedicated management interfaces using the `config system dedicated-mgmt` command. Instead you can enter the following to configure an interface to be dedicated to management:

```
config system interface
  edit <interface-name>
    set dedicated-to management
  end
```

FortiGate-6000 v5.6.6 special features and limitations

This section describes special features and limitations for FortiGate-6000 v5.6.6.

Remote console limitations

Some console input may not function as expected. For example, when remotely connecting to an FPC console using Telnet, when viewing the BIOS menu, pressing the H key to display BIOS menu help does not always work as expected.

Default management VDOM

By default the FortiGate-6000 configuration includes a management VDOM named `mgmt-vdom`. The `ha1`, `ha2`, `mgmt1`, `mgmt2`, and `mgmt3` interfaces are in `mgmt-vdom` and all other interfaces are in the root VDOM. For the FortiGate-6000 system to operate normally, `mgmt-vdom` must always be the management VDOM. You also must not remove interfaces from this VDOM. You can change the IP addresses of the interfaces in `mgmt-vdom`, allow the required management services, and add routes as required for management traffic.

You have full control over the configurations of other FortiGate-6000 VDOMs.

Maximum number of LAGs

FortiGate-6000 systems support up to 16 link aggregation groups (LAGs). This includes both normal link aggregation groups and redundant interfaces.

Firewall

TCP or UDP sessions with NAT enabled that are expected to be idle for more than the distributed processing normal TCP timer (which is 3605 seconds) will timeout. If you encounter this problem you can use the following command to increase the TCP timer:

```
config system global
  set dp-tcp-normal-timer <timer>
end
```

IP Multicast

IPv4 and IPv6 Multicast traffic is only sent to the primary FPC. This is controlled by the following configuration:

```
config load-balance flow-rule
  edit 15
    set status enable
    set vlan 0
    set ether-type ipv4
    set src-addr-ipv4 0.0.0.0 0.0.0.0
    set dst-addr-ipv4 224.0.0.0 240.0.0.0
    set protocol any
    set action forward
    set forward-slot master
    set priority 5
    set comment "ipv4 multicast"
  next
  edit 16
    set status enable
    set vlan 0
    set ether-type ipv6
    set src-addr-ipv6 ::/0
    set dst-addr-ipv6 ff00::/8
    set protocol any
    set action forward
    set forward-slot master
    set priority 5
    set comment "ipv6 multicast"
end
```

High Availability

Only the HA1 and HA2 interfaces are used for the HA heartbeat communication. For information on how to set up HA heartbeat communication using the HA1 and HA2 interfaces, see [Connect the HA1 and HA2 interfaces for HA heartbeat communication on page 653](#).

The following FortiOS HA features are not supported or are supported differently by FortiGate-6000 v5.6.6:

- Active-active HA is not supported.
- The range for the HA `group-id` is 0 to 15.
- Failover logic for FortiGate-6000 v5.6.6 HA is the same as FGCP for other FortiGate clusters.
- HA heartbeat configuration is specific to FortiGate-6000 systems and differs from standard HA.
- FortiGate Session Life Support Protocol (FGSP) HA (also called standalone session synchronization) is not supported.

FortiOS features that are not supported by FortiGate-6000 v5.6.6

The following mainstream FortiOS 5.6.6 features are not supported by the FortiGate-6000 v5.6.6:

- SD-WAN (because of known issues)
- Policy learning mode
- HA dedicated management interfaces
- Hardware switch
- Switch controller
- WiFi controller

- IPv4 over IPv6, IPv6 over IPv4, IPv6 over IPv6 features
- GRE tunneling is only supported after creating a load balance flow rule, for example:

```
config load-balance flow-rule
  edit 0
    set status enable
    set vlan 0
    set ether-type ip
    set protocol gre
    set action forward
    set forward-slot master
    set priority 3
  end
```

- Only the FortiGate-6301F and the FortiGate-6501F support hard disk features such as WAN optimization, web caching, explicit proxy content caching, disk logging, and GUI-based packet sniffing.
- The FortiGate-6000 platform, including the FortiGate-6301F and the FortiGate-6501F does not support quarantining files to the internal hard disks. Instead you must set the quarantine function to quarantine files to FortiAnalyzer.
- The management interfaces (mgmt1-3) do not support device detection for the networks they are connected to.

IPsec VPN tunnels terminated by the FortiGate-6000

For a list of new FortiOS 5.6.6 FortiGate-6000 IPsec VPN features and a list of IPsec VPN features not supported by FortiOS 5.6.6 FortiGate-6000 IPsec VPN, see [New IPsec VPN features on page 645](#).

SSL VPN

Sending all SSL VPN sessions to the primary (master) FPC is recommended. You can do this by:

- Creating a flow rule that sends all sessions that use the SSL VPN destination port and IP address to the primary FPC.
- Creating flow rules that send all sessions that use the SSL VPN IP pool addresses to the primary FPC.

Traffic shaping

You can only configure traffic shaping from the CLI. Each FPC applies traffic shaping quotas independently. Traffic is first load balanced to the FPCs and then traffic shaping is applied by the FPC to the traffic load balanced to it. This may result in traffic shaping allowing more traffic than expected.

DDoS quotas

Each FPC applies DDoS quotas independently. Traffic is first load balanced to the FPCs and then DDoS quotas are applied by the FPC to the traffic load balanced to it. This may result in DDoS quotas being less effective than expected.

Sniffer mode (one-arm sniffer)

One-arm sniffer mode is only supported after creating a load balance flow rule to direct sniffer traffic to a specific FPC.

FortiGuard Web filtering and Spam filtering

The FortiGate-6000 sends all FortiGuard web filtering and spam filtering rating queries through a management interface from the management VDOM.

Log messages include a slot field

An additional "slot" field has been added to log messages to identify the FPC that generated the log.

Special notice for new deployment connectivity testing

Only the management board can successfully ping external IP addresses. During a new deployment, while performing connectivity testing from the Fortigate-6000, make sure to run `execute ping` tests from the management board and not from an FPC. See [Using data interfaces for management traffic on page 622](#) for information about changes to this limitation.

Dedicated management interfaces not supported

The FortiGate-6000 does not support configuring dedicated management interfaces using the `config system dedicated-mgmt` command. Instead you can enter the following to configure an interface to be dedicated to management:

```
config system interface
  edit <interface-name>
    set dedicated-to management
  end
```

FortiGate-6000 load balancing commands

See the [FortiOS 5.6 CLI Reference](#) for information about FortiGate-6000 CLI commands:

- [config load-balance flow-rule](#)
- [config load-balance setting](#)
- [execute load-balance](#)
- [execute system console-server](#)
- [execute reset-vd-license](#)
- [execute log filter confsync-member](#)

Chapter 6 - FortiGate-7000

What's new for FortiGate-7000 v5.6.7

The following new features have been added to FortiGate-7000 v5.6.7 build 4214:

- Policy learning mode is now supported.
- The FortiGate-7000 supports 64000 explicit proxy web proxy users.
- The HA group ID range is now from 0 to 31 (was 0 to 15).

What's new for FortiGate-7000 5.6.6

Version 5.6.6 enhancements include adding FortiOS 5.6.6 to the FortiGate-7000 platform. This release also includes bug fixes and improvements and the following new features.

- Support for FortiOS 5.6.6 and most 5.6.6 features including FortiOS 5.6.6 GUI features.
- You can configure new Resource Usage dashboard widgets to show CPU use, log rate, memory use, session creation rate, and the number of active sessions for individual FIMs, the management plane, the data plan and the security fabric.
- The Security Fabric dashboard widget shows high level status and configuration information for all of the FPMs.
- The Sensor Information dashboard widget displays temperature information and allows you to drill down for information about individual temperature sensors.
- DP2 firmware upgrade
- VRRP support. For a list of know VRRP issues, see [VRRP known issues on page 1](#).
- The management VDOM is now named mgmt-vdom (was dmngmt-vdom).
- The `diagnose sniffer packet` command now shows the name of the FPM that processed the packet.
- You can now use the `execute ping` and `execute traceroute` commands from an FIM CLI to an external destination.
- FIMs directly query LDAP/FSSO/RADIUS servers. These queries no longer have to go through the management VDOM.
- The Route Monitor displays accurate routing information.
- SNMP integration improvements including new MIBs.
- The following FortiOS 5.6.6 features are not supported:
 - SD-WAN
 - Some IPsec VPN features
 - Policy learning mode
 - HA dedicated management interfaces

New IPsec VPN features

FortiOS 5.6.6 includes the following IPsec VPN improvements:

- Including a phase 2 selector is no longer mandatory.
- Dynamic routing (RIP, OSPF, BGP) is supported over IPsec VPN tunnels.

IPsec VPN features supported by FortiOS 5.6.6 for FortiGate-7000

FortiOS 5.6.6 for FortiGate-7000 supports the following IPsec VPN features.

- Interface-based IPsec VPN (also called route-based IPsec VPN).
- Static routes can point IPsec VPN interfaces.
- Dynamic routing (RIP, OSPF, BGP) over IPsec VPN tunnels.
- Remote networks with 16- to 32-bit netmasks.
- IPsec VPN tunnels must terminate on the primary FPM (the ELBC master).
- Site-to-Site IPsec VPN.

- Dialup IPsec VPN. The FortiGate-7000 can be the dialup server or client.
- IPv4 clear-text traffic (IPv4 over IPv4 or IPv4 over IPv6)

IPsec VPN features not supported by FortiOS 5.6.6 for FortiGate-7000

FortiOS 5.6.6 for FortiGate-7000 does not support the following IPsec VPN features.

- Policy-based IPsec VPN.
- Policy routes for VPN traffic.
- Remote networks with 0- to 15-bit netmasks.
- IPv6 clear-text traffic (IPv6 over IPv4 or IPv6 over IPv6).
- Load-balancing IPsec VPN tunnels to multiple FPMs.
- IPsec SA synchronization between both FortiGate-7000s in an HA configuration.

New High Availability features and changes

Configuring FortiGate-7000 HA has been simplified for FortiOS 5.6.6. To set up HA, you no longer have to configure HA settings for both of the FIMs in a FortiGate-7000. Instead, you configure HA settings on the primary FIM and this configuration is synchronized to the other FIM.

As well, FortiGate-7000 HA is configured and operates more like standard FGCP HA. The link failure threshold concept that was part of FortiGate-7000 for FortiOS 5.4 has been removed and board failover tolerance has been simplified. As well, primary unit selection has been simplified to be more like FGCP primary unit selection.

FortiOS 5.6.6 also includes the following new features and changes:

- The **System > HA** GUI page now appears and can be used to configure most HA settings.
- You can configure HA interface monitoring (or port monitoring) to detect link failures.
- You can configure HA remote link failover (also called remote IP monitoring) to detect remote link failures using the following options:
 - Enable remote IP monitoring with the `pingserver-monitor-interface` option.
 - Set the remote IP monitoring failover threshold with the `pingserver-failover-threshold` option.
 - Force the cluster to negotiate after a remote IP monitoring failover with the `pingserver-slave-force-reset` option.
 - Adjust the time to wait in minutes before renegotiating after a remote IP monitoring failover with the `pingserver-flip-timeout` option.
- You can use the `get system ha status` command to display HA status. The `diagnose sys ha status` command is no longer available.
- The `diagnose sys ha force-slave-state` command is no longer available. To force the primary FortiGate-7000 into a backup (or slave) state you can use the `diagnose sys ha reset-uptime` command.
- The HA `link-failure-threshold` option has been removed.
- The `board-failover-tolerance` option has been simplified and determines how the cluster responds to failed FIMs.

FortiGate-7000 overview

A FortiGate-7000 product consists of a FortiGate-7000 series chassis (for example, the FortiGate-7040E) with FortiGate-7000 modules installed in the chassis slots. A FortiGate-7040E chassis comes with two interface modules (FIM) to be installed in slots 1 and 2 to provide network connections and session-aware load balancing to two processor modules (FPM) to be installed in slots 3 and 4.

FortiGate-7000 products are sold and licensed as packages that include the chassis as well as the modules to be included in the chassis. When you receive your FortiGate-7000 series product the chassis has to be installed in a rack and the modules installed in the chassis. Interface modules always go in slots 1 and 2 and processor modules in slots 3 and up.

If your FortiGate-7000 product includes two different interfaces modules, for optimal configuration you should install the module with the lower model number in slot 1 and the module with the higher model number in slot 2. For example, if your chassis includes a FIM-7901E and a FIM-7904E, install the FIM-7901E in chassis slot 1 and the FIM-7904E in chassis slot 2. This applies to any combination of two different interface modules.

As an administrator, when you browse to the FortiGate-7000 management IP address you log into the interface module in slot 1 (the primary or master interface module or FIM) to view the status of the FortiGate-7000 and make configuration changes. The FortiOS firmware running on each module has the same configuration and when you make configuration changes to the primary interface module, the configuration changes are synchronized to all modules.

The same FortiOS firmware build runs on each module in the chassis. You can upgrade FortiGate-7000 firmware by logging into the primary interface module and performing a firmware upgrade as you would for any FortiGate. During the upgrade process the firmware of all of the modules in the chassis upgrades in one step. Firmware upgrades should be done during a quiet time because traffic will briefly be interrupted during the upgrade process.

Licenses, device registration, and support

A FortiGate-7000 product is made up of a FortiGate-7000 series chassis, one or two FIM interface modules and two to four FPM processor modules. The entire package is licensed and configured as a single product under the FortiGate-7000 chassis serial number. When you receive a new FortiGate-7000 product you register it on <https://support.fortinet.com> using the chassis serial number. Use the chassis serial number when requesting support from Fortinet for the product.

All Fortinet licensing, including FortiCare Support, IPS, AntiVirus, Web Filtering, Mobile Malware, FortiClient, FortiCloud, and additional virtual domains (VDOM) is for the entire FortiGate-7000 product and not for individual components.

If an individual component, such as a single interface or processor fails you can RMA and replace just that component.

FortiGate-7060E

The FortiGate-7060E is a 8U 19-inch rackmount 6-slot chassis with a 80Gbps fabric and 1Gbps base backplane designed by Fortinet. The fabric backplane provides network data communication and the base backplane provides management and synch communication among the chassis slots.

FortiGate-7060E front panel

The chassis is managed by two redundant management modules. Each module includes an Ethernet connection as well as two switchable console ports that provide console connections to the modules in the chassis slots. The active management module controls chassis cooling and power management and provides an interface for managing the modules installed in the chassis.

FortiGate-7060E front panel, (example module configuration)

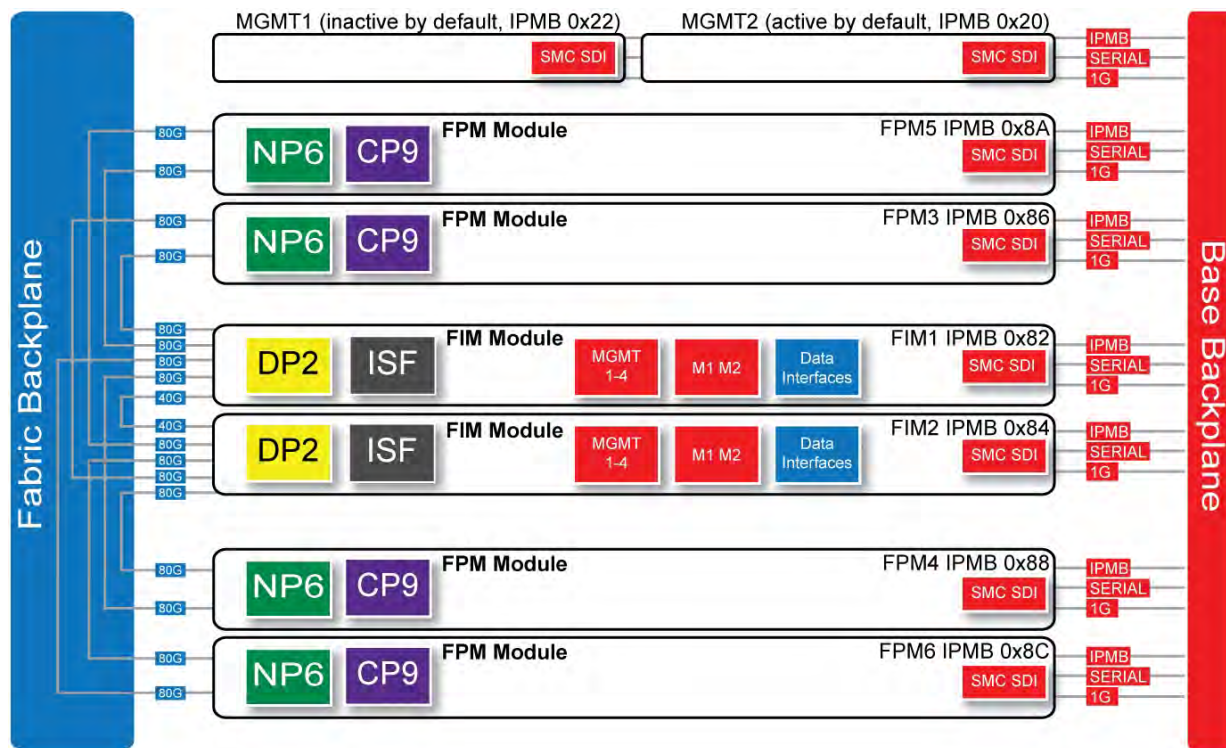

Power is provided to the chassis using four hot swappable 3+1 redundant 100-240 VAC, 50-60 Hz power supply units (PSUs). You can also optionally add up to six PSUs to provide 3+3 redundancy. The FortiGate-7060E can also be equipped with DC PSUs allowing you to connect the chassis to -48V DC power.

The standard configuration of the FortiGate-7060E includes two FIM (interface) modules in chassis slots 1 and 2 and up to four FPM (processing) modules in chassis slots 3 to 6.

FortiGate-7060E schematic

The FortiGate-7060E chassis schematic below shows the communication channels between chassis components including the management modules (MGMT), the FIMs (called FIM1 and FIM2) and the FPMs (FPM3, FPM4,

FPM5, and FPM6).

By default, MGMT2 is the active management module and MGMT1 is inactive. The active management module always has the Intelligent Platform Management Bus (IPMB) address 0x20 and the inactive management module always has the IPMB address 0x22.

The active management module communicates with all modules in the chassis over the base backplane. Each module, including the management modules has a Shelf Management Controller (SMC). These SMCs support IPMB communication between the active management module and the FIM and FPMs for storing and sharing sensor data that the management module uses to control chassis cooling and power distribution. The base backplane also supports serial communications to allow console access from the management module to all modules, and 1Gbps Ethernet communication for management and heartbeat communication between modules.

FIM1 and FIM2 (IPMB addresses 0x82 and 0x84) are the FIMs in slots 1 and 2. The interfaces of these modules connect the chassis to data networks and can be used for Ethernet management access to chassis components. The FIMs include DP2 processors that distribute sessions over the Integrated Switch Fabric (ISF) to the NP6 processors in the FPMs. Data sessions are communicated to the FPMs over the 80Gbps chassis fabric backplane.

FPM03, FPM04, FPM05, and FPM06 (IPMB addresses 0x86, 0x88, 0x8A, and 0x8C) are the FPM processor modules in slots 3 to 6. These worker modules process sessions distributed to them by the FIMs. FPMs include NP6 processors to offload sessions from the FPM CPU and CP9 processors that accelerate content processing.

FortiGate-7040E

The FortiGate-7040E is a 6U 19-inch rackmount 4-slot chassis with a 80Gbps fabric and 1Gbps base backplane designed by Fortinet. The fabric backplane provides network data communication and the base backplane

provides management and synch communication among the chassis slots.

FortiGate-7040E front panel

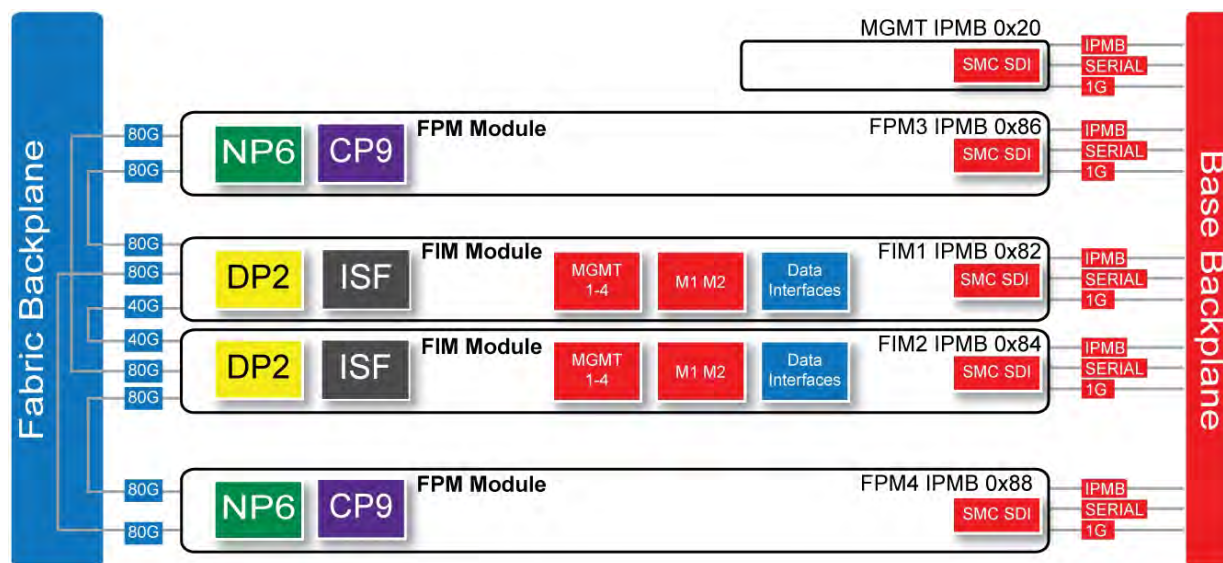

The FortiGate-7040E chassis is managed by a single management module that includes an Ethernet connection as well as two switchable console ports that provide console connections to the modules in the chassis slots. The management module controls chassis cooling and power management and provides an interface for managing the modules installed in the chassis. The standard configuration of the FortiGate-7040E includes two FIM (interface) modules in chassis slots 1 and 2 and two FPM (processing) modules in chassis slots 3 and 4.

FortiGate-7040E front panel

FortiGate-7040E schematic

The FortiGate-7040E chassis schematic below shows the communication channels between chassis components including the management module (MGMT), the FIMs (called FIM1 and FIM2) and the FPMs (FPM3 and FPM4).

The management module (MGMT, with Intelligent Platform Management Bus (IPMB) address 0x20) communicates with all modules in the chassis over the base backplane. Each module, including the management module, includes a Shelf Management Controller (SMC). These SMCs support IPMB communication between the management module and the FIM and FPMs for storing and sharing sensor data that the management module uses to control chassis cooling and power distribution. The base backplane also supports serial communications to allow console access from the management module to all modules, and 1Gbps Ethernet communication for management and heartbeat communication between modules.

FIM1 and FIM2 (IPMB addresses 0x82 and 0x84) are the FIMs in slots 1 and 2. The interfaces of these modules connect the chassis to data networks and can be used for Ethernet management access to chassis components. The FIMs include DP2 processors that distribute sessions over the Integrated Switch Fabric (ISF) to the NP6 processors in the FPMs. Data sessions are communicated to the FPMs over the 80Gbps chassis fabric backplane.

FPM3 and FPM4 (IPMB addresses 0x86 and 0x88) are the FPM processor modules in slots 3 and 4. These worker modules process sessions distributed to them by the FIMs. FPMs include NP6 processors to offload sessions from the FPM CPU and CP9 processors that accelerate content processing.

FortiGate-7030E

The FortiGate-7030E is a 6U 19-inch rackmount 3-slot chassis with a 80Gbps fabric and 1Gbps base backplane designed by Fortinet. The fabric backplane provides network data communication and the base backplane provides management and synch communication among the chassis slots.

FortiGate-7030E front panel

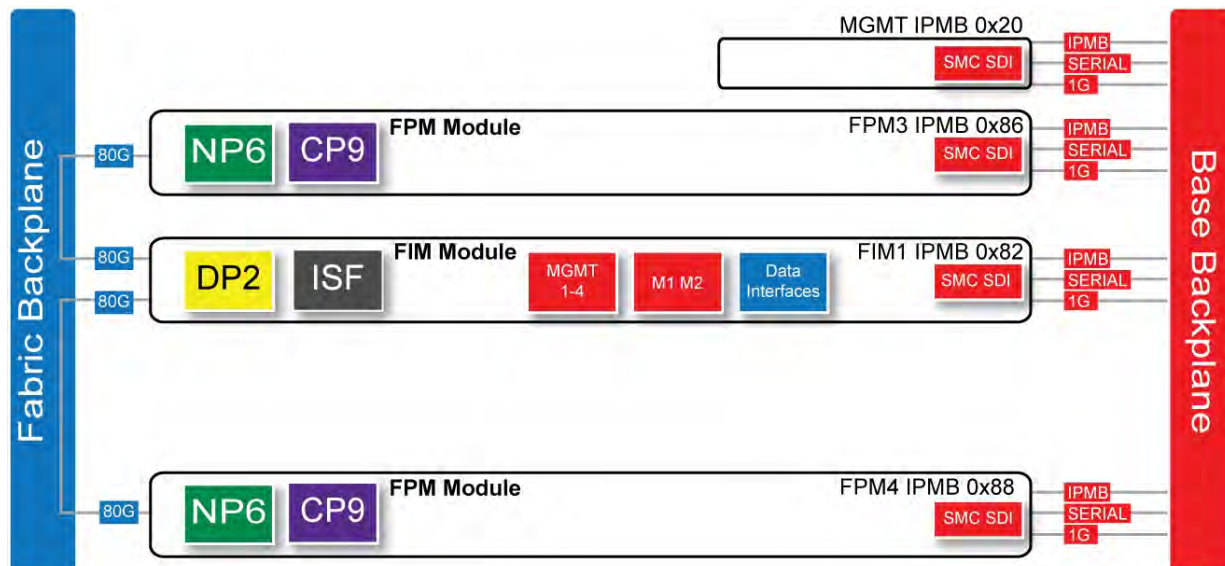

The FortiGate-7030E chassis is managed by a single management module that includes an Ethernet connection as well as two switchable console ports that provide console connections to the modules in the chassis slots. The management module controls chassis cooling and power management and provides an interface for managing the modules installed in the chassis. The standard configuration of the FortiGate-7030E includes one FIM (interface) module in chassis slot 1 and two FPM (processing) modules in chassis slots 3 and 4. The front panel also includes a sealed blank panel. Breaking the seal or removing the panel voids your FortiGate-7030E warranty.

FortiGate-7030E front panel (example module configuration)

FortiGate-7030E schematic

The FortiGate-7030E chassis schematic below shows the communication channels between chassis components including the management module (MGMT), the FIM (called FIM1) and the FPMs (FPM3 and FPM4).

The management module (MGMT, with Intelligent Platform Management Bus (IPMB) address 0x20) communicates with all modules in the chassis over the base backplane. Each module, including the management module includes a Shelf Management Controller (SMC). These SMCs support IPMB communication between the

management module and the FIM and FPMs for storing and sharing sensor data that the management module uses to control chassis cooling and power distribution. The base backplane also supports serial communications to allow console access from the management module to all modules, and 1Gbps Ethernet communication for management and heartbeat communication between modules.

FIM1 (IPMB address 0x82) is the FIM in slot 1. The interfaces of this module connect the chassis to data networks and can be used for Ethernet management access to chassis components. The FIM includes DP2 processors that distribute sessions over the Integrated Switch Fabric (ISF) to the NP6 processors in the FPMs. Data sessions are communicated to the FPMs over the 80Gbps chassis fabric backplane.

FPM3 and FPM4 (IPMB addresses 0x86 and 0x88) are the FPM processor modules in slots 3 and 4. These worker modules process sessions distributed to them by the FIM. FPMs include NP6 processors to offload sessions from the FPM CPU and CP9 processors that accelerate content processing.

FIM-7901E interface module

The FIM-7901E interface module is a hot swappable module that provides data, management and session sync/heartbeat interfaces, base backplane switching and fabric backplane session-aware load balancing for a FortiGate-7000 chassis. The FIM-7901E includes an integrated switch fabric and DP2 processors to load balance millions of data sessions over the chassis fabric backplane to FPM processor modules.

The FIM-7901E can be installed in any FortiGate-7000 series chassis in hub/switch slots 1 and 2. The FIM-7901E provides thirty-two 10GigE small form-factor pluggable plus (SPF+) interfaces for a FortiGate-7000 chassis.

You can also install FIM-7901Es in a second chassis and operate the chassis in HA mode with another set of processor modules to provide chassis failover protection.

FIM-7901E front panel

The FIM-7901E includes the following hardware features:

- Thirty-two front panel 10GigE SFP+ fabric channel interfaces (A1 to A32). These interfaces are connected to 10Gbps networks to distribute sessions to the FPM processor modules installed in chassis slots 3 and up. These interfaces can also be configured to operate as Gigabit Ethernet interfaces using SFP transceivers. These interfaces also support creating link aggregation groups (LAGs) that can include interfaces from both FIM-7901Es.
- Two front panel 10GigE SFP+ interfaces (M1 and M2) that connect to the base backplane channel. These interfaces are used for heartbeat, session sync, and management communication between FIM-7901Es in different chassis. These interfaces can also be configured to operate as Gigabit Ethernet interfaces using SFP transceivers,

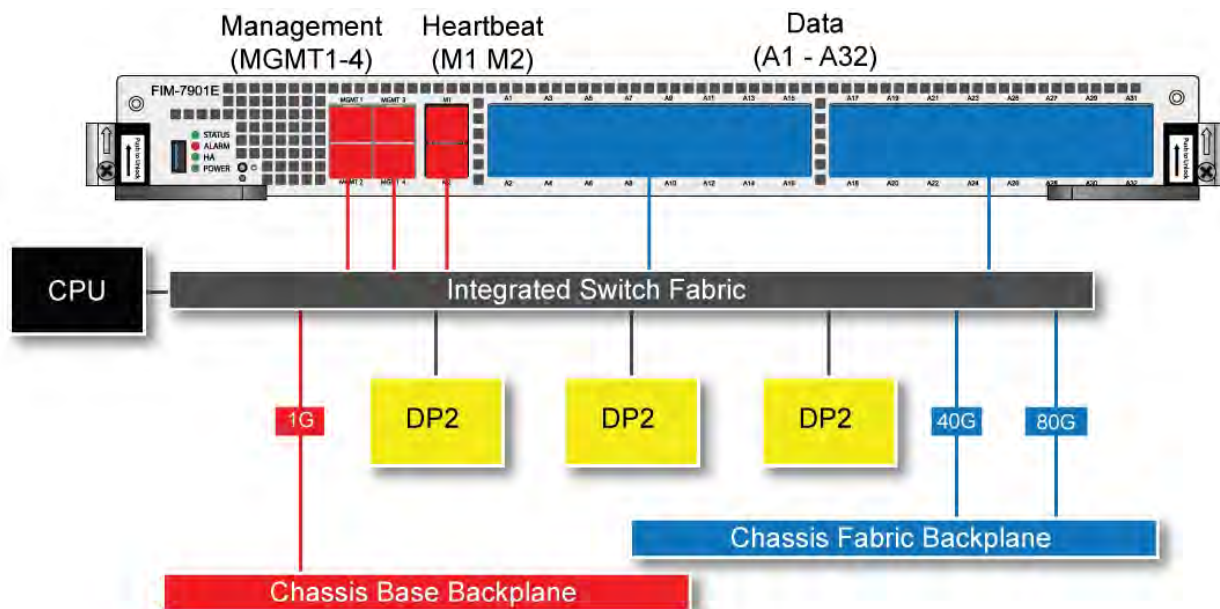

but should not normally be changed. If you use switches to connect these interfaces, the switch ports should be able to accept packets with a maximum frame size of at least 1526. The M1 and M2 interfaces need to be on different broadcast domains. If M1 and M2 are connected to the same switch, Q-in-Q must be enabled on the switch.

- Four 10/100/1000BASE-T out of band management Ethernet interfaces (MGMT1 to MGMT4).
- One 80Gbps fabric backplane channel for traffic distribution with each FPM installed in the same chassis as the FIM-7901E.
- One 1Gbps base backplane channel for base backplane with each FPM installed in the same chassis as the FIM-7901E.
- One 40Gbps fabric backplane channel for fabric backplane communication with the other FIM-7901E in the chassis.
- One 1Gbps base backplane channel for base backplane communication with the other FIM-7901E in the chassis.
- On-board DP2 processors and an integrated switch fabric to provide high-capacity session-aware load balancing.
- One front panel USB port.
- Power button.
- NMI switch (for troubleshooting as recommended by Fortinet Support).
- Mounting hardware.
- LED status indicators.

FIM-7901E schematic

The FIM-7901E includes an integrated switch fabric (ISF) that connects the FIM front panel interfaces to the DP2 session-aware load balancers and to the chassis fabric and base backplanes. The ISF also allows the DP2 processors to distribute sessions among all NP6 processors on the FortiGate Processor Modules (FPM) in the FortiGate-7000 chassis.

FIM-7901E schematic

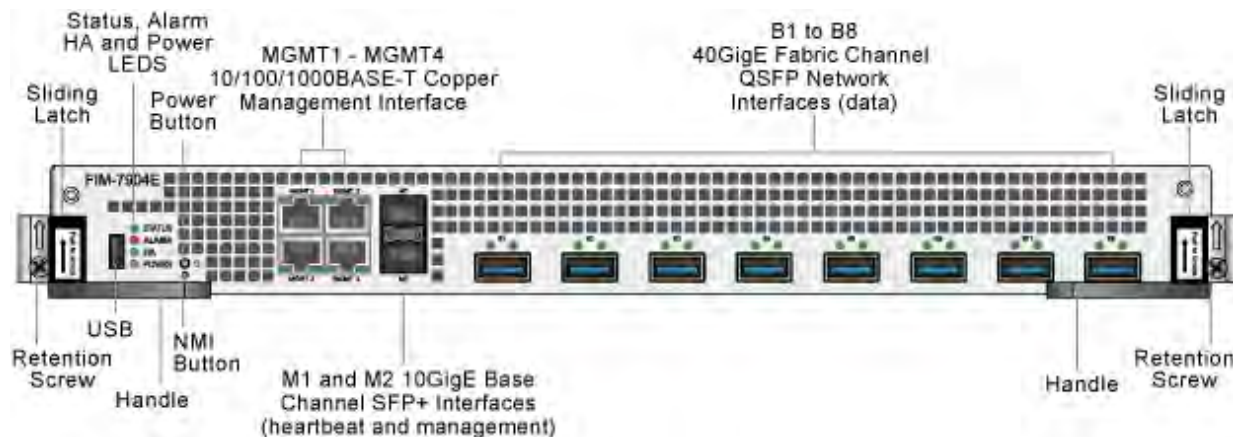

FIM-7904E interface module

The FIM-7904E interface module is a hot swappable module that provides data, management and session sync/heartbeat interfaces, base backplane switching and fabric backplane session-aware load balancing for a FortiGate-7000 series chassis. The FIM-7904E includes an integrated switch fabric and DP2 processors to load balance millions of data sessions over the chassis fabric backplane to FPM processor modules.

The FIM-7904E can be installed in any FortiGate-7000 series chassis in hub/switch slots 1 and 2. The FIM-7904E provides four Quad Small Form-factor Pluggable plus (QSFP+) interfaces for a FortiGate-7000 chassis. Using a 40GBASE-SR10 multimode QSFP+ transceiver, each QSFP+ interface can also be split into four 10GBASE-SR interfaces.

You can also install FIM-7904Es in a second chassis and operate the chassis in HA mode with another set of processor modules to provide chassis failover protection.

FIM-7904E front panel

The FIM-7904E includes the following hardware features:

- Eight front panel 40GigE QSFP+ fabric channel interfaces (B1 to B8). These interfaces are connected to 40Gbps networks to distribute sessions to the FPM processor modules installed in chassis slots 3 and up. Using 40GBASE-SR10 multimode QSFP+ transceivers, each QSFP+ interface can also be split into four 10GBASE-SR interfaces. These interfaces also support creating link aggregation groups (LAGs) that can include interfaces from both FIM-7904Es.
- Two front panel 10GigE SFP+ interfaces (M1 and M2) that connect to the base backplane channel. These interfaces are used for heartbeat, session sync, and management communication between FIM-7904Es in different chassis. These interfaces can also be configured to operate as Gigabit Ethernet interfaces using SFP transceivers, but should not normally be changed. If you use switches to connect these interfaces, the switch ports should be able to accept packets with a maximum frame size of at least 1526. The M1 and M2 interfaces need to be on different broadcast domains. If M1 and M2 are connected to the same switch, Q-in-Q must be enabled on the switch.
- Four 10/100/1000BASE-T out of band management Ethernet interfaces (MGMT1 to MGMT4).
- One 80Gbps fabric backplane channel for traffic distribution with each FPM installed in the same chassis as the FIM-7904E.
- One 1Gbps base backplane channel for base backplane with each FPM installed in the same chassis as the FIM-7904E.

- One 40Gbps fabric backplane channel for fabric backplane communication with the other FIM-7904E in the chassis.
- One 1Gbps base backplane channel for base backplane communication with the other FIM-7904E in the chassis.
- On-board DP2 processors and an integrated switch fabric to provide high-capacity session-aware load balancing.
- One front panel USB port.
- Power button.
- NMI switch (for troubleshooting as recommended by Fortinet Support).
- Mounting hardware.
- LED status indicators.

Splitting the FIM-7904E B1 to B8 interfaces

Each 40GE interface (B1 to B8) on the FIM-7904Es in slot 1 and slot 2 of a FortiGate-7000 system can be split into 4x10Gbps interfaces. You split these interfaces after the FIM-7904Es are installed in your FortiGate-7000 system and the system is up and running. You can split the interfaces of the FIM-7904Es in slot 1 and slot 2 at the same time by entering a single CLI command. Splitting the interfaces requires a system reboot so Fortinet recommends that you split multiple interfaces at the same time according to your requirements to avoid traffic disruption.

For example, to split the B1 interface of the FIM-7904E in slot 1 (this interface is named 1-B1) and the B1 and B4 interfaces of the FIM-7904E in slot 2 (these interfaces are named 2-B1 and 2-B4) connect to the CLI of your FortiGate-7000 system using the management IP and enter the following command:

```
config system global
    set split-port 1-B1 2-B1 2-B4
end
```

After you enter the command, the FortiGate-7000 reboots and when it comes up:

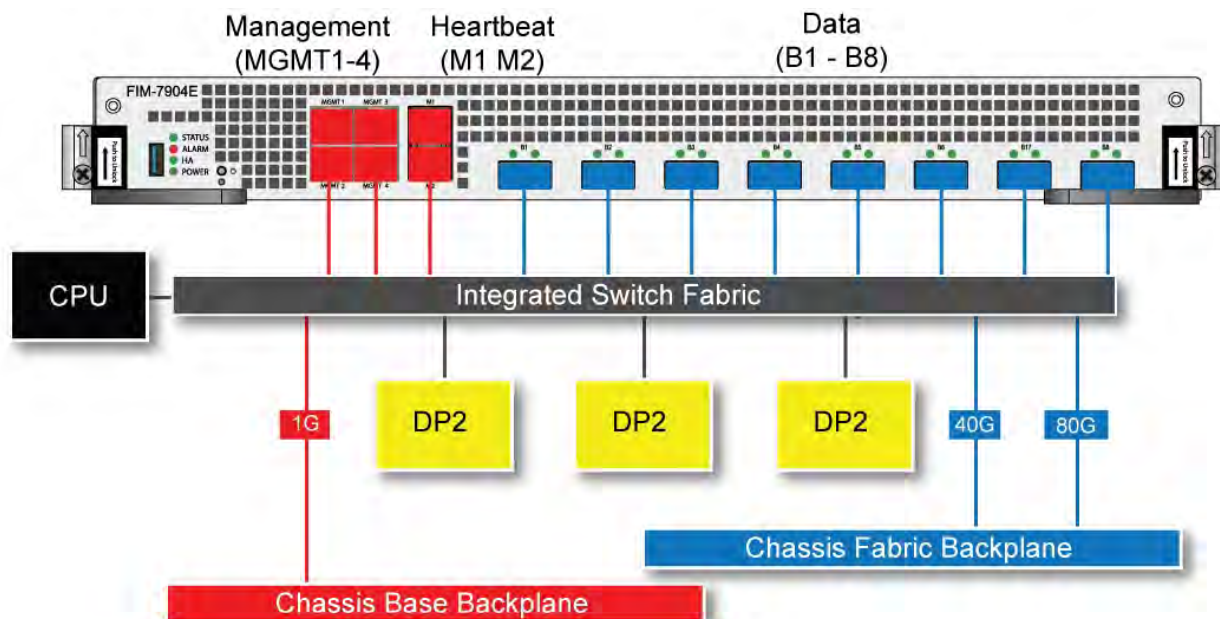

- The 1-B1 interface will no longer be available. Instead the 1-B1/1, 1-B1/2, 1-B1/3, and 1-B1/4 interfaces will be available.
- The 2-B1 interface will no longer be available. Instead the 2-B1/1, 2-B1/2, 2-B1/3, and 2-B1/4 interfaces will be available.
- The 2-B4 interface will no longer be available. Instead the 2-B4/1, 2-B4/2, 2-B4/3, and 2-B4/4 interfaces will be available.

You can now connect breakout cables to these interfaces and configure traffic between them just like any other FortiGate interface.

FIM-7904E hardware schematic

The FIM-7904E includes an integrated switch fabric (ISF) that connects the front panel interfaces to the DP2 session-aware load balancers and to the chassis backplanes. The ISF also allows the DP2 processors to distribute sessions among all NP6 processors on the FortiGate Processor Modules (FPM) in the FortiGate-7000 chassis.

FIM-7904E hardware architecture

FIM-7910E interface module

The FIM-7910E interface module is a hot swappable module that provides data, management and session sync/heartbeat interfaces, base backplane switching and fabric backplane session-aware load balancing for a FortiGate-7000 series chassis. The FIM-7910E includes an integrated switch fabric and DP2 processors to load balance millions of data sessions over the chassis fabric backplane to FPM processor modules.

The FIM-7910E can be installed in any FortiGate-7000 series chassis in hub/switch slots 1 and 2. The FIM-7910E provides four C form-factor pluggable 2 (CFP2) interfaces for a FortiGate-7000 chassis. Using a 100GBASE-SR10 multimode CFP2 transceiver, each CFP2 interface can also be split into ten 10GBASE-SR interfaces.

FIM-7910E front panel

The FIM-7910E includes the following hardware features:

- Four front panel 100GigE CFP2 fabric channel interfaces (C1 to C4). These interfaces are connected to 100Gbps networks to distribute sessions to the FPM processor modules installed in chassis slots 3 and up. Using 100GBASE-SR10 multimode CFP2 transceivers, each CFP2 interface can also be split into ten 10GBASE-SR interfaces. These interfaces also support creating link aggregation groups (LAGs) that can include interfaces from both FIM-7910Es.
- Two front panel 10GigE SFP+ interfaces (M1 and M2) that connect to the base backplane channel. These interfaces are used for heartbeat, session sync, and management communication between FIM-7910Es in different chassis. These interfaces can also be configured to operate as Gigabit Ethernet interfaces using SFP transceivers, but should not normally be changed. If you use switches to connect these interfaces, the switch ports should be able to accept packets with a maximum frame size of at least 1526. The M1 and M2 interfaces need to be on different broadcast domains. If M1 and M2 are connected to the same switch, Q-in-Q must be enabled on the switch.
- Four 10/100/1000BASE-T out of band management Ethernet interfaces (MGMT1 to MGMT4).
- One 80Gbps fabric backplane channel for traffic distribution with each FPM installed in the same chassis as the FIM-7910E.
- One 1Gbps base backplane channel for base backplane with each FPM installed in the same chassis as the FIM-7910E.
- One 40Gbps fabric backplane channel for fabric backplane communication with the other FIM-7910E in the chassis.
- One 1Gbps base backplane channel for base backplane communication with the other FIM-7910E in the chassis.
- On-board DP2 processors and an integrated switch fabric to provide high-capacity session-aware load balancing.
- One front panel USB port.
- Power button.
- NMI switch (for troubleshooting as recommended by Fortinet Support).
- Mounting hardware.
- LED status indicators.

Splitting the FIM-7910E C1 to C4 interfaces

Each 100GE interface (C1 to C4) on the FIM-7910Es in slot 1 and slot 2 of a FortiGate-7000 system can be split into 10 x 10GBE interfaces. You split these interfaces after the FIM-7910Es are installed in your FortiGate-7000 system and the system is up and running. You can split the interfaces of the FIM-7910Es in slot 1 and slot 2 at the same time by entering a single CLI command. Splitting the interfaces requires a system reboot so Fortinet recommends that you split multiple interfaces at the same time according to your requirements to avoid traffic disruption.

For example, to split the C1 interface of the FIM-7910E in slot 1 (this interface is named 1-C1) and the C1 and C4 interfaces of the FIM-7910E in slot 2 (these interfaces are named 2-C1 and 2-C4) connect to the CLI of your FortiGate-7000 system using the management IP and enter the following command:

```
config system global
    set split-port 1-C1 2-C1 2-C4
end
```

After you enter the command, the FortiGate-7000 reboots and when it comes up:

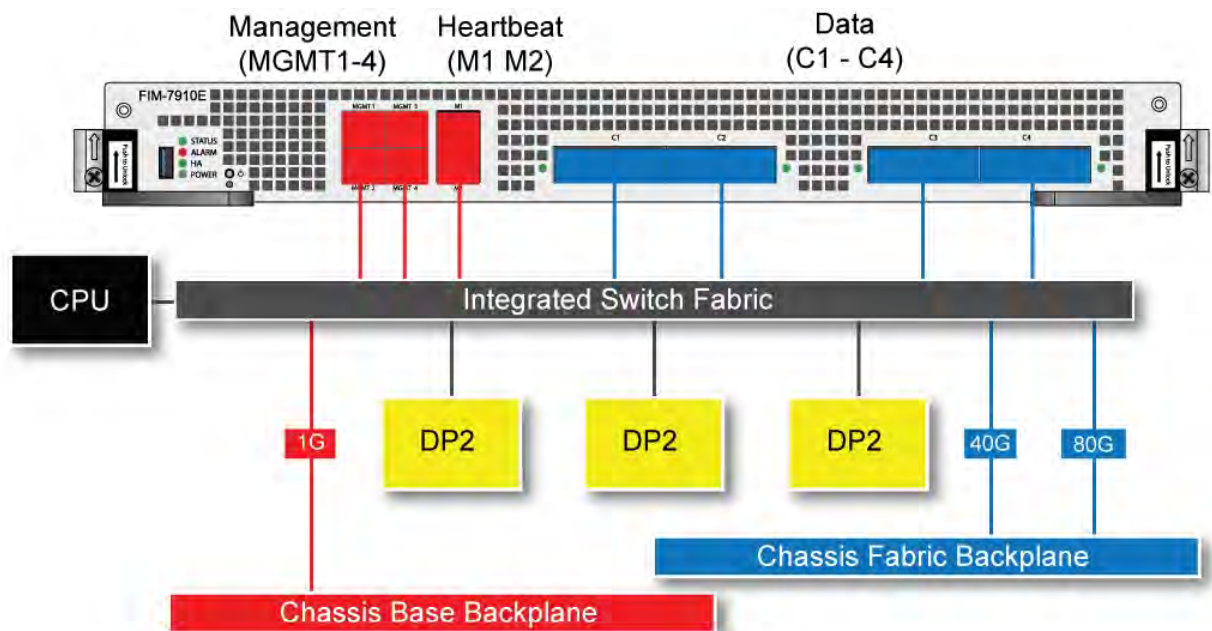

- The 1-C1 interface will no longer be available. Instead the 1-C1/1, 1-C1/2, ..., and 1-C1/10 interfaces will be available.
- The 2-C1 interface will no longer be available. Instead the 2-C1/1, 2-C1/2, ..., and 2-C1/10 interfaces will be available.
- The 2-C4 interface will no longer be available. Instead the 2-C4/1, 2-C4/2, ..., and 2-C4/10 interfaces will be available.

You can now connect breakout cables to these interfaces and configure traffic between them just like any other FortiGate interface.

FIM-7910E hardware schematic

The FIM-7910E includes an integrated switch fabric (ISF) that connects the front panel interfaces to the DP2 session-aware load balancers and to the chassis backplanes. The ISF also allows the DP2 processors to distribute sessions among all NP6 processors on the FortiGate Processor Modules (FPM) in the FortiGate-7000 chassis.

FIM-7910E hardware schematic

FIM-7920E interface module

The FIM-7920E interface module is a hot swappable module that provides data, management and session sync/heartbeat interfaces, base backplane switching and fabric backplane session-aware load balancing for a FortiGate-7000 series chassis. The FIM-7920E includes an integrated switch fabric and DP2 processors to load balance millions of data sessions over the chassis fabric backplane to FPM processor modules.

The FIM-7920E can be installed in any FortiGate-7000 series chassis in hub/switch slots 1 or 2. The FIM-7920E provides four Quad Small Form-factor Pluggable 28 (QSFP28) 100GigE interfaces for a FortiGate-7000 chassis. Using a 100GBASE-SR4 QSFP28 or 40GBASE-SR4 QSFP+ transceiver, each QSFP28 interface can also be split into four 10GBASE-SR interfaces.

You can also install FIM-7920Es in a second chassis and operate the chassis in HA mode with another set of processor modules to provide chassis failover protection.

FIM-7920E front panel

The FIM-7920E includes the following hardware features:

- Four front panel 100GigE QSFP28 fabric channel interfaces (C1 to C4). These interfaces are connected to 100Gbps networks to distribute sessions to the FPM processor modules installed in chassis slots 3 and up. Using a 100GBASE-SR4 QSFP28 or 40GBASE-SR4 QSFP+ transceiver, each QSFP28 interface can also be split into four 10GBASE-SR interfaces. These interfaces also support creating link aggregation groups (LAGs) that can include interfaces from both FIM-7920Es.
- Two front panel 10GigE SFP+ interfaces (M1 and M2) that connect to the base backplane channel. These interfaces are used for heartbeat, session sync, and management communication between FIM-7920Es in different chassis. These interfaces can also be configured to operate as Gigabit Ethernet interfaces using SFP transceivers, but should not normally be changed. If you use switches to connect these interfaces, the switch ports should be able to accept packets with a maximum frame size of at least 1526. The M1 and M2 interfaces need to be on different broadcast domains. If M1 and M2 are connected to the same switch, Q-in-Q must be enabled on the switch.
- Four 10/100/1000BASE-T out of band management Ethernet interfaces (MGMT1 to MGMT4).
- One 80Gbps fabric backplane channel for traffic distribution with each FPM installed in the same chassis as the FIM-7920E.
- One 1Gbps base backplane channel for base backplane with each FPM installed in the same chassis as the FIM-7920E.
- One 40Gbps fabric backplane channel for fabric backplane communication with the other FIM-7920E in the chassis.
- One 1Gbps base backplane channel for base backplane communication with the other FIM-7920E in the chassis.
- On-board DP2 processors and an integrated switch fabric to provide high-capacity session-aware load balancing.
- One front panel USB port.
- Power button.
- NMI switch (for troubleshooting as recommended by Fortinet Support).
- Mounting hardware.
- LED status indicators.

Changing the interface type and splitting the FIM-7920E C1 to C4 interfaces

By default, the FIM-7920E C1 to C4 interfaces are configured as 100GE QSFP28 interfaces. You can use the following command to convert them to 40GE QSFP+ interfaces. Once converted, you can use the other command below to split them into four 10GBASE-SR interfaces.

Changing the interface type

For example, to change the interface type of the C1 interface of the FIM-7920E in slot 1 to 40GE QSFP+ connect to the CLI of your FortiGate-7000 system using the management IP and enter the following command:

```
config system global
    set qsfp28-40g-port 1-C1
end
```

The FortiGate-7000 system reboots and when it starts up interface C1 of the FIM-7920E in slot 1 is operating as a 40GE QSFP+ interface .

To change the interface type of the C3 and C4 ports of the FIM-7920E in slot 2 to 40GE QSFP+ enter the following command:

```
config system global
    set qsfp28-40g-port 2-C3 2-C4
end
```

The FortiGate-7000 system reboots and when it starts up interfaces C3 and C4 of the FIM-7920E in slot 2 are operating as a 40GE QSFP+ interfaces.

Splitting the C1 to C4 interfaces

Each 40GE interface (C1 to C4) on the FIM-7920Es in slot 1 and slot 2 of a FortiGate-7000 system can be split into 4 x 10GBE interfaces. You split these interfaces after the FIM-7920Es are installed in your FortiGate-7000 system and the system is up and running. You can split the interfaces of the FIM-7920Es in slot 1 and slot 2 at the same time by entering a single CLI command. Splitting the interfaces requires a system reboot so Fortinet recommends that you split multiple interfaces at the same time according to your requirements to avoid traffic disruption.

For example, to split the C1 interface of the FIM-7920E in slot 1 (this interface is named 1-C1) and the C1 and C4 interfaces of the FIM-7920E in slot 2 (these interfaces are named 2-C1 and 2-C4) connect to the CLI of your FortiGate-7000 system using the management IP and enter the following command:

```
config system global
    set split-port 1-C1 2-C1 2-C4
end
```

After you enter the command, the FortiGate-7000 reboots and when it comes up:

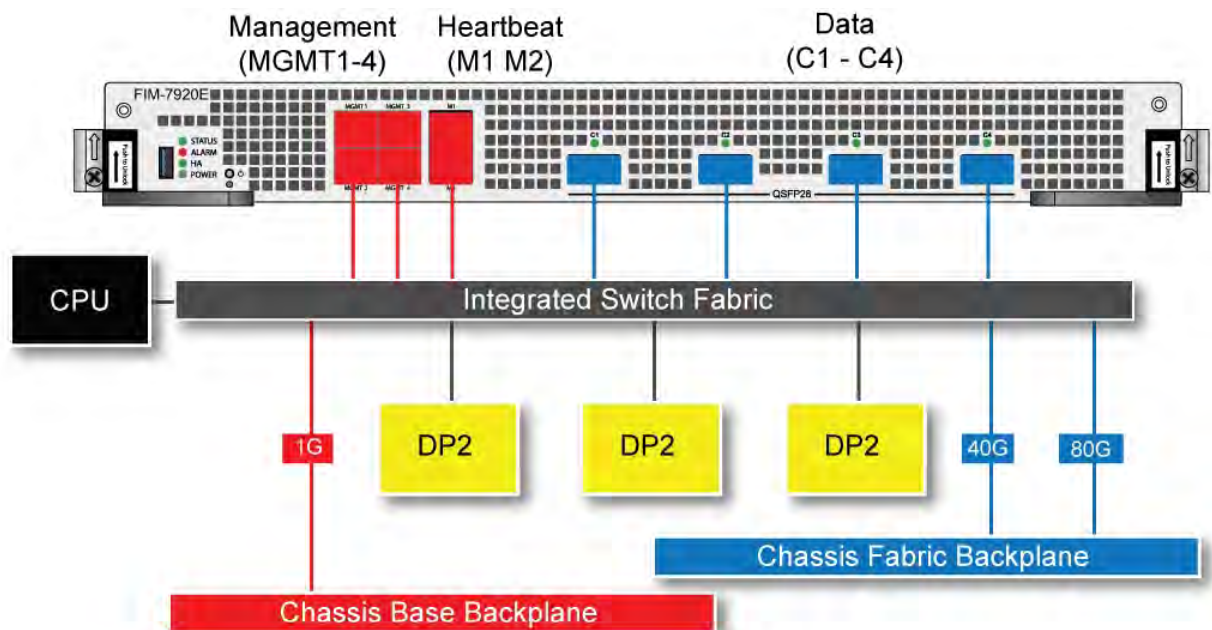

- The 1-C1 interface will no longer be available. Instead the 1-C1/1, 1-C1/2, 1-C1/3, and 1-C1/4 interfaces will be available.
- The 2-C1 interface will no longer be available. Instead the 2-C1/1, 2-C1/2, 2-C1/3, and 2-C1/4 interfaces will be available.
- The 2-C4 interface will no longer be available. Instead the 2-C4/1, 2-C4/2, 2-C4/3, and 2-C4/4 interfaces will be available.

You can now connect breakout cables to these interfaces and configure traffic between them just like any other FortiGate interface.

FIM-7920E hardware schematic

The FIM-7920E includes an integrated switch fabric (ISF) that connects the front panel interfaces to the DP2 session-aware load balancers and to the chassis backplanes. The ISF also allows the DP2 processors to distribute sessions among all NP6 processors on the FortiGate Processor Modules (FPM) in the FortiGate-7000 chassis.

FIM-7920E hardware schematic

FPM-7620E processing module

The FPM-7620E processing module is a high-performance worker module that processes sessions load balanced to it by FortiGate-7000 series interface (FIM) modules over the chassis fabric backplane. The FPM-7620E can be installed in any FortiGate-7000 series chassis in slots 3 and up.

The FPM-7620E includes two 80Gbps connections to the chassis fabric backplane and two 1Gbps connections to the base backplane. The FPM-7620E processes sessions using a dual CPU configuration, accelerates network traffic processing with 4 NP6 processors and accelerates content processing with 8 CP9 processors. The NP6 network processors are connected by the FIM switch fabric so all supported traffic types can be fast path accelerated by the NP6 processors.

The FPM-7620E includes the following hardware features:

- Two 80Gbps fabric backplane channels for load balanced sessions from the FIMs installed in the chassis.
- Two 1Gbps base backplane channels for management, heartbeat and session sync communication.
- Dual CPUs for high performance operation.
- Four NP6 processors to offload network processing from the CPUs.
- Eight CP9 processors to offload content processing and SSL and IPsec encryption from the CPUs.

FPM-7620E front panel

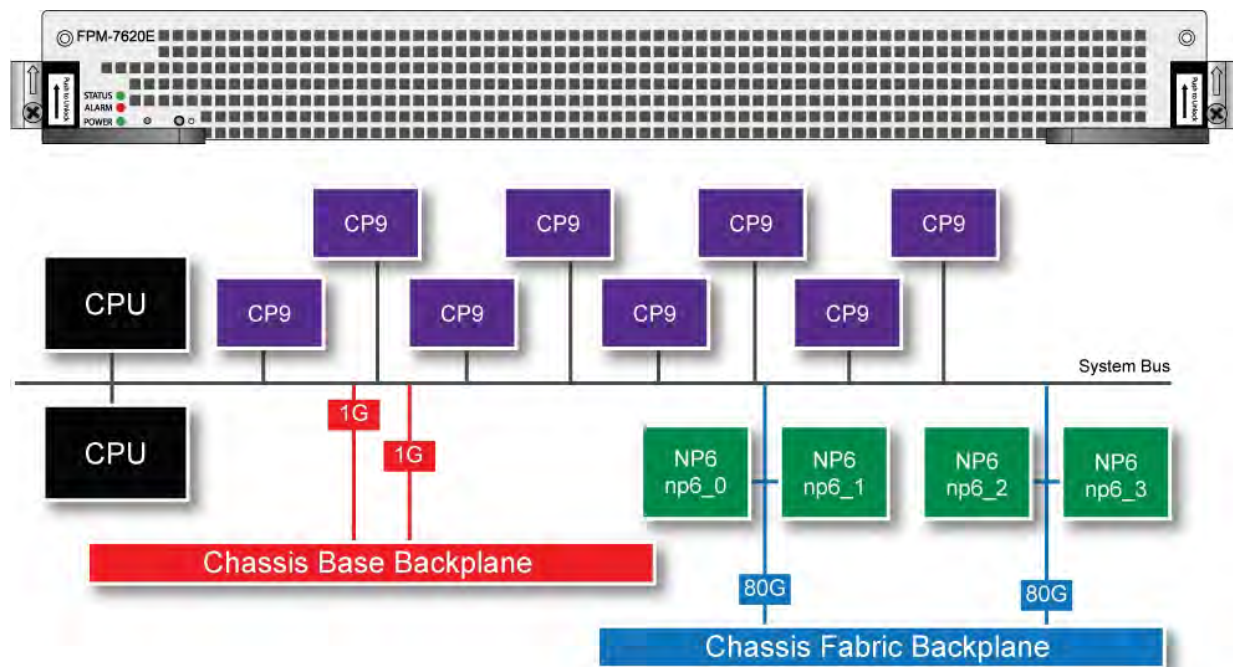

- Power button.
- NMI switch (for troubleshooting as recommended by Fortinet Support).
- Mounting hardware.
- LED status indicators.

NP6 network processors - offloading load balancing and network traffic

In a FortiGate-7000 chassis, FPM-7620E NP6 network processors combined with the FortiGate Interface Module (FIM) Integrated Switch Fabric (ISF) provide hardware acceleration by offloading sessions from the FPM-7620E CPUs. The result is enhanced network performance provided by the NP6 processors plus the removal of network processing load from the FPM-7620 CPUs. The NP6 processors can also handle some CPU-intensive tasks, like IPsec VPN encryption/decryption. Because of the ISF in each FIM, all sessions are fast-pathed and accelerated.

FPM-7620E hardware architecture

Accelerated IPS, SSL VPN, and IPsec VPN (CP9 content processors)

The FPM-7620E includes eight CP9 processors that provide the following performance enhancements:

- Flow-based inspection (IPS, application control etc.) pattern matching acceleration with over 10Gbps throughput
 - IPS pre-scan
 - IPS signature correlation
 - Full match processors
- High performance VPN bulk data engine
 - IPsec and SSL/TLS protocol processor
 - DES/3DES/AES128/192/256 in accordance with FIPS46-3/FIPS81/FIPS197
 - MD5/SHA-1/SHA256/384/512-96/128/192/256 with RFC1321 and FIPS180
 - HMAC in accordance with RFC2104/2403/2404 and FIPS198
 - ESN mode
 - GCM support for NSA "Suite B" (RFC6379/RFC6460) including GCM-128/256; GMAC-128/256
- Key Exchange Processor that supports high performance IKE and RSA computation
 - Public key exponentiation engine with hardware CRT support
 - Primary checking for RSA key generation
 - Handshake accelerator with automatic key material generation
 - True Random Number generator
 - Elliptic Curve support for NSA "Suite B"
 - Sub public key engine (PKCE) to support up to 4096 bit operation directly (4k for DH and 8k for RSA with CRT)
- DLP fingerprint support
 - TTTD (Two-Thresholds-Two-Divisors) content chunking
 - Two thresholds and two divisors are configurable

Getting started with FortiGate-7000

Once you have installed your FortiGate-7000 chassis in a rack and installed FIM interface modules and FPM processing modules in it, you can power on the chassis and all modules in the chassis will power up.

Whenever a chassis is first powered on, it takes about 5 minutes for all modules to start up and become completely initialized and synchronized. During this time the chassis will not allow traffic to pass through and you may not be able to log into the GUI, or if you manage to log in the session could time out as the FortiGate-7000 continues negotiating.

Review the chassis and module front panel LEDs to verify that everything is operating normally. Wait until the chassis has completely started up and synchronized before making configuration changes.

You can use the `diagnose sys ha status` command to confirm that the FortiGate-7000 is completely initialized. If the output from entering this command hasn't changed after checking for a few minutes you can assume that the system has initialized. You don't normally have to confirm that the system has initialized, but this `diagnose` command is available to verify that the system is initialized.

Once the system has initialized, you have a few options for connecting to the FortiGate-7000 GUI or CLI:

- Log into the GUI by connecting the MGMT1 interface of the FIM in slot 1 to your network. Then browse to <https://192.168.1.99>. The default administrator account is **admin** with no password. For more information about using the MGMT interfaces for management connections to the FortiGate-7000, see [Setting up management connections on page 692](#).
- Log into the CLI by connecting the MGMT1 interface of the FIM in slot 1 to your network. Then use an SSH client to connect to 192.168.1.99 and use the same admin account to log in.
- Log into the CLI with a serial connection to the Console 1 serial port on the FortiGate-7000 management module. For more information, including the serial port settings, see [Connecting to module CLIs using the management module on page 697](#).

Setting up management connections

When your FortiGate-7000 first starts up, the MGMT1 to MGMT4 interfaces of both of the FIMs are part of a static 802.3 aggregate interface with a default IP address of 192.168.1.99. On the GUI or CLI the 802.3 aggregate interface is named **mgmt**.

Example mgmt management interface configuration

Interface Name	mgmt										
Alias	<input type="text"/>										
Link Status	Up										
Type	802.3ad Aggregate										
Virtual Domain	mgmt-vdom										
Interface Members	<table border="1"> <tr> <td> 1-mgmt1 ✕</td> <td> 1-mgmt2 ✕</td> </tr> <tr> <td> 1-mgmt3 ✕</td> <td> 1-mgmt4 ✕</td> </tr> <tr> <td> 2-mgmt1 ✕</td> <td> 2-mgmt2 ✕</td> </tr> <tr> <td> 2-mgmt3 ✕</td> <td> 2-mgmt4 ✕</td> </tr> <tr> <td colspan="2" style="text-align: center;">+</td> </tr> </table>	1-mgmt1 ✕	1-mgmt2 ✕	1-mgmt3 ✕	1-mgmt4 ✕	2-mgmt1 ✕	2-mgmt2 ✕	2-mgmt3 ✕	2-mgmt4 ✕	+	
1-mgmt1 ✕	1-mgmt2 ✕										
1-mgmt3 ✕	1-mgmt4 ✕										
2-mgmt1 ✕	2-mgmt2 ✕										
2-mgmt3 ✕	2-mgmt4 ✕										
+											
Role	LAN										

Setting up a single management connection

You can configure and manage your FortiGate-7000 by connecting an Ethernet cable to any of the MGMT1 - 4 interfaces of the FIM in slot 1 or slot 2 and logging into the GUI using HTTPS or the CLI using SSH. The default IP address is 192.168.1.99 and you can log in with the **admin** administrator account with no password.

For security reasons you should add a password to the admin account before connecting the chassis to your network.

Setting up redundant management connections

You can set up redundant management connections to your FortiGate-7000 by adding a static 802.3 aggregate interface to a switch and setting up multiple connections between the switch and the FIM MGMT ports. Then connect the switch to your network.

LACP is not supported for the mgmt aggregate interface.

You do not have to change the configuration of the FortiGate-7000 to set up redundant management connections. The following example shows connections between the MGMT 1 interfaces of each FIM to a switch. The switch is configured with a 802.3 static aggregate interface that includes two ports, one for each MGMT 1 interface. The switch also connects the MGMT 1 interfaces to a management network.

Example FortiGate-7000 redundant management connections

The following example shows redundant connections between both FIMs and the switch. In this case you need to add more switch ports to the static aggregate interface on the switch. You do not have to change the configuration of the FortiGate-7000 to set up this redundant management connection configuration.

Example FortiGate-7000 redundant management connections with redundant connections to each FIM

In either of these configurations, for additional redundancy you can use two switches. If you use two redundant switches, the static aggregate interface should span across both switches.

Managing individual FIMs and FPMs

When you log into the GUI or CLI using the mgmt interface IP address you are actually connected to the primary (or master) FIM in slot 1 (the address of slot 1 is FIM01). To verify which module you have logged into, the GUI header banner and the CLI prompt shows the hostname of the module you are logged into. The CLI prompt also shows slot address in the format `<hostname> [<slot address>] #`.

In some cases you may want to connect to individual modules. For example, you may want to view the traffic being processed by a specific FPM. You can connect to the GUI or CLI of individual modules in the chassis using the system management IP address with a special port number.

For example, if the system management IP address is 192.168.1.99 you can connect to the GUI of the FIM in slot 1 using the system management IP address (for example, by browsing to <https://192.168.1.99>). You can also use the system management IP address followed by the special port number: <https://192.168.1.99:44301>.

The special port number (in this case 44301) is a combination of the service port (for HTTPS the service port is 443) and the chassis slot number (in this example, 01). The following table lists the special ports to use to connect to each chassis slot using common admin protocols:

FortiGate-7000 special administration port numbers

Slot Number	Slot Address	HTTP (80)	HTTPS (443)	Telnet (23)	SSH (22)
5	FPM05	8005	44305	2305	2205
3	FPM03	8003	44303	2303	2203
1	FIM01	8001	44301	2301	2201
2	FIM02	8002	44302	2302	2202
4	FPM04	8004	44304	2304	2204
6	FPM06	8006	44306	2306	2206

For example:

- To connect to the GUI of the FIM in slot 3 using HTTPS you would browse to <https://192.168.1.99:44303>.

The FortiGate-7000 configuration is the same no matter which module you log into. You can log into different modules to use FortiView or Monitor GUI pages to view the activity of that module. Even though you can log into different modules, you should only make configuration changes from the primary FIM; which is the FIM in slot 1.

Managing individual modules from the CLI

From the CLI you can use the following command to switch between chassis slots and perform different operations on the modules in each slot:

```
execute load-balance slot {manage | power-off | power-on | reboot} <slot-number>
```

Use `manage` to connect to the CLI of a different module, use `power-off`, `power-on`, and `reboot` to turn off or turn on the power or reboot the module in `<slot-number>`.

Using data interfaces for management traffic

Normally, all management traffic connects with the FortiGate-7000 through the FIM MGMT1, MGMT2, MGMT3, and MGMT4 interfaces. The FortiGate-7000 does also support management traffic connections to the FIM data interfaces. To enable management connections to these interfaces you must configure the VDOM that the data interfaces are included in to allow traffic forwarding to the primary FIM. By default, the root VDOM includes all of the data interfaces. To allow management communication between the root VDOM and the primary FIM, edit the root VDOM from the CLI and use the following command:

```
config vdom
  edit root
    config system settings
      set motherboard-traffic-forwarding {icmp | admin}
    end
```

The `icmp` option, enabled by default, allows you to log into the primary FIM from one of the MGMT interfaces and use the `execute ping` command to ping an address through one of the FIM data interfaces. The interface used depends on the routing configuration.

The `admin` option allows Telnet, SSH, HTTP, and HTTPS administrator connections from a management PC to a data interface. You cannot configure data interfaces to accept management connections using non-standard ports.

Currently, the `admin` setting is in development and not recommended.

FortiGate-7000 dashboard widgets

The FortiGate-7000 includes a number of custom dashboard widgets that provide extra or custom information for FortiGate-7000 systems.

Security Fabric

The Security Fabric dashboard widget shows the FIMs and FPMs in your FortiGate-7000 system. You can hover over the components in the Security Fabric dashboard widget to see details about each components host name, serial number, model, firmware version, and management IP address.

Interface Bandwidth

You can add Interface Bandwidth dashboard widgets to view traffic in and out of any FortiGate-7000 interface. You can add an Interface Bandwidth widget to the dashboard for:

- Any physical interface
- Any link aggregation (LAG) interface
- Any member of a LAG
- Any VLAN interface

- Any IPsec VPN tunnel interface
- Any redundant interface

The displayed data includes all of the traffic processed by the interface, independent of how the traffic is load balanced.

You can add individual Interface Bandwidth widgets for each interface that you want to monitor. After you have added the widget you can choose to display traffic for the last hour, 24 hours or week. The data displayed on the widget updates in real time.

From the CLI, for physical interfaces, you can use the `diagnose hardware deviceinfo nic <interface-name>` command to view transmitted and received packets.

For LAG and VLAN interfaces you can display transmitted and received packets using the `diagnose netlink interface list <interface-name>` command.

Resource Usage

You can create multiple Resource Usage dashboard widgets to show CPU use, log rate, memory use, session creation rate, and the number of active sessions for the management board and for individual FPMs. After you have added the widget you can choose to display data for times ranging between 1 minute to 24 hours. The data displayed on the widget updates in real time.

Sensor Information

The Sensor Information dashboard widget displays temperature information for the FortiGate-7000 hardware and allows you to drill down for information about individual temperature sensors.

Connecting to module CLIs using the management module

All FortiGate-7000 chassis includes a front panel management module (also called a shelf manager) on the chassis front panel. See the system guide for your chassis for details about the management module.

FortiGate-7040E management module front panel

The management module includes two console ports named Console 1 and Console 2 that can be used to connect to the CLI of the FIM and FPMs in the chassis. As described in the system guide, the console ports are also used to connect to SMC CLIs of the management module and the FIM and FPMs

By default when the chassis first starts up Console 1 is connected to the FortiOS CLI of the FIM in slot 1 and Console 2 is disconnected. The default settings for connecting to each console port are:

Baud Rate (bps) 9600, Data bits 8, Parity None, Stop bits 1, and Flow Control None.

You can use the console connection change buttons to select the CLI that each console port is connected to. Press the button to cycle through the FIM and FPM FortiOS CLIs and disconnect this console. The console's LEDs indicate what it is connected to. If no LED is lit the console is either connected to the management module SMC SDI console or disconnected. Both console ports cannot be connected to the same CLI at the same time. If a console button press would cause a conflict that module is skipped. If one of the console ports is disconnected then the other console port can connect to any CLI.

If you connect a PC to one of the management module console ports with a serial cable and open a terminal session you begin by pressing Ctrl-T to enable console switching mode. Press Ctrl-T multiple times to cycle through the FIM and FPM FortiOS CLIs (the new destination is displayed in the terminal window). If you press Ctrl-T after connecting to the FPM in the highest slot number, the console is disconnected. Press Ctrl-T again to start over again at slot 1.

Once the console port is connected to the CLI that you want to use, press Enter to enable the CLI and login. The default administrator account for accessing the FortiOS CLIs is admin with no password.

When your session is complete you can press Ctrl-T until the prompt shows you have disconnected from the console.

Connecting to the FortiOS CLI of the FIM in slot 1

Use the following steps to connect to the FortiOS CLI of the FIM in slot 1:

1. Connect the console cable supplied with your chassis to Console 1 and to your PC or other device RS-232 console port.
2. Start a terminal emulation program on the management computer. Use these settings:
Baud Rate (bps) 9600, Data bits 8, Parity None, Stop bits 1, and Flow Control None.
3. Press Ctrl-T to enter console switch mode.
4. Repeat pressing Ctrl-T until you have connected to slot 1. Example prompt:
`<Switching to Console: FIM01 (9600)>`
5. Login with an administrator name and password.
The default is admin with no password. For security reasons, it is strongly recommended that you change the password.
6. When your session is complete, enter the `exit` command to log out.

Default VDOM configuration

By default when the FortiGate-7000 first starts up it is operating in multiple VDOM mode. The system has a management VDOM (named mgmt-vdom) and the root VDOM. All management interfaces are in mgmt and all other interfaces are in the root VDOM. You can add more VDOMs and add interfaces to them or just use the root VDOM.

Default management VDOM

By default the FortiGate-7000 configuration includes a management VDOM named mgmt-vdom. For the FortiGate-7000 system to operate normally you should not change the configuration of this VDOM and this

VDOM should always be the management VDOM. You should also not add or remove interfaces from this VDOM.

You have full control over the configurations of other FortiGate-7000 VDOMs.

Firmware upgrades

All of the FIMs and FPMs in your FortiGate-7000 system run the same firmware image. You upgrade the firmware from the primary FIM GUI or CLI just as you would any FortiGate product. During the upgrade process, the firmware running on all of the FIMs and FPMs upgrades in one step. Firmware upgrades should be done during a quiet time because traffic will briefly be interrupted during the upgrade process. The entire firmware upgrade will take a few minutes depending on the number of FIMs and FPMs in your FortiGate-7000 system. Also, some firmware upgrades may take longer depending on other factors such as the size of the configuration and whether a DP processor firmware upgrade is included.

Before beginning a firmware upgrade, Fortinet recommends the following:

- Review the latest release notes for the firmware version that you are upgrading to.
- Verify the recommended upgrade path as documented in the release notes.
- Backup your FortiGate-7000 configuration.

Fortinet recommends that you review the services provided by your FortiGate-7000 before a firmware upgrade and then again after the upgrade to make sure everything continues to operate normally. For example, you might want to verify that you can successfully access an important server used by your organization before the upgrade and make sure after the upgrade that you can still reach the server and that performance is comparable. You could also take a snapshot of key performance indicators (number of sessions, CPU usage, and memory usage) before the upgrade and verify that you see comparable performance after the upgrade.

Verifying that a firmware upgrade is successful

After a FortiGate-7000 firmware upgrade, you should verify that all of the FIMs and FPMs have been successfully upgraded to the new firmware version.

After the firmware upgrade appears to be complete:

1. Log into the primary FIM and verify that it is running the expected firmware version.
You can verify the firmware version running on the primary FIM from the dashboard or by using the `get system status` command.
2. Log into the other FIMs and the FPMs, and in the same way confirm that they are also running the expected firmware version.
You can log into individual FIMs or FPMs using the system management IP address and the special port number for each module. For example, `https://192.268.1.99:44303` connects to the FPM in slot 3. The special port number (in this case 44303) is a combination of the service port (for HTTPS the service port is 443) and the slot number (in this example, 03). For more information, see [Managing individual FIMs and FPMs on page 695](#). If you are using a management module console port to connect to the primary FIM CLI you can use Ctrl-T to switch between the CLIs of each of the modules.

Upgrading the firmware running on individual FIMs or FPMs

If, after a firmware upgrade or at any time, one or more of the FIMs or FPMs are not running the correct firmware version, use the procedures described in [Installing firmware on individual FIMs and FPMs on page 715](#) to upgrade these FIMs or FPMs.

Upgrading the firmware running on a FortiGate-7000 HA cluster

For information about upgrading FortiGate-7000 HA cluster firmware, see [HA cluster firmware upgrades on page 738](#).

Limitations of installing FortiGate-7000 firmware from the BIOS after a reboot

A common method for resetting the configuration of a FortiGate involves installing firmware by restarting the FortiGate, interrupting the boot process, and using BIOS prompts to download a firmware image from a TFTP server. This process is also considered the best way to reset the configuration of your FortiGate.

Installing or upgrading FortiGate-7000 firmware in this way installs firmware on and resets the configuration of the primary FIM only. The other FIM and the FPMs will continue to operate with their current configuration and firmware build. The FortiGate-7000 system does not synchronize firmware upgrades performed from the BIOS.

To also reset all of the FIMs and FPCs, after installing firmware from the BIOS on the primary FIM, install the same firmware image (or optionally a newer firmware image) from the GUI or from the CLI using the `execute restore image` command. This operation synchronizes the same firmware build and reset configuration to the FIMs and FPCs.

You could also manually install firmware on each individual FIM and FPM from the BIOS after a reboot. This manual process is just as effective as installing the firmware for a second time on the primary FIM to trigger synchronization to the FIM and FPMs, but takes much longer.

Restarting the FortiGate-7000

To restart all of the modules in a FortiGate-7000 chassis, connect to the primary FIM CLI and enter the command `execute reboot`. When you enter this command all of the modules in the chassis reboot.

You can restart individual modules by logging into that module's CLI and entering the `execute reboot` command.

Configuration synchronization

The FortiGate-7000 synchronizes the configuration to all modules in the chassis. To support this feature, the FIM in slot 1 becomes the config-sync master and this FIM makes sure the configurations of all modules are synchronized. Every time you make a configuration change you must be logged into the chassis using the management address, which logs you into the config-sync master. All configuration changes made to the config-sync master are synchronized to all of the modules in the chassis.

If the FIM in slot 1 fails or reboots, the FIM in slot 2 becomes the config-sync master.

Packet sniffing for FIM and FPM packets

You can use the `diagnose sniffer packet` command to view or sniff packets as they are processed by FIM or FPMs. To use this command you have to be logged into a VDOM. You can run this command from any FIM or FPM CLI.

The command output includes the address of the slot containing the module that processed the packet. From the primary FIM, you can see packets processed by all of the FIMs and FPMs. From individual FIMs or FPMs you can see packets processed by that FIM or FPM.

From the primary FIM, you can enter the `diagnose sniffer options slot current` command to only see packets processed by the primary FIM. You can also enter the `diagnose sniffer options slot default` command to see packets processed by all modules.

The command syntax is:

```
diagnose sniffer packet <interface> <protocol-filter> <verbose> <count> <timestamp> <slot>
```

Where:

`<interface>` is the name of one or more interfaces on which to sniff for packets. Use `any` to sniff packets for all interfaces. To view management traffic use the `elbc-base-ctrl` interface name.

`<protocol-filter>` a filter to select the protocol for which to view traffic. This can be simple, such as entering `udp` to view UDP traffic or complex to specify a protocol, port, and source and destination interface and so on.

`<verbose>` the amount of detail in the output, and can be:

- 1 display packet headers only.
- 2 display packet headers and IP data.
- 3 display packet headers and Ethernet data (if available).
- 4 display packet headers and interface names.
- 5 display packet headers, IP data, and interface names.
- 6 display packet headers, Ethernet data (if available), and interface names.

`<count>` the number of packets to view. You can enter Ctrl-C to stop the sniffer before the count is reached.

`<timestamp>` the timestamp format, `a` for UTC time and `l` for local time.

Sample diagnose sniffer packet output from the primary FIM

```

```

FortiGate-7000 support for VRRP

The FortiGate-7000 platform supports the Virtual Router Redundancy Protocol (VRRP), allowing you to configure VRRP HA between FortiGate-7000 devices. You can also add a FortiGate-7000 to a VRRP group with other VRRP routers.

Configure VRRP on the FortiGate-7000 by creating a VRRP group and adding one or more front panel interfaces to the group.

During normal operation, the primary FortiGate-7000 sends outgoing VRRP routing advertisements. Both the primary and backup FortiGate-7000s listen for incoming VRRP advertisements from other routers in the VRRP

group. If the primary FortiGate-7000 fails, the new primary FortiGate-7000 takes over the role of both sending and receiving VRRP advertisements, maintaining the FortiGate-7000 within the VRRP group.

Load balancing and flow rules

This chapter provides an overview of how FortiGate-7000 Session-Aware Load Balancing (SLBC) works and then breaks down the details and explains why you might want to change some load balancing settings.

FortiGate-7000 SLBC works as follows.

1. SLBC attempts to match all incoming sessions with a configured flow rule (see [Load balancing and flow rules on page 703](#)). If a session matches a flow rule, the session is directed according to the action setting of the flow rule. Usually flow rules send traffic that can't be load balanced to a specific FPM.
2. TCP, UDP, SCTP, ICMP (IPv4 only) and ESP (IPv4 only) sessions that do not match a flow rule are directed to the DP2 processors.
The DP2 processors distribute sessions to the FPMs according to the load balancing method set by the `dp-load-distribution-method` option of the `config load-balance setting` command.
3. All other sessions are sent to the primary FPM.

Setting the load balancing method

Sessions are load balanced or distributed based on the load balancing method set by the following command:

```
config load-balance setting
    set dp-load-distribution-method {to-master | src-ip | dst-ip | src-dst-ip | src-ip-
        sport | dst-ip-dport | src-dst-ip-sport-dport}
end
```

Where:

`to-master` directs all session to the primary FPM. This method is for troubleshooting only and should not be used for normal operation. Directing all sessions to the primary FPM will have a negative impact on performance.

`src-ip` sessions are distributed across all FPMs according to their source IP address.

`dst-ip` sessions are statically distributed across all FPMs according to their destination IP address.

`src-dst-ip` sessions are distributed across all FPMs according to their source and destination IP addresses.

`src-ip-sport` sessions are distributed across all FPMs according to their source IP address and source port.

`dst-ip-dport` sessions are distributed across all FPMs according to their destination IP address and destination port.

`src-dst-ip-sport-dport` sessions are distributed across all FPMs according to their source and destination IP address, source port, and destination port. This is the default load balance algorithm and represents true session-aware load balancing. All session information is taken into account when deciding where to send new sessions and where to send additional packets that are part of an already established session.

The `src-ip` and `dst-ip` load balancing methods use layer 3 information (IP addresses) to identify and load balance sessions. All of the other load balancing methods (except for `to-master`) use both layer 3 and layer 4 information (IP addresses and port numbers) to identify a TCP and UDP session. The layer 3 and layer 4 load balancing methods only use layer 3 information for other types of traffic (SCTP, ICMP, and ESP). If GTP load balancing is enabled, Tunnel Endpoint Identifiers (TEIDs) are used to identify GTP sessions.

Flow rules for sessions that cannot be load balanced

Some traffic types cannot be load balanced. Sessions for traffic types that cannot be load balanced should normally be sent to the primary (or master) FPM by configuring flow rules for that traffic. You can also configure flow rules to send traffic that cannot be load balanced to specific FPMs.

Create flow rules using the `config loadbalance flow-rule` command. The default configuration uses this command to send IKE, GRE, session helper, Kerberos, BGP, RIP, IPv4 and IPv6 DHCP, PPTP, BFD, IPv4 multicast and IPv6 multicast to the primary FPM. You can view the default configuration of the `config loadbalance flow-rule` command to see how this is all configured. For example, the following configuration sends all IKE sessions to the primary FPM:

```
config load-balance flow-rule
  edit 1
    set status enable
    set vlan 0
    set ether-type ip
    set protocol udp
    set src-l4port 500-500
    set dst-l4port 500-500
    set action forward
    set forward-slot master
    set priority 5
    set comment "ike"
  next
  edit 2
    set status disable
    set vlan 0
    set ether-type ip
    set protocol udp
    set src-l4port 4500-4500
    set dst-l4port 0-0
    set action forward
    set forward-slot master
    set priority 5
    set comment "ike-natt src"
  next
  edit 3
    set status disable
    set vlan 0
    set ether-type ip
    set protocol udp
    set src-l4port 0-0
    set dst-l4port 4500-4500
    set action forward
    set forward-slot master
    set priority 5
    set comment "ike-natt dst"
  next
```

See [Default configuration for traffic that cannot be load balanced on page 707](#) for a listing of all of the default configuration flow rules.

Determining the primary FPM

You can use the `diagnose load-balance status` command to determine which FPM is operating as the primary FPM. The primary FPM is also responsible for dynamic routing.

Example `diagnose load-balance status` output for a FortiGate-7060E showing that the FPM in slot 3 is the primary (master) FPM. The command output also shows the status of all of the FPMs in the FortiGate-7060E. The output also shows that the FPM in slot 4 is either missing or down.

```
diagnose load-balance status
=====
Slot: 2  Module SN: FIM04E3E16000222
      FIM02: FIM04E3E16000222
      Master FPM Blade: slot-3

      Slot 3: FPM20E3E17900133
      Status:Working   Function:Active
      Link:           Base: Up           Fabric: Up
      Heartbeat: Management: Good   Data: Good
      Status Message:"Running"
Slot 4:
      Status:Dead      Function:Active
      Link:           Base: Up           Fabric: Down
      Heartbeat: Management: Failed Data: Failed
      Status Message:"Waiting for management heartbeat."
.
.
.
```

SSL VPN load balancing

FortiGate-7000s do not support load balancing SSL VPN sessions terminated by the FortiGate-7000. The recommended configuration is to direct SSL VPN sessions terminated by the FortiGate-7000 to the primary FPM.

SSL VPN sessions are sessions from an SSL VPN client to your configured SSL VPN server listening port.

Using a FortiGate-7000 as an SSL VPN server requires you to manually add an SSL VPN load balance flow rule to configure the FortiGate-7000 to send all SSL VPN sessions to the primary (master) FPM. To match with the SSL VPN server traffic, the rule should include a destination port that matches the destination port of the SSL VPN server. A basic rule to allow SSL VPN traffic could be:

```
config load-balance flow-rule
edit 0
set status enable
set ether-type ipv4
set protocol tcp
set dst-l4port 10443-10443
set forward-slot master
set comment "ssl vpn server to primary FPM"
next
```

end

This flow rule matches all sessions sent to port 10443 (the default SSL VPN server listening port) and sends these sessions to the primary FPM. This should match all of your SSL VPN traffic if you are using the default SSL VPN server listening port (10443). This flow rule also matches all other sessions using 10443 as the destination port so all of this traffic is also sent to the primary FPM.

Adding the SSL VPN server IP address

You can add the IP address of the FortiGate-7000 interface that receives SSL VPN traffic to the SSL VPN flow rule to make sure that the flow rule only matches SSL VPN server settings. For example, if the IP address of the interface is 172.25.176.32 and the SSL VPN flow rule ID is 26:

```
config load-balance flow-rule
  edit 26
    set status enable
    set ether-type ipv4
    set protocol tcp
    set dst-addr-ipv4 172.25.176.32 255.255.255.0
    set dst-l4port 10443-10443
    set forward-slot master
    set comment "ssl vpn server to primary FPM"
  next
end
```

This flow rule will now only match SSL VPN sessions with 172.25.176.32 as the destination address and send all of these sessions to the primary FPM.

If you change the SSL VPN server listening port

If you have changed the SSL VPN server listening port to 20443, you can change the SSL VPN flow rule as follows. This example also sets the source interface to port12, which is the SSL VPN server interfaces, instead of adding the IP address of port12 to the configuration:

```
config load-balance flow-rule
  edit 26
    set status enable
    set ether-type ipv4
    set protocol tcp
    set src-interface port12
    set dst-l4port 20443-20443
    set forward-slot master
    set comment "ssl vpn server to primary FPM"
  next
end
```

GTP load balancing

You can use the following command to enable or disable GTP load balancing.

```
config load-balance setting
  config gtp-load-balance {disable | enable}
end
```

By default, this option is disabled and GTP load balancing is disabled. The following flow rule is enabled and GTP traffic is directed to the primary (master) FPM.

```
config load-balance flow-rule
  edit 17
```

```

        set ether-type ipv4
        set protocol udp
        set dst-l4port 2123-2123
        set comment "gtp-c to master blade"
    next
end

```

When the `gtp-load-balance` option is enabled, the GTP load balancing is flow rule is disabled and GTP sessions are directed to the DP2 processors and load balanced to the FPMs.

Default configuration for traffic that cannot be load balanced

The default FortiGate-7000 `configure load-balance flow-rule` command contains the recommended default rules for how the FortiGate-7000 handles traffic types that cannot be load balanced. All of these flow rules identify the traffic type using the options available in the command and direct the traffic to the primary (or master) FPM. The rules also include a comment that identifies the traffic type.

Most of the flow rules are enabled (`status` set to `enable`) and they will direct matching traffic to the primary FPM. However, the configuration does include some disabled flow rules. You can enable these flow rules if required for your network.

The CLI syntax below was created with the `show` command and just shows the configuration changes. All other options are set to their defaults. Flow rules with no `status` option are disabled by default. Also the default `forward-slot` setting is `master`, which directs matching traffic to the primary FPM.

```

config load-balance flow-rule
    edit 1
        set status disable
        set vlan 0
        set ether-type ip
        set protocol udp
        set src-l4port 88-88
        set dst-l4port 0-0
        set action forward
        set forward-slot master
        set priority 5
        set comment "kerberos src"
    next
    edit 2
        set status disable
        set vlan 0
        set ether-type ip
        set protocol udp
        set src-l4port 0-0
        set dst-l4port 88-88
        set action forward
        set forward-slot master
        set priority 5
        set comment "kerberos dst"
    next
    edit 3
        set status enable
        set vlan 0
        set ether-type ip

```

```
        set protocol tcp
        set src-l4port 179-179
        set dst-l4port 0-0
        set tcp-flag any
        set action forward
        set forward-slot master
        set priority 5
        set comment "bgp src"
    next
    edit 4
        set status enable
        set vlan 0
        set ether-type ip
        set protocol tcp
        set src-l4port 0-0
        set dst-l4port 179-179
        set tcp-flag any
        set action forward
        set forward-slot master
        set priority 5
        set comment "bgp dst"
    next
    edit 5
        set status enable
        set vlan 0
        set ether-type ip
        set protocol udp
        set src-l4port 520-520
        set dst-l4port 520-520
        set action forward
        set forward-slot master

Operating a FortiGate-7000

This chapter describes some FortiGate-7000 general operating procedure.

Failover in a standalone FortiGate-7000

A FortiGate-7000 will continue to operate even if one of the FIM or FPMs fails or is removed. If an FPM fails, sessions being processed by that module fail. All sessions are then load balanced to the remaining FPMs. Sessions that were being processed by the failed module are restarted and load balanced to the remaining FPMs.

If an FIM fails, the other FIM will continue to operate and will become the config-sync master. However, traffic received by the failed FIM will be lost.

You can use LACP or redundant interfaces to connect interfaces of both FIMs to the same network. In this way, if one of the FIMs fails the traffic will continue to be received by the other FIM.

Replacing a failed FPM or FIM

This section describes how to remove a failed FPM or FIM and replace it with a new one. The procedure is slightly different depending on if you are operating in HA mode with two chassis or just operating a standalone chassis.

Replacing a failed module in a standalone FortiGate-7000 chassis

1. Power down the failed module by pressing the front panel power button.
2. Remove the module from the chassis.
3. Insert the replacement module. It should power up when inserted into the chassis if the chassis has power.
4. The module's configuration is synchronized and its firmware is upgraded to match the firmware version on the primary module. The new module reboots.
5. Confirm that the new module is running the correct firmware version either from the GUI or by using the `get system status` command.
Manually update the module to the correct version if required. You can do this by logging into the module and performing a firmware upgrade. See [Installing firmware on individual FIMs and FPMs on page 715](#).
6. Verify that the configuration has been synchronized.

The following command output shows the sync status of the FIMs in a FortiGate-7000 chassis. The field `in_sync=1` indicates that the configurations of the modules are synchronized.

```
diagnose sys confsync
status | grep in_sy
FIM04E3E16000080, Slave, uptime=177426.45, priority=2,
slot_id=1:2, idx=0, flag=0x0, in_sync=1
FIM10E3E16000063, Master, uptime=177415.38, priority=1,
slot_id=1:1, idx=1, flag=0x0, in_sync=1
```

If `in_sync` is not equal to 1 or if a module is missing in the command output you can try restarting the modules in the chassis by entering `execute reboot` from any module CLI. If this does not solve the problem, contact Fortinet support.

Replacing a failed module in a FortiGate-7000 chassis in an HA cluster

1. Power down the failed module by pressing the front panel power button.
2. Remove the module from the chassis.

3. Insert the replacement module. It should power up when inserted into the chassis if the chassis has power.
4. The module's configuration is synchronized and its firmware is upgraded to match the configuration and firmware version on the primary module. The new module reboots.
5. Confirm that the module is running the correct firmware version.
Manually update the module to the correct version if required. You can do this by logging into the module and performing a firmware upgrade.
6. Configure the new module for HA operation. For example:

```
config system ha
    set mode a-p
    set chassis-id 1
    set hbdev m1 m2
    set hbdev-vlan-id 999
    set hbdev-second-vlan-id 990
end
```

7. Optionally configure the hostname:

```
config system global
    set hostname <name>
end
```

The HA configuration and the hostname must be set manually because HA settings and the hostname is not synchronized.

8. Verify that the configuration has been synchronized.

The following command output shows the sync status of the FIMs in a FortiGate-7000 chassis. The field `in_sync=1` indicates that the configurations of the modules are synchronized.

```
diagnose sys confsync
status | grep in_sy
FIM04E3E16000080, Slave, uptime=177426.45, priority=2,
slot_id=1:2, idx=0, flag=0x0, in_sync=1
FIM10E3E16000063, Master, uptime=177415.38, priority=1,
slot_id=1:1, idx=1, flag=0x0, in_sync=1
```

If `in_sync` is not equal to 1 or if a module is missing in the command output you can try restarting the modules in the chassis by entering `execute reboot` from any module CLI. If this does not solve the problem, contact Fortinet support.

Installing firmware on individual FIMs and FPMs

You can install firmware on individual FIMs or FPMs by logging into the FIM or FPM GUI or CLI. You can also setup a console connection to the FortiGate-7000 front panel Management Module and install firmware on individual FIMs or FPMs from a TFTP server after interrupting the FIM or FPM boot up sequence from the BIOS.

Normally you wouldn't need to upgrade the firmware on individual FIMs or FPMs because the FortiGate-7000 keeps the firmware on all of the FIMs and FPMs synchronized. However, FIM or FPM firmware may go out of sync in the following situations:

- Communication issues during a normal FortiGate-7000 firmware upgrade.
- Installing a replacement FIM or FPM that is running a different firmware version.
- Installing firmware on or formatting an FIM or FPM from the BIOS.

To verify the firmware versions on each FIM or FPM you can check each FIM and FPM GUI or enter the `get system status` command from each FIM or FPM CLI. You can also use the `diagnose sys confsync status | grep in_sy` command to see if the FIMs and FPMs are all synchronized. In the command output

`in_sync=1` means the FIM or FPM is synchronized. `in_sync=0` means the FIM or FPM is not synchronized, which could indicate the FIM or FPM is running a different firmware build than the primary FIM.

The procedures in this section work for FIMs or FPMs in a standalone FortiGate-7000. These procedures also work for FIMs or FPMs in the primary FortiGate-7000 in an HA configuration. To upgrade firmware on an FIM or FPM in the backup FortiGate-7000 in an HA configuration, you should either remove the backup FortiGate-7000 from the HA configuration or cause a failover so that the backup FortiGate-7000 becomes the primary FortiGate-7000.

In general, if you need to update both FIMs and FPMs in the same FortiGate-7000, you should update the FIMs first as the FPMs can only communicate through FIM interfaces.

Upgrading FIM firmware

Use the following procedure to upgrade the firmware running on a single FIM. For this procedure to work, you must connect at least one of the FIM MGMT interfaces to a network. You must also be able to log into the FIM GUI or CLI from that MGMT interface. If you perform the firmware upgrade from the CLI, the FIM must be able to communicate with an FTP or TFTP server.

During the upgrade, the FIM will not be able to process traffic. However, the other FIM and the FPMs should continue to operate normally.

1. Log into the FIM GUI or CLI and perform a normal firmware upgrade.
You may need to use the special port number to log into the FIM in slot two (for example, browse to <https://192.168.1.99:44302>).
2. Once the FIM restarts, verify that the new firmware has been installed.
You can do this from the FIM GUI dashboard or from the FIM CLI using the `get system status` command.
3. Verify that the configuration has been synchronized to the upgraded FIM. The following command output shows the sync status of a FortiGate-7040E. The field `in_sync=1` indicates that the configurations of the FIMs and FPMs are synchronized.

```
diagnose sys confsync status | grep in_sy
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x64, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x4, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x64, in_sync=1
```

If `in_sync` is not equal to 1 or if an FIM or FPM is missing in the command output, you can log into the FIM or FPM CLI and try to restart it using the `execute reboot` command. If this does not solve the problem, contact [Fortinet Support](#).

Upgrading FPM firmware

Use the following procedure to upgrade the firmware running on an individual FPM. To perform the upgrade, you must enter a command from the primary FIM CLI to allow ELBC communication with the FPM. Then you can just log into the FPM GUI or CLI and perform the firmware upgrade.

During this procedure, the FPM will not be able to process traffic. However, the other FPMs and the FIMs should continue to operate normally.

After you verify that the FPM is running the right firmware, you must log back into the primary FIM CLI and return the FPM to normal operation.

1. Log into to the primary FIM CLI and enter the following command:
`diagnose load-balance switch set-compatible <slot> enable elbc`
 Where <slot> is the number of the FortiGate-7000 slot containing the FPM to be upgraded.
2. Log into the FPM GUI or CLI using its special port number (for example, for the FPM in slot 3, browse to <https://192.168.1.99:44303> to connect to the GUI) and perform a normal firmware upgrade of the FPM.
3. Once the FPM restarts, verify that the new firmware has been installed.
 You can do this from the FPM GUI dashboard or from the FPM CLI using the `get system status` command.
4. Verify that the configuration has been synchronized. The following command output shows the sync status of a FortiGate-7040E. The field `in_sync=1` indicates that the configurations of the FIMs and FPMs are synchronized.

```
diagnose sys confsync status | grep in_sy
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x64, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x4, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x64, in_sync=1
```

If `in_sync` is not equal to 1 or if an FIM or FPM is missing in the command output, you can log into the FIM or FPM CLI and try to restart it using the `execute reboot` command. If this does not solve the problem, contact [Fortinet Support](#).

5. Once the FPM is operating normally, log back into the primary FIM CLI and enter the following command to reset the FPM to normal operation:

```
diagnose load-balance switch set-compatible <slot> disable
```

Configuration synchronization errors will occur if you do not reset the FPM to normal operation.

Upgrading FIM firmware from the FIM BIOS using a TFTP server

Use the following steps to upload firmware from a TFTP server to an FIM. The procedure involves creating a connection between the TFTP server and one of the FIM MGMT interfaces. You don't have to use a MGMT interface on the FIM that you are upgrading.

This procedure also involves connecting to the FIM CLI using a FortiGate-7000 front panel Management Module console port, rebooting the FIM, interrupting the boot from the console session, and following FIM BIOS prompts to install the firmware.

During this procedure, the FIM will not be able to process traffic. However, the other FIM and the FPMs should continue to operate normally.

1. Set up a TFTP server and copy the firmware file to the TFTP server default folder.
2. Set up your network to allow traffic between the TFTP server and one of the FIM MGMT interfaces.
 If the MGMT interface you are using is one of the MGMT interfaces connected as a LAG to a switch, you must shutdown or disconnect all of the other connections in the LAG from the switch. This includes the MGMT interfaces in the other FIM.

3. Connect the console cable supplied with your FortiGate-7000 to the front panel Management Module Console 1 port and to your management computer's RS-232 console port.
4. Start a terminal emulation program on the management computer. Use these settings:
Baud Rate (bps) 9600, Data bits 8, Parity None, Stop bits 1, and Flow Control None.
5. Press Ctrl-T to enter console switch mode.
6. Repeat pressing Ctrl-T until you have connected to the FIM to be updated. Example prompt for the FIM in slot 2:
<Switching to Console: FIM02 (9600)>
7. Optionally log into the FIM's CLI.
8. Reboot the FIM.
You can do this using the `execute reboot` command from the CLI or by pressing the power switch on the FIM front panel.
9. When the FIM starts up, follow the boot process in the terminal session and press any key when prompted to interrupt the boot process.
10. Press C to set up the TFTP configuration.
11. Use the BIOS menu to set the following. Only change settings if required.
[P]: Set image download port: MGMT1

[D]: Set DHCP mode: Disabled

[I]: Set local IP address: The IP address of the MGMT interface, to be used to connect to the TFTP server. This address must not be the same as the FortiGate-7000 management IP address and cannot conflict with other addresses on your network

[S]: Set local Subnet Mask: Set as required for your network.

[G]: Set local gateway: Set as required for your network.

[V]: Local VLAN ID: Use -1 to clear the Local VLAN ID.

[T]: Set remote TFTP server IP address: The IP address of the TFTP server.

[F]: Set firmware image file name: The name of the firmware file to be installed.
12. Press Q to quit this menu.
13. Press R to review the configuration.
If you need to make any corrections, press C and make the changes as required. When the configuration is correct, proceed to the next step.
14. Press T to start the TFTP transfer.
The firmware image is uploaded from the TFTP server and installed on the FIM. The FIM then restarts with its configuration reset to factory defaults. After restarting, the FIM configuration is synchronized to match the configuration of the primary FIM. The FIM restarts again and can start processing traffic.
15. Once the FIM restarts, verify that the correct firmware has been installed.
You can do this from the FIM GUI dashboard or from the FPM CLI using the `get system status` command.
16. Verify that the configuration has been synchronized.
The following command output shows the sync status of a FortiGate-7040E. The field `in_sync=1` indicates that the configurations of the FIMs and FPMs are synchronized.

```
diagnose sys confsync status | grep in_sy
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x64, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x4, in_sync=1
```

```
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x64, in_sync=1
```

If `in_sync` is not equal to 1 or if an FIM or FPM is missing in the command output, you can log into the FIM or FPM CLI and try restarting it using the `execute reboot` command. If this does not solve the problem, contact Fortinet support.

Upgrading FPM firmware from the FPM BIOS using a TFTP server

Use the following steps to upload firmware from a TFTP server to an FPM. To perform the upgrade, you must enter a command from the primary FIM CLI to allow the FPM BIOS to communicate through an FIM MGMT interface. The procedure involves creating a connection between the TFTP server and one of the FIM MGMT interfaces.

This procedure also involves connecting to the FPM CLI using a FortiGate-7000 front panel Management Module console port, rebooting the FPM, interrupting the boot from the console session, and following FPM BIOS prompts to install the firmware.

During this procedure, the FPM will not be able to process traffic. However, the other FPMs and the FIMs should continue to operate normally.

After you verify that the FPM is running the right firmware, you must log back into the primary FIM CLI and return the FPM to normal operation.

1. Set up a TFTP server and copy the firmware file into the TFTP server default folder.
2. Log into the primary FIM CLI and enter the following command:
`diagnose load-balance switch set-compatible <slot> enable bios`
 Where `<slot>` is the number of the FortiGate-7000 slot containing the FPM to be upgraded.
3. Set up your network to allow traffic between the TFTP server and a MGMT interface of one of the FIMs. You can use any MGMT interface of either of the FIMs. If the MGMT interface you are using is one of the MGMT interfaces connected as a LAG to a switch you must shutdown or disconnect all of the other connections in the LAG from the switch. This includes the MGMT interfaces in the other FIM.
4. Connect the console cable supplied with your FortiGate-7000 to the management module Console 1 port and to your management computer's RS-232 console port.
5. Start a terminal emulation program on the management computer. Use these settings:
 Baud Rate (bps) 9600, Data bits 8, Parity None, Stop bits 1, and Flow Control None.
6. Press Ctrl-T to enter console switch mode.
7. Repeat pressing Ctrl-T until you have connected to the module to be updated. Example prompt:
`<Switching to Console: FPM03 (9600)>`
8. Optionally log into the FPM's CLI.
9. Reboot the FPM.
 You can do this using the `execute reboot` command from the FPM's CLI or by pressing the power switch on the FPM front panel.
10. When the FPM starts up, follow the boot process in the terminal session and press any key when prompted to interrupt the boot process.
11. Press C to set up the TFTP configuration.
12. Use the BIOS menu to set the following. Only change settings if required.

[P]: Set image download port: The name of the FIM that can connect to the TFTP server (FIM01 is the FIM in slot 1 and FIM02 is the FIM in slot 2).

[D]: Set DHCP mode: Disabled.

[I]: Set local IP address: The IP address of the MGMT interface, to be used to connect to the TFTP server. This address must not be the same as the FortiGate-7000 management IP address and cannot conflict with other addresses on your network.

[S]: Set local Subnet Mask: Set as required for your network.

[G]: Set local gateway: Set as required for your network.

[T]: Set remote TFTP server IP address: The IP address of the TFTP server.

[F]: Set firmware image file name: The name of the firmware file to be installed.

13. Press Q to quit this menu.

14. Press R to review the configuration.

If you need to make any corrections, press C and make the changes as required. When the configuration is correct proceed to the next step.

15. Press T to start the TFTP transfer.

The firmware image is uploaded from the TFTP server and installed on the FPM. The FPM then restarts with its configuration reset to factory defaults. After restarting, the FPM configuration is synchronized to match the configuration of the primary FPM. The FPM restarts again and can start processing traffic.

16. Once the FPM restarts, verify that the correct firmware has been installed.

You can do this from the FPM GUI dashboard or from the FPM CLI using the `get system status` command.

17. Verify that the configuration has been synchronized.

The following command output shows the sync status of a FortiGate-7040E. The field `in_sync=1` indicates that the configurations of the FIMs and FPMs are synchronized.

```
diagnose sys confsync status | grep in_sy
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x64, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x4, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x64, in_sync=1
```

If `in_sync` is not equal to 1 or if an FIM or FPM is missing in the command output, you can log into the FIM or FPM CLI and try restarting it using the `execute reboot` command. If this does not solve the problem, contact [Fortinet Support](#).

18. Log back into the primary FIM CLI and enter the following command to reset the FPM to normal operation:

```
diagnose load-balance switch set-compatible <slot> disable
```

Configuration synchronization errors will occur if you do not reset the FPM to normal operation.

Synchronizing FIMs and FPMs after upgrading the primary FIM firmware from the BIOS

After installing firmware on the primary FIM from the BIOS after a reboot, the firmware version and configuration of the primary FIM will most likely be out of synch with other FIMs and FPMs. You can verify this from the primary

FIM CLI using the `diagnose sys confsync status | grep in_sy` command. The `in_sync=0` entries in the following example output extract show that the management board (serial number ending in 10) is out of sync with the other FIM and the FPMs shown in the output.

```
diagnose sys confsync status | grep in_sy
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=0
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x64, in_sync=0
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
...
```

You can also verify synchronization status from management board **Security Fabric** dashboard widget.

To re-synchronize the FortiGate-7000, (which has the effect of resetting the other FIM and the FPS) you can install firmware on the primary FIM using a normal firmware install processes.

You could also manually install firmware on each individual FIM and FPM from the BIOS after a reboot. This manual process is just as effective as installing the firmware for a second time on the primary FIM to trigger synchronization to the FIM and the FPMs, but takes much longer.

1. Log into the primary FIM GUI.
2. Click the **System Information** dashboard widget select **Update firmware in System > Firmware**.
You can also connect to the management board CLI and use the `execute restore image` command. Either operation synchronizes the firmware build and configuration from the primary FIM to the other FIM and the FPMs. The firmware build you install on the primary FIM can either be the same firmware build or a different one.
3. Once you have installed or re-installed firmware on the primary FIM, check the synchronization status from the **Security Fabric** dashboard widget or by using the `diagnose sys confsync status | grep in_sy` command. The output should be similar to the following (shown for a ForGate-7040E):

```
diagnose sys confsync status | grep in_sy
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x64, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x4, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FIM04E3E16000010, Master, uptime=69398.91, priority=1, slot_id=1:1, idx=0, flag=0x0, in_sync=1
FIM10E3E16000040, Slave, uptime=69346.99, priority=2, slot_id=1:2, idx=1, flag=0x0, in_sync=1
FPM20E3E17900217, Slave, uptime=69387.74, priority=20, slot_id=1:4, idx=2, flag=0x64, in_sync=1
```

IPsec VPN

This chapter highlights special FortiGate-7000 VPN features and configurations.

New IPsec VPN features

FortiOS 5.6 includes the following IPsec VPN improvements:

- Including a phase 2 selector is no longer mandatory.
- Dynamic routing (RIP, OSPF, BGP) is supported over IPsec VPN tunnels.

IPsec VPN features supported by FortiOS 5.6 for FortiGate-7000

FortiOS 5.6 for FortiGate-7000 supports the following IPsec VPN features.

- Interface-based IPsec VPN (also called route-based IPsec VPN).
- Static routes can point IPsec VPN interfaces.
- Dynamic routing (RIP, OSPF, BGP) over IPsec VPN tunnels.
- Remote networks with 16- to 32-bit netmasks.
- IPsec VPN tunnels must terminate on the primary FPM (the ELBC master).
- Site-to-Site IPsec VPN.
- Dialup IPsec VPN. The FortiGate-7000 can be the dialup server or client.
- IPv4 clear-text traffic (IPv4 over IPv4 or IPv4 over IPv6)

IPsec VPN features not supported by FortiOS 5.6 for FortiGate-7000

FortiOS 5.6 for FortiGate-7000 does not support the following IPsec VPN features.

- Policy-based IPsec VPN.
- Policy routes for VPN traffic.
- Remote networks with 0- to 15-bit netmasks.
- IPv6 clear-text traffic (IPv6 over IPv4 or IPv6 over IPv6).
- Load-balancing IPsec VPN tunnels to multiple FPMs.
- IPsec SA synchronization between both FortiGate-7000s in an HA configuration.

Adding source and destination subnets to IPsec VPN phase 2 configurations

If your FortiGate-7000 configuration includes IPsec VPNs you should enhance your IPsec VPN Phase 2 configurations as described in this section.

Because the FortiGate-7000 only allows 16-bit to 32-bit routes, you must add one or more destination subnets to your IPsec VPN phase 2 configuration for FortiGate-7000 v5.4.5 using the following command:

```
config vpn ipsec phase2-interface
edit "to_fgt2"so
    set phaselname <name>
    set src-subnet <IP> <netmask>
```

```

    set dst-subnet <IP> <netmask>
end

```

Where

src-subnet the subnet protected by the FortiGate that you are configuring and from which users connect to the destination subnet. Configuring the source subnet is optional but recommended.

dst-subnet the destination subnet behind the remote IPsec VPN endpoint. Configuring the destination subnet is required.

You can add the source and destination subnets either before or after upgrading to v5.4.5 as these settings are compatible with both v5.4.3 and v5.4.5. However, if you make these changes after upgrading, your IPsec VPNs may not work correctly until these configuration changes are made.

Example basic IPsec VPN phase 2 configuration

In a simple configuration such as the one below with an IPsec VPN between two remote subnets you can just add the subnets to the phase 2 configuration.

Enter the following command to add the source and destination subnets to the FortiGate-7000 IPsec VPN Phase 2 configuration.

```

config vpn ipsec phase2-interface
edit "to_fgt2"so
    set phaselname "to_fgt2"
    set src-subnet 172.16.1.0 255.255.255.0
    set dst-subnet 172.16.2.0 255.255.255.0
end

```

Example multiple subnet IPsec VPN phase 2 configuration

In a more complex configuration, such as the one below with a total of 5 subnets you still need to add all of the subnets to the Phase 2 configuration. In this case you can create a firewall address for each subnet and the addresses to address groups and add the address groups to the Phase 2 configuration.

Enter the following commands to create firewall addresses for each subnet.

```
config firewall address
  edit "local_subnet_1"
    set subnet 4.2.1.0 255.255.255.0
  next
  edit "local_subnet_2"
    set subnet 4.2.2.0 255.255.255.0
  next
  edit "remote_subnet_3"
    set subnet 4.2.3.0 255.255.255.0
  next
  edit "remote_subnet_4"
    set subnet 4.2.4.0 255.255.255.0
  next
  edit "remote_subnet_5"
    set subnet 4.2.5.0 255.255.255.0
  end
```

And then put the five firewall addresses into two firewall address groups.

```
config firewall addrgrp
  edit "local_group"
    set member "local_subnet_1" "local_subnet_2"
  next
  edit "remote_group"
    set member "remote_subnet_3" "remote_subnet_4" "remote_subnet_5"
  end
```

Now, use the firewall address groups in the Phase 2 configuration:

```
config vpn ipsec phase2-interface
  edit "to-fgt2"
    set phase1name "to-fgt2"
    set src-addr-type name
    set dst-addr-type name
    set src-name "local_group"
    set dst-name "remote_group"
  end
```

Configuring the FortiGate-7000 as a dialup IPsec VPN server

FortiGate-7000s can be configured as dialup IPsec VPN servers or clients.

Example dialup IPsec VPN server configuration

The following shows how to setup a dialup IPsec VPN configuration where the FortiGate-7000 acts as a dialup IPsec VPN server.

To configure the FortiGate-7000 as a dialup IPsec VPN server:

Configure the phase1, set type to dynamic.

```

config vpn ipsec phase1-interface
  edit dialup-server
    set type dynamic
    set interface "v0020"
    set peertype any
    set psksecret < password>
  end

```

Configure the phase 2, to support dialup IPsec VPN, set the destination subnet to 0.0.0.0 0.0.0.0.

```

config vpn ipsec phase2-interface
  edit dialup-server
    set phase1name dialup-server
    set src-subnet 4.2.0.0 255.255.0.0
    set dst-subnet 0.0.0.0 0.0.0.0
  end

```

To configure the remote FortiGate as a dialup IPsec VPN client

The dialup IPsec VPN client should advertise its local subnet(s) using the phase 2 src-subnet option.

If there are multiple local subnets create a phase 2 for each one. Each phase 2 only advertises one local subnet to the dialup IPsec VPN server. If more than one local subnet is added to the phase 2, only the first one is advertised to the server.

Dialup client configuration:

```

config vpn ipsec phase1-interface

```

```

edit "to-fgt7k"
    set interface "v0020"
    set peertype any
    set remote-gw 1.2.0.1
    set psksecret <password>
end
config vpn ipsec phase2-interface
edit "to-fgt7k"
    set phaselname "to-fgt7k"
    set src-subnet 4.2.6.0 255.255.255.0
    set dst-subnet 4.2.0.0 255.255.0.0
next
edit "to-fgt7k-2"
    set phaselname "to-fgt7k"
    set src-subnet 4.2.7.0 255.255.255.0
    set dst-subnet 4.2.0.0 255.255.0.0
end

```

Troubleshooting

Use the following commands to verify that IPsec VPN sessions are up and running.

Use the `diagnose load-balance status` command from the primary FIM interface module to determine the primary FPM processor module. For FortiGate-7000 HA, run this command from the primary FortiGate-7000. The third line of the command output shows which FPM is operating as the primary FPM.

```
diagnose load-balance status
```

```
FIM01: FIM04E3E16000074
```

```
Master FPM Blade: slot-4
```

```

Slot 3: FPM20E3E17900113
Status:Working Function:Active
Link:      Base: Up      Fabric: Up
Heartbeat: Management: Good Data: Good
Status Message:"Running"
Slot 4: FPM20E3E16800033
Status:Working Function:Active
Link:      Base: Up      Fabric: Up
Heartbeat: Management: Good Data: Good
Status Message:"Running"

```

```
FIM02: FIM10E3E16000040
```

```
Master FPM Blade: slot-4
```

```

Slot 3: FPM20E3E17900113
Status:Working Function:Active
Link:      Base: Up      Fabric: Up
Heartbeat: Management: Good Data: Good
Status Message:"Running"
Slot 4: FPM20E3E16800033
Status:Working Function:Active
Link:      Base: Up      Fabric: Up
Heartbeat: Management: Good Data: Good
Status Message:"Running"

```

Log into the primary FPM CLI and from here log into the VDOM that you added the tunnel configuration to and run the command `diagnose vpn tunnel list <phase2-name>` to show the sessions for the phase 2 configuration. The example below is for the `to-fgt2` phase 2 configuration configured previously in this chapter. The command output shows the security association (SA) setup for this phase 2 and the all of the destination subnets.

From the command output, make sure the SA is installed and the `dst` addresses are correct.

```
CH15 [FPM04] (002ipsecvpn) # diagnose vpn tunnel list name to-fgt2
list ipsec tunnel by names in vd 11

High availability

FortiGate-7000 supports a variation of active-passive FortiGate Clustering Protocol (FGCP) high availability (HA) between two identical FortiGate-7000s. With active-passive FortiGate-7000 HA, you create redundant network connections to two identical FortiGate-7000s and add redundant HA heartbeat connections. Then you configure each FortiGate-7000 for HA. The FGCP forms a cluster and selects a primary FortiGate-7000. You can set device priorities and enable override to select the primary FortiGate-7000.

Example FortiGate-7040 HA configuration

The primary FortiGate-7000 processes all traffic. The backup FortiGate-7000 operates in hot standby mode. The FGCP synchronizes the configuration, active sessions, routing information, and so on to the backup FortiGate-7000. If the primary FortiGate-7000 fails, traffic automatically fails over to the backup FortiGate-7000.

New HA features and changes

Configuring FortiGate-7000 HA has been simplified for FortiOS 5.6.6. To set up HA, you no longer have to configure HA settings for both of the FIMs in a FortiGate-7000. Instead, you configure HA settings on the primary FIM and this configuration is synchronized to the other FIM.

As well, FortiGate-7000 HA is configured and operates more like standard FGCP HA. The link failure threshold concept that was part of FortiGate-7000 for FortiOS 5.4 has been removed and board failover tolerance has been simplified. As well, primary unit selection has been simplified to be more like FGCP primary unit selection.

FortiOS 5.6.6 also includes the following new features and changes:

- The **System > HA** GUI page now appears and can be used to configure most HA settings.
- You can configure HA interface monitoring (or port monitoring) to detect link failures.
- You can configure HA remote link failover (also called remote IP monitoring) to detect remote link failures using the following options:
 - Enable remote IP monitoring with the `pingserver-monitor-interface` option.
 - Set the remote IP monitoring failover threshold with the `pingserver-failover-threshold` option.
 - Force the cluster to negotiate after a remote IP monitoring failover with the `pingserver-slave-force-reset` option.
 - Adjust the time to wait in minutes before renegotiating after a remote IP monitoring failover with the `pingserver-flip-timeout` option.
- You can use the `get system ha status` command to display HA status. The `diagnose sys ha status` command is no longer available.
- The `diagnose sys ha force-slave-state` command is no longer available. To force the primary FortiGate-7000 into a backup (or slave) state you can use the `diagnose sys ha reset-uptime` command.
- The HA `link-failure-threshold` option has been removed.
- The `board-failover-tolerance` option has been simplified and determines how the cluster responds to failed FIMs.

Before you begin configuring HA

Before you begin, the FortiGate-7000s to be added to an HA cluster should be running the same FortiOS firmware version and interfaces should not be configured to get their addresses from DHCP or PPPoE. Register and apply licenses to the each FortiGate-7000 before setting up the HA cluster. This includes licensing for FortiCare, IPS, AntiVirus, Web Filtering, Mobile Malware, FortiClient, FortiCloud, and additional virtual domains (VDOMs). Both FortiGate-7000s in the cluster must have the same level of licensing for FortiGuard, FortiCloud, FortiClient, and VDOMs. FortiToken licenses can be added at any time because they are synchronized to all cluster members.

Configure split ports

If required, you should configure split ports on the FIMs on both FortiGate-7000s before configuring HA because the FortiGate-7000 has to reboot to enable the split port configuration.

For example, to split the C1, C2, and C4 interfaces of an FIM-7910E in slot 1, enter the following command:

```
config system global
    set split-port 1-C1 2-C1 2-C4
end
```

After configuring split ports, the FortiGate-7000 reboots and synchronizes the configuration.

On each FortiGate-7000, make sure configurations of the FIMs and FPMs are synchronized before starting to configure HA. You can use the following command to verify the synchronization status of all modules:

```
diagnose sys confsync showchsum | grep all
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
```

```
all: c0 68 d2 67 e1 23 d9 3a 10 50 45 c5 50 f1 e6 8e
```

If the modules are synchronized, the checksums displayed should all be the same.

You can also use the following command to list the modules that are synchronized. The example output shows all four modules in a FortiGate-7040E have been configured for HA and added to the cluster.

```
diagnose sys confsync status | grep in_sync
FIM10E3E16000062, Slave, uptime=58852.50, priority=2, slot_id=2:2, idx=3, flag=0x10, in_sync=1
FIM04E3E16000010, Slave, uptime=58726.83, priority=3, slot_id=1:1, idx=0, flag=0x10, in_sync=1
FIM04E3E16000014, Master, uptime=58895.30, priority=1, slot_id=2:1, idx=1, flag=0x10, in_sync=1
FIM10E3E16000040, Slave, uptime=58857.80, priority=4, slot_id=1:2, idx=2, flag=0x10, in_sync=1
FPM20E3E16900234, Slave, uptime=58895.00, priority=16, slot_id=2:3, idx=4, flag=0x64, in_sync=1
FPM20E3E16900269, Slave, uptime=58333.37, priority=120, slot_id=2:4, idx=5, flag=0x64, in_sync=1
FPM20E3E17900113, Slave, uptime=58858.90, priority=116, slot_id=1:3, idx=6, flag=0x64, in_sync=1
FPM20E3E17900217, Slave, uptime=58858.93, priority=117, slot_id=1:4, idx=7, flag=0x64, in_sync=1
...
```

In this command output, `in_sync=1` means the module is synchronized with the primary FIM and `in_sync=0` means the module is not synchronized.

Connect the M1 and M2 interfaces for HA heartbeat communication

HA heartbeat communication between FortiGate-7000s happens over the 10Gbit M1 and M2 interfaces of the FIMs in each chassis. To set up HA heartbeat connections:

- Connect the M1 interfaces of all FIMs together using a switch.
- Connect the M2 interfaces of all FIMs together using another switch.

All of the M1 interfaces must be connected together with a switch and all of the M2 interfaces must be connected together with another switch. Connecting M1 interfaces or M2 interfaces directly is not supported as each FIM needs to communicate with all other FIMs.

Connect the M1 and M2 interfaces before enabling HA. Enabling HA moves heartbeat communication between the FIMs in the same chassis to the M1 and M2 interfaces. So if these interfaces are not connected before you enable HA, FIMs in the same chassis will not be able to communicate with each other.

Heartbeat packets are VLAN packets with VLAN ID 999 and ethertype 9890. The MTU value for the M1 and M2 interfaces is 1500.

You can use the following command to change the HA heartbeat packet VLAN ID and ethertype values if required for your switches. By default the M1 and M2 interface heartbeat packets use the same VLAN IDs. The following example changes the M1 VLAN ID to 4086 and the M2 VLAN ID to 4087.

```
config system ha
```

```

set hbdev "1-M1" 50 "2-M1" 50 "1-M2" 50 "2-M2" 50
set hbdev-vlan-id 4086
set hbdev-second-vlan-id 4087
set ha-eth-type <eth-type>
end

```

For this configuration to work, you must change both VLAN IDs. You cannot use the default value of 999.

Recommended HA heartbeat interface configuration

If you are setting up an HA configuration of two FortiGate-7030Es installed in the same location, you can directly connect their M1 interfaces and their M2 interfaces without using switches.

For redundancy, for other FortiGate-7000s, Fortinet recommends using separate switches for the M1 and M2 connections. These switches should be dedicated to HA heartbeat communication and not used for other traffic.

If you use the same switch for the M1 and M2 interfaces, separate the M1 and M2 traffic on the switch and set the heartbeat traffic on the M1 and M2 interfaces to have different VLAN IDs.

If you don't set different VLAN IDs for the M1 and M2 heartbeat packets, you must enable q-in-q on the switch.

Example FortiGate-7000 switch configuration

The switch that you use for connecting HA heartbeat interfaces does not have to support IEEE 802.1ad (also known as Q-in-Q, double-tagging). But the switch should be able to forward the double-tagged frames. Some switches will strip out the inner tag and Fortinet recommends avoiding these switches. FortiSwitch D and E series can correctly forward double-tagged frames.

This configuration is not required for FortiGate-7030E HA configurations if you have set up direct connections between the HA heartbeat interfaces.

This example shows how to configure a FortiGate-7000 to use different VLAN IDs for the M1 and M2 HA heartbeat interfaces and then how to configure two ports on a Cisco switch to allow HA heartbeat packets.

This example sets the native VLAN ID for both switch ports to 777. You can use any VLAN ID as the native VLAN ID as long as the native VLAN ID is not the same as the allowed VLAN ID.

1. On both FortiGate-7000s in the HA configuration, enter the following command to use different VLAN IDs for the M1 and M2 interfaces. The command sets the M1 VLAN ID to 4086 and the M2 VLAN ID to 4087:

```

config system ha
set hbdev "1-M1" 50 "2-M1" 50 "1-M2" 50 "2-M2" 50
set hbdev-vlan-id 4086
set hbdev-second-vlan-id 4087
end

```

2. Use the `get system ha status` command to confirm the VLAN IDs.

```

get system ha status
...

tx=196965080/761864/0/0, vlan-id=4087
...

```

3. Configure the Cisco switch port that connects the M1 interfaces to allow packets with a VLAN ID of 4086:

```

interface <name>
  switchport mode trunk
  switchport trunk native vlan 777
  switchport trunk allowed vlan 4086

```

4. Configure the Cisco switch port that connects the M2 interfaces to allow packets with a VLAN ID of 4087:

```

interface <name>
  switchport mode trunk
  switchport trunk native vlan 777
  switchport trunk allowed vlan 4087

```

Basic FortiGate-7000 HA configuration

Use the following steps to set up HA between two FortiGate-7000s. To configure HA, you assign a chassis ID (1 and 2) to each of the FortiGate-7000s. These IDs allow the FGCP to identify the chassis and do not influence primary FortiGate-7000 selection. Before you start, determine which FortiGate-7000 should be chassis 1 and which should be chassis 2.

1. Set up HA heartbeat communication as described in [Connect the M1 and M2 interfaces for HA heartbeat communication on page 730](#).
2. Log into the GUI or CLI of the FIM in slot 1 of the FortiGate-7000 that will become chassis 1. Usually you would do this by connecting the management IP address of this FortiGate-7000.
3. Use the following CLI command to change the host name. This step is optional, but setting a host name makes the FortiGate-7000 easier to identify after the cluster has formed.

```

config system global
  set hostname 7K-Chassis-1
end

```

From the GUI you can configure the host name by going to **System > Settings** and changing the **Host name**.

4. Enter the following command to configure basic HA settings for the chassis 1 FortiGate-7000:

```

config system ha
  set group-id <id>
  set group-name My-7K-Cluster

```

```

set mode a-p
set hbdev 1-M1 50 1-M2 50 2-M1 50 2-M2 50
set chassis-id 1
set hbdev-vlan-id 4086
set hbdev-second-vlan-id 4087
set password <password>
end

```

From the GUI you can configure HA by going to **System > HA**. Set the **Mode** to **Active-Passive**, set the **Group Name**, add a **Password**, and set the **Heartbeat Interface Priority** for the heartbeat interfaces (1-M1, 1-M2, 2-M1, and 2-M2). You must configure the chassis ID and group ID from the CLI.

5. Log into the chassis 2 FortiGate-7000 and configure its host name, for example:

```

config system global
    set hostname 7K-Chassis-2
end

```

From the GUI you can configure the host name by going to **System > Settings** and changing the **Host name**.

6. Enter the following command to configure basic HA settings. The configuration must be the same as the chassis 1 configuration, except for the chassis ID.

```

config system ha
    set group-id <id>
    set group-name My-7K-Cluster
    set mode a-p
    set hbdev 1-M1 50 1-M2 50 2-M1 50 2-M2 50
    set chassis-id 2
    set hbdev-vlan-id 4086
    set hbdev-second-vlan-id 4087
    set password <password>
end

```

From the GUI you can configure HA by going to **System > HA**. Set the **Mode** to **Active-Passive**, set the **Group Name**, add a **Password**, and set the **Heartbeat Interface Priority** for the heartbeat interfaces (1-M1, 1-M2, 2-M1, and 2-M2). You must configure the chassis ID and group ID from the CLI.

Once you save your configuration changes, if the HA heartbeat interfaces are connected, the FortiGate-7000s negotiate to establish a cluster. You may temporarily lose connectivity with the FortiGate-7000s as the cluster negotiates and the FGCP changes the MAC addresses of the FortiGate-7000 interfaces. To be able to reconnect sooner, you can update the ARP table of your management PC by deleting the ARP table entry for the FortiGate (or just deleting all ARP table entries). You may be able to delete the ARP table of your management PC from a command prompt using a command similar to `arp -d`. When the cluster has completed negotiating, you can log into it using the management IP address of the primary FortiGate-7000.

7. Log into the cluster and view the HA Status dashboard widget or enter the `get system ha status` command to confirm that the cluster has formed and is operating normally.

If the cluster is operating normally, you can connect network equipment, add your configuration, and start operating the cluster.

Verifying that the cluster is operating normally

You view the cluster status from the HA Status dashboard widget or by using the `get system ha status` command.

If the HA Status widget or the `get system ha status` command shows a cluster has not formed, check the HA heartbeat connections. They should be configured as described in [Connect the M1 and M2 interfaces for HA heartbeat communication on page 730](#).

You should also review the HA configurations of the FortiGate-7000s. When checking the configurations, make sure both FortiGate-7000s have the same HA configuration, including identical HA group IDs, group names, passwords, and HA heartbeat VLAN IDs.

The following example FortiGate-7000 `get system ha status` output shows a FortiGate-7000 cluster that is operating normally. The output shows which FortiGate-7000 has become the primary (master) FortiGate-7000 and how it was chosen. You can also see CPU and memory use data, HA heartbeat VLAN IDs, and so on.

```
get system ha status
Master selected using:
HA Health Status: OK
Model: FortiGate-7000E
Mode: HA A-P
Group: 7
Debug: 0

Setting up HA management connections

Fortinet recommends the following configurations for redundant management connections to a FortiGate-7000 HA configuration.

- Single management connections to each of the FIMs.
- Redundant management connections to each of the FIMs.

These management connections involve connecting the static redundant management interfaces (MGMT1 to MGMT4) of each FIM in the HA configuration to one or more switches. You do not have to change the FortiGate-7000 configuration to set up redundant management connections. However, specific switch configurations are required for each of these configurations as described below.

LACP is not supported for the mgmt aggregate interface.

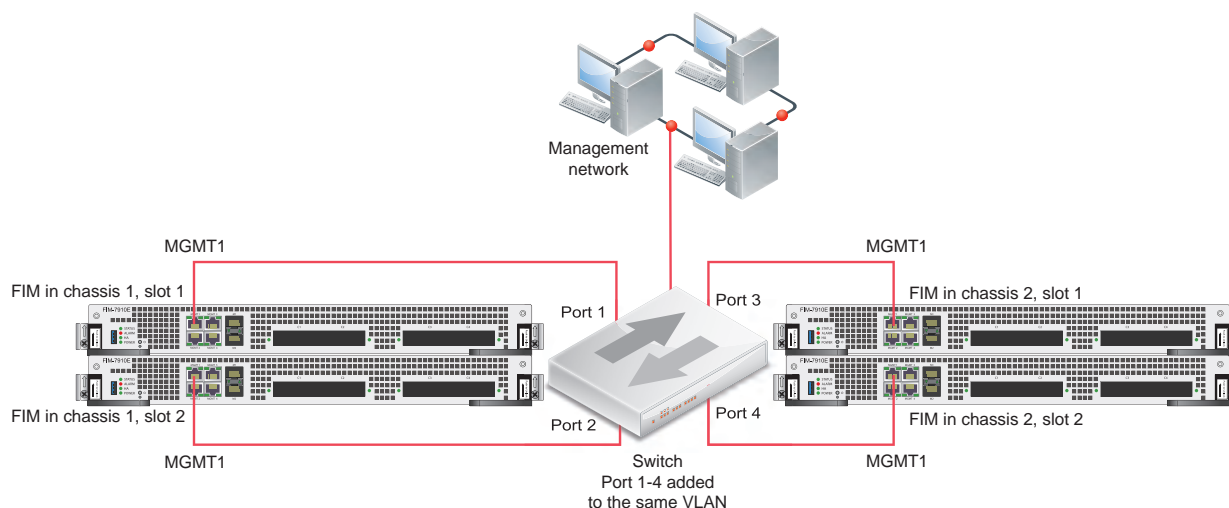

Setting up single management connections to each of the FIMs

The simplest way to provide redundant management connections to a FortiGate-7000 HA configuration involves connecting the MGMT1 interface of each of the FIMs to four ports on a switch. On the switch you must add the four switch ports to the same VLAN. Then connect the switch to your management network and allow traffic from the VLAN to the management network.

A FortiGate-7030E HA configuration only has two FIMs so would only require two switch ports.

Example FortiGate-7000 HA redundant management connections

Setting up redundant management connections to each of the FIMs

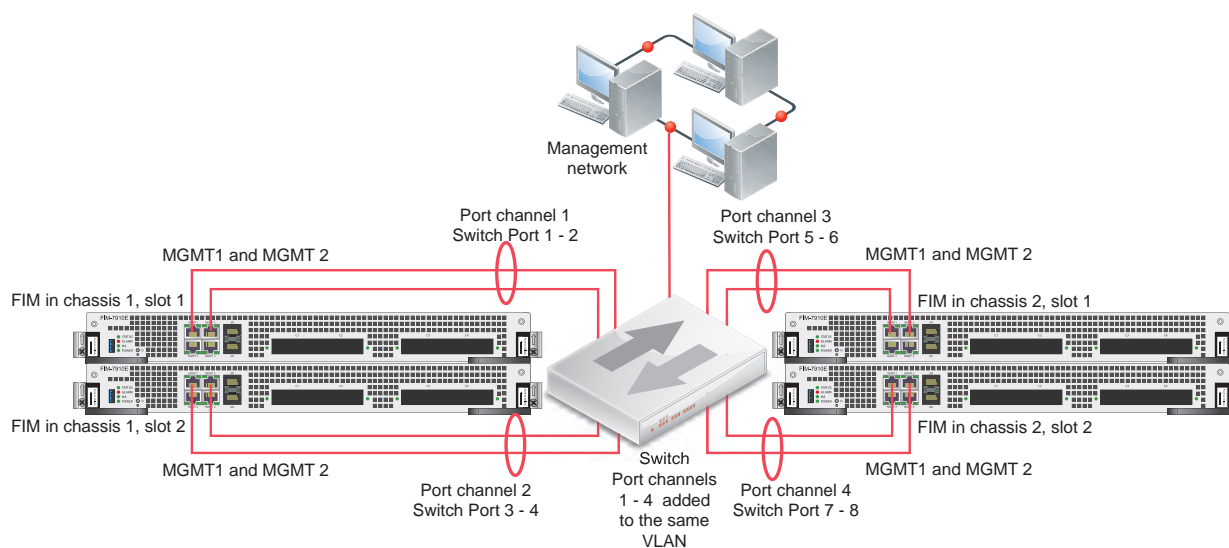

You can enhance redundancy by setting up two redundant management connections to each FIM. To support this configuration, on the switch you must create a port channel for each FIM interface. Create a total of four port channels, one for each FIM and add each of the port channels to the same VLAN. Then connect the switch to your management network and allow traffic from the VLAN to the management network.

If you use two switches, the VLAN should span across both switches.

A FortiGate-7030E HA configuration only has two FIMs so would only require two port channels.

Example FortiGate-7000 HA redundant management connections with redundant connections to each FIM

Managing individual modules in HA mode

In some cases you may want to connect to an individual FIM or FPM in a specific FortiGate-7000. For example, you may want to view the traffic being processed by the FPM in slot 3 of the FortiGate-7000 designated as chassis 2. You can connect to the GUI or CLI of individual modules in the chassis using the system management IP address with a special port number.

For example, if the system management IP address is 1.1.1.1 you can browse to <https://1.1.1.1:44323> to connect to the FPM in the FortiGate-7000 chassis 2 slot 3. The special port number (in this case 44323) is a combination of the service port, chassis ID, and slot number. The following table lists the special ports for common admin protocols:

FortiGate-7000 HA special administration port numbers

Chassis and Slot Number	Slot Address	HTTP (80)	HTTPS (443)	Telnet (23)	SSH (22)	SNMP (161)
Ch1 slot 5	FPM05	8005	44305	2305	2205	16105
Ch1 slot 3	FPM03	8005	44303	2303	2203	16103
Ch1 slot 1	FIM01	8003	44301	2301	2201	16101
Ch1 slot 2	FIM02	8002	44302	2302	2202	16102
Ch1 slot 4	FPM04	8004	44304	2304	2204	16104
Ch1 slot 6	FPM06	8006	44306	2306	2206	16106
Ch2 slot 5	FPM05	8005	44325	2325	2225	16125
Ch2 slot 3	FPM03	8005	44323	2323	2223	16123
Ch2 slot 1	FIM01	8003	44321	2321	2221	16121
Ch2 slot 2	FIM02	8002	44322	2322	2222	16122
Ch2 slot 4	FPM04	8004	44324	2324	2224	16124
Ch2 slot 6	FPM06	8006	44326	2326	2226	16126

For example:

- To connect to the GUI of the FPM in chassis 1 slot 3 using HTTPS you would browse to <https://1.1.1.1:44313>.

The formula for calculating the special port number is based on Chassis ID. CH1 = Chassis ID1, CH2 = Chassis ID2. The formula is: $\text{service_port} \times 100 + (\text{chassis_id} - 1) \times 20 + \text{slot_id}$.

HA cluster firmware upgrades

All of the FIMs and FPMs in your FortiGate-7000 system run the same firmware image. You upgrade the firmware from the primary FIM GUI or CLI just as you would any FortiGate product. During the upgrade process, the firmware running on all of the FIMs and FPMs upgrades in one step. Firmware upgrades should be done during a quiet time because traffic will briefly be interrupted during the upgrade process. The entire firmware upgrade will take a few minutes depending on the number of FIMs and FPMs in your FortiGate-7000 system. Also, some firmware upgrades may take longer depending on other factors such as the size of the configuration and whether a DP processor firmware upgrade is included.

Before beginning a firmware upgrade, Fortinet recommends the following:

- Review the latest release notes for the firmware version that you are upgrading to.
- Verify the recommended upgrade path as documented in the release notes.
- Backup your FortiGate-7000 configuration.

Fortinet recommends that you review the services provided by your FortiGate-7000 before a firmware upgrade and then again after the upgrade to make sure everything continues to operate normally. For example, you might want to verify that you can successfully access an important server used by your organization before the upgrade and make sure after the upgrade that you can still reach the server and that performance is comparable. You could also take a snapshot of key performance indicators (number of sessions, CPU usage, and memory usage) before the upgrade and verify that you see comparable performance after the upgrade.

Enabling uninterruptable-upgrade

Fortinet recommends upgrading your FortiGate-7000 HA configuration firmware with `uninterruptable-upgrade` enabled. With `uninterruptable-upgrade` enabled, the FortiGate-7000 HA configuration goes through a multi-step process to upgrade the firmware of all components in the configuration. Since many components are involved, the entire upgrade process may take a few minutes. It all happens automatically and should cause only minor traffic disruptions. Because of the possible disruptions, you should upgrade HA cluster firmware when traffic is low or during a maintenance period.

Use the following command to enable `uninterruptable-upgrade`:

```
config system ha
  set uninterruptable-upgrade enable
end
```

The following steps happen in the background when upgrading the firmware running on a FortiGate-7000 HA cluster with `uninterruptable-upgrade` enabled.

- The firmware upgrade downloads to the primary (master) FortiGate-7000.
- The primary FortiGate-7000 sends a copy of the firmware upgrade file to the backup (slave) FortiGate-7000.
- The backup FortiGate-7000 upgrades its firmware, restarts, and rejoins the cluster.
- The primary FortiGate-7000 verifies that all members of the backup FortiGate-7000 can process traffic. The firmware upgrade will not proceed until all of the backup FortiGate-7000 components are operating.
- The primary FortiGate-7000 then sends a switchover command and the backup FortiGate-7000 becomes the primary FortiGate-7000.
- The new primary FortiGate-7000 sends gratuitous ARP packets to inform attached network devices to send packets to the new primary FortiGate-7000.

- Traffic switches over to the new primary FortiGate-7000.
- The original primary FortiGate-7000 upgrades its firmware, restarts, and rejoins the cluster as the backup FortiGate-7000.

The amount of time this process takes and the probability of minor traffic disruptions depends on the number of modules in your FortiGate-7000 and on traffic load conditions, the network configuration, and how quickly the gratuitous ARP packets update network devices.

Verifying that a firmware upgrade is successful

After a FortiGate-7000 cluster firmware upgrade, you should verify that all of the FIMs and FPMs have been successfully upgraded to the new firmware version.

After the firmware upgrade appears to be complete:

1. Log into the primary FIM and verify that it is running the expected firmware version.
You can verify the firmware version running on the primary FIM from the dashboard or by using the `get system status` command.
2. Log into the other FIMs and the FPMs, and in the same way confirm that they are also running the expected firmware version.
You can log into individual FIMs or FPMs using the system management IP address and the special port number for each module. For example, `https://192.268.1.99:44303` connects to the module in slot 3. The special port number (in this case 44303) is a combination of the service port (for HTTPS the service port is 443) and the slot number (in this example, 03). For more information, see [Managing individual modules in HA mode on page 737](#). If you are using a management module console port to connect to the primary FIM CLI you can use Ctrl-T to switch between the CLIs of each of the modules.
3. If one or more of the FIMs or FPMs are not running the correct firmware version, use the procedures described in [Installing firmware on individual FIMs and FPMs on page 715](#) to upgrade these FIMs or FPMs.

Distributed clustering

FortiGate-7000 HA supports separating the FortiGate-7000s in different physical locations. Distributed FortiGate-7000 HA clustering (or geographically distributed FortiGate-7000 HA or geo clustering) can involve two FortiGate-7000s in different rooms in the same building, different buildings in the same location, or even different geographical sites such as different cities, countries or continents.

Just like any FortiGate-7000 HA configuration, distributed FortiGate-7000 HA requires heartbeat communication between the FortiGate-7000s over the M1 and M2 interfaces. In a distributed FortiGate-7000 HA configuration this heartbeat communication can take place over the Internet or over other transmission methods including satellite linkups.

Most Data Center Interconnect (DCI) or MPLS-based solutions that support layer 2 extensions and VLAN tags between the remote data centers should also support HA heartbeat communication between the FortiGates in the distributed locations. Using VLANs and switches in promiscuous mode to pass all traffic between the locations can also be helpful.

You cannot change HA heartbeat IP addresses, so the heartbeat interfaces have to be able to communicate over the same subnet.

The M1 and M2 interface traffic must be separated. You can do this by using separate channels for each interface or by configuring the M1 and M2 interfaces to use different VLANs.

Example FortiGate-7000 distributed clustering configuration

Because of the possible distance between sites, it may take a relatively long time for heartbeat packets to be transmitted between the FortiGate-7000s. This could lead to a split brain scenario. To avoid a split brain scenario you can modify heartbeat timing so that the cluster expects extra time between heartbeat packets. As a general rule, set the heartbeat failover time (`hb-interval`) to be longer than the max latency or round trip time (RTT). You could also increase the `hb-lost-threshold` to tolerate losing heartbeat packets if the network connection is less reliable.

In addition you could use different link paths for heartbeat packets to optimize HA heartbeat communication. You could also configure QoS on the links used for HA heartbeat traffic to make sure heartbeat communication has the highest priority.

Modifying heartbeat timing

If the FortiGate-7000s in the HA cluster do not receive heartbeat packets on time, the FortiGate-7000s in the HA configuration may each determine that the other FortiGate-7000 has failed. HA heartbeat packets may not be sent on time because of network issues. For example, if the M1 and M2 communications links between the FortiGate-7000s become too busy to handle the heartbeat traffic. Also, in a distributed clustering configuration the round trip time (RTT) between the FortiGate-7000s may be longer the expected time between heartbeat packets.

In addition, if the FortiGate-7000s becomes excessively busy, they may delay sending heartbeat packets.

Even with these delays, the FortiGate-7000 HA cluster can continue to function normally as long as the HA heartbeat configuration supports longer delays between heartbeat packets and more missed heartbeat packets.

You can use the following commands to configure heartbeat timing:

```
config system ha
    set hb-interval <interval_integer>
    set hb-lost-threshold <threshold_integer>
    set hello-holddown <holddown_integer>
end
```

Changing the heartbeat interval

The heartbeat interval is the time between sending HA heartbeat packets. The heartbeat interval range is 1 to 20 (100*ms). The heartbeat interval default is 2 (200 ms).

A heartbeat interval of 2 means the time between heartbeat packets is 200 ms. Changing the heartbeat interval to 5 changes the time between heartbeat packets to 500 ms ($5 * 100\text{ms} = 500\text{ms}$).

Use the following CLI command to increase the heartbeat interval to 10:

```
config system ha
    set hb-interval 10
end
```

Changing the lost heartbeat threshold

The lost heartbeat threshold is the number of consecutive heartbeat packets that a FortiGate does not receive before assuming that a failure has occurred. The default value of 6 means that if a FortiGate-7000 does not receive 6 heartbeat packets it determines that the other FortiGate-7000 in the cluster has failed. The range is 1 to 60 packets.

The lower the `hb-lost-threshold`, the faster a FortiGate-7000 HA configuration responds when a failure occurs. However, sometimes heartbeat packets may not be received because the other FortiGate-7000 is very busy or because of network conditions. This can lead to a false positive failure detection. To reduce these false positives you can increase the `hb-lost-threshold`.

Use the following command to increase the lost heartbeat threshold to 12:

```
config system ha
    set hb-lost-threshold 12
end
```

Adjusting the heartbeat interval and lost heartbeat threshold

The heartbeat interval combines with the lost heartbeat threshold to set how long a FortiGate-7000 waits before assuming that the other FortiGate-7000 has failed and is no longer sending heartbeat packets. By default, if a FortiGate-7000 does not receive a heartbeat packet from a cluster unit for $6 * 200 = 1200$ milliseconds or 1.2 seconds the FortiGate-7000 assumes that the other FortiGate-7000 has failed.

You can increase both the heartbeat interval and the lost heartbeat threshold to reduce false positives. For example, increasing the heartbeat interval to 20 and the lost heartbeat threshold to 30 means a failure will be assumed if no heartbeat packets are received after $30 * 2000$ milliseconds = 60,000 milliseconds, or 60 seconds.

Use the following command to increase the heartbeat interval to 20 and the lost heartbeat threshold to 30:

```
config system ha
```

```
set hb-lost-threshold 20
set hb-interval 30
end
```

Changing the time to wait in the hello state

The hello state hold-down time is the number of seconds that a FortiGate-7000 waits before changing from hello state to work state. After a failure or when starting up, FortiGate-7000s in HA mode operate in the hello state to send and receive heartbeat packets to find each other and form a cluster. A FortiGate-7000 should change from the hello state to work state after it finds the FortiGate-7000 to form a cluster with. If for some reason the FortiGate-7000s cannot find each other during the hello state both FortiGate-7000s may assume that the other one has failed and each could form separate clusters of one FortiGate-7000. The FortiGate-7000s could eventually find each other and negotiate to form a cluster, possibly causing a network interruption as they re-negotiate.

One reason for a delay of the FortiGate-7000s finding each other could be the FortiGate-7000s are located at different sites or for some other reason communication is delayed between the heartbeat interfaces. If you find that your FortiGate-7000s leave the hello state before finding each other you can increase the time that they wait in the hello state. The hello state hold-down time range is 5 to 300 seconds. The hello state hold-down time default is 20 seconds.

Use the following command to increase the time to wait in the hello state to 1 minute (60 seconds):

```
config system ha
    set hello-holddown 60
end
```

Session failover (session-pickup)

Session failover means that after a failover, communications sessions resume on the new primary FortiGate-7000 with minimal or no interruption. Two categories of sessions need to be resumed after a failover:

- Sessions passing through the cluster
- Sessions terminated by the cluster

Session failover (also called session-pickup) is not enabled by default for FortiGate-7000 HA. If sessions pickup is enabled, while the FortiGate-7000 HA cluster is operating the primary FortiGate-7000 informs the backup FortiGate-7000 of changes to the primary FortiGate-7000 connection and state tables for TCP and UDP sessions passing through the cluster, keeping the backup FortiGate-7000 up-to-date with the traffic currently being processed by the cluster.

After a failover the new primary FortiGate-7000 recognizes open sessions that were being handled by the cluster. The sessions continue to be processed by the new primary FortiGate-7000 and are handled according to their last known state.

Session-pickup has some limitations. For example, session failover is not supported for sessions being scanned by proxy-based security profiles. Session failover is supported for sessions being scanned by flow-based security profiles; however, flow-based sessions that fail over are not inspected after they fail over.

Sessions terminated by the cluster include management sessions (such as HTTPS connections to the FortiGate GUI or SSH connection to the CLI as well as SNMP and logging and so on). Also included in this category are IPsec VPN, SSL VPN, sessions terminated by the cluster, and explicit proxy sessions. In general, whether or not session-pickup is enabled, these sessions do not failover and have to be restarted.

Enabling session pickup for TCP and UDP

To enable session-pickup, from the CLI enter:

```
config system ha
    set session-pickup enable
end
```

When session-pickup is enabled, sessions in the primary FortiGate-7000 TCP and UDP session tables are synchronized to the backup FortiGate-7000. As soon as a new TCP or UDP session is added to the primary FortiGate-7000 session table, that session is synchronized to the backup FortiGate-7000. This synchronization happens as quickly as possible to keep the session tables synchronized.

If the primary FortiGate-7000 fails, the new primary FortiGate-7000 uses its synchronized session tables to resume all TCP and UDP sessions that were being processed by the former primary FortiGate-7000 with only minimal interruption. Under ideal conditions all TCP and UDP sessions should be resumed. This is not guaranteed though and under less than ideal conditions some sessions may need to be restarted.

If session pickup is disabled

If you disable session pickup, the FortiGate-7000 HA cluster does not keep track of sessions and after a failover, active sessions have to be restarted or resumed. Most session can be resumed as a normal result of how TCP and UDP resumes communication after any routine network interruption.

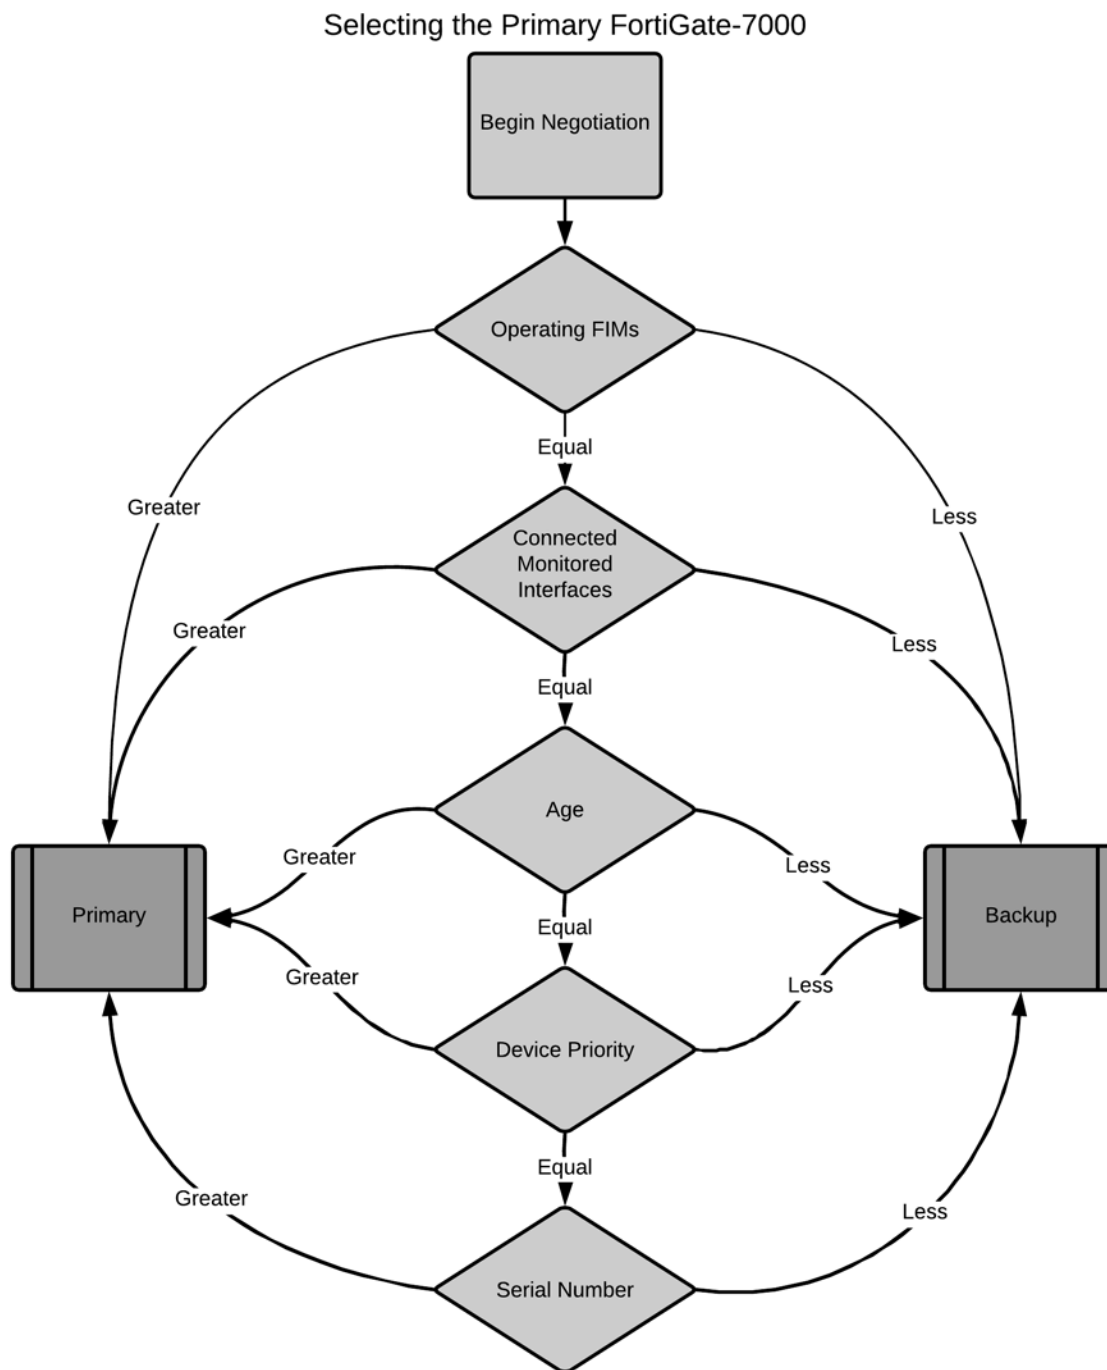

The session-pickup setting does not affect session failover for sessions terminated by the cluster.

If you do not require session failover protection, leaving session pickup disabled may reduce CPU usage and reduce HA heartbeat network bandwidth usage. Also if your FortiGate-7000 HA cluster is mainly being used for traffic that is not synchronized (for example, for proxy-based security profile processing) enabling session pickup is not recommended since most sessions will not be failed over anyway.

Primary FortiGate-7000 selection

Once two FortiGate-7000s recognize that they can form a cluster, they negotiate to select a primary FortiGate-7000. Primary FortiGate-7000 selection occurs automatically based on the selection criteria shown in the diagram below. After the cluster selects the primary FortiGate-7000, the other FortiGate-7000 becomes the backup.

Negotiation and primary FortiGate-7000 selection also takes place if the one of the criteria for selecting the primary FortiGate-7000 changes. For example, an interface can become disconnected or an FIM can fail. After this happens, the cluster can renegotiate to select a new primary FortiGate-7000 using the same selection criteria.

If there are no FIM failures and if you haven't configured any settings to influence primary FortiGate-7000 selection, the FortiGate-7000 with the highest serial number becomes the primary FortiGate-7000.

This section highlights some aspects of primary FortiGate-7000 selection. For more details about how this works, see [Primary unit selection on page 1744](#).

Age and primary FortiGate-7000 selection

Age (or uptime) is also a factor in primary FortiGate-7000 selection. Normally when two FortiGate-7000s start, their uptimes are similar and do not affect primary FortiGate-7000 selection. However, during operation, if one of the FortiGate-7000s goes down the other will have a much higher age or uptime and will be selected as the primary FortiGate-7000 before checking priority and serial number.

In some cases, age differences can result in the wrong FortiGate-7000 becoming the primary FortiGate-7000. For example, if the FortiGate-7000 set to a high priority reboots, it will have a lower age than other FortiGate-7000 when it rejoins the cluster. Since age takes precedence over priority it will become the backup FortiGate-7000 when it rejoins the cluster.

One way to resolve this issue is to reboot both FortiGate-7000s in the cluster at the same time to reset the age of both FortiGate-7000s. However, doing this would disrupt traffic. Instead you can use the following command to reset the age of one the primary FortiGate-7000 to zero.

```
diagnose sys ha reset-uptime
```

The primary FortiGate-7000 now has the lowest age and the other FortiGate-7000 will have the highest age and can then become the primary FortiGate-7000.

The `diagnose sys ha reset-uptime` command should only be used as a temporary solution. You should reboot the FortiGate-7000s during a maintenance window to permanently bring their ages back together.

Device priority and primary FortiGate-7000 selection

In some situations you may want to select a FortiGate-7000 to always become the primary FortiGate-7000. You can do this by setting its device priority higher. You can change the device priority of an FIM from the **System > HA** GUI page or by using the following command:

```
config system ha
  set priority <number>
end
```

The default priority is 128.

During negotiation, the FortiGate-7000 with the highest device priority becomes the primary FortiGate-7000.

Override and primary FortiGate-7000 selection

You can enable override to select a FortiGate-7000 to always becomes the primary FortiGate-7000. Enabling override changes how primary select works. For details, see [Override and primary FortiGate-7000 selection on page 1](#).

FIM failure and primary FortiGate-7000 selection

If an FIM fails, the FortiGate-7000 cluster negotiates to select a new Primary FortiGate-7000 and the FortiGate-7000 with the most operating FIMs becomes the primary FortiGate-7000.

You can also configure board failover tolerance to control how a FortiGate-7000 cluster responds to an FIM failure.

```
config system ha
  set board-failover-tolerance <tolerance>
end
```

Where `<tolerance>` can be 0 or 1. A tolerance of 0 (the default) means that if a single FIM fails in the primary FortiGate-7000, a failover occurs and the FortiGate-7000 with the fewest failed FIMs becomes the new primary FortiGate-7000. A failover tolerance of 1 means that both FIMs must fail before a failover occurs.

Verifying primary FortiGate-7000 selection

You can use the `get system ha status` command to verify which FortiGate-7000 has become the primary FortiGate-7000. The command output shows which FortiGate-7000 is currently operating as the primary FortiGate-7000. The following command output excerpt shows that the FortiGate-7000 labeled as chassis 2 has become the primary (master) FortiGate-7000:

```
get system ha status
Master selected using:
HA Health Status: OK
Model: FortiGate-7000E
Mode: HA A-P
Group: 7
Debug: 0
Cluster Uptime: 0 days 16:42:5
...
Master: CH16, FG74E83E16000016, cluster index = 0
Slave : FG74E83E16000015, FG74E83E16000015, cluster index = 1
number of vcluster: 1
vcluster 1: work 10.101.11.20
Master: FG74E83E16000016, operating cluster index = 0
Slave : FG74E83E16000015, operating cluster index = 1
Chassis Status: (Local chassis ID: 2)
  Chassis ID 1: Slave Chassis
    Slot ID 1: Master Slot
    Slot ID 2: Slave Slot
  Chassis ID 2: Master Chassis
    Slot ID 1: Master Slot
    Slot ID 2: Slave Slot
```

Primary FortiGate-7000 selection and override

When configuring FortiGate-7000 HA, if you want one of the FortGate-7000s to always become the primary FortiGate-7000 you can enable `override` on that FortiGate-7000. For `override` to be effective, you must also set the device priority highest on this FortiGate-7000.

To enable override and increase device priority:

```
config system ha
  set override enable
  set priority 200
end
```

The FortiGate-7000 with override enabled and the highest device priority always becomes the primary FortiGate-7000.

In most cases, with override enabled the cluster will negotiate more often. For example, with override enabled it is more likely that changes to the backup FortiGate-7000 may cause the cluster to negotiate. More frequent negotiation can lead to more traffic disruptions.

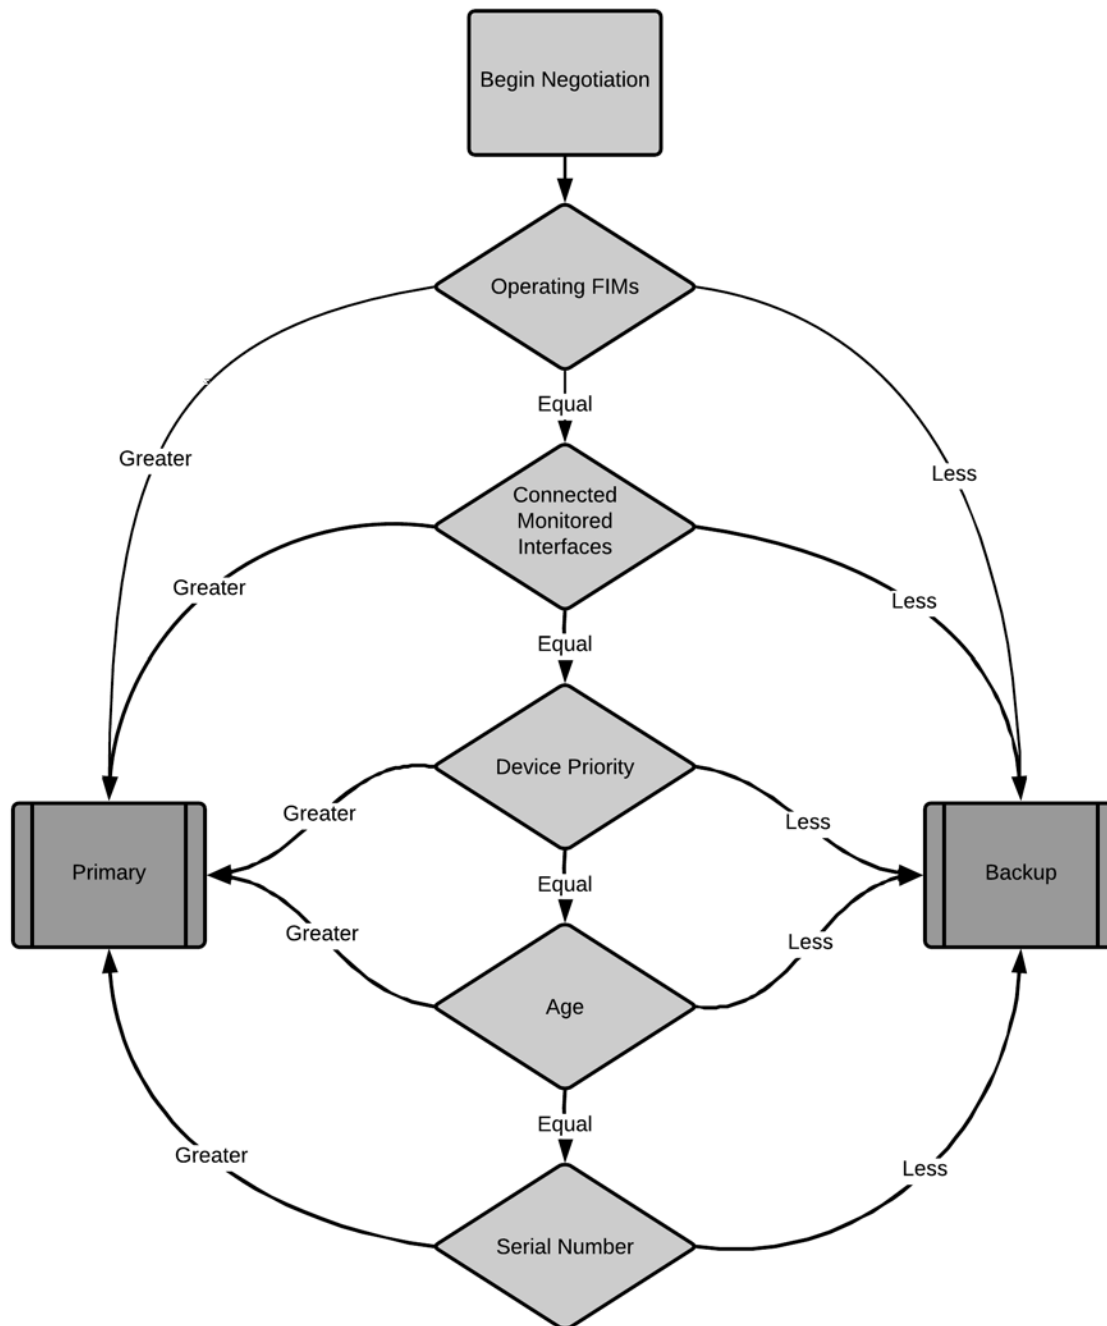

This section highlights some aspects of enabling override. For more details about how this works, see [HA override on page 1752](#).

Enabling override changes primary FortiGate-7000 selection

Enabling `override` changes the order of primary FortiGate-7000 selection. As shown below, if `override` is enabled, primary FortiGate-7000 selection considers device priority before age and serial number. This means that if you set the device priority higher on one FortiGate-7000, with `override` enabled this FortiGate-7000 becomes the primary FortiGate-7000 even if its age and serial number are lower.

Similar to when `override` is disabled, when `override` is enabled primary FortiGate-7000 selection checks for operating FIMs and connected monitored interfaces first. So if interface monitoring is enabled, the FortiGate-7000 with the most disconnected monitored interfaces cannot become the primary FortiGate-7000, even if this FortiGate-7000 has the highest device priority.

Selecting the Primary FortiGate-7000 with Override enabled

**Link failover (port monitoring or interface monitoring)**

Link failover means that if a monitored interface fails, the FortiGate-7000 cluster reorganizes to reestablish a link to the network that the monitored interface was connected to and to continue operating with minimal or no disruption of network traffic.

You configure monitored interfaces (also called interface monitoring or port monitoring) by selecting FIM front panel interfaces to monitor as part of the HA configuration.

You can monitor up to 64 interfaces. The FGCP synchronizes the interface monitoring configurations to both FortiGate-7000s in the cluster.

The interfaces that you can monitor appear on the HA GUI page **Monitor Interfaces** list. You can monitor any FIM interfaces including redundant interfaces and 802.3ad aggregate interfaces.

You cannot monitor the following types of interfaces (you cannot select these types of interfaces on the Monitor Interfaces list):

- VLAN subinterfaces.
- IPsec VPN interfaces.
- Individual physical interfaces that have been added to a redundant or 802.3ad aggregate interface.

You should only monitor interfaces that are connected to networks, because a failover may occur if you monitor an unconnected interface. For this reason, you should also wait until your FortiGate-7000 HA setup has been configured and connected and is operating as expected before enabling interface monitoring.

To enable interface monitoring

From the GUI, go to **System > HA** and add interfaces to the **Monitor Interfaces** list.

From the CLI, enter the following command to monitor the 1-B1/2 and 2-C1/10 interfaces:

```
config system ha
  set monitor 1-B1/2 2-C1/10
end
```

With interface monitoring enabled, during FortiGate-7000 cluster operation, the cluster monitors each FIM in the cluster to determine if the monitored interfaces are operating and connected. Each FIM can detect a failure of its network interface hardware.

FIMs cannot determine if the switches that its interfaces are connected to are still connected to networks. However, you can use remote IP monitoring to make sure that the cluster unit can connect to downstream network devices. See [Remote link failover on page 750](#).

If a monitored interface on the primary FortiGate-7000 fails

Because the primary FortiGate-7000 receives all traffic processed by the cluster, a FortiGate-7000 cluster can only process traffic from a network if the primary FortiGate-7000 can connect to it. So, if the link between a network and the primary FortiGate-7000 fails, to maintain communication with this network, the cluster must set the FortiGate-7000 that is still connected to this network to become the primary FortiGate-7000. Unless another link failure has occurred, the new primary FortiGate-7000 will have an active link to the network and will be able to maintain communication with it.

To support link failover, the FortiGate-7000s store link state information for all monitored interfaces in a link state database. If one of the monitored interfaces on one of the FortiGate-7000s becomes disconnected or fails, this information is immediately shared with the other FortiGate-7000 in the cluster.

If a monitored interface on the primary FortiGate-7000 fails, the cluster renegotiates to select the primary FortiGate-7000 using the process described in [Primary FortiGate-7000 selection on page 743](#). Because the

FortiGate-7000 with the failed monitored interface has the lowest monitor priority, the other FortiGate-7000 becomes the primary FortiGate-7000. The new primary FortiGate-7000 should have fewer link failures.

If a monitored interface on the backup FortiGate-7000 fails

If a monitored interface on a the backup FortiGate-7000 fails, this information is shared with the primary FortiGate-7000. The cluster does not renegotiate. The backup FortiGate-7000 with the failed monitored interface continues to function in the cluster.

Remote link failover

Remote link failover (also called remote IP monitoring) is similar to interface monitoring and link health monitoring (also known as dead gateway detection). Remote IP monitoring uses link health monitors to test connectivity between the primary FortiGate-7000 and remote network devices such as a downstream router. Remote IP monitoring causes a failover if one or more of these remote IP addresses does not respond to link health checking.

In the simplified example topology shown above, the switch connected directly to the primary FortiGate-7000 is operating normally but the link on the other side of the switches fails. As a result, traffic can no longer flow between the primary FortiGate-7000 and the Internet.

This section highlights some aspects of FortiGate-7000 remote IP monitoring. For more details about how this works, see [Remote link failover \(remote IP monitoring\) on page 1943](#).

Configuring remote IP monitoring

Enter the following command to enable HA remote IP monitoring on the 1-B1/1 interface:

```
config system ha
  set pingserver-monitor-interface 1-B1/1
  set pingserver-failover-threshold 5
  set pingserver-flip-timeout 120
end
```

Keep the `pingserver-failover-threshold` set to the default value of 5. This means a failover occurs if the link health monitor doesn't get a response after 5 attempts.

Set the `pingserver-flip-timeout` set to 120 minutes. After a failover, if HA remote IP monitoring on the new primary unit also causes a failover, the flip timeout prevents the failover from occurring until the timer runs out. Setting the `pingserver-flip-timeout` to 120 means that remote IP monitoring can only cause a failover every 120 minutes. This flip timeout is required to prevent repeating failovers if remote IP monitoring causes a failover from all cluster units because none of the cluster units can connect to the monitored IP addresses.

Enter the following command to add a link health monitor for the 1-B1/1 interface and to set HA remote IP monitoring priority for this link health monitor.

```
config system link-monitor
  edit ha-link-monitor
    set server 192.168.20.20
    set srcintf port2
    set ha-priority 1
    set interval 5
    set failtime 2
  end
```

The `detectserver` option sets the remote IP address to monitor to 192.168.20.20.

Leave the `ha-priority` keyword set to the default value of 1. You only need to change this priority if you change the HA `pingserver-failover-threshold`. The `ha-priority` setting is not synchronized among the FortiGate-7000s in the HA configuration.

The `ha-priority` setting is not synchronized. So if you want to change the `ha-priority` setting you must change it separately on each FortiGate-7000. Otherwise it will remain set to the default value of 1.

Use the `interval` option to set the time between link health checks and use the `failtime` keyword to set the number of times that a health check can fail before a failure is detected (the failover threshold). The example reduces the failover threshold to 2 but keeps the health check interval at the default value of 5.

FortiGate-7000 v5.6.7 special features and limitations

This section describes special features and limitations for FortiGate-7000 v5.6.7.

Managing the FortiGate-7000

Management is only possible through the MGMT1 to MGMT4 front panel management interfaces. By default the MGMT1 to MGMT4 interfaces of the FIMs in slot 1 and slot 2 are in a single static aggregate interface named mgmt with IP address 192.168.1.99. You manage the FortiGate-7000 by connecting any one of these eight interfaces to your network, opening a web browser and browsing to the management IP address. For a factory default configuration, browse to <https://192.168.1.99>.

The FortiGate-7030E has one FIM and the MGMT1 to MGMT4 interfaces of that module are the only interfaces in the aggregate interface.

Default management VDOM

By default the FortiGate-7000 configuration includes a management VDOM named mgmt-vm. For the FortiGate-7000 system to operate normally you should not change the configuration of this VDOM and this VDOM should always be the management VDOM. You should also not add or remove interfaces from this VDOM.

You have full control over the configurations of other FortiGate-7000 VDOMs.

Maximum number of LAGs

FortiGate-7000 systems support up to 16 link aggregation groups (LAGs). This includes both normal link aggregation groups and redundant interfaces and including the redundant interface that contains the M1 to M4 management interfaces.

Firewall

TCP sessions with NAT enabled that are expected to be idle for more than the distributed processing normal TCP timer (which is 3605 seconds) should only be distributed to the master FPM using a flow rule. You can configure the distributed normal TCP timer using the following command:

```
config system global
    set dp-tcp-normal-timer <timer>
end
```

UDP sessions with NAT enabled that are expected to be idle for more than the distributed processing normal UDP timer should only be distributed to the primary FPM using a flow rule.

IP multicast

IPv4 and IPv6 Multicast traffic is only sent to the primary FPM (usually the FPM in slot 3). This is controlled by the following configuration:

```
config load-balance flow-rule
    edit 18
        set status enable
        set vlan 0
        set ether-type ipv4
        set src-addr-ipv4 0.0.0.0 0.0.0.0
        set dst-addr-ipv4 224.0.0.0 240.0.0.0
        set protocol any
    end
end
```

```
        set action forward
        set forward-slot master
        set priority 5
        set comment "ipv4 multicast"
    next
    edit 19
        set status enable
        set vlan 0
        set ether-type ipv6
        set src-addr-ipv6 ::/0
        set dst-addr-ipv6 ff00::/8
        set protocol any
        set action forward
        set forward-slot master
        set priority 5
        set comment "ipv6 multicast"
    end
```

High availability

Only the M1 and M2 interfaces are used for the HA heartbeat communication. For information on how to set up HA heartbeat communication using the M1 and M2 interfaces, see [Connect the M1 and M2 interfaces for HA heartbeat communication on page 730](#)

The following FortiOS HA features are not supported or are supported differently by FortiGate-7000 v5.6.7:

- Active-active HA is not supported.
- The range for the HA `group-id` is 0 to 31.
- Failover logic for FortiGate-7000 HA is not the same as FGCP for other FortiGate clusters.
- HA heartbeat configuration is specific to FortiGate-7000 systems and differs from standard HA.
- FortiGate Session Life Support Protocol (FGSP) HA (also called standalone session synchronization) is not supported.
- FortiGate-7000 HA does not support the `route-ttl`, `route-wait`, and `route-hold` options for tuning route synchronization between FortiGate-7000s.

Shelf manager module

It is not possible to access SMM CLI using Telnet or SSH. Only console access is supported using the chassis front panel console ports as described in the FortiGate-7000 system guide.

For monitoring purpose, IPMI over IP is supported on SMM Ethernet ports. See your FortiGate-7000 system guide for details.

FortiOS features not supported by FortiGate-7000 v5.6.7

The following mainstream FortiOS 5.6.7 features are not supported by the FortiGate-7000 v5.6.7:

- Hardware switch
- Switch controller
- WiFi controller
- WAN load balancing (SD-WAN)

- IPv4 over IPv6, IPv6 over IPv4, IPv6 over IPv6 features
- GRE tunneling is only supported after creating a load balance flow rule, for example:

```
config load-balance flow-rule
  edit 0
    set status enable
    set vlan 0
    set ether-type ip
    set protocol gre
    set action forward
    set forward-slot master
    set priority 3
  end
```

- Hard disk features including, WAN optimization, web caching, explicit proxy content caching, disk logging, and GUI-based packet sniffing.
- The FortiGate-7000 platform only supports quarantining files to FortiAnalyzer.
- Log messages should be sent only using the management aggregate interface

IPsec VPN tunnels terminated by the FortiGate-7000

For a list of new FortiOS 5.6 FortiGate-7000 IPsec VPN features and a list of IPsec VPN features not supported by FortiOS 5.6 FortiGate-7000 IPsec VPN, see [New IPsec VPN features on page 722](#).

SSL VPN

Sending all SSL VPN sessions to the primary FPM is recommended. You can do this by:

- Creating a flow rule that sends all sessions that use the SSL VPN destination port and IP address to the primary FPM.
- Creating flow rules that send all sessions that use the SSL VPN IP pool addresses to the primary FPM.

For more information about FortiGate-7000 SSL VPN support, see [SSL VPN load balancing on page 705](#).

Traffic shaping and DDoS policies

Each FPM applies traffic shaping and DDoS quotas independently. Because of load-balancing, this may allow more traffic than expected.

Sniffer mode (one-arm sniffer)

One-arm sniffer mode is only supported after creating a load balance flow rule to direct sniffer traffic to a specific FPM.

FortiGuard web filtering

All FortiGuard rating queries are sent through management aggregate interface from the management VDOM (named mgmt).

Log messages include a slot field

An additional "slot" field has been added to log messages to identify the FPM that generated the log.

FortiOS Carrier

You have to apply a FortiOS Carrier license separately to each FIM and FPM to license a FortiGate-7000 for FortiOS Carrier.

Special notice for new deployment connectivity testing

Only the primary FPM can successfully ping external IP addresses. During a new deployment, while performing connectivity testing from the FortiGate-7000, make sure to run `execute ping` tests from the primary FPM CLI.

Dedicated management interfaces not supported

The FortiGate-7000 does not support configuring dedicated management interfaces using the `config system dedicated-mgmt` command. Instead you can enter the following to configure an interface to be dedicated to management:

```
config system interface
  edit <interface-name>
    set dedicated-to management
  end
```

FortiGate-7000 v5.6.6 special features and limitations

This section describes special features and limitations for FortiGate-7000 v5.6.6.

Managing the FortiGate-7000

Management is only possible through the MGMT1 to MGMT4 front panel management interfaces. By default the MGMT1 to MGMT4 interfaces of the FIMs in slot 1 and slot 2 are in a single static aggregate interface named `mgmt` with IP address 192.168.1.99. You manage the FortiGate-7000 by connecting any one of these eight interfaces to your network, opening a web browser and browsing to the management IP address. For a factory default configuration, browse to <https://192.168.1.99>.

The FortiGate-7030E has one FIM and the MGMT1 to MGMT4 interfaces of that module are the only interfaces in the aggregate interface.

Default management VDOM

By default the FortiGate-7000 configuration includes a management VDOM named `mgmt-vdom`. For the FortiGate-7000 system to operate normally you should not change the configuration of this VDOM and this VDOM should always be the management VDOM. You should also not add or remove interfaces from this VDOM.

You have full control over the configurations of other FortiGate-7000 VDOMs.

Maximum number of LAGs

FortiGate-7000 systems support up to 16 link aggregation groups (LAGs). This includes both normal link aggregation groups and redundant interfaces and including the redundant interface that contains the M1 to M4 management interfaces.

Firewall

TCP sessions with NAT enabled that are expected to be idle for more than the distributed processing normal TCP timer (which is 3605 seconds) should only be distributed to the master FPM using a flow rule. You can configure the distributed normal TCP timer using the following command:

```
config system global
    set dp-tcp-normal-timer <timer>
end
```

UDP sessions with NAT enabled that are expected to be idle for more than the distributed processing normal UDP timer should only be distributed to the primary FPM using a flow rule.

IP multicast

IPv4 and IPv6 Multicast traffic is only sent to the primary FPM (usually the FPM in slot 3). This is controlled by the following configuration:

```
config load-balance flow-rule
    edit 18
        set status enable
        set vlan 0
        set ether-type ipv4
        set src-addr-ipv4 0.0.0.0 0.0.0.0
        set dst-addr-ipv4 224.0.0.0 240.0.0.0
        set protocol any
        set action forward
        set forward-slot master
        set priority 5
        set comment "ipv4 multicast"
    next
    edit 19
        set status enable
        set vlan 0
        set ether-type ipv6
        set src-addr-ipv6 ::/0
        set dst-addr-ipv6 ff00::/8
        set protocol any
        set action forward
        set forward-slot master
        set priority 5
        set comment "ipv6 multicast"
    end
```

High availability

Only the M1 and M2 interfaces are used for the HA heartbeat communication. For information on how to set up HA heartbeat communication using the M1 and M2 interfaces, see [Connect the M1 and M2 interfaces for HA](#)

[heartbeat communication on page 730](#)

The following FortiOS HA features are not supported or are supported differently by FortiGate-7000 v5.6.6:

- Active-active HA is not supported.
- The range for the HA `group-id` is 0 to 14.
- Failover logic for FortiGate-7000 HA is not the same as FGCP for other FortiGate clusters.
- HA heartbeat configuration is specific to FortiGate-7000 systems and differs from standard HA.
- FortiGate Session Life Support Protocol (FGSP) HA (also called standalone session synchronization) is not supported.
- FortiGate-7000 HA does not support the `route-ttl`, `route-wait`, and `route-hold` options for tuning route synchronization between FortiGate-7000s.

Shelf manager module

It is not possible to access SMM CLI using Telnet or SSH. Only console access is supported using the chassis front panel console ports as described in the FortiGate-7000 system guide.

For monitoring purpose, IPMI over IP is supported on SMM Ethernet ports. See your FortiGate-7000 system guide for details.

FortiOS features not supported by FortiGate-7000 v5.6.6

The following mainstream FortiOS 5.6.6 features are not supported by the FortiGate-7000 v5.6.6:

- Hardware switch
- Switch controller
- WiFi controller
- WAN load balancing (SD-WAN)
- IPv4 over IPv6, IPv6 over IPv4, IPv6 over IPv6 features
- GRE tunneling is only supported after creating a load balance flow rule, for example:

```
config load-balance flow-rule
  edit 0
    set status enable
    set vlan 0
    set ether-type ip
    set protocol gre
    set action forward
    set forward-slot master
    set priority 3
  end
```

- Hard disk features including, WAN optimization, web caching, explicit proxy content caching, disk logging, and GUI-based packet sniffing.
- The FortiGate-7000 platform only supports quarantining files to FortiAnalyzer.
- Log messages should be sent only using the management aggregate interface

IPsec VPN tunnels terminated by the FortiGate-7000

For a list of new FortiOS 5.6.6 FortiGate-7000 IPsec VPN features and a list of IPsec VPN features not supported by FortiOS 5.6.6 FortiGate-7000 IPsec VPN, see [New IPsec VPN features on page 722](#).

SSL VPN

Sending all SSL VPN sessions to the primary FPM is recommended. You can do this by:

- Creating a flow rule that sends all sessions that use the SSL VPN destination port and IP address to the primary FPM.
- Creating flow rules that send all sessions that use the SSL VPN IP pool addresses to the primary FPM.

For more information about FortiGate-7000 SSL VPN support, see [SSL VPN load balancing on page 705](#).

Traffic shaping and DDoS policies

Each FPM applies traffic shaping and DDoS quotas independently. Because of load-balancing, this may allow more traffic than expected.

Sniffer mode (one-arm sniffer)

One-arm sniffer mode is only supported after creating a load balance flow rule to direct sniffer traffic to a specific FPM.

FortiGuard web filtering

All FortiGuard rating queries are sent through management aggregate interface from the management VDOM (named mgmt).

Log messages include a slot field

An additional "slot" field has been added to log messages to identify the FPM that generated the log.

FortiOS Carrier

You have to apply a FortiOS Carrier license separately to each FIM and FPM to license a FortiGate-7000 for FortiOS Carrier.

Special notice for new deployment connectivity testing

Only the primary FPM can successfully ping external IP addresses. During a new deployment, while performing connectivity testing from the Fortigate-7000, make sure to run `execute ping` tests from the primary FPM CLI.

Dedicated management interfaces not supported

The FortiGate-7000 does not support configuring dedicated management interfaces using the `config system dedicated-mgmt` command. Instead you can enter the following to configure an interface to be dedicated to management:

```
config system interface
  edit <interface-name>
    set dedicated-to management
  end
```

FortiGate-7000 Load balancing commands

See the [FortiOS 5.6 CLI Reference](#) for information about FortiGate-7000 CLI commands:

- [config load-balance flow-rule](#)
- [config load-balance setting](#)
- [execute load-balance](#)
- [execute system console-server](#)
- [execute reset-vd-license](#)
- [execute log filter confsync-member](#)

Chapter 7 - FortiOS Carrier

FortiOS Carrier

FortiOS Carrier provides all the features found on FortiGate units plus added features specific to carrier networks. These features are explained in this document and include dynamic profiles and groups, Multimedia messaging service (MMS) protection, and GPRS Tunneling Protocol (GTP) protection.

This chapter contains the following sections:

- [Before you begin](#)
- [How this guide is organized](#)

Before you begin

Before you begin ensure that:

- You have administrative access to the web-based manager and/or CLI.
- The Carrier-enabled FortiGate unit is integrated into your network.
- The operation mode has been configured.

How this guide is organized

This FortiOS Handbook chapter contains the following sections:

- [What's New in FortiOS 5.6](#)
 - Features and improvements that have been added in version FortiOS 5.6
- [Overview of FortiOS Carrier features](#)
 - The high altitude overview of FortiOS Carrier
- ["MMS Concepts" on page 769](#)
 - Basic background on MMS and its concepts so that there is some context to the settings used in the MMS configuration
- ["MMS Configuration" on page 784](#)
 - Listing of the MMS configuration options and settings
 - Procedures and insights in the configuration of the MMS components of FortiOS Carrier
- [GTP basic concepts](#)
 - Basic background on GTP and its concepts so that there is some context to the settings used in the GTP configuration
- ["GTP Configuration" on page 849](#)
 - Listing of the GTP configuration options and settings
 - Procedures and insights in the configuration of the GTP components of FortiOS Carrier
- ["SCTP Concepts" on page 891](#)
 - Background on SCTP, and how it makes the FortiOS Carrier different than the FortiGate

- ["Troubleshooting" on page 895](#)
 - Some basic procedures for troubleshooting FortiOS Carrier

What's New in FortiOS 5.6

New features added in 5.6.3

Improved CLI attribute name under 'gtp.message-filter-v0v1' (452813)

CLI "gtp.message-filter-v0v1" had an attribute "create-aa-pdp|init-pdp-ctx", which contains a vertical pipe |. The attribute name was changed to "v0-create-aa-pdp--v1-init-pdp-ctx".

Its help text is also changed to avoid the vertical bar.

Syntax

```
config gtp message-filter-v0v1
  edit <name>
    set ?
    .....
    v0-create-aa-pdp--v1-init-pdp-ctx
```

Improved GTP performance (423332)

There are independent Receive and Transmit queues for gtp-u process. These queues are and their associated resources are initialized when the ftp-enhance-mode is enabled.

CLI changes under system npu

gtp-enhance-mode

```
config system npu
  set gtp-enhance-mode [enable|disable]
end
```

This configuration requires a reboot of the device to initialize the changes.

gtp-enhance-cpu-range

This is used to set the CPUs which can process the GTP-U packet inspection.

```
config system npu
  set gtp-enhance-cpu-range [0|1|2]
end
```

Option	Description
0	Inspect GTPU packets by all CPUs
1	Inspect GTPU packets by Master CPUs
2	Inspect GTPU packets by Slave CPUs

New diagnose commands

```
diagnose npu np6 hbq-stats [all|np xx]
```

Used to see the GTP-U packet counter by all NP or the corresponding np.

```
diagnose npu np6 hbq-stats-clear all /np xx
```

Used to clear the GTP-U packet counter by all NP or the corresponding np.

Verifying the enhance-mode is disabled

Before execute the test or enable/disable the gtp enhance, first check the gtp-enhance-mode status as in the example below:

```
config system npu
get
gtp-enhance-mode: disable
gtp-enhance-cpu-range: 0
end
```

If the gtp-enhance-mode is disable, use the command `diagnose npu np6 hbq-stats all`.

The output will be similar to below:

```
# diagnose npu np6 hbq-stats all
Total :0
```

If the gtp-enhance-mode is enable, use the command `diagnose npu np6 hbq-stats all`

The output will be similar to below:

```
# diagnose npu np6 hbq-stats all
cpu_ 0:0
cpu_ 1:0
cpu_ 2:0
cpu_ 3:0
cpu_ 4:0
cpu_ 5:0
cpu_ 6:0
cpu_ 7:0
cpu_ 8:0
cpu_ 9:0
cpu_10:0
cpu_11:0
cpu_12:0
cpu_13:0
cpu_14:0
cpu_15:0
cpu_16:0
```

```
cpu_17:0
cpu_18:0
cpu_19:0
cpu_20:0
cpu_21:0
cpu_22:0
cpu_23:0
cpu_24:0
cpu_25:0
cpu_26:0
cpu_27:0
cpu_28:0
cpu_29:0
cpu_30:0
cpu_31:0
cpu_32:0
cpu_33:0
cpu_34:0
cpu_35:0
cpu_36:0
cpu_37:0
cpu_38:0
cpu_39:0
Total :0
```

Sometimes, when loading the new configure file, and the new configure file does not match the old configure file, the `gtp-enhance-mode` status will be confused.

You can see :

```
#config system npu
#get
gtp-enhance-mode: enable
```

but you can also see that

```
diagnose npu np6 hbq-stats all
Total :0
```

This means the `gtp-enhance-mode` is actually set to `disable`.

The inverse is also possible, when you see

```
#config system npu
#get
gtp-enhance-mode: disable
```

but you also see that

```
# diagnose npu np6 hbq-stats all
cpu_ 0:0
...
cpu_39:0
Total :0
```

This means the `gtp-enhance-mode` is actually set to `enable`.

If these combinations occur, just run the command below:

```
config system npu
    set gtp-enhance-mode enable
end
```

or

```
config system npu
    set gtp-enhance-mode disable
end
```

Once this is done, reboot the device to let the 2 statuses match.

New features added in 5.6.1

GTP enhancement and GTP Performance Improvement. (423332)

The GTP changes in 5.6.1 take place in the following categories:

New GTP features and functionality enhancements.

- GTP message filter enhancements, including:
 - Unknown message white list
 - GTPv1 and GTPv2 profile separation
 - Message adoption.
- GTP IE white list.
- Global APN rate limit, including:
 - sending back REJECT message with back-off timer
 - "APN congestion" cause value
- GTP half-open, half-close configurable timer.

GTP performance improvements.

- Implemented RCU on GTP-U running path. i.e, no locking needed to look up tunnel state when processing GTP-U.
Note the RCU is only applied on GTPv1 and GTPv2 tunnels. It is not used for GTPv0 tunnels, due to the fact that (1) GTPv0 traffic is relatively minor compared with GTPv1 and GTPv2, and (2) GTPv0 tunnel indexing is totally different from GTPv1 and GTPv2. GTPv0 tunnel is indexed by [IMSI, NSAPI]. GTPv1 and GTPv2 tunnel is indexed by [IP, TEID]
- Localized CPU memory usage on GTP-U running path.
- GTP-C: changed some GTP tables from RB tree to hash table, including
 - GTP request tables, and GTPv0 tunnel tables.
 - Testing showed, when handling millions of entries adding/deleting, hash table performance was much better.
 - 2.3.2 Hash table is compatible with RCU API, so we can apply RCU on these GTP-C tables later for further performance improvements.
- GTP-C, improved GTP path management logic, so that GTP path will time out sooner when there are no tunnels linked to it

CLI Changes:**New Diagnose commands:**

```
diagnose firewall gtp
```

Option	Description
hash-stat-tunnel	GTP tunnel hash statistics.
hash-stat-v0tunnel	GTPv0 tunnel hash statistics.
hash-stat-path	GTP path hash statistics.
hash-stat-req	GTP request hash statistics.
vd-apn-shaper	APN shaper on VDOM level.
ie-white-list-v0v1	IE white list for GTPv0 or v1.
ie-white-list-v2	IE white list for GTPv2.

```
diagnose firewall gtp vd-apn-shaper
```

Option	Description
list	List

```
diagnose firewall gtp ie-white-list-v0v1
```

Option	Description
list	List

```
diagnose firewall gtp ie-white-list-v2
```

Option	Description
list	List

```
config gtp apn-shaperapn-shaper
```

Option	Description
apn	APN to match. Leave empty to match ANY. "apn" field can be empty, it matches ANY apn. when configured, it is used to set a limit for any apn which is not explicitly listed; Also, if configured, such an entry should be the last entry, as it is first-match rule.
rate-limit	Rate limit in packets/s (0 - 1000000, 0 means unlimited).
action	Action. [drop reject] There is no back-off timer in GTPv0, therefor the <code>reject</code> action is not available for V0
back-off-time	Back off time in seconds (10 - 360). <code>back-off-time</code> visible when action is "reject"

Changed commands:

Under command `firewall gtp,config message-filter` is replaced by `set message-filter-v0v1`

Example:

```
config firewall gtp
edit <name>
set message-filter-v0v1
```

New fields have been added to the `config firewall gtp` command context

Option	Description
half-open-timeout	Half-open tunnel timeout (in seconds).
half-close-timeout	Half-close tunnel timeout (in seconds).

Example:

```
config firewall gtp
edit <name>
set half-open-timeout 10
set half-close-timeout 10
```

Models affected by change

- FortiGate 3700D
- FortiGate 3700DX
- FortiGate 3800D

Overview of FortiOS Carrier features

FortiOS Carrier specific features include Multimedia messaging service (MMS) protection, and GPRS Tunneling Protocol (GTP) protection.

All FortiGate units, carrier-enabled or not, are capable of handling Stream Control Transmission Protocol (SCTP) traffic, which is a protocol designed for and primarily used in Carrier networks.

This section includes:

Overview

FortiOS Carrier provides all the features found on FortiGate units plus added features specific to carrier networks: MMS and GTP.

MMS

MMS is a standard for sending messages that include multimedia content between mobile phones. MMS is also popular as a method of delivering news and entertainment content including videos, pictures, and text. Carrier networks include four different MMS types of messages — MM1, MM3, MM4, and MM7.

GTP

The GPRS Tunneling Protocol (GTP) runs on GPRS carrier networks. GPRS is a GSM packet radio standard. It provides more efficient usage of the radio interface so that mobile devices can share the same radio channel. FortiOS supports GTPv1 and GTPv2.

GPRS provides direct connections to the Internet (TCP/IP) and X.25 networks for point-to-point services (connection-less/connection oriented) and point-to-multipoint services (broadcast).

GPRS currently supports data rates from 9.6 kbps to more than 100 kbps, and it is best suited for burst forms of traffic. GPRS involves both radio and wired components. The mobile phone sends the message to a base station unit (radio based) that converts the message from radio to wired, and sends the message to the carrier network and eventually the Internet (wired carrier network). See [GTP](#).

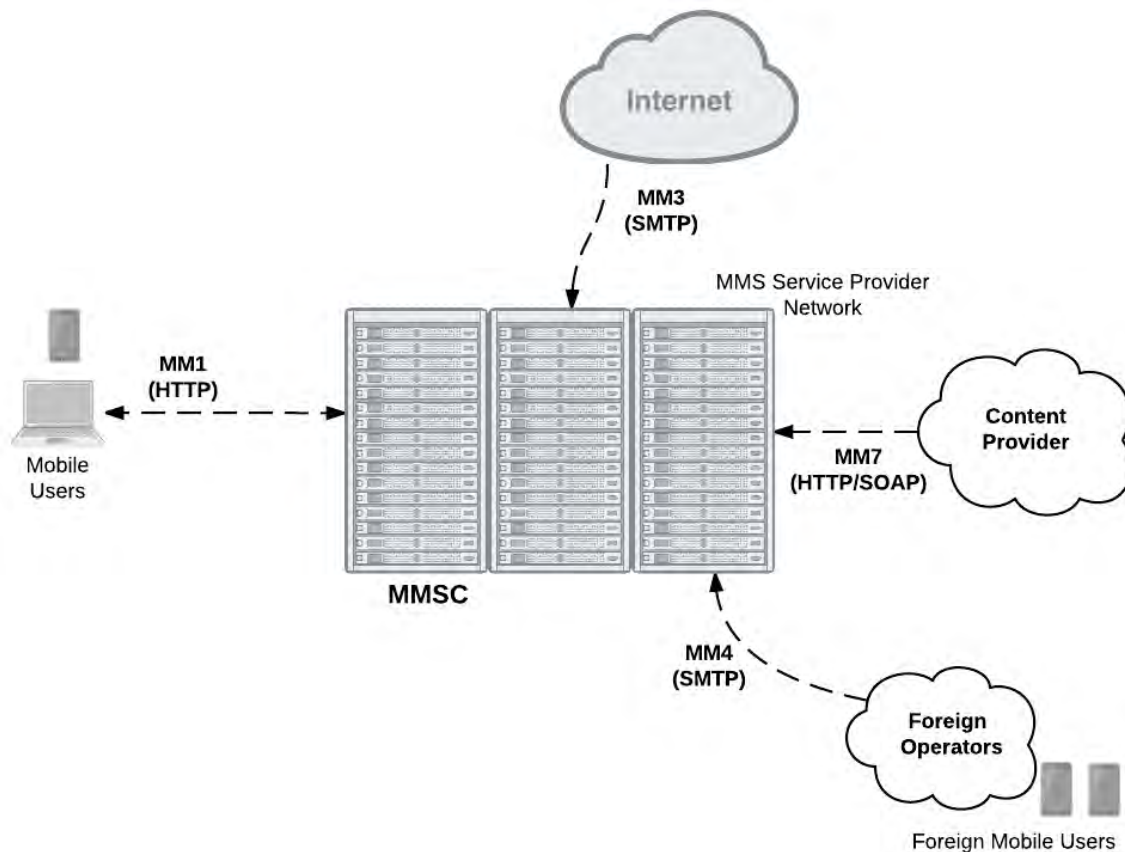

MMS Concepts

MMS background

MMS is a common method for mobile users to send and receive multimedia content. A Carrier network supports MMS across its network. This makes up the MMS Service Provider Network (MSPN).

Messages can be sent or received between the MMSC and a number of other services including the Internet, content providers, or other carriers. Each of these different service connections uses different MMS formats including MM1 and MM7 messages (essentially HTTP format), and MM3 and MM4 messages (SMTP formatted). These different formats reflect the different purposes and content for each type of MMS message.

MMS content interfaces

MMS content interfaces

MMS messages are sent from devices and servers to other devices and servers using MMS content interfaces

There are eight interfaces defined for the MMS standard, referred to as MM1 through MM8. The most important of these interfaces for the transfer of data is the MM1 interface, as this defines how mobile users communicate from the mobile network to the Multimedia Message Service Center (MMSC). MMS content to be monitored and controlled comes from these mobile users and is going to the provider network.

Other MMS content interfaces that connect a service provider network to other external sources can pose threats as well. MM3 handles communication between the Internet and the MMSC and is a possible source of viruses and other content problems from the Internet. MM4 handles communication between different content provider MMSCs. Filtering MM4 content protects the service provider network from content sent from foreign service providers and their subscribers. Finally MM7 is used for communication between content providers and the MMSC. Filtering MM3 content can also keep harmful content off of the service provider network.

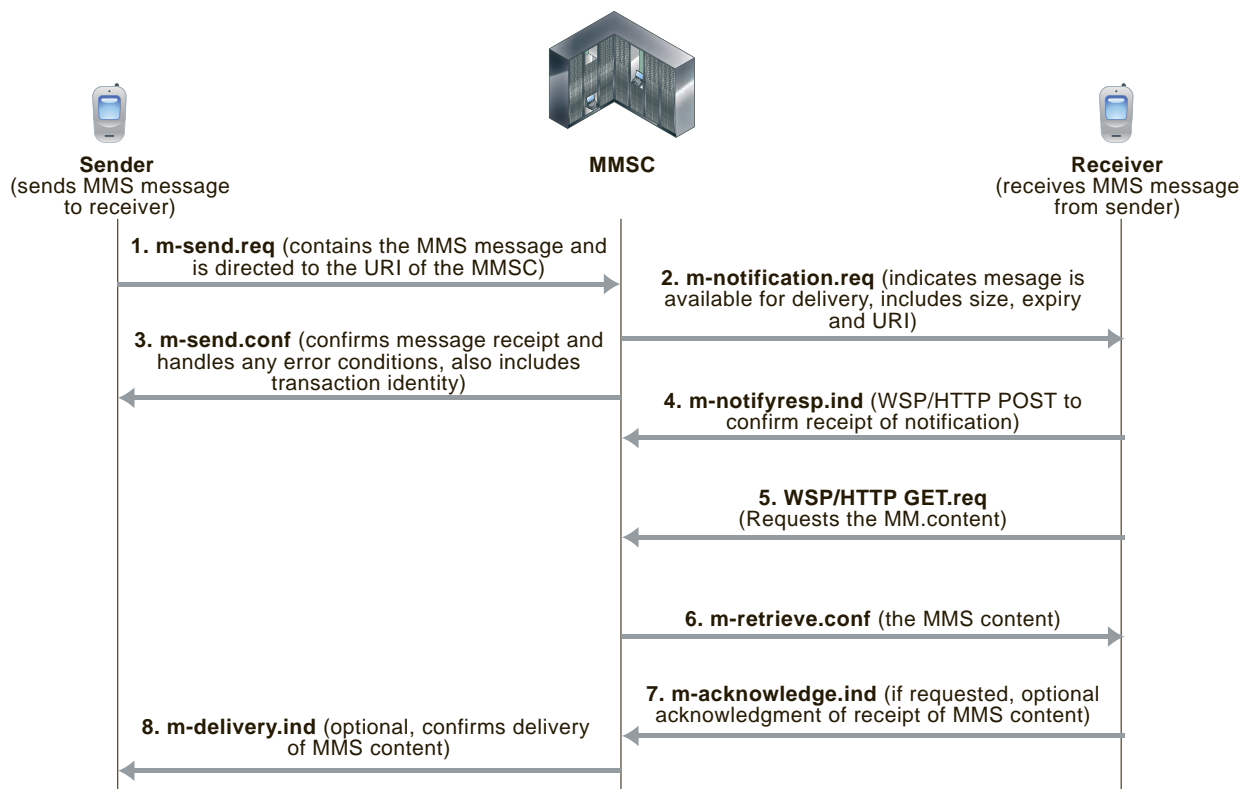

MMS content interfaces

Type	Transaction	Similar to
MM 1	Handset to MMSC	HTTP
MM 3	Between MMSC and Internet	SMTP
MM 4	Between Operator MMSCs	SMTP
MM 7	Content Providers to MMSC	HTTP and SOAP

How MMS content interfaces are applied

As shown below, the sender's mobile device encodes the MMS content in a form similar to MIME email message (MMS MIME content formats are defined by the MMS Message Encapsulation specification). The encoded message is then forwarded to the service provider's MMSC. Communication between the sending device and the MMSC uses the MM1 content interface. The MM1 content interface establishes a connection and sends an MM1 send request (`m-send.req`) message that contains the MMS message. The MMSC processes this request and sends back an MM1 send confirmation (`m-send.conf`) HTTP response indicating the status of the message — accepted or an error occurred, for example.

MM1 transactions between senders and receivers and the MMSC

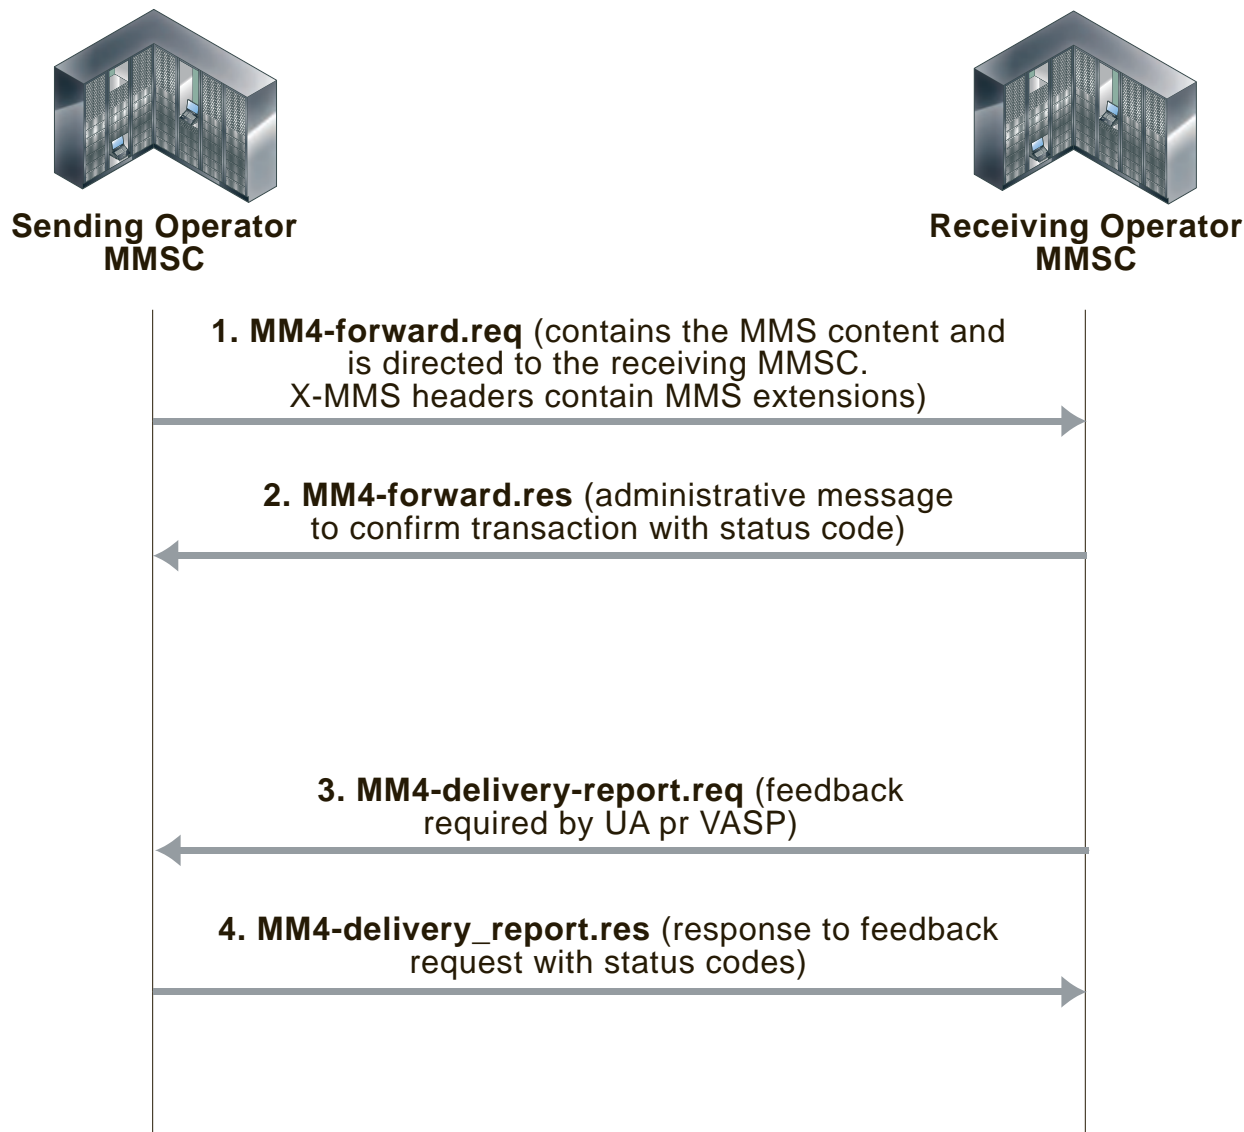

If the recipient is on another carrier, the MMSC forwards the message to the recipient's carrier. This forwarding uses the MM4 content interface for forwarding content between operator MMSCs (see the figure below).

Before the MMSC can forward the message to the final recipient, it must first determine if the receiver's handset can receive MMS messages using the MM1 content interface. If the recipient can use the MM1 content interface, the content is extracted and sent to a temporary storage server with an HTTP front-end.

To retrieve the message, the receiver's handset establishes a connection with the MMSC. An HTTP get request is then sent from the recipient to the MMSC. This message contains the URL where the content of the message is stored. The MMSC responds with a retrieve confirmation (`m-retrieve.conf`) HTTP response that contains the message.

MM4 messages sent between operator MMSCs

This causes the receiver's handset to retrieve the content from the embedded URL. Several messages are exchanged to indicate status of the delivery attempt. Before delivering content, some MMSCs also include a content adaptation service that attempts to modify the multimedia content into a format suitable for the recipient's handset.

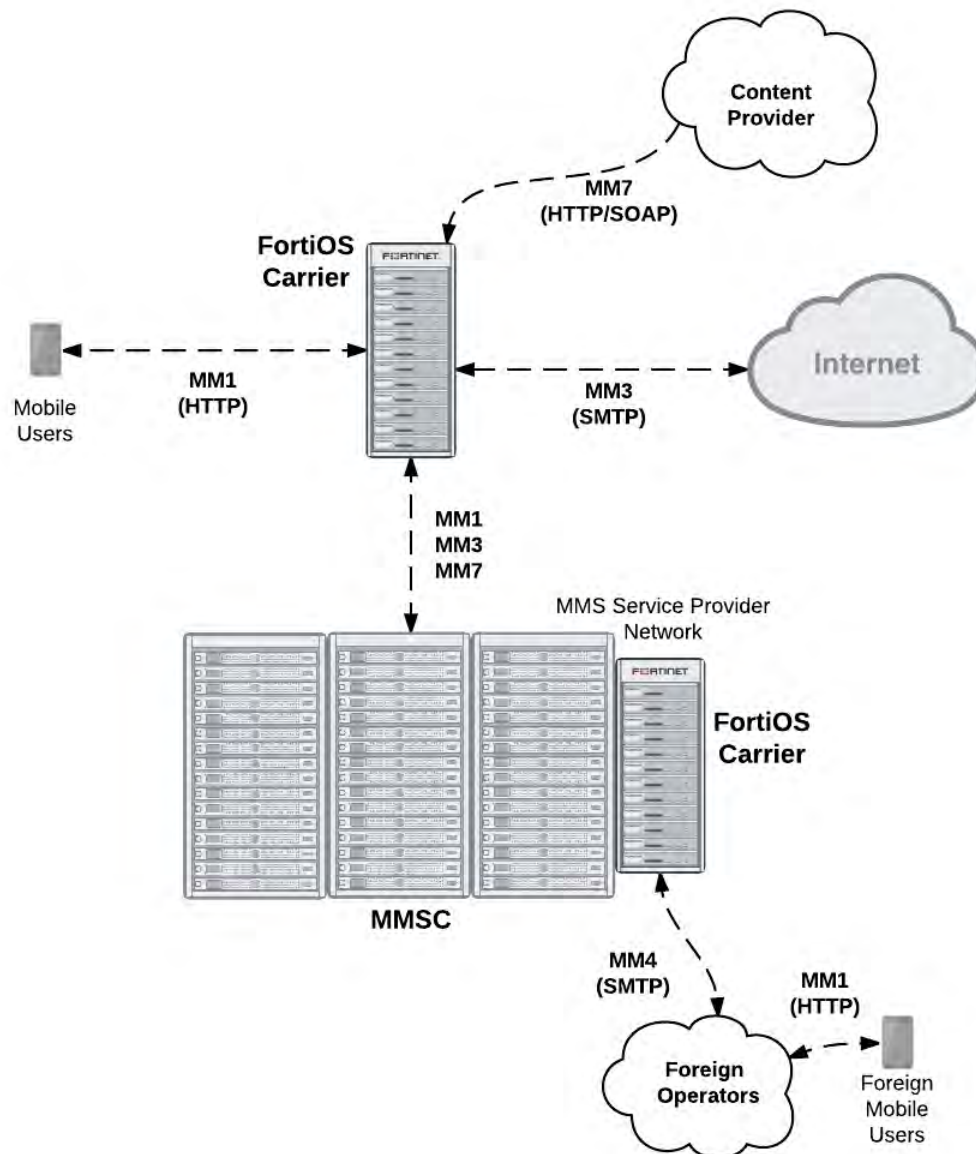

If the receiver's handset is not MM1 capable, the message can be delivered to a web based service and the receiver can view the content from a normal Internet browser. The URL for the content can be sent to the receiver in an SMS text message. Using this method, non-MM1 capable recipients can still receive MMS content.

The method for determining whether a handset is MMS capable is not specified by the standards. A database is usually maintained by the operator, and in it each mobile phone number is marked as being associated with a legacy handset or not. It can be a bit hit and miss since customers can change their handset at will and this database is not usually updated dynamically.

Email and web-based gateways from MMSC to the Internet use the MM3 content interface. On the receiving side, the content servers can typically receive service requests both from WAP and normal HTTP browsers, so delivery via the web is simple. For sending from external sources to handsets, most carriers allow MIME encoded message to be sent to the receiver's phone number with a special domain.

How FortiOS Carrier processes MMS messages

MMS messages can be vectors for propagating undesirable content such as spam and viruses. FortiOS Carrier can scan MMS messages sent using the MM1, MM3, MM4, and MM7 content interfaces. You can configure FortiOS Carrier to scan MMS messages for spam and viruses by configuring and adding MMS protection profiles and adding the MMS protection profiles to security policies. You can also use MMS protection profiles to apply content blocking, carrier endpoint filtering, MMS address translation, sending MMS notifications, DLP archiving of MMS messages, and logging of MMS message activity.

FortiOS Carrier MMS processing

FortiOS Carrier can send MMS messages to senders informing those senders that their devices are infected. FortiOS Carrier can also send MMS notifications to administrators to inform them of suspicious activity on their networks.

For message floods and duplicate messages, FortiOS Carrier does not send notifications to message senders but does send notifications to administrators and sends messages to sender handsets to complete MM1 and MM4 sessions.

Where MMS messaging uses the TCP/IP set of protocols, SMS text messaging uses the Signaling System Number 7 (SS7) set of protocols, which is not supported by FortiOS.

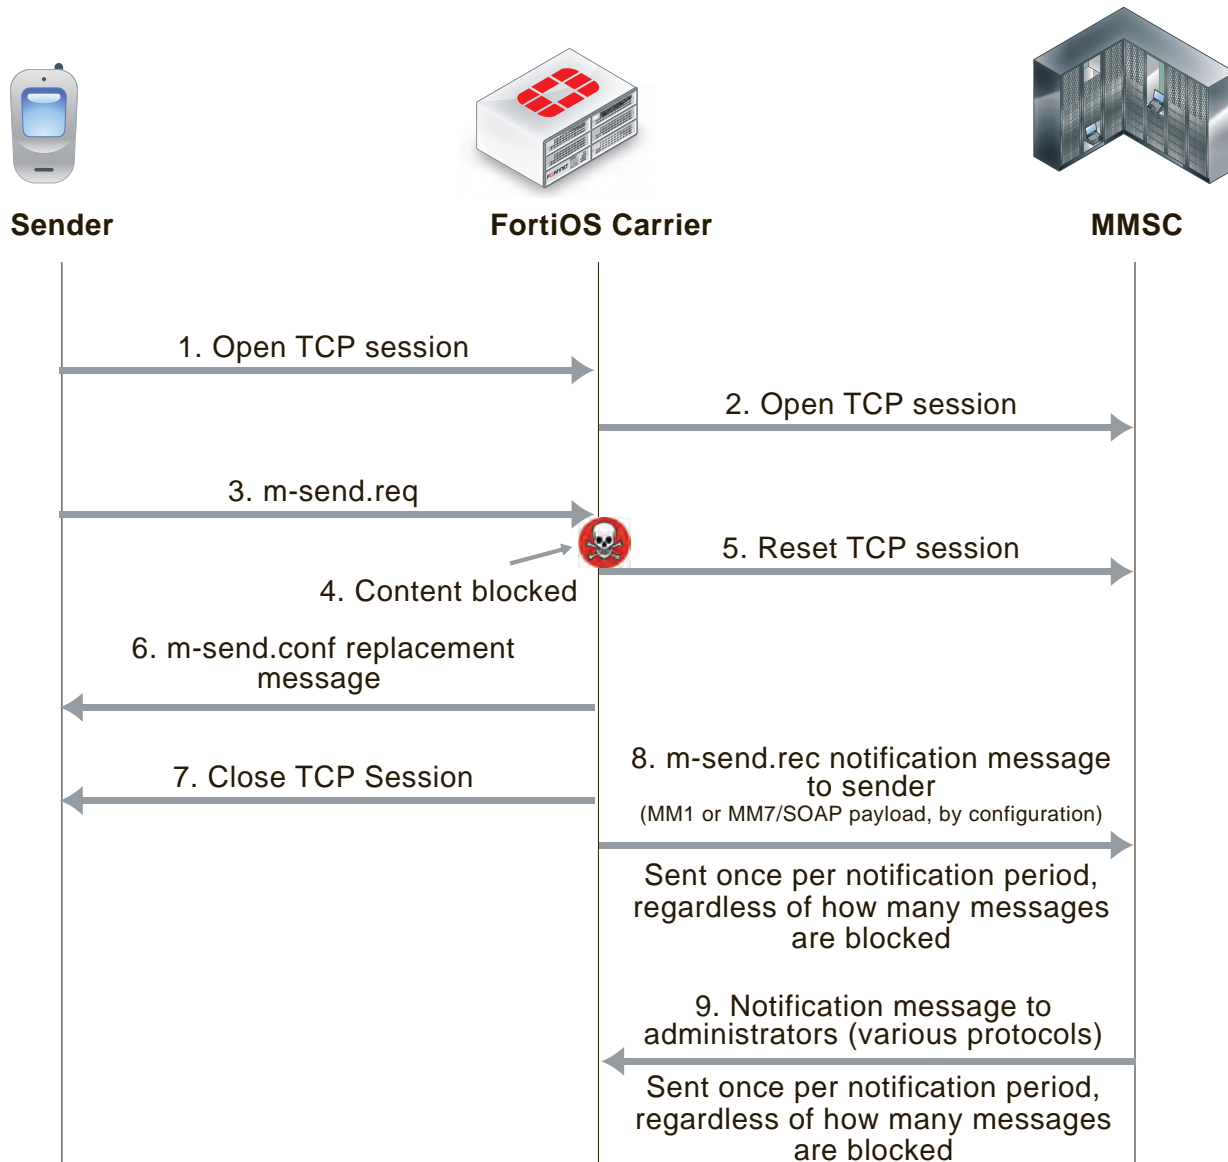

FortiOS Carrier and MMS content scanning

The following section applies to MMS content scanning, including virus scanning, file filtering, content spam filtering, carrier endpoint filtering, and MMS content checksum filtering.

MM1 Content Scanning

During MM1 content scanning a message is first transmitted from the sender, establishing a connection with the MMSC. FortiOS Carrier intercepts this connection and acts as the endpoint. FortiOS Carrier then establishes its own connection to the MMSC. Once connected, the client transmits its `m-send.req` HTTP post request to FortiOS Carrier which scans it according to the MMS protection profile settings. If the content is clean, the message is forwarded to the MMSC. The MMSC returns `m-send.conf` HTTP response through FortiOS Carrier to the sender.

If FortiOS Carrier blocks the message (for example because a virus was found, see the figure below), FortiOS Carrier resets the connection to the MMSC and sends `m-send.conf` HTTP response back to the sender. The response message can be customized using replacement messages. FortiOS Carrier then terminates the connection. Sending back an `m-send.conf` message prevents the sender from trying to send the message again.

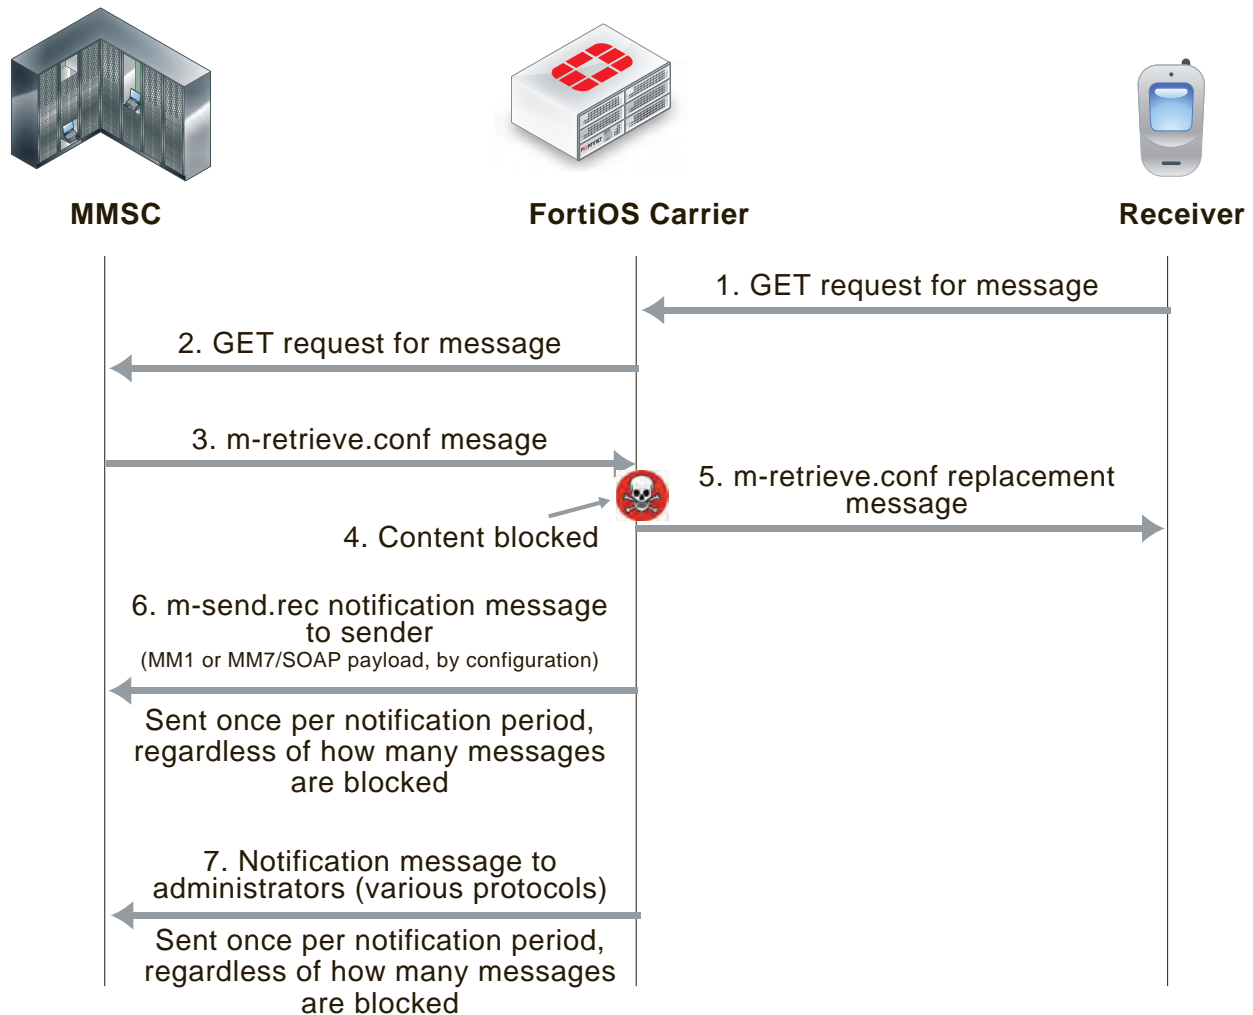

MM1 MMS scanning of message sent by sender (blocking m.send.req messages)

FortiOS Carrier also sends `m-send.rec` notifications messages to the MMSC that are then forwarded to the sender to notify them of blocked messages.

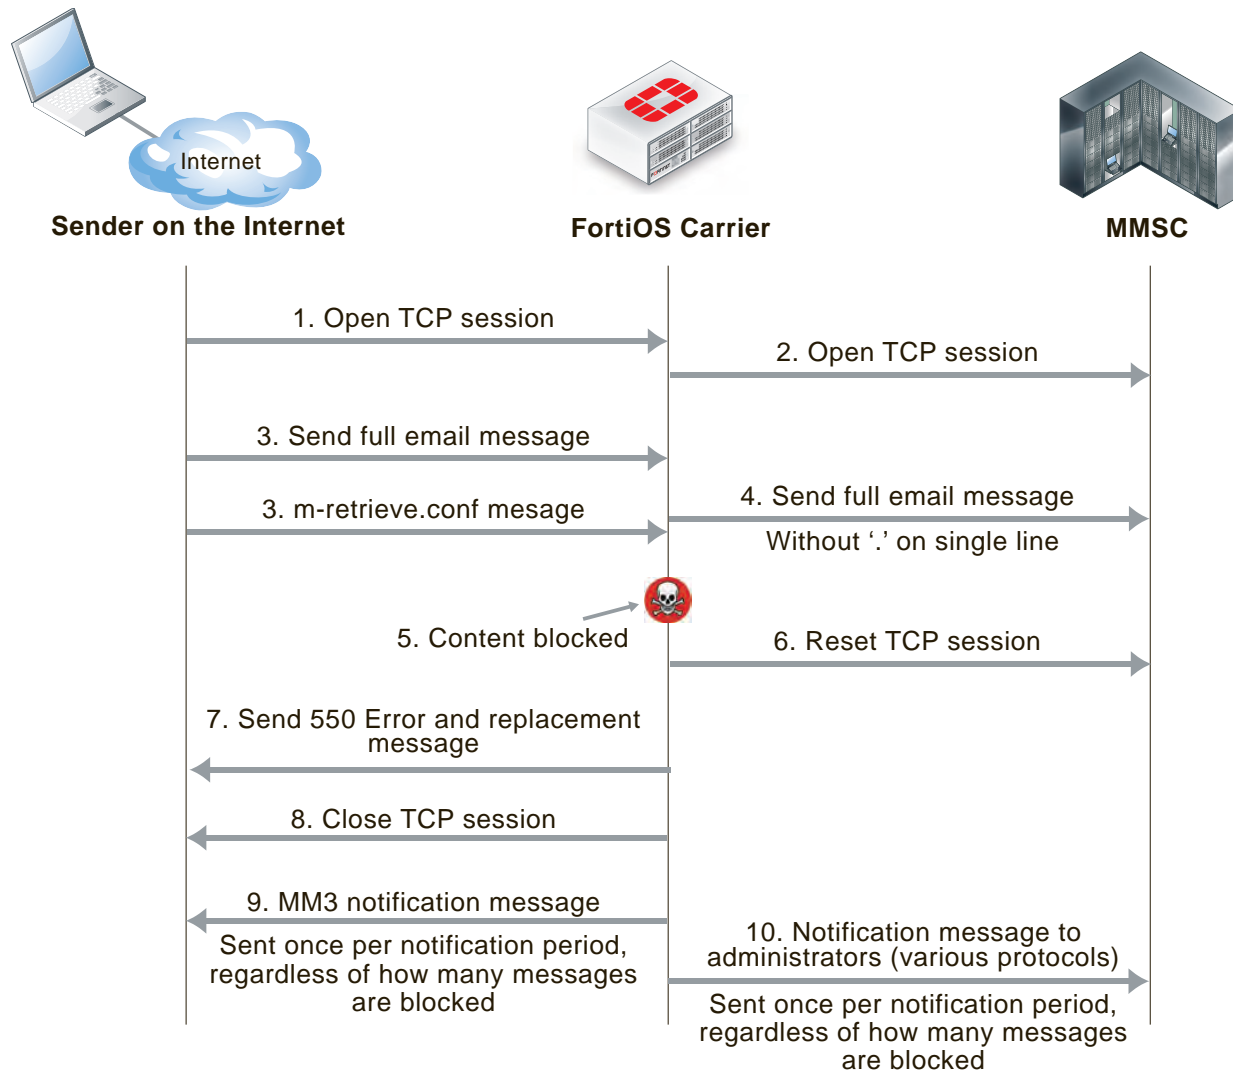

Filtering message retrieval

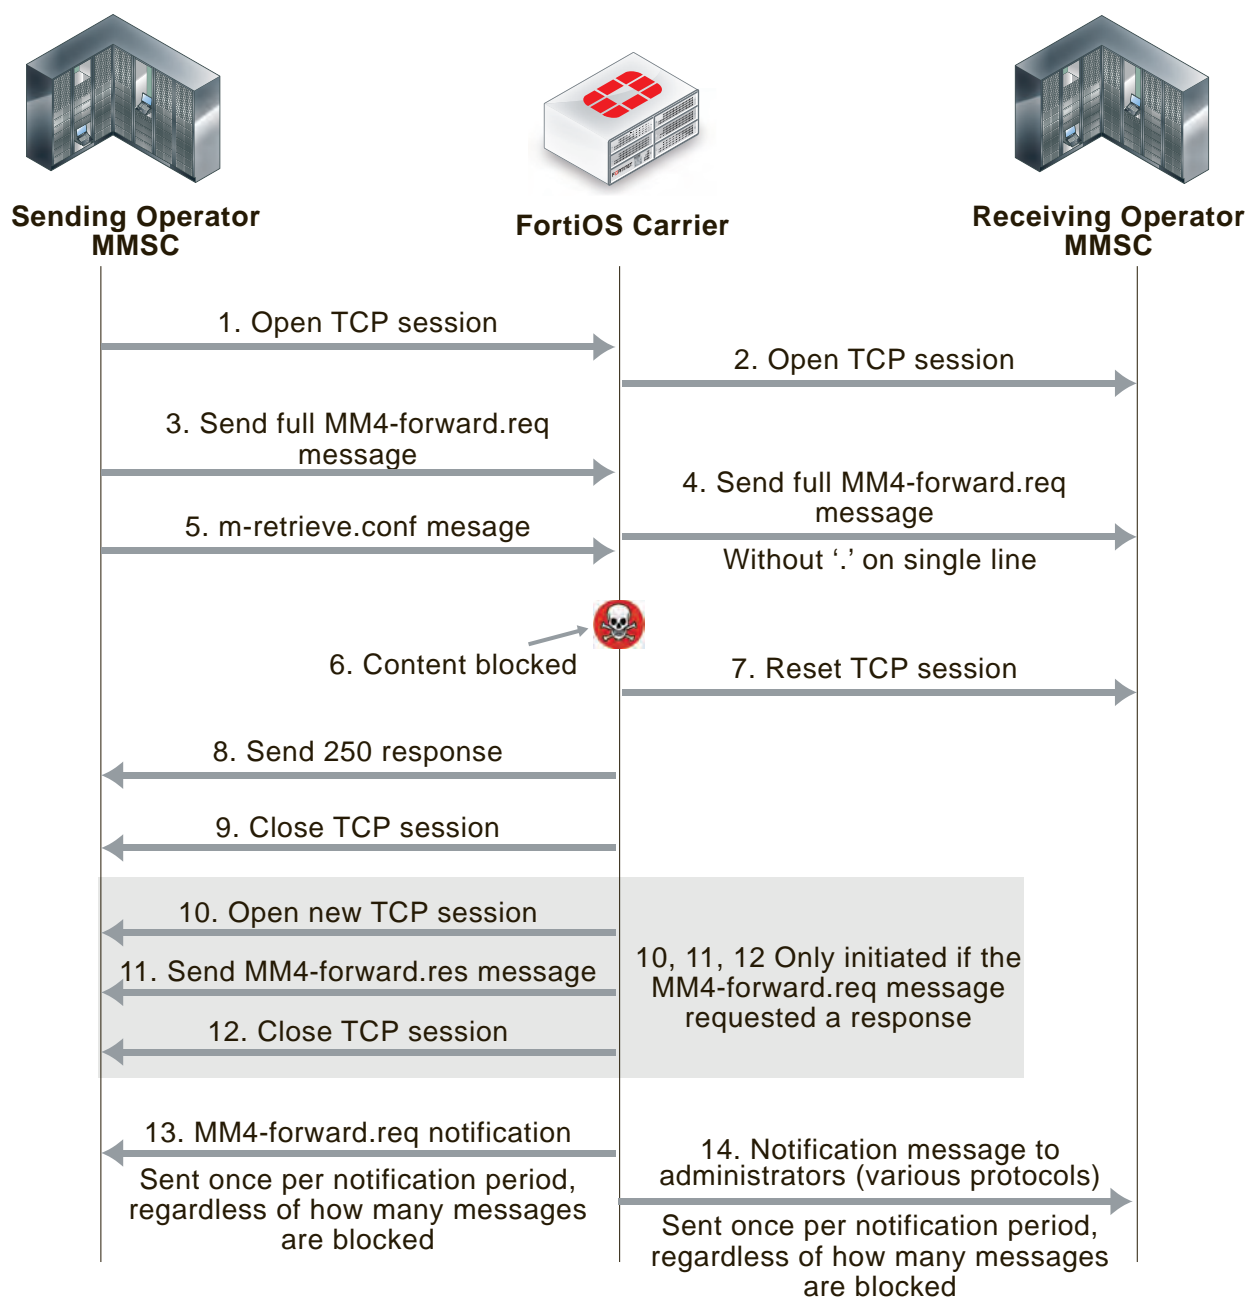

FortiOS Carrier intercepts the connection to the MMSC, and the `m-retrieve.conf` HTTP response from the MMSC is scanned according to the MMS content scanning settings. If the content is clean, the response is forwarded back to the client. If the content is blocked, FortiOS Carrier drops the connection to the MMSC. It then builds an `m-retrieve.conf` message from the associated replacement message and transmits this back to the client.

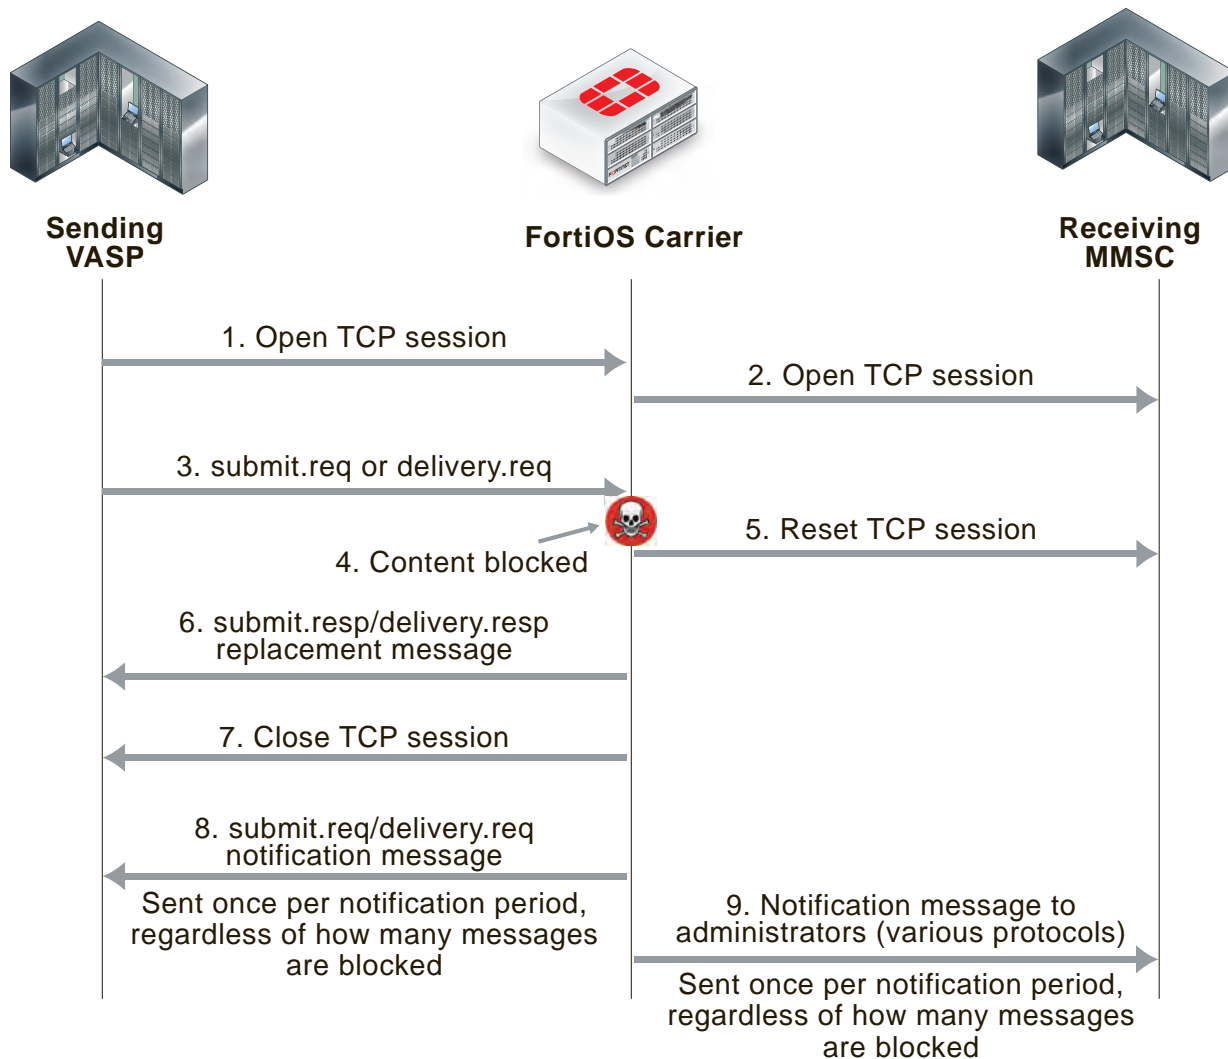

FortiOS Carrier also sends `m-send.rec` notifications messages to the MMSC that are then forwarded to the receiver to notify them of blocked messages.

MM1 MMS scanning of messages received by receiver (blocking m.retrieve.conf messages)

Filtering MM3 and MM4 messages works in an similar way to MM1 (see the figures below). FortiOS Carrier intercepts connections to the MMSC, and scans messages as configured. When messages are blocked, FortiOS Carrier closes sessions as required, sends confirmation messages to the sender, notifies administrators, and notifies senders and receivers of messages.

MM3 MMS scanning of messages sent from a sender on the Internet to an MMSC

MM4 MMS scanning of messages sent between operator MMSCs

MM7 MMS scanning of messages sent between a VASP and an MMSC**FortiOS Carrier and MMS duplicate messages and message floods**

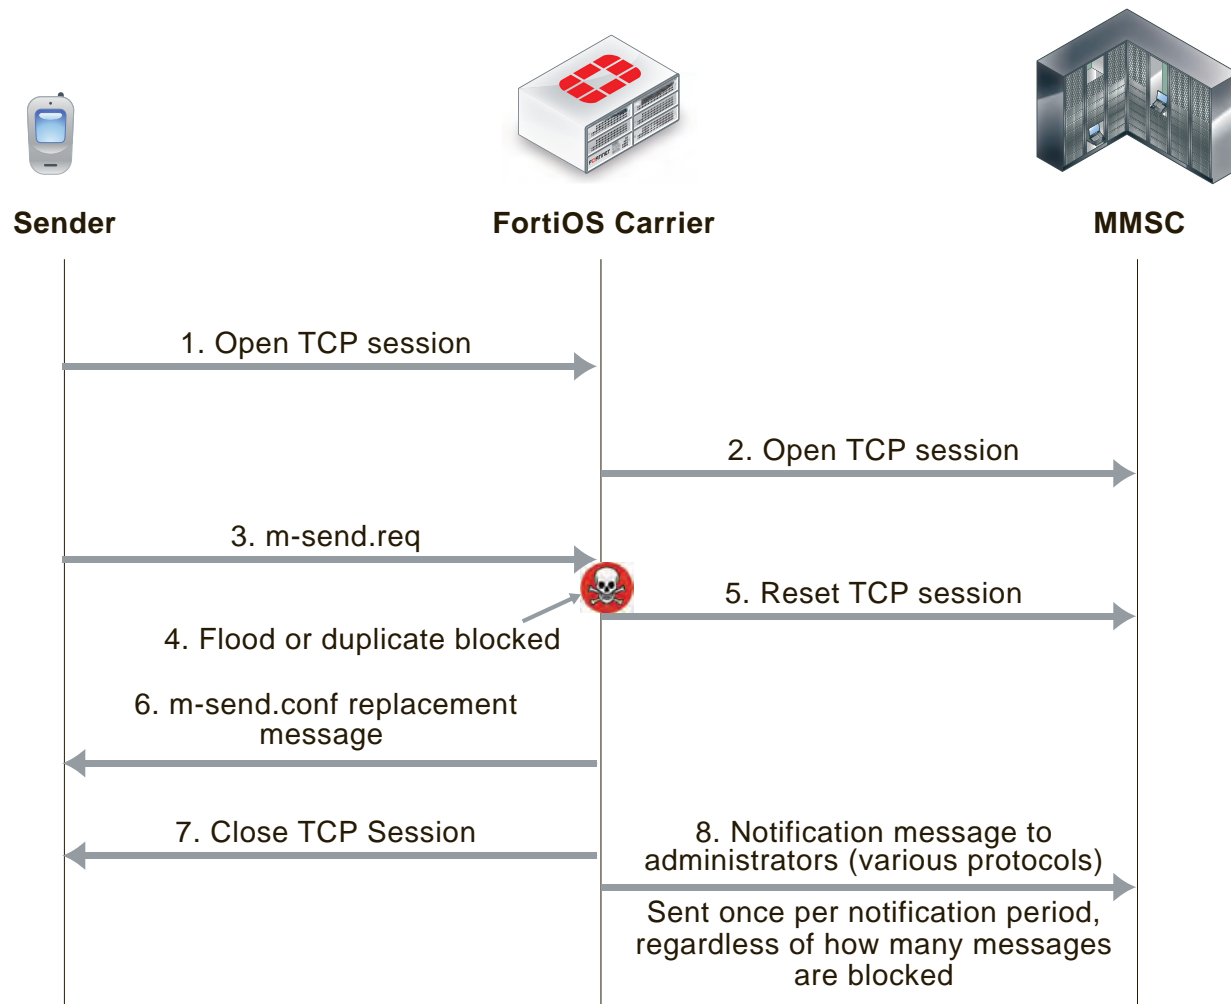

FortiOS Carrier detects duplicate messages and message floods for the MM1 and MM4 interfaces. How FortiOS Carrier detects and responds to duplicate messages and message floods is different from how FortiOS Carrier detects and responds to viruses and other MMS scanning protection measures.

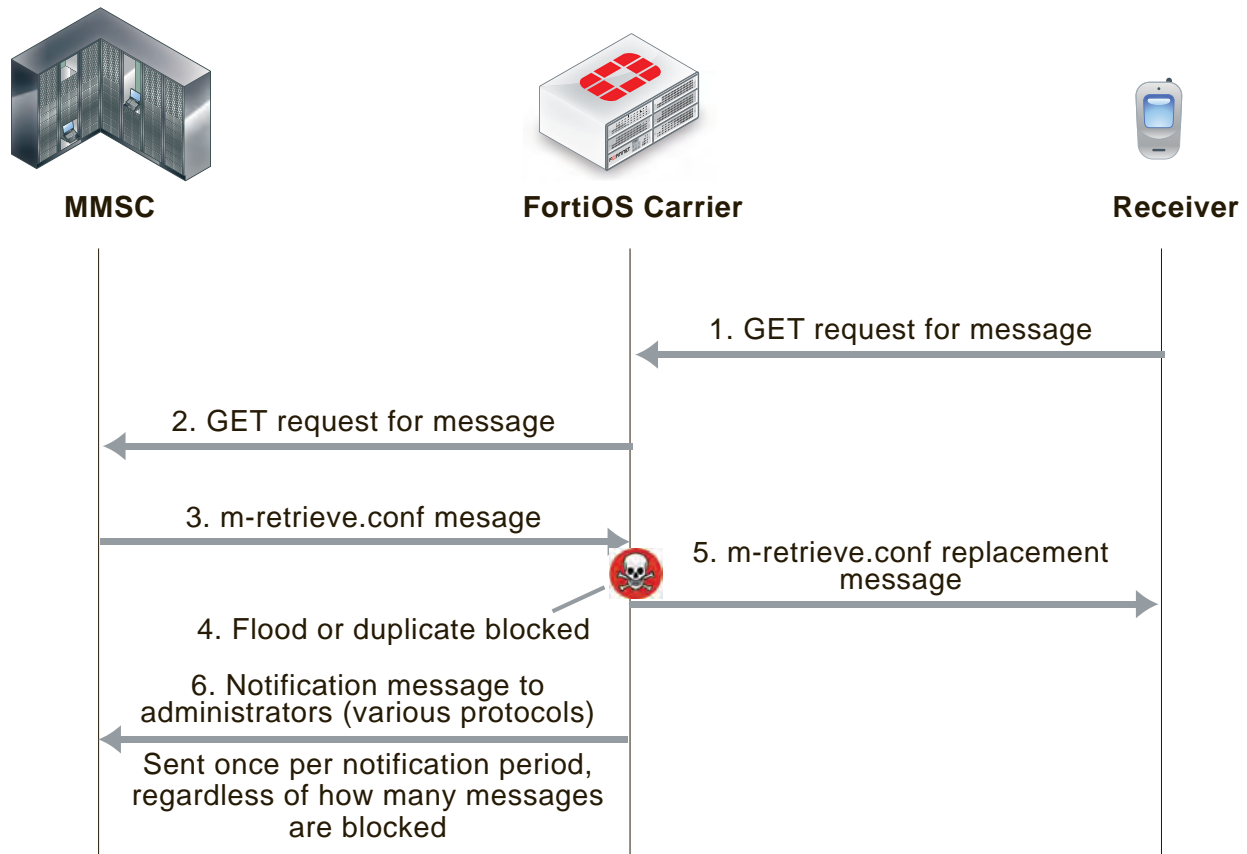

For message floods and duplicate messages, the sender does not receive notifications about floods or duplicate messages, as if the sender is an attacker they can gain useful information about flood and duplicate thresholds. Plus, duplicate messages and message floods are usually a result of a large amount of messaging activity and filtering of these messages is designed to reduce the amount of unwanted messaging traffic. Adding to the traffic by sending notifications to senders and receivers could result in an increase in message traffic.

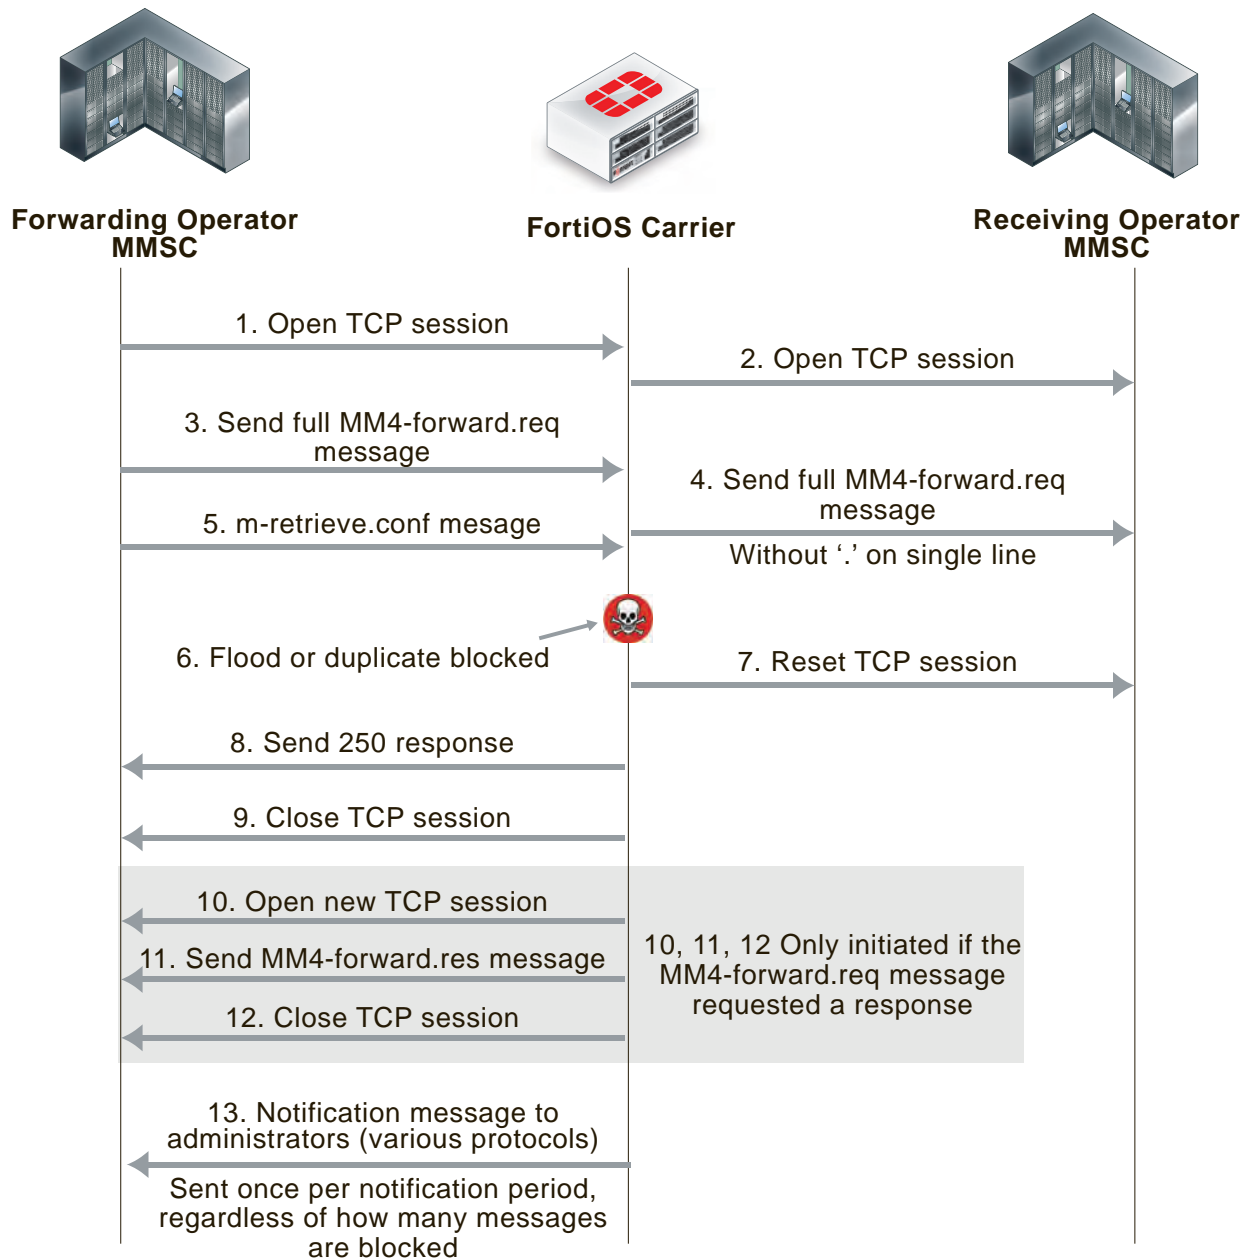

You can create up to three thresholds for detecting duplicate messages and message floods. For each threshold you can configure the FortiOS Carrier unit to respond by logging the activity, archiving or quarantining the messages, notifying administrators of the activity, and by blocking the messages. In many cases you may only want to configure blocking for higher activity thresholds, and to just monitor and send administrator notifications at lower activity thresholds.

When a block threshold is reached for MM1 messages, FortiOS Carrier sends `m-send.conf` or `m-retrieve.conf` messages to the originator of the activity. These messages are sent to end the MM1 sessions, otherwise the originator would continue to re-send the blocked message. When a block threshold is reached for MM4, FortiOS Carrier sends a `MM4-forward.res` message to close the MM4 session. An MM4 message is sent only if initiated by the originating `MM4-forward.req` message.

MM1 message flood and duplicate message blocking of sent messages

MM1 message flood and duplicate message blocking of received messages

MM4 message flood and duplicate message blocking**MMS protection profiles**

An MMS protection profile is a group of settings that you can apply to an MMS session matched by a security policy.

MMS protection profiles are easy to configure and can be used by more than one security policy. You can configure a single MMS protection profile for the different traffic types handled by a set of security policies that require identical protection levels and types. This eliminates the need to repeatedly configure those same MMS protection profile settings for each individual security policy.

For example, while traffic between trusted and untrusted networks might need strict protection, traffic between trusted internal addresses might need only moderate protection. You would configure two separate MMS protection profiles to provide the different levels of protection: one for traffic between trusted networks, and one for traffic between trusted and untrusted networks.

Once you have configured the MMS Protection Profile, you need to add it to a security policy to apply the profile to MMS traffic.

Bypassing MMS protection profile filtering based on carrier endpoints

You can use carrier endpoint filtering to exempt MMS sessions from MMS protection profile filtering. Carrier endpoint filtering matches carrier endpoints in MMS sessions with carrier endpoint patterns. If you add a carrier endpoint pattern to a filter list and set the action to exempt from all scanning, all messages from matching carrier endpoints bypass MMS protection profile filtering. See Bypassing message flood protection based on user's carrier endpoints.

Applying MMS protection profiles to MMS traffic

To apply an MMS protection profile you must first create the MMS protection profile and then add the MMS protection profile to a security policy by enabling the Carrier security profile. The MMS protection profile then applies itself to the traffic accepted by that security policy.

MMS protection profiles can contain settings relevant to many different services. Each security policy uses the subset of the MMS protection profile settings that apply to the sessions accepted by the security policy. In this way, you might define just one MMS protection profile that can be used by many security policies, each policy using a different or overlapping subset of the MMS protection profile.

To add an MMS protection profile to a security policy

1. Go to **Security Profiles > MMS Profile**.
2. Select **Create New** to add an MMS protection profile.
3. Configure as needed, and save.
4. Go to **Policy & Objects > IPv4 Policy**.
5. Select **Create New** to add a security policy, or select an existing policy and **Edit** to add the MMS profile.
6. Configure the security policy as required.
7. Enable **MMS Profile**, and select the MMS profile to add to the security policy.
8. Select **OK**.

MMS Configuration

MMS profiles

Since MMS profiles can be used by more than one security policy, you can configure one profile for the traffic types handled by a set of security policies requiring identical protection levels and types, rather than repeatedly configuring those same profile settings for each individual security policy.

If the security policy requires authentication, do not select the MMS profile in the security policy. This type of profile is specific to the authenticating user group. For details on configuring the profile associated with the user group, see User Groups in the Authentication guide.

For example, while traffic between trusted and untrusted networks might need strict protection, traffic between trusted internal addresses might need moderate protection. To provide the different levels of protection, you might configure two separate protection profiles: one for traffic between trusted networks, and one for traffic between trusted and untrusted networks.

Once you have configured the MMS profile, you can then apply the profile to MMS traffic by applying it to a security policy.

MMS profiles can contain settings relevant to many different services. Each security policy uses the subset of the MMS profile settings that apply to the sessions accepted by the security policy. In this way, you might define just one MMS profile that can be used by many security policies, each policy using a different or overlapping subset of the MMS profile.

The MMS Profile page contains options for each of the following:

- MMS scanning
- MMS Bulk Email Filtering Detection
- MMS Address Translation
- MMS Notifications
- DLP Archive
- Logging

MMS profile configuration settings

The following are MMS profile configuration settings in **Security Profiles > MMS Profile**.

MMS Profile page	
Lists each individual MMS profile that you created. On this page, you can edit, delete or create an MMS profile.	
Create New	Creates a new MMS profile. When you select Create New , you are automatically redirected to the New MMS Profile page.
Edit	Modifies settings within an MMS profile. When you select Edit , you are automatically redirected to the Edit MMS Profile.
Delete	Removes an MMS profile from the list on the MMS Profile page.
	To remove multiple MMS profiles from within the list, on the MMS Profile page, in each of the rows of the profiles you want removed, select the check box and then select Delete .
Delete	To remove all MMS profiles from the list, on the MMS Profile page, select the check box in the check box column, and then select Delete .
Name	The name of the MMS profile.

Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a security policy; on the Profile page (**Security Profiles > Antivirus**), 1 appears in **Ref.** .

To view the location of the referenced object, select the number in **Ref.**, and the Object Usage window appears displaying the various locations of the referenced object.

To view more information about how the object is being used, use one of the following icons that is available within the Object Usage window:

Ref.

View the list page for these objects – automatically redirects you to the list page where the object is referenced at.

Edit this object – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a security policy and so, when this icon is selected, the user is redirected to the Edit Policy page.

View the details for this object – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a security policy, and that security policy's settings appear within the table.

New MMS Profile page

Provides settings for configuring an MMS profile. This page also provides settings for configuring DLP archives and logging.

Profile Name	Enter a name for the profile.
Comments	Enter a description about the profile. This is optional.
MMS Scanning	Configure MMS Scanning options.
MMS Bulk Email Filtering Detection	Configure MMS Bulk Email options.
MMS Address Translation	Configure MMS Address Translation options.
MMS Notifications	Configure MMS Notification options.
DLP Archive	Configure DLP archive option.
Logging	Configure logging options.

MMS scanning options

You can configure MMS scanning protection profile options to apply virus scanning, file filtering, content filtering, carrier endpoint blocking, and other scanning to MMS messages transmitted using the MM1, MM3, MM4 and

MM7 protocols.

The following are the MMS Scanning options that are available within an MMS profile. You can create an MMS profile in **Security Profiles > MMS Profile** or edit an existing one. You must expand MMS Scanning to access the following options.

MMS Scanning section of the New MMS Profile page

Monitor Only	<p>Select to cause the unit to record log messages when MMS scanning options find a virus, match a file name, or match content using any of the other MMS scanning options. Select this option to be able to report on viruses and other problems in MMS traffic without affecting users.</p> <p>Tip: Select Remove Blocked if you want the unit to actually remove content intercepted by MMS scanning options.</p>
Virus Scan	<p>Select to scan attachments in MMS traffic for viruses.</p> <p>Since MM1 and MM7 use HTTP, the oversize limits for HTTP and the HTTP antivirus port configuration also applies to MM1 and MM7 scanning.</p> <p>MM3 and MM4 use SMTP and the oversize limits for SMTP and the SMTP antivirus port configuration also applies to MM3 and MM4 scanning.</p>
Scan MM1 message retrieval	<p>Select to scan message retrievals that use MM1. If you enable Virus Scan for all MMS interfaces, messages are also scanned while being sent. In this case, you can disable MM1 message retrieval scanning to improve performance.</p>
Remove Blocked	<p>Select to remove blocked content from each protocol and replace it with the replacement message.</p> <p>Select Constant if the unit is to preserve the length of the message when removing blocked content, as may occur when billing is affected by the length of the message.</p> <p>Tip: If you only want to monitor blocked content, select Monitor Only.</p>
Content Filter	<p>Select to filter messages based on matching the content of the message with the words or patterns in the selected web content filter list.</p>
Carrier Endpoint Block	<p>Select to add Carrier Endpoint Filtering in this MMS profile. Select the carrier endpoint filter list to apply it to the profile.</p>
MMS Content Checksum	<p>Select to add MMS Content Checksum in this MMS profile. Select the MMS content checksum list to apply it to the profile.</p>

MMS Scanning section of the New MMS Profile page

Pass Fragmented Messages	Select to pass fragmented MM3 and MM4 messages. Fragmented MMS messages cannot be scanned for viruses. If you do not select these options, fragmented MM3 and MM4 message are blocked.
Comfort Clients	<p>Select client comforting for MM1 and MM7 sessions.</p> <p>Since MM1 and MM7 messages use HTTP, MM1 and MM7 client comforting operates like HTTP client comforting.</p>
Comfort Servers	<p>Select server comforting for each protocol.</p> <p>Similar to client comforting, you can use server comforting to prevent server connection timeouts that can occur while waiting for the unit to buffer and scan large POST requests from slow clients.</p>
Interval (1-900 seconds)	Enter the time in seconds before client and server comforting starts after the download has begun, and the time between sending subsequent data.
Amount (1-10240 bytes)	The number of bytes sent by client or server comforting at each interval.
Oversized MMS Message	<p>Select Block or Pass for files and email messages exceeding configured thresholds for each protocol.</p> <p>The oversize threshold refers to the final size of the message, including attachments, after encoding by the client. Clients can use a variety of encoding types; some result in larger file sizes than the original attachment. As a result, a file may be blocked or logged as oversized even if the attachment is several megabytes smaller than the oversize threshold.</p>
Threshold (1KB - 800 MB)	Enter the oversized file threshold and select KB or MB. If a file is larger than the threshold the file is passed or blocked depending on the Oversized MMS Message setting. The web-based manager displays the allowed threshold range. The threshold maximum is 10% of the unit's RAM.

MMS Bulk Anti-Spam Detection options

You can use the MMS bulk email filtering options to detect and filter MM1 and MM4 message floods and duplicate messages. You can configure three thresholds that define a flood of message activity and three thresholds that define excessive duplicate messages. The configuration of each threshold includes the response actions for the threshold.

The configurable thresholds for each of the flood and duplicate sensors and must be enabled in sequence. For example, you can enable Flood Threshold 1 and Flood Threshold 2, but you cannot disable Flood Threshold 1 and enable Flood Threshold 2.

You can also add MSISDN to the bulk email filtering configuration and select a subset of the bulk email filtering options to applied to these individual MSISDNs.

You must first select MM1 and/or MM4 to detect excessive message duplicates. If excessive message duplicates are detected, the unit will perform the **Duplicate Message Action** for the specified duration.

You can configure three duplicate message thresholds and enable them with separate values and actions. They are labeled Duplicate Threshold 1 through 3 and must be enabled in sequence. For example, you can enable Duplicate Threshold 1 and Duplicate Threshold 2, but you cannot disable Duplicate Threshold 1 and enable Duplicate Threshold 2.

When traffic accepted by a security policy that contains an MMS profile with duplicate message configured receives MM1 or MM4 duplicate messages that match a threshold configured in the MMS protection profile, the unit performs the duplicate message action configured for the matching threshold.

You can configure three message flood thresholds and enable them with separate values and actions. They are labeled Flood Threshold 1 through 3 and must be enabled in sequence. For example, you can enable Flood Threshold 1 and Flood Threshold 2, but you cannot disable Flood Threshold 1 and enable Flood Threshold 2.

When traffic accepted by a security policy that contains an MMS protection profile with message flooding configured experiences MM1 or MM4 message flooding that matches a threshold configured in the MMS profile, the unit performs the message flood action configured for the matching threshold.

MMS Bulk Anti-Spam Detection

This section of the New MMS Profile page contains numerous sections where you can configure specific settings for flood threshold, duplicate threshold and recipient MSISDNs.

Message Flood

The message flood settings for each flood threshold. Expand each to configure settings for a threshold.

Flood Threshold 1	Expand to reveal the flood threshold settings for Flood Threshold 1. The settings for Flood Threshold 1 are the same for Flood Threshold 2 and 3.
Enable	Select to apply Flood Threshold 1 to the MSISDN exception.
Message Flood Window	Enter the period of time during which a message flood will be detected if the Message Flood Limit is exceeded. The message flood window can be 1 to 2880 minutes (48 hours).
Message Flood Limit	Enter the number of messages which signifies a message flood if exceeded within the Message Flood Window .
Message Flood Block Time	Enter the amount of time during which the unit performs the Message Flood Action after a message flood is detected.
Message Flood Action	Select one or more actions that the unit is to perform when a message flood is detected.

Flood Threshold 2	Expand to configure settings for Flood Threshold 2 or 3 respectively.
Flood Threshold 3	
Duplicate Message	
The duplicate message threshold settings. Expand each to configure settings for a threshold.	
MM1 Retrieve Duplicate Enable	Select to scan MM1 <code>mm1-retr</code> messages for duplicates. By default, <code>mm1-retr</code> messages are not scanned for duplicates as they may often be the same without necessarily being bulk or spam.
Enable	Select to enable the selected duplicate message threshold and to make the rest of the options available for configuration.
Duplicate Message Window	Enter the period of time during which excessive message duplicates will be detected if the Duplicate message Limit it exceeded. The duplicate message window can be 1 to 2880 minutes (48 hours).
Duplicate Message Limit	Enter the number of messages which signifies excessive message duplicates if exceeded within the Duplicate Message Window.
Duplicate Message Block Time	Enter the amount of time during which the unit will perform the Duplicate Message Action after a message flood is detected.
Duplicate Message Action	Select one or more actions that the unit is to perform when excessive message duplication is detected.
Duplicate Threshold 2	Expand to configure settings for Duplicate Threshold 2 or 3 respectively.
Duplicate Threshold 3	
Recipient MSISDN	
The recipient Mobile Subscriber Integrated Services Digital Network Number (MSISDN) settings for each recipient MSISDN. When you select Create New , you are automatically redirected to the New MSISDN page.	
You need to save the profile before you can add MSISDNs.	
Recipient MSISDN	The recipient MSISDN.
Flood Threshold 1	Check to enable Flood Threshold 1 settings for this MSISDN.
Flood Threshold 2	Check to enable Flood Threshold 2 settings for this MSISDN.
Flood Threshold 3	Check to enable Flood Threshold 3 settings for this MSISDN..
Duplicate Threshold 1	Check to enable Duplicate Threshold 1 settings for this MSISDN.

Duplicate Threshold 2	Check to enable Duplicate Threshold 2 settings for this MSISDN..
Duplicate Threshold 3	Check to enable Duplicate Threshold 3 settings for this MSISDN..
Edit	Modifies the settings of a Recipient MSISDN in the Recipient MSISDN list. When you select Edit , you are automatically redirected to the New MSISDN page.
Delete	Removes a Recipient MSISDN in the Recipient MSISDN list within the Recipient MSISDN section of the page.
New MSISDN page	
Create New	Creates a new Recipient MSISDN. When you select Create New , you are automatically redirected to the New MSISDN page.
Recipient MSISDN	Enter a name for the recipient MSISDN.
Flood Threshold 1	Select to apply Flood Threshold 1 to the MSISDN exception.
Flood Threshold 2	Select to apply Flood Threshold 2 to the MSISDN exception.
Flood Threshold 3	Select to apply Flood Threshold 3 to the MSISDN exception.
Duplicate Threshold 1	Select to apply Duplicate Threshold 1 to the MSISDN exception.
Duplicate Threshold 2	Select to apply Duplicate Threshold 2 to the MSISDN exception.
Duplicate Threshold 3	Select to apply Duplicate Threshold 3 to the MSISDN exception.

MMS Address Translation options

The sender's carrier endpoint is used to provide logging and reporting details to the mobile operator and to identify the sender of infected content.

When MMS messages are transmitted, the **From** field may or may not contain the sender's address. When the address is not included, the sender information will not be present in the logs and the unit will not be able to notify the user if the message is blocked unless the sender's address is made available elsewhere in the request.

The unit can extract the sender's address from an extended HTTP header field in the HTTP request. This field must be added to the HTTP request before it is received by the unit. If this field is present, it will be used instead of the sender's address in the MMS message for logging and notification. If this header field is present when a message is retrieved, it will be used instead of the **To** address in the message. If this header field is not present the content of the **To** header field is used instead.

Alternatively, the unit can extract the sender's address from a cookie.

You can configure MMS address translation to extract the sender's carrier endpoint so that it can be added to log and notification messages. You can configure MMS address translation settings to extract carrier endpoints from HTTP header fields or from cookies. You can also configure MMS address translation to add an endpoint prefix to the extracted carrier endpoints. For more information, see Dynamic Profiles and Endpoints in the Authentication guide.

MMS Address Translation

Sender Address Source

Select to extract the sender's address from the **HTTP Header Field** or a **Cookie**. You must also specify the identifier that contains the carrier endpoint.

Enter the sender address identifier that includes the carrier endpoint. The default identifier is `x-up-calling-line-id`.

If the **Sender Address Source** is **HTTP Header Field**, the address and its identifier in the HTTP request header takes the format:

```
<Sender Address Identifier>: <MSISDN_value>
```

Where the `<MSISDN_value>` is the carrier endpoint. For example, the HTTP header might contain:

```
x-up-calling-line-id: 6044301297
```

where `x-up-calling-line-id` would be the Sender Address Identifier.

Sender Address Identifier

If the **Sender Address Source** is **Cookie**, the address and its identifier in the HTTP request header's **Cookie** field takes the format of attribute-value pairs:

```
Cookie: id=<cookie-id>;
```

```
<Sender Address Identifier>=<MSISDN Value>
```

For example, the HTTP request headers might contain:

```
Cookie: id=0123jfla;x-up-calling-line-id=6044301297
```

where `x-up-calling-line-id` would be the **Sender Address Identifier**.

Convert Sender Address From / To HEX

Select to convert the sender address from ASCII to hexadecimal or from hexadecimal to ASCII. This is required by some applications.

Add Carrier Endpoint Prefix for Logging / Notification

Select the following to enable adding endpoint prefixes for logging and notification.

Enable

Select to enable adding the country code to the extracted carrier endpoint, such as the MSISDN, for logging and notification purposes. You can limit the number length for the test numbers used for internal monitoring without a country code.

MMS Address Translation

Prefix	Enter a carrier endpoint prefix to be added to all carrier endpoints. Use the prefix to add extra information to the carrier endpoint in the log entry.
Minimum Length	Enter the minimum length of the country code information being added. If this and Maximum Length are set to zero (0), length is not limited.
Maximum Length	Enter the maximum length of the country code information being added. If this and Minimum Length are set to zero (0), length is not limited.

MMS Notifications

MMS notifications are messages that a unit sends when an MMS profile matches content in an MM1, MM3, MM4 or MM7 session. For example, the MMS profile detects a virus or uses content blocking to block a web page, text message or email. You can send notifications to the sender of the message using same protocol and the addressing headers in the original message. You can also configure MMS notifications to send notification messages to another destination (such as a system administrator) using the MM1, MM3, MM4 or MM7 protocol.

You need to enable one or more **Notification Types** or you can add an **Antivirus Notification List** to enable sending notifications.

You can also use MMS notifications options to configure how often notifications are sent. The unit sends notification messages immediately for the first event, then at a configurable interval if events continue to occur. If the interval does not coincide with the window of time during which notices may be sent, the unit waits to send the notice in the next available window. Subsequent notices contain a count of the number of events that have occurred since the previous notification.

There are separate notifications for each notification type, including virus events. Virus event notifications include the virus name. Up to three viruses are tracked for each user at a time. If a fourth virus is found, one of the existing tracked viruses is removed from the list.

The notifications are MM1 `m-send-req` messages sent from the unit directly to the MMSC for delivery to the client. The host name of the MMSC, the URL to which `m-send-req` messages are sent, and the port must be specified.

MMS Notification

Antivirus Notification List	<p>Optionally select an antivirus notification list to select a list of virus names to send notifications for. The unit sends a notification message whenever a virus name or prefix in the antivirus notification list matches the name of a virus detected in a session scanned by the MMS protection profile. Select Disabled if you do not want to use a notification list.</p> <p>Instead of selecting a notification list you can configure the Virus ScanNotification Type to send notifications for all viruses.</p>
------------------------------------	--

MMS Notification

Message Protocol	<p>In each column, select the protocol used to send notification messages. You can use a different protocol to send the notification message than the protocol on which the violation was sent. The MMS Notifications options change depending on the message protocol that you select.</p> <p>If you select a different message protocol, you must also enter the User Domain. If selecting MM7 you must also enter the Message Type.</p>
Message Type	Select the MM7 message type to use if sending notifications using MM7. Options include deliver.REQ and submit.REQ
Detect Server Details	<p>Select to use the information in the headers of the original message to set the address of the notification message. If you do not select this option, you can enter the required addressing information manually.</p> <p>You cannot select Detect Server Details if you are sending notification messages using a different message protocol.</p> <p>If you select Detect Server Details, you cannot change the Port where the notification is being sent.</p>
Hostname	Enter the FQDN or the IP address of the server where the notifications will be sent.
URL	<p>Enter the URL of the server. For example if the notification is going to www.example.com/home/alerts , the URL is /home/alerts.</p> <p>This option is available only when Message Protocol is mm1 or mm7.</p>
Port	<p>Enter the port number of the server.</p> <p>You cannot change the Port if Detect Server Details is enabled.</p>
Username	<p>Enter the user name required for sending messages using this server (optional).</p> <p>This option is available only when Message Protocol is mm7.</p>
Password	<p>Enter the password required for sending messages using this server (optional).</p> <p>This option is available only when Message Protocol is mm7.</p>

MMS Notification	
VASP ID	<p>Enter the value-added-service-provider (VASP) ID to be used when sending a notification message. If a VAS is not offered by the mobile provider, it is offered by a third party or a VAS provider or content provider (CP).</p> <p>This option is available only when Message Protocol is mm7.</p>
VAS ID	<p>Enter the value-added-service (VAS) ID to be used when sending a notification message. A VAS is generally any service beyond voice calls and fax.</p> <p>This option is available only when Message Protocol is mm7.</p>
All Notification Types	<p>In each column, select notification for all MMS event types for that MMS protocol, then enter the amount of time and select the time unit for notice intervals.</p> <p>Alternatively, expand All Notification Types, and then select notification for individual MMS event types for each MMS protocol. Then enter the amount of time and select the time unit for notice intervals.</p> <p>Not all event types are available for all MMS protocols.</p>
Content Filter	In each column, select to notify when messages are blocked by the content filter, then enter the amount of time and select the time unit for notice intervals.
File Block	In each column, select to notify when messages are blocked by file block, then enter the amount of time and select the time unit for notice intervals.
Carrier Endpoint Block	In each column, select to notify when messages are blocked, then enter the amount of time and select the time unit for notice intervals.
Flood	In each column, select to notify when message flood events occur, then enter the amount of time and select the time unit for notice intervals.
Duplicate	In each column, select to notify when duplicate message events occur, then enter the amount of time and select the time unit for notice intervals.
MMS Content Checksum	In each column, select to notify when the content within an MMS message is scanned and banned because of the checksum value that was matched.
Virus Scan	In each column, select to notify when the content within an MMS message is scanned for viruses.

MMS Notification	
Notifications Per Second Limit	For each MMS protocol, enter the number of notifications to send per second. If you enter zero (0) , the notification rate is not limited.
Day of Week	For each MMS protocol, select the days of the week the unit is allowed to send notifications.
Window Start Time	For each MMS protocol, select the time of day to begin the message alert window. By default, the message window starts at 00:00. You can change this if you want to start the message window later in the day. When configured, notification outside this window will not be sent.
Window Duration	For each MMS protocol, select the time of day at which to end the message alert window. By default, the message window ends at 00:24. You can change this if you want to end the message window earlier in the day. When configured, notification outside this window will not be sent

DLP Archive options

Select DLP archive options to archive MM1, MM3, MM4, and MM7 sessions. In addition to the MMS profile's DLP archive options, you can:

- Archive MM1 and MM7 message floods
- Archive MM1 and MM7 duplicate messages
- Select **DLP archiving** for carrier endpoint patterns in a **Carrier Endpoint List** and select the **Carrier Endpoint Block** option in the **MMS Scanning** section of an MMS Profile

The unit only allows one sixteenth of its memory for transferring content archive files. For example, for units with 128 MB RAM, only 8 MB of memory is used when transferring content archive files. Best practices dictate to not enable full content archiving if antivirus scanning is also configured because of these memory constraints.

DLP Archive	
Display DLP meta-information on the system dashboard	Select each required protocol to display the content archive summary in the Log and Archive Statistics dashboard widget on the System Dashboard.

DLP Archive

Archive to FortiAnalyzer/FortiGuard	Select the type of archiving that you want for the protocol (MM1, MM3, MM4, and MM7). You can choose from Full, Summary or None.
	None — Do not send content archives.
	Summary — Send content archive metadata only. Includes information such as date and time, source and destination, request and response size, and scan result.
	Full — Send content archive both metadata and copies of files or messages. In some cases, FortiOS Carrier may not archive content, or may make only a partial content archive, regardless of your selected option. This behavior varies by prerequisites for each protocol. This option is available only if a FortiAnalyzer unit or FortiGuard Analysis and Management Service is configured.

Logging

You can enable logging in an MMS profile to write event log messages when the MMS profile options that you have enabled perform an action. For example, if you enable MMS antivirus protection, you could also use the MMS profile logging options to write an event log message every time a virus is detected.

You must first configure how the unit stores log messages so that you can then record these logs messages. For more information, see the FortiOS Handbook Logging and Reporting guide.

Logging

MMS-Antivirus	If antivirus settings are enabled for this MMS profile, select the following options to record Antivirus Log messages.
Viruses	Record a log message when this MMS profile detects a virus.
Blocked Files	Record a log message when antivirus file filtering enabled in this MMS profile blocks a file.
Oversized Files/Emails	Record a log message when this MMS profile encounters an oversized file or email message. Oversized files and email messages cannot be scanned for viruses.
MMS Scanning	If MMS scanning settings are enabled for this MMS profile, select the following options to record Email Filter Log messages.
Notification Messages	Select to log the number of MMS notification messages sent.

Logging	
Bulk Messages	Select to log MMS Bulk AntiSpam events. You must also select which protocols to write log messages for in the MMS bulk email filtering part of the MMS profile.
Carrier Endpoint Filter Block	Select to log MMS carrier endpoint filter events, such as MSISDN filtering.
MMS Content Checksum	Select to log MMS content checksum activity.
Content Block	Select to log content blocking events.

MMS Content Checksum

The MMS Content Checksum menu allows you to configure content checksum lists.

Configure MMS content checksum lists in **Security Profiles > MMS Content Checksum** using the following table.

MMS Content Checksum	
Lists each individual content checksum list that you created. On this page, you can edit, delete or create a content checksum list.	
Create New	Creates a new MMS content checksum list. When you select Create New , you are automatically redirected to the New List. This page provides a name field and comment field. You must enter a name to go to MMS Content Checksum Settings page.
Edit	Modifies settings to a MMS content checksum. When you select Edit , you are automatically redirected to the MMS Content Checksum Settings page.
Delete	Removes an MMS content checksum from the page.
	To remove multiple content checksum lists from within the list, on the MMS Content Checksum page, in each of the rows of the content checksum lists you want removed, select the check box and then select Delete .
	To remove all content checksum lists from list, on the MMS Content Checksum page, select the check box in the check box column and then select Delete .
Name	The name of the MMS content checksum list that you created.
# Entries	The number of checksums that are included in the content checksum list.

MMS Profiles	The MMS profile or profiles that have the MMS content checksum list applied. For example if two different MMS profiles use this content checksum list, they will both be listed here.
Comments	A description given to the MMS content checksum.
Ref.	<p>Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a security policy; on the Profile page (Security Profiles > AntiVirus > Profiles), 1 appears in Ref. .</p> <p>To view the location of the referenced object, select the number in Ref., and the Object Usage window appears displaying the various locations of the referenced object.</p> <p>To view more information about how the object is being used, use one of the following icons that is available within the Object Usage window:</p> <ul style="list-style-type: none"> • View the list page for these objects – automatically redirects you to the list page where the object is referenced at. • Edit this object – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a security policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • View the details for this object – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a security policy, and that security policy's settings appear within the table.

Notification List

The Notification List menu allows you to configure a list of viruses. This virus list provides a list for scanning viruses in MMS messages. You can use one virus list in multiple MMS profiles, and configure multiple virus lists.

Notification list configuration settings

The following are notification list configuration settings in **Security Profiles > Notification List**.

Notification List	Lists all the notification lists that you created. On this page you can edit, delete or create a new notification list.
Create New	Creates a new notification list. When you select Create New , you are automatically redirected to the New List page. You must enter a name to go to the Notification List Settings page.

Edit	Modifies settings within the notification list. When you select Edit , you are automatically redirected to the Notification List Settings page.
Delete	<p>Removes a notification list from the list on the Notification List page.</p> <p>To remove multiple notification lists from within the list, on the Notification List page, in each of the rows of the notification lists you want removed, select the check box and then select Delete.</p> <p>To remove all notification lists from the list, on the Notification List page, select the check box in the check box column and then select Delete.</p>
Name	The name of the MMS content checksum list that you created.
# Entries	The number of checksums that are included in that content checksum list.
MMS Profiles	The MMS profile or profiles that are associated with
Comments	A description given to the MMS notification list.
Ref.	<p>Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a security policy; on the Profile page (Security Profiles > Antivirus > Profiles), 1 appears in Ref. .</p> <p>To view the location of the referenced object, select the number in Ref., and the Object Usage window appears displaying the various locations of the referenced object.</p> <p>To view more information about how the object is being used, use one of the following icons that is available within the Object Usage window:</p> <ul style="list-style-type: none"> • View the list page for these objects – automatically redirects you to the list page where the object is referenced at. • Edit this object – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a security policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • View the details for this object – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a security policy, and that security policy's settings appear within the table.
Notification List Settings	
Provides settings for configuring a notification list, which is a list of viruses and is used for scanning viruses in MMS messages. This list is called the Antivirus Notification List in an MMS profile.	

Name	If editing the name of a notification list, enter the new name in this field. You must select OK to save the change.
Comments	If you want to enter a comment, enter the comment in the field. You must select OK to save the change.
Create New	Creates a notification entry in the list. When you select Create New , you are automatically redirected to the New Entry page.
Edit	Modifies settings within a notification list. When you select Edit , you are automatically redirected to the Edit Entry page.
Delete	Removes a notification entry from the list on the page. To remove multiple notification entries from within the list, on the Notification List Settings page, in each of the rows of the entries you want removed, select the check box and then select Delete . To remove all notification entries from the list, on the Notification List Settings page, select the check box in the check box column and then select Delete .
Enable	Enables a notification entry that is disabled.
Disable	Disables a notification entry so that it is not active and available for use, but it is not deleted.
Remove All Entries	Removes all notification entries that are listed on the Notification List Settings page.
Enable	Displays whether or not the checksum is enabled.
Virus Name/Profile	The name of the virus that was added to the list.
Entry Type	The type of match that will be used to match the virus stated in the notification list to the actual virus that is found.
New Entry page	
Virus Name/Profile	Enter the virus name.
Entry Type	Select the type of match that will be used to match the virus stated in the notification list to the actual virus that is found.
Enable	Select to enable the virus in the list.

Message Flood

The convenience offered by MM1 and MM4 messaging can be abused by users sending spam or attempting to overload the network with an excess of messages. MMS flood prevention can help prevent this type of abuse. A

message flood occurs when a single subscriber sends a volume of messages that exceed the flood threshold that you set. The threshold defines the maximum number of messages allowed, the period during which the subscriber sent messages are considered, and the length of time the sender is restricted from sending messages after a flood is detected. For example, for the first threshold you may determine that any subscriber who sends more than 100 MM1 messages in an hour (60 minutes) will have all outgoing messages blocked for 30 minutes.

Action	Description
Log	Add a log entry indicating that a message flood has occurred. You must also enable logging by going to Security Profiles > MMS Profile, <applicable profile> > Logging > MMS Scanning > Bulk Messages , and toggling on the checkbox.
DLP Archive	Save the first message to exceed the flood threshold, or all the messages that exceed the flood threshold, in the DLP archive. DLP archiving flood messages may not always produce useful results. Since different messages can be causing the flood, reviewing the archived messages may not be a good indication of what is causing the problem since the messages could be completely random.
All messages	All the messages that exceed the flood threshold will be saved in the DLP archive.
First message only	Save only the first message to exceed the flood threshold in the DLP archive. Other messages in the flood are not saved. For message floods this may not produce much useful information since a legitimate message could trigger the flood threshold.
Intercept	Messages that exceed the flood threshold are passed to the recipients, but if quarantine is enabled for intercepted messages, a copy of each message will also be quarantined for later examination. If the quarantine of intercepted messages is disabled, the Intercept action has no effect.
Block	Messages that exceed the flood threshold are blocked and will not be delivered to the message recipients. If quarantine is enabled for blocked messages, a copy of each message will be quarantined for later examination.
Alert Notification	<p>If the flood threshold is exceeded, the Carrier-enabled FortiGate unit will send an MMS flood notification message.</p> <p>In the web-based manager when Alert Notification is selected it displays the fields to configure the notification.</p>

Flood protection for MM1 messages prevents your subscribers from sending too many messages to your MMSC. Configuring flood protection for MM4 messages prevents another service provider from sending too many messages from the same subscriber to your MMSC.

Message flood configuration settings

The following are message flood configuration settings in **Security Profiles > Message Flood**.

Message Flood	
Lists the large amount of messages that are being sent to you from outside sources.	
Delete	<p>Removes messages from the list.</p> <p>To remove multiple messages from within the list, on the Message Flood page, in each row of the messages you want removed, select the check box and then select Delete.</p> <p>To remove all messages from the list, on the Message Flood page, select the check box in the check box column and then select Delete.</p>
Remove All Entries	Removes all messages from the list.
Protocol	Sorts/filters by the protocol used.
MMS Profile	Sorts/filters by the MMS profile that is used.
Sender	Sorts/filters by the sender's email address.
Level	Sorts/filters by the level of severity of the message.
Count	The count column can be up or down and these settings can be turned off by selecting beside the column's name.
Window Size (minutes)	The time in minutes.
Timer (minutes:seconds)	The time in seconds and in minutes. The timer column can be up or down and these settings turned off by selecting beside the column's name.
Page Controls	Use to navigate through the list.

Duplicate Message

Duplicate message protection for MM1 messages prevents multiple subscribers from sending duplicate messages to your MMSC. Duplicate message protection for MM4 messages prevents another service provider from sending duplicate messages from the same subscriber to your MMSC.

The unit keeps track of the sent messages. If the same message appears more often than the threshold value that you have configured, action is taken. Possible actions are logging the duplicate messages, blocking or intercepting them, archiving, and sending an alert to inform an administrator that duplicate messages are occurring.

Duplicate message configuration settings

View duplicate messages in **Security Profiles > Duplicate Message**.

Duplicate Message	
Lists duplicates of messages that were sent to you.	
Delete	Removes a message from the list.
	To remove multiple duplicate messages from within the list, on the Message Flood page, in each row of the messages you want removed, select the check box and then select Delete .
	To remove all duplicate messages from the list, on the Message Flood page, select the check box in the check box column and then select Delete .
Page Controls	Use to navigate through the list.
Remove All Entries	Removes all duplicate messages from the list.
Protocol	Sorts/filters by the protocol used.
MMS Profile	Sorts/filters by the MMS profile that logs the detection.
Checksum	Sorts/filters by the checksum of the MMS message.
Level	Sorts/filters by the level of severity of the message.
Count	Displays the number of messages in the last window of time.
Window Size (minutes)	The period of time during which a message flood will be detected if the Message Flood Limit is exceeded.
Timer (minutes:seconds)	Either the time left in the window if the message is unflagged, or the time until the message will be unflagged if it is already flagged.

Carrier Endpoint Filter Lists

A carrier endpoint filter list contains carrier endpoint patterns. A pattern can match one carrier endpoint or can use wildcards or regular expressions to match multiple carrier endpoints. For each pattern, you select the action that the unit takes on a message when the pattern matches a carrier endpoint in the message. Actions include blocking the message, exempting the message from MMS scanning, and exempting the message from all scanning. You can also configure the pattern to intercept the message and content archive the message to a FortiAnalyzer unit.

Carrier endpoint filter lists configuration settings

The following are Carrier endpoint filter list configuration settings in **Security Profiles > Carrier Endpoint Filter Lists**.

Carrier Endpoint Filter Lists

Lists all the endpoint filters that you created. On this page, you can edit, delete or create a new endpoint filter list.

Create New	Creates a new endpoint filter list. When you select Create New , you are automatically redirected to the New List page. You must enter a name to go to the Carrier Endpoint Filter Lists Settings page.
Edit	Modifies settings within an endpoint filter list in the list.
Delete	<p>Removes an endpoint filter in the list.</p> <p>To remove multiple endpoint filter lists from within the list, on the Carrier Endpoint Filter List page, in each of the rows of the endpoint filter lists you want removed, select the check box and then select Delete.</p> <p>To remove all endpoint filter lists from the list, on the Carrier Endpoint Filter List page, select the check box in the check box column and then select Delete.</p>
Name	The name of the endpoint filter.
# Entries	The number of carrier endpoint patterns in each carrier endpoint filter list.
MMS Profiles	The MMS profile that the carrier endpoint filter list is added to.
Comments	A description about the endpoint filter.

Ref.

Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a security policy; on the Profile page (**Security Profiles > Antivirus > Profiles**), 1 appears in **Ref.** .

To view the location of the referenced object, select the number in **Ref.**, and the Object Usage window appears displaying the various locations of the referenced object.

To view more information about how the object is being used, use one of the following icons that is available within the Object Usage window:

- **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at.
- **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a security policy and so, when this icon is selected, the user is redirected to the Edit Policy page.
- **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a security policy, and that security policy's settings appear within the table.

Carrier Endpoint Filter Lists Settings

Provides settings for configuring an endpoint filter.

Name	The name you entered on the New List page, after selecting Create New on the Carrier Endpoint Filter page.
Comments	A description about the endpoint filter. You can add one here if you did not enter one on the New List page.
Create New	Creates a new endpoint filter list. When you select Create New , you are automatically redirected to the New Entry page.
Edit	Select to modify the settings of a pattern in the list.
Delete	Select to remove a pattern in the list.
Enable	Enables a disabled pattern in the list.
Disable	Disables a pattern in the list.
Remove All Entries	Removes all patterns in the list on the Carrier Endpoint Filter Lists Settings page.
Enable	Indicates whether or not the pattern is enabled.

Pattern	Enter or change the pattern that FortiOS Carrier uses to match with carrier endpoints. The pattern can be a single carrier endpoint or consist of wildcards or Perl regular expressions that will match more than one carrier endpoint. Set Pattern Type to correspond to the pattern that you want to use.
Action	Select the action taken by FortiOS Carrier for messages from a carrier endpoint that matches the carrier endpoint pattern:
Pattern Type	The type of pattern chosen.
New Entry page	
Pattern	Enter or change the pattern that FortiOS Carrier uses to match with carrier endpoints. The pattern can be a single carrier endpoint or consist of wildcards or Perl regular expressions that will match more than one carrier endpoint. Set Pattern Type to correspond to the pattern that you want to use.
Action(s)	<p>Select the action taken by FortiOS Carrier for messages from a carrier endpoint that matches the carrier endpoint pattern:</p> <p>Action(s) can be:</p> <ul style="list-style-type: none"> • None • Block • Exempt from mass MMS • Exempt from all scanning
Content Archive	MMS messages from the carrier endpoint are delivered, the message content is DLP archived according to MMS DLP archive settings. Content archiving is also called DLP archiving.
Pattern Type	<p>Select a pattern type as one of Single Carrier Endpoint, Wildcard or Regular Expression.</p> <p>Wildcard and Regular Expression will match multiple patterns where Single Carrier Endpoint matches only one.</p>
Enable	Select to enable this carrier endpoint filter pattern.

Message flood protection

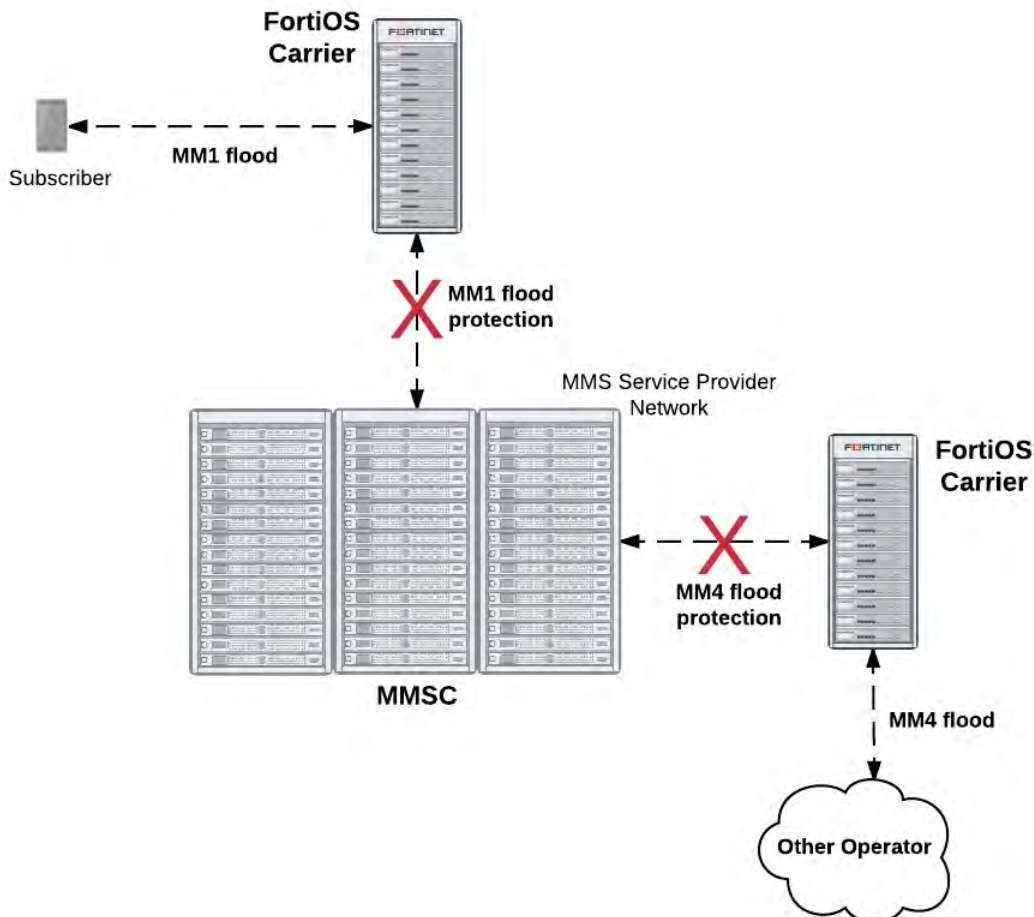

The convenience offered by MM1 and MM4 messaging can be abused by users sending spam or attempting to overload the network with an excess of messages. MMS flood prevention can help prevent this type of abuse.

Overview

Flood protection for MM1 messages prevents your subscribers from sending too many messages to your MMSC. Configuring flood protection for MM4 messages prevents another service provider from sending too many

messages from the same subscriber to your MMSC.

MM1 and MM4 flood protection

The FortiOS Carrier unit keeps track of the number of messages each subscriber sends for the length of time you specify. If the number of messages a subscriber sends exceeds the threshold, a configured action is taken. Possible actions are logging the flood, blocking or intercepting messages in the flood, archiving the flood messages, and sending an alert message to inform the administrator that the flood is occurring.

You can create three different thresholds to take different levels of action at different levels of activity.

With this highly configurable system, you can prevent subscribers from sending more messages than you determine is acceptable, or monitor anyone who exceeds the thresholds.

Setting message flood thresholds

A message flood occurs when a single subscriber sends a volume of messages that exceeds the flood threshold you set. The threshold defines the maximum number of messages allowed, the period during which the subscriber sent messages are considered, and the length of time the sender is restricted from sending messages after a flood is detected.

If a subscriber exceeds the message flood threshold and is blocked from sending more messages, any further attempts to send messages will re-start the block period. You must also enable logging for **MMS Scanning > Bulk Messages** in the Logging section of the MMS protection profile.

A subscriber is still able to receive messages while they are blocked from sending messages.

Example

For example, for the first threshold you may determine that any subscriber who sends more than 100 MM1 messages in an hour (60 minutes) will have all messages blocked for half an hour (30 minutes).

Using this example, if the subscriber exceeds the flood threshold, they are blocked from sending message for 30 minutes. If the subscriber tries to send any message after 15 minutes, the message will be blocked and the block period will be reset again to 30 minutes. The block period must expire with no attempts to send a message. Only then will the subscriber be allowed to send more messages.

To configure MM1 message flood threshold - web-based manager

1. Go to **Security Profiles > MMS Profile**.
2. Select **Create New**.
3. Enter `MM1 flood` for **Profile Name**.
4. Expand **MMS Bulk Email Filtering Detection**.
5. Enter the following information, and select **OK**.

MM1 (first column)	
Enable	Enable
Message Flood Window	60 minutes
Message Flood Limit	100
Message Flood Block Time	30 minutes
Message Flood Action	Block

To configure MM1 message flood threshold - CLI

```
config firewall mms-profile
edit profile_name
config flood mm1
set status1 enable
set window1 60
set limit1 100
set action1 block
set block-time1 30
end
end
```

The threshold values that you set for your network will depend on factors such as how busy your network is and the kinds of problems that your network and your subscribers encounter. For example, if your network is not too busy you may want to set message flood thresholds relatively high so that only an exceptional situation will exceed a flood threshold. Then you can use log messages and archived MMS messages to determine what caused the flood.

If your subscribers are experiencing problems with viruses that send excessive amounts of messages, you may want to set thresholds lower and enable blocking to catch problems as quickly as possible and block access to keep the problem from spreading.

Flood actions

When the Carrier-enabled FortiGate unit detects a message flood, it can take any combination of the five actions that you can configure for the flood threshold. For detailed options, see Message Flood.

Notifying administrators of floods

You can configure alert notifications for message floods by selecting the Alert Notification message flood action.

The FortiOS Carrier unit sends alert notifications to administrators using the MM1, MM3, MM4, or MM7 content interface. To send an alert notification you must configure addresses and other settings required for the content interface.

For example, to send notifications using the MM1 content interface you must configure a source MSISDN, hostname, URL, and port to which to send the notification. You can also configure schedules for when to send the notifications.

Finally you can add multiple MSISDN numbers to the MMS protection profile and set which flood thresholds to send to each MSISDN.

Example — three flood threshold levels with different actions for each threshold

You can set up to three threshold levels to take different actions at different levels of activity.

The first example threshold records log messages when a subscriber's handset displays erratic behavior by sending multiple messages using MM1 at a relatively low threshold. The erratic behavior could indicate a problem with the subscriber's handset. For example, you may have determined for your network that if a subscriber sends more the 45 messages in 30 minutes that you want to record log messages as a possible indication or erratic behavior.

From the web-based manager in an MMS profile set message **Flood Threshold 1** to:

Enable	Selected
Message Flood Window	30 minutes
Message Flood Limit	45
Message Flood Action	Log

From the CLI:

```
config firewall mms-profile
  edit profile_name
    config flood mm1
```

```

        set status1 enable
        set window1 30
        set limit1 45
        set action1 log
    end
end

```

Set a second higher threshold to take additional actions when a subscriber sends more that 100 messages in 30 minutes. Set the actions for this threshold to log the flood, archive the message that triggered the second threshold, and block the sender for 15 minutes.

From the web-based manager in an MMS profile set message **Flood Threshold 2** to:

Enable	Selected
Message Flood Window	30 minutes
Message Flood Limit	100
Message Block Time	15 minutes
Message Flood Action	Log, DLP archive First message only, Block

From the CLI:

```

config firewall mms-profile
  edit profile_name
    config flood mm1
      set status2 enable
      set window2 30
      set limit2 100
      set action2 block log archive-first
      set block-time2 15
    end
  end
end

```

Set the third and highest threshold to block the subscriber for an extended period and sand an administrator alert if the subscriber sends more than 200 messages in 30 minutes. Set the actions for this threshold to block the sender for four hours (240 minutes), log the flood, archive the message that triggered the third threshold, and send an alert to the administrator.

From the web-based manager in an MMS profile set message **Flood Threshold 3** to:

Enable	Selected
Message Flood Window	30 minutes
Message Flood Limit	200
Message Block Time	240 minutes
Message Flood Action	Log, Block, Alert Notification

Because you have selected the **Alert Notification** action you must also configure alert notification settings. For this example, the source MSISDN is 5551234—telephone number 555-1234. When administrators receive MMS messages from this MSISDN they can assume a message flood has been detected.

In this example, alert notifications are sent by the FortiOS Carrier unit to the MMSC using MM1. The host name of the MMSC is `mmscexample`, the MMSC URL is `/`, and the port used by the MMSC is 80. In this example, the alert notification window starts at 8:00am and extends for eight hours on weekdays (Monday-Friday) and the minimum interval between message flood notifications is two hours.

Source MSISDN	5551234
Message Protocol	MM1
Hostname	mmscexample
URL	/
Port	80
Notifications Per Second Limit	0
Window Start Time	8:00
Window Duration	8:00
Day of Week	Mon, Tue, Wed, Thu, Fri, Sat
Interval	2 hours

From the CLI:

```
config firewall mms-profile
  edit profile_name
    config notification alert-flood-1
      set alert-src-msisdn 5551234
      set msg-protocol mm1
      set mmsc-hostname mmscexample
      set mmsc-url /
      set mmsc-port 80
      set rate-limit 0
      set tod-window-start 8:00
      set tod-window-duration 8:00
      set days-allowed monday tuesday wednesday thursday friday
      set alert-int 2
      set alert-int-mode hours
    end
```

You must also add the MSISDNs of the administrators to be notified of the message flood. In this example, the administrator flood threshold 3 alert notifications are sent to one administrator with MSISDN 5554321.

To add administrator's MSISDNs for flood threshold 3 from the web-based manager when configuring a protection profile, select **MMS Bulk Email Filtering Detection > Recipient MSISDN > Create New**.

MSISDN	5554321
Flood Level 3	Select

From the CLI:

```
config firewall mms-profile
  edit profile_name
    config notif-msisdn
      edit 5554321
        set threshold flood-thresh-3
      end
    end
  end
```

Notifying message flood senders and receivers

The FortiOS Carrier unit does not send notifications to the sender or receiver that cause a message flood. If the sender or receiver is an attacker and is explicitly informed that they have exceeded a message threshold, the attacker may try to determine the exact threshold value by trial and error and then find a way around flood protection. For this reason, no notification is set to the sender or receiver.

However, FortiOS Carrier does have replacement messages for sending reply confirmations to MM1 senders and receivers and for MM4 senders for blocked messages identified as message floods. For information about how FortiOS Carrier responds when message flood detection blocks a message, see and MMS duplicate messages and message floods.

Responses to MM1 senders and receivers

When the FortiOS Carrier unit identifies an MM1 message sent by a sender to an MMSC as a flood message and blocks it, the FortiOS Carrier unit returns a message submission confirmation (`m-send.conf`) to the sender — otherwise the sender's handset would keep retrying the message. The `m-send.conf` message is sent only when the MM1 message flood action is set to Block. For other message flood actions the message is actually delivered to the MMSC and the MMSC sends the `m-send.conf` message.

You can customize the `m-send.conf` message by editing the **MM1 send-conf flood message** MM1 replacement message (from the CLI the `mm1-send-conf-flood` replacement message). You can customize the response status and message text for this message. The default response status is "Content not accepted". To hide the fact that FortiOS Carrier is responding to a flood, you can change the response status to "Success". The default message text informs the sender that the message was blocked. You could change this to something more generic.

For example, the following command sets the submission confirmation response status to "Success" and changes the message text to "Message Sent OK":

```
config system replacemsg mm1 mm1-send-conf-flood
  set rsp-status ok
  set rsp-text "Message Sent OK"
end
```

When the FortiOS Carrier unit identifies an MM1 message received by a receiver from an MMSC as a flood message and blocks it, the FortiOS Carrier unit returns a message retrieval confirmation (`m-retrieve.conf`) to the sender (otherwise the sender's handset would keep retrying the message). The `m-retrieve.conf` message is sent only when the MM1 message flood action is set to Block. For other message flood actions the message is actually delivered to the receiver, so the MMSC sends the `m-retrieve.conf` message.

You can customize the m-retrieve.conf message by editing the **MM1 retrieve-conf flood message** MM1 replacement message (from the CLI the `mm1-retr-conf-flood` replacement message). You can customize the class, subject, and message text for this message.

For example, you could use the following command make the response more generic:

```
config system replacemsg mm1 mm1-retr-conf-flood
  set subject "Message blocked"
  set message "Message temporarily blocked by carrier"
end
```

Forward responses for MM4 message floods

When the FortiOS Carrier unit identifies an MM4 message as a flood message and blocks it, the FortiOS Carrier unit returns a message forward response (MM4_forward.res) to the forwarding MMSC (otherwise the forwarding MMSC would keep retrying the message). The MM4_forward.res message is sent only when the MM4 message flood action is set to Block and the MM4-forward.req message requested a response. For more information, see and MMS duplicate messages and message floods.

You can customize the MM4_forward.res message by editing the **MM4 flood message** MM4 replacement message (from the CLI the `mm4-flood` replacement message). You can customize the response status and message text for this message. The default response status is "Content not accepted" (`err-content-not-accept`). To hide the fact that the FortiOS Carrier unit is responding to a flood, you can change the response status to "Success". The default message text informs the sender that the message was blocked. You could change this to something more generic.

For example, the following command sets the submission confirmation response status to "Success" and changes the message text to "Message Sent OK" for the MM4 message forward response

```
config system replacemsg mm4 mm4-flood
  set rsp-status ok
  set rsp-text "Message Forwarded OK"
end
```

Viewing DLP archived messages

If **DLP Archive** is a selected message flood action, the messages that exceed the threshold are saved to the MMS DLP archive. The default behavior is to save all of the offending messages, but you can configure the DLP archive setting to save only the first message that exceeds the threshold. This still provides a sample of the offending messages without requiring as much storage.

To select only the first message in a flood for DLP archiving - web-based manager

1. Go to **Security Profiles > MMS Profile**.
2. Edit an existing MMS Profile.
3. Expand the **MMS Bulk Email Filtering Detection** section, the **Message Flood** subsection, and the desired **Flood Threshold** subsection.
4. Next to **DLP Archive**, select **First message only** from the drop down menu.
5. Select **OK**.

Order of operations: flood checking before duplicate checking

Although duplicate checking involves only examination and comparison of message contents and not the sender or recipient, and flood checking involves only totaling the number of messages sent by each subscriber regardless

of the message content, there are times when a selection of messages exceed both flood and duplicate thresholds.

The Carrier-enabled FortiGate unit checks for message floods before checking for duplicate messages. Flood checking is less resource-intensive and if the flood threshold invokes a **Block** action, the blocked messages are stopped before duplicate checking occurs. This saves both time and FortiOS Carrier system resources.

The duplicate scanner will only scan content. It will not scan headers. Content must be exactly the same. If there is any difference at all in the content, it will not be considered a duplicate.

Bypassing message flood protection based on user's carrier endpoints

You can use carrier endpoint filtering to exempt MMS sessions from message flood protection. Carrier endpoint filtering matches carrier endpoints in MMS sessions with carrier endpoint patterns.

If you add a carrier endpoint pattern to a filter list and set the action to exempt from mass MMS, all messages from matching carrier endpoints bypass message flood protection. This allows legitimate bulk messages, such as system outage notifications, to be delivered without triggering message flood protection.

For more information on carrier endpoints, see the User Authentication chapter of the FortiOS Handbook.

Configuring message flood detection

To have the Carrier-enabled FortiGate unit check for message floods, you must first configure the flood threshold in an MMS profile, select the MMS profile in a security policy. All the traffic examined by the security policy will be checked for message floods according to the threshold values you set in the MMS profile.

Configure the MMS profile - web-based manager

1. Go to **Firewall Objects > MMS Profile**.
2. If you are editing an MMS profile, select the **Edit** icon of the MMS profile.
If you are creating a new MMS profile, select **Create New** and enter a profile name.
3. Expand **MMS Bulk Email Filtering Detection**.
4. Expand **Message Flood**.
5. Expand **Flood Threshold 1**.
6. Select the **Enable** check box for MM1 messages, MM4 messages, or both.
7. In the **Message Flood Window** field, enter the length of time the Carrier-enabled FortiGate unit will keep track of the number of messages each subscriber sends.
If the Carrier-enabled FortiGate unit detects the quantity of messages specified in the **Message Flood Limit** sent during the number of minutes specified in the **Message Flood Window**, a message flood is in progress.
8. In the **Message Flood Limit** field, enter the number of messages required to trigger the flood.
9. In the **Message Flood Block Time** field, enter the length of time a user will be blocked from sending messages after causing the message flood.
10. Select the message flood actions the Carrier-enabled FortiGate unit will take when the message flood is detected.
11. Select **OK**.

Configure the security policy - web-based manager

1. Go to **Policy**.
2. Select the **Edit** icon of the security policy that controls the traffic in which you want to detect message floods.
3. Select the **MMS Profile** check box to enable the use of a protection profile.
4. Select the MMS protection profile from the list.
5. Select **OK**.

Sending administrator alert notifications

When message floods are detected, the Carrier-enabled FortiGate unit can be configured to notify you immediately with an MMS message. Enable this feature by selecting Alert Notification in the message flood action. Each message flood threshold can be configured separately.

Configuring how and when to send alert notifications

You can configure different alert notifications for MM1 and MM4 message floods. You can configure the FortiOS Carrier unit to send these alert notifications using the MM1, MM3, MM4, or MM7 content interface. Each of these content interfaces requires alert notification settings that the FortiOS Carrier unit uses to communicate with a server using the selected content interface.

For the MM1 content interface you require:

- The hostname of the server
- The URL of the server (usually "/")
- The server port (usually 80)

For the MM3 and MM4 content interfaces you require:

- The hostname of the server
- The server port (usually 80)
- The server user domain

For the MM7 content interface you require:

- The message type
- **submit.REQ** to send a notification message to the sender in the form of a submit request. The message goes from a VAS application to the MMSC.
- **deliver.REQ** to send a notification message to the sender in the form of a deliver request. The message goes from the MMSC to a VAS application.
- The hostname of the server
- The URL of the server (usually "/")
- The server port (usually 80)
- A user name and password to connect to the server
- The value-added-service-provider (VASP) ID
- The value-added-service (VAS) ID

For more information, see MMS notifications.

To configure administrator alert notifications - web-based manager

1. Go to **Firewall Objects > MMS Profile** and edit or add a new MMS protection profile.
2. Expand **MMS Bulk Email Filtering Detection**.
There are three message flood thresholds.
3. Expand the threshold that you want to configure alert notification for.
4. For **Message Flood Action**, select the **Alert Notification** check box. Alert notification options appear.
5. For the **Source MSISDN**, enter the MSISDN from which the alert notification message will be sent.
6. Select the Message Protocol the alert notification will use: **MM1**, **MM3**, **MM4**, or **MM7**.
7. Add the information required by FortiOS Carrier to send messages using the selected message protocol:
8. For **Notifications Per Second Limit**, enter the number of notifications to send per second.
Use this setting to reduce control the number of notifications sent by the FortiOS Carrier unit. If you enter zero (0), the notification rate is not limited.
9. If required, change **Window Start Time** and **Window Duration** configure when the FortiOS Carrier unit sends alert notifications.
By default, notifications are sent at any time of the day. You can change the Window Start Time if you want to delay sending alert messages. You can also reduce the Window Duration if you want to stop sending alert notifications earlier.

For example, you might not want FortiOS Carrier sending notifications except during business hours. In this case the Window Start Time could be 9:00 and the Window Duration could be 8:00 hours.

You can set different alert notifications for each message threshold. For example, you could limit the message window for lower thresholds and set it to 24 hours for higher thresholds. This way administrators will only receive alert notifications outside of business hours for higher thresholds.
10. For **Day of Week**, select the days of the week to send notifications.
For example, you may only want to send alert notifications on weekends for higher thresholds.
11. In the **Interval field**, enter the maximum frequency that alert notification messages will be sent, in minutes or hours.
All alerts occurring during the interval will be included in a single alert notification message to reduce the number of alert messages that are sent.

Configuring who to send alert notifications to

In each MMS protection profile you add a list of recipient MSISDNs. For each of these MSISDNs you select the message flood threshold that triggers sending notifications to this MSISDN.

To configure the alert notification recipients - web-based manager

1. Go to **Firewall Objects > MMS Profile**.
2. Select the **Edit** icon of the MMS profile in which you want to configure the alert notification recipients.
3. Expand **MMS Bulk Email Filtering Detection**.
4. Expand **Recipient MSISDN**.
5. Select **Create New**.
6. In the **New MSISDN** window, enter the MSISDN to use for flood threshold alert notification.
7. Select the duplicate thresholds at which to send alert notifications to the MSISDN.

For the flood threshold to be able to send an alert notification to the MSISDN, the alert notification action must be enabled and configured within the flood threshold.

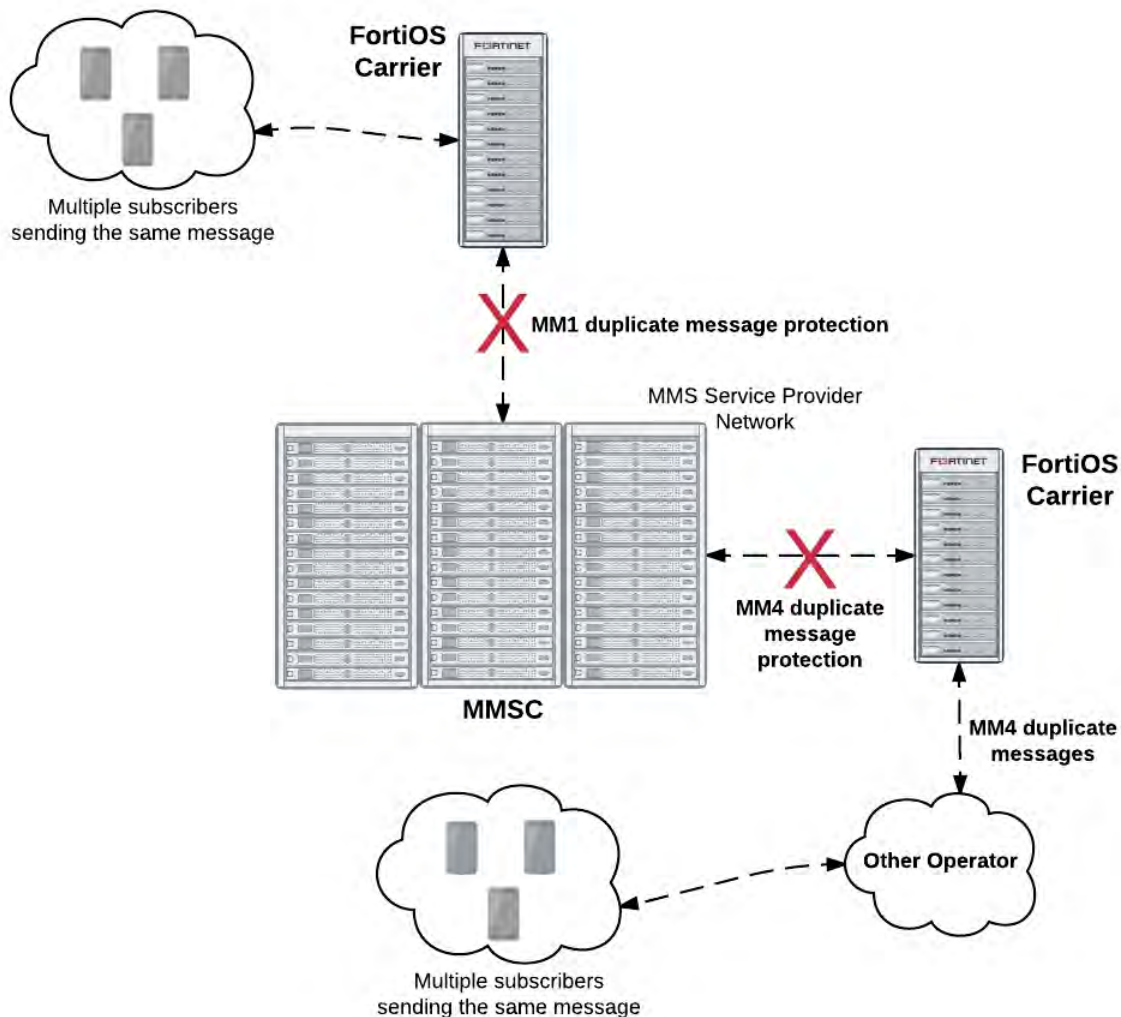

Duplicate message protection

The convenience offered by MM1 and MM4 messaging can be abused by users sending spam or other unwanted messages. Often, the same message will be sent by multiple subscribers. The message can be spam, viral marketing, or worm-generated messages. MMS duplicate prevention can help prevent this type of abuse by keeping track of the messages being sent.

Overview

Duplicate message protection for MM1 messages prevents multiple subscribers from sending duplicate messages to your MMSC. Duplicate message protection for MM4 messages prevents another service provider from sending duplicate messages from the same subscriber to your MMSC. This can help prevent a potential flood that would otherwise become widespread between carriers.

MM1 and MM4 duplicate message protection

The FortiOS Carrier unit keeps track of the sent messages. If the same message appears more often than the threshold value you configure, then action is taken. Possible actions are logging the duplicates, blocking or intercepting duplicate messages, archiving the duplicate messages, and sending an alert to inform an administrator that duplicates are occurring.

With this highly configurable system, you can prevent the transmission of duplicate messages when there are more than you determine is acceptable.

For detailed configuration options, see Duplicate Message.

Using message fingerprints to identify duplicate messages

The Carrier-enabled FortiGate unit detects duplicates by keeping a record of all the messages travelling on the network and comparing new messages to those that have already been sent.

Rather than save the messages, the FortiOS carrier creates a checksum using the message body and subject. This serves as a fingerprint to identify the message. If another message with the same message body and subject appears, the fingerprint will also be the same and the Carrier-enabled FortiGate unit will recognize it as a duplicate.

By creating and saving message fingerprints instead of saving the messages, the Carrier-enabled FortiGate unit can save resources and time.

Messages from any sender to any recipient

Duplicate message detection will detect duplicate messages regardless of the sender or recipient. To do this, message fingerprints are generated using only the message body and subject. The sender, recipient, and other header information is not included.

If multiple messages appear with the same subject and message body, the Carrier-enabled FortiGate unit will recognize them as being the same.

Setting duplicate message thresholds

The FortiOS Carrier recognizes all duplicate messages, but it will take action when it detects a volume of duplicate messages that exceed the duplicate threshold you set. The threshold defines the maximum number of duplicate messages allowed, the period during which the messages are considered, and the length of time the duplicate message can not be sent by anyone.

For example, you may determine that once a duplicate message is sent more than 300 times in an hour, any attempt to send the same duplicate message will be blocked for 30 minutes.

If a particular duplicate message exceeds the duplicate message threshold and is blocked, any further attempts to send the same message will re-start the block period.

Using the example above, if the duplicate message count exceeds the duplicate threshold, any attempt to send a copy of the duplicate message will be blocked for 30 minutes. If a subscriber tries to send a copy of the message after waiting 15 minutes, the message will be blocked and the block period will be reset to 30 minutes. The block period must expire with no attempts to send a duplicate message. Only then will a subscriber be allowed to send the message. Non-duplicate messages will not reset the block period.

Duplicate message actions

When the Carrier-enabled FortiGate unit detects that a duplicate message has exceeded duplicate threshold, it can take any combination of the five actions you configure for the duplicate threshold.

Action	Description
Log	Add a log entry indicating that a duplicate message event has occurred. You must also enable logging for MMS Scanning > Bulk Messages in the Logging section of the MMS protection profile.
DLP Archive	

Action	Description
All messages	Save all the messages that exceed the duplicate threshold in the DLP archive.
First message only	Save the first message to exceed the duplicate threshold in the DLP archive. Subsequent messages that exceed the duplicate threshold will not be saved.
Intercept	Messages that exceed the duplicate threshold are passed to the recipients, but if quarantine is enabled for intercepted messages, a copy of each message is also quarantined for later examination. If the quarantine of intercepted messages is disabled, the Intercept action has no effect.
Block	Messages that exceed the duplicate threshold are blocked and will not be delivered to the message recipients. If quarantine is enabled for blocked messages, a copy of each blocked message is quarantined for later examination.
Alert Notification	If the duplicate threshold is exceeded, the Carrier-enabled FortiGate unit will send an MMS duplicate message notification message.

Notifying duplicate message senders and receivers

The FortiOS Carrier unit does not send notifications to the sender or receiver of duplicate messages. If the sender or receiver is an attacker and is explicitly informed that they have exceeded a message threshold, the attacker may try to determine the exact threshold value by trial and error and then find a way around duplicate message protection. For this reason, no notification is set to the sender or receiver.

However, the FortiOS Carrier unit does have replacement messages for sending reply confirmations to MM1 senders and receivers and for MM4 senders for blocked messages identified as duplicate messages. For information about how FortiOS Carrier responds when message flood detection blocks a message, see and MMS duplicate messages and message floods.

Responses to MM1 senders and receivers

When the FortiOS Carrier unit identifies an MM1 message sent by a sender to an MMSC as a duplicate message and blocks it, the FortiOS Carrier unit returns a message submission confirmation (m-send.conf) to the sender (otherwise the sender's handset would keep retrying the message). The m-send.conf message is sent only when the MM1 duplicate message action is set to Block. For other duplicate message actions the message is actually delivered to the MMSC and the MMSC sends the m-send.conf message.

You can customize the m-send.conf message by editing the **MM1 send-conf duplicate message** MM1 replacement message (from the CLI the `mm1-send-conf-dupe` replacement message). You can customize the response status and message text for this message. The default response status is "Content not accepted". To hide the fact that the FortiOS Carrier unit is responding to a duplicate message, you can change the response status to "Success". The default message text informs the sender that the message was blocked. You could change this to something more generic.

For example, the following command sets the submission confirmation response status to "Success" and changes the message text to "Message Sent OK":

```
config system replacemsg mm1 mm1-send-conf-dupe
  set rsp-status ok
  set rsp-text "Message Sent OK"
end
```

When the FortiOS Carrier unit identifies an MM1 message received by a receiver from an MMSC as a duplicate message and blocks it, the FortiOS Carrier unit returns a message retrieval confirmation (m-retrieve.conf) to the sender (otherwise the sender's handset would keep retrying). The m-retrieve.conf message is sent only when the MM1duplicate message action is set to Block. For other message flood actions the message is actually received by the receiver, so the MMSC sends the m-retrieve.conf message.

You can customize the m-retrieve.conf message by editing the **MM1 retrieve-conf duplicate message** MM1 replacement message (from the CLI the mm1-retr-conf-dupe replacement message). You can customize the class, subject, and message text for this message.

For example, you could use the following command make the response more generic:

```
config system replacemsg mm1 mm1-retr-conf-dupe
  set subject "Message blocked"
  set message "Message temporarily blocked by carrier"
end
```

Forward responses for duplicate MM4 messages

When the FortiOS Carrier unit identifies an MM4 message as a duplicate message and blocks it, the FortiOS Carrier unit returns a message forward response (MM4_forward.res) to the forwarding MMSC (otherwise the forwarding MMSC would keep retrying the message). The MM4_forward.res message is sent only when the MM4 duplicate message action is set to Block and the MM4-forward.req message requested a response. For more information, see and MMS duplicate messages and message floods.

You can customize the MM4_forward.res message by editing the **MM4 duplicate message** MM4 replacement message (from the CLI the mm4-dupe replacement message). You can customize the response status and message text for this message. The default response status is "Content not accepted" (err-content-not-accept). To hide the fact that the FortiOS Carrier unit is responding to a duplicate message, you can change the response status to "Success". The default message text informs the sender that the message was blocked. You could change this to something more generic.

For example, the following command sets the submission confirmation response status to "Success" and changes the message text to "Message Forwarded OK":

```
config system replacemsg mm4 mm4-dupe
  set rsp-status ok
  set rsp-text "Message Forwarded OK"
end
```

Viewing DLP archived messages

If **DLP Archive** is a selected duplicate message action, the messages that exceed the threshold are saved to the MMS DLP archive. The default behavior is to save all of the offending messages but you can configure the DLP archive setting to save only the first message that exceeds the threshold. See Viewing DLP archived messages.

Order of operations: flood checking before duplicate checking

Although duplicate checking involves only examination and comparison of message contents and not the sender or recipient, and flood checking involves only totalling the number of messages sent by each subscriber

regardless of the message content, there are times when a selection of messages exceed both flood and duplicate thresholds.

The Carrier-enabled FortiGate unit checks for message floods before checking for duplicate messages. Flood checking is less resource-intensive and if the flood threshold invokes a **Block** action, the blocked messages are stopped before duplicate checking occurs. This saves both time and FortiOS Carrier system resources.

Bypassing duplicate message detection based on user's carrier endpoints

You can use carrier endpoint filtering to exempt MMS sessions from duplicate message detection. Carrier endpoint filtering matches carrier endpoints in MMS sessions with carrier endpoint patterns. If you add a carrier endpoint pattern to a filter list and set the action to exempt from mass MMS, all messages from matching carrier endpoints bypass duplicate message detection. For more information about endpoints, see FortiOS Handbook User Authentication guide.

Configuring duplicate message detection

To have the Carrier-enabled FortiGate unit check for duplicate messages, configure the duplicate threshold in an MMS profile, and select the MMS profile in a security policy.

All traffic matching the security policy will be checked for duplicate messages according to the settings in the MMS profile.

The duplicate scanner will only scan content. It will not scan headers. Content must be exactly the same. If there is any difference at all in the content, it will not be considered a duplicate.

The modular nature of the profiles allows you great flexibility in how you configure the scanning options. MMS profiles can be used in any number of policies, with different GTP profiles.

In a complex configuration, there may be many security policies, each with a different MMS profile. For a simpler network, you may have many security policies all using the same MMS profile.

Sending administrator alert notifications

When duplicate messages are detected, the Carrier-enabled FortiGate unit can be configured to notify you immediately with an MMS message. Enable this feature by selecting Alert Notification in the duplicate message action. Each duplicate message threshold can be configured separately.

Configuring how and when to send alert notifications

You can configure different alert notifications for MM1 and MM4 duplicate messages. You can configure the FortiOS Carrier unit to send these alert notifications using the MM1, MM3, MM4, or MM7 content interface. Each of these content interfaces requires alert notification settings that the FortiOS Carrier unit uses to communicate with a server using the selected content interface.

For the MM1 content interface you require:

- The hostname of the server
- The URL of the server (usually "/")
- The server port (usually 80)

For the MM3 and MM4 content interfaces you require:

- The hostname of the server
- The server port (usually 80)
- The server user domain

For the MM7 content interface you require:

- The message type
- **submit.REQ** to send a notification message to the sender in the form of a submit request. The message goes from a VAS application to the MMSC.
- **deliver.REQ** to send a notification message to the sender in the form of a deliver request. The message goes from the MMSC to a VAS application.
- The hostname of the server
- The URL of the server (usually "/")
- The server port (usually 80)
- A user name and password to connect to the server
- The value-added-service-provider (VASP) ID
- The value-added-service (VAS) ID

To configure administrator alert notifications - web-based manager

1. Go to **Security Profiles > MMS Profile** and edit or add a new MMS protection profile.
2. Expand **MMS Bulk Email Filtering Detection**.
There are three duplicate message thresholds.
3. Expand the threshold that you want to configure alert notification for.
4. For **Duplicate Message Action**, select the **Alert Notification** check box. Alert notification options appear.
5. For the **Source MSISDN**, enter the MSISDN from which the alert notification message will be sent.
6. Select the Message Protocol the alert notification will use: **MM1**, **MM3**, **MM4**, or **MM7**.
7. Add the information required by FortiOS Carrier to send messages using the selected message protocol:
8. For **Notifications Per Second Limit**, enter the number of notifications to send per second.
Use this setting to reduce control the number of notifications sent by the FortiOS Carrier unit. If you enter zero (0), the notification rate is not limited.
9. If required, change **Window Start Time** and **Window Duration** configure when the FortiOS Carrier unit sends alert notifications.
By default, notifications are sent at any time of the day. You can change the Window Start Time if you want to delay sending alert messages. You can also reduce the Window Duration if you want to stop sending alert notifications earlier.

For example, you might not want FortiOS Carrier sending notifications except during business hours. In this case the Window Start Time could be 9:00 and the Window Duration could be 8:00 hours.

You can set different alert notifications for each message threshold. For example, you could limit the message window for lower thresholds and set it to 24 hours for higher thresholds. This way administrators will only receive alert notifications outside of business hours for higher thresholds.
10. For **Day of Week**, select the days of the week to send notifications.
For example, you may only want to send alert notifications on weekends for higher thresholds.
11. In the **Interval field**, enter the maximum frequency that alert notification messages will be sent, in minutes or hours.

All alerts occurring during the interval will be included in a single alert notification message to reduce the number of alert messages that are sent.

Configuring who to send alert notifications to

In each MMS protection profile you add a list of recipient MSISDNs. For each of these MSISDNs you select the duplicate threshold that triggers sending notifications to this MSISDN.

To configure the alert notification recipients - web-based manager

1. Go to **Security Profiles > MMS Profile**.
2. Select the **Edit** icon of the MMS profile in which you want to configure the alert notification recipients.
3. Expand **MMS Bulk Email Filtering Detection**.
4. Expand **Recipient MSISDN**.
5. Select **Create New**.
6. In the **New MSISDN** window, enter the MSISDN to use for duplicate threshold alert notification.

Select the duplicate thresholds at which to send alert notifications to the MSISDN.

For the duplicate threshold to be able to send an alert notification to the MSISDN, the duplicate message threshold alert notification action must be enabled and configured.

Employing MMS Security features

FortiOS Carrier includes all the Security features of FortiOS with extra features specific to MMS carrier networks.

This section includes:

Why scan MMS messages for viruses and malware?

The requirement for scanning MM1 content comes from the fact that MMS is an increasingly popular technique for propagating malware between mobile devices.

Example: COMMWARRIOR

This is a virus for Series 60 type cell phones, such as Nokia, operating Symbian OS version 6 [or higher]. The object of the virus is to spread to other phones using Bluetooth and MMS as transport avenues. The targets are selected from the contact list of the infected phone and also sought via Bluetooth searching for other Bluetooth-enabled devices (phones, printers, gaming devices etc.) in the proximity of the infected phone.

This virus is more than a proof of concept - it has proven successfully its ability to migrate from a zoo collection to being in-the-wild. Currently, this virus is being reported in over 18 different countries around Europe, Asia and North America.

When the virus first infects a cell phone, a prompt is displayed asking the recipient if they want to install "Caribe". Symptoms of an infected phone may include rapid battery power loss due to constant efforts by the virus to spread to other phones via a Bluetooth seek-and-connect outreach.

The following variants among others are currently scanned by the FortiOS Carrier devices, in addition to more signatures that cover all known threats.

- **SymbOS/COMWAR.V10B!WORM**
- Aliases: SymbOS.Commwarrior.B, SymbOS/Commwar.B, SymbOS/Commwar.B!wm, SymbOS/Commwar.B-net, SymbOS/Commwarrior.b!sis, SymbOS/Comwar.B, SymbOS/Comwar.B!wm, SymbOS/Comwar.B-wm, SYMBOS_COMWAR.B, SymbOS/Comwar.1.0.B!wormSYMBOS/COMWAR.V10B.SP!WORM [Spanish version]
- First Discovered In The Wild: July 04, 2007
- Impact Level: 1
- Virus Class: Worm
- Virus Name Size: 23,320
- **SymbOS/Commwar.A!worm**
- Aliases: Commwarrior-A, SymbOS.Commwarrior.A [NAV], SymbOS/Commwar.A-net, SymbOS/Commwar_ezboot.A-ne, SymbOS/Comwar.A, SymbOS/Comwar.A-wm, SYMBOS_COMWAR.A [Trend]
- First Discovered In The Wild: May 16 2005
- Impact Level: 1
- Virus Class: Worm
- Virus Name Size: 27,936
- SymbOS/Commwarriie.C-wm
- Aliases: None
- First Discovered In The Wild: Oct 17 2005
- Impact Level: 1
- Virus Class: File Virus
- Virus Name Size: None

For the latest list of threats Fortinet devices detect, visit the FortiGuard Center.

MMS virus scanning

You can use MMS virus scanning to scan content contained within MMS messages for viruses. FortiOS Carrier virus scanning can be applied to the MM1, MM3, MM4, and MM7 interfaces to detect and remove content containing viruses at many points in an MMS network. Perhaps the most useful interface to apply virus scanning would be the MM1 interface to block viruses sent by mobile users before they get into the service provider network.

To go to MMS virus scanning, go to **Security Profiles MMS Profile**, select an existing or create a new profile, and expand **MMS Scanning**. See MMS scanning options.

This section includes:

- [MMS virus monitoring](#)
- [MMS virus scanning blocks messages \(not just attachments\)](#)
- [Scanning MM1 retrieval messages](#)
- [Configuring MMS virus scanning](#)
- [Removing or replacing blocked messages](#)
- [Carrier Endpoint Block](#)
- [MMS Content Checksum](#)
- [Passing or blocking fragmented messages](#)
- [Client comforting](#)
- [Server comforting](#)
- [Handling oversized MMS messages](#)

MMS virus monitoring

To enable MMS virus monitoring, expand **MMS Scanning** and enable **Monitor only** for the selected MMS types.

This feature causes the FortiOS Carrier unit to record log messages when MMS scanning options find a virus, match a file name, or match content using any of the other MMS scanning options. Selecting this option enables reporting on viruses and other problems in MMS traffic without affecting users.

MMS virus scanning blocks messages (not just attachments)

To enable MMS virus scanning, expand **MMS Scanning** and enable **Virus Scan** for the selected MMS types.

Because MM1 and MM7 use HTTP, the oversize limits for HTTP and the HTTP antivirus port configurations also apply to MM1 and MM7 scanning. See

MM3 and MM4 use SMTP and the oversize limits for SMTP and the SMTP antivirus port configurations also apply to MM3 and MM4 scanning.

The message contents will be scanned for viruses, matched against the file extension blocking lists and scanned for banned words. All these items will be configured via the standard GUI interfaces available for the other protocols and will be controlled at the protection profile level with new options specifically for the MM1 messages.

The FortiOS Carrier unit extracts the sender's Mobile Subscriber Integrated Services Digital Network Number (MSISDN) from the HTTP headers if available. The `POST` payload will be sent to the scan units which will parse the MMS content and scan each message data section. If any part of the data is to be blocked, the proxy will be informed, the connection to the MMSC will be reset and the Carrier-enabled FortiGate unit will return an `HTTP 200 OK` message with an `m-send-conf` payload to the client to prevent a retry. Finally the appropriate logging, alert, and replacement message events will be triggered.

For client notification, the `x-mms-response-status` and `x-mms-response-text` fields can also be customized as required.

Scanning MM1 retrieval messages

To scan MM1 retrieval messages, expand **MMS Scanning** and select **Scan MM1 message retrieval**.

Select to scan message retrievals that use MM1. If you enable **Virus Scan** for all MMS interfaces, messages are also scanned while being sent. In this case, you can disable MM1 message retrieval scanning to improve performance.

Configuring MMS virus scanning

To configure MMS virus scanning, expand **MMS Scanning** and enable **Virus Scan**.

Once applied to a security policy, the MMS protection profile will then perform virus scans on all traffic accepted by that policy.

Removing or replacing blocked messages

To remove blocked messages, expand **MMS Scanning** and select **Remove Blocked** for the selected MMS types.

Select **Remove Blocked** remove blocked content from each protocol and replace it with the replacement message. If FortiOS Carrier is to preserve the length of the message when removing blocked content, as may occur when billing is affected by the length of the message, select **Constant**.

If you only want to monitor blocked content, select **Monitor Only**.

Carrier Endpoint Block

A carrier endpoint defines a specific client on the carrier network. Typically the client IP address is used to identify the client, however on a carrier network this may be impractical when the client is using a mobile device. Other identifying information such as the MSISDN number is used instead.

This information can be used to block a specific endpoint on the network. Reasons for blocking may include clients whose accounts have expired, clients from another carrier, clients who have sent malicious content (phishing, exploits, viruses, etc), or other violations of terms of use.

Enabling carrier endpoint blocking

To enable carrier endpoint blocking you first need to create a carrier endpoint filter list, and then enable it.

To enable carrier endpoint blocking - web-based manager

1. Create a carrier endpoint filter list.
2. Go to **Security Profiles > MMS Profile**.
3. Select **Create New**, or select an existing profile to edit and select **Edit**.
4. Expand MMS Scanning.
5. Select one or more types of MMS messaging to enable endpoint blocking on.
6. Select the carrier endpoint filter list to use in matching the endpoints to be blocked.

In MMS Profile, endpoints can only be blocked.

Create a carrier endpoint filter list

A carrier endpoint filter list contains one or more carrier endpoints to match. When used in MMS scanning entries in the filter list that are matched are blocked.

You can configure multiple filter lists for different purposes and groups of clients, such as blocking clients, clients with different levels of service agreements, and clients from other carriers. See Carrier endpoint filter lists configuration settings.

To create a carrier endpoint filter list - web-based manager

1. Go to **Security Profiles > Carrier Endpoint Filter Lists**.
2. Select **Create New**.
3. Enter a descriptive name for the filter list, such as `blocked_clients` or `CountryX_clients`, and select **OK**.
4. Select **Create New** to add one or more entries to the list.
5. Select **OK** to return to display the list of filter lists.

Configuring endpoint filter list entries

For each single endpoint or group of endpoints have part of their identifying information in common, you create an entry in the endpoint filter list.

For example a `blocked_clients` filter list may include entries for single endpoints added as each one needs to be blocked and a group of clients from a country that does not allow certain services.

To configure an endpoint filter list entry - web-based manager

1. Select **Create New**.
2. Enter the following information and select **OK**.

Name	Name of endpoint filter list. Select this name in an MMS protection profile.
Comments	Optional description of the endpoint filter list.
Check/Uncheck All	<p>Select the check box to enable all endpoint patterns in the MMS filter list.</p> <p>Clear the check box to disable all entries on the MMS filter list.</p> <p>You can also select or clear individual check boxes to enable or disable individual endpoint patterns.</p>
Pattern	The pattern that FortiOS Carrier uses to match with endpoints. The pattern can be a single endpoint or consist of wildcards or Perl regular expressions that will match more than one endpoint. For more on wildcard and regular expressions, see Using wildcards and Perl regular expressions in the UTM guide.
Action	<p>Select the action taken by FortiOS Carrier for messages from a carrier endpoint that matches the endpoint pattern:</p> <p>None - No action is taken.</p> <p>Block - MMS messages from the endpoint are not delivered and FortiOS Carrier records a log message.</p> <p>Exempt from mass MMS - MMS messages from the endpoint are delivered and are exempt from mass MMS filtering. Mass MMS filtering is configured in MMS protection profiles and is also called MMS Bulk Email Filtering and includes MMS message flood protection and MMS duplicate message detection. A valid use of mass MMS would be when a service provider notifies customers of a system-wide event such as a shutdown.</p> <p>Exempt from all scanning - MMS messages from the endpoint are delivered and are exempt from all MMS protection profile scanning.</p>

Content Archive	MMS messages from the endpoint are delivered, the message content is DLP archived according to MMS DLP archive settings. Content archiving is also called DLP archiving.
Intercept	MMS messages from the endpoint are delivered. Based on the quarantine configuration, attached files may be removed and quarantined.
Pattern Type	The pattern type: Wildcard , Regular Expression , or Single Endpoint .
Enable	Select to enable this endpoint filter pattern.

Blocking network access based on endpoints

You can use endpoint IP filtering to block traffic from source IP addresses associated with endpoints. You can also configure FortiOS Carrier to record log messages whenever endpoint IP filtering blocks traffic. Endpoint IP filtering blocks traffic at the IP level, before the traffic is accepted by a security policy.

To configure endpoint IP filtering, go to **Security Profiles > IP Filter** and add endpoints to the IP filter list. For each endpoint you can enable or disable both blocking traffic and logging blocked traffic.

You cannot add endpoint patterns to the endpoint IP filter list. You must enter complete and specific endpoints that are valid for your network.

The only action available is block. You cannot use endpoint IP filtering to exempt endpoints from IP filtering or to content archive or quarantine communication sessions.

FortiOS Carrier looks in the current user context list for the endpoints in the IP filter list and extracts the source IP addresses for these endpoints. Then any communication session with a source IP address that matches one of these IP addresses is blocked at the IP level, before the communication session is accepted by a security policy.

FortiOS Carrier dynamically updates the list of IP addresses to block as the user context list changes. Only these updated IP addresses are blocked by endpoint IP filtering.

For information about the carrier endpoints and the user context list, including how entries are added to and removed from this list.

MMS Content Checksum

The MMS content checksum feature attempts to match checksums of known malicious MMS messages, and on a successful match it will be blocked. The checksums are applied to each part of the message—attached files and message body have separate checksums. These checksums are created with CRC-32, the same method as FortiAnalyzer checksums.

For example, if an MMS message contains a browser exploit in the message body, you can add the checksum for that message body to the list, and future occurrences of that exact message will be blocked. Content will be replaced by the content checksum block notification replacement message for that type of MMS message, and if it is enabled the event will be logged.

One possible implementation would be to configure all .sis files to be intercepted. When one is found to be infected or malicious it would be added to the MMS content checksum list.

To use this feature a list of one or more malicious checksums must be created and then the feature is enabled using that list. For a detailed list of options, see MMS Content Checksum.

To configure an MMS content checksum list

1. Go to **Security Profiles > MMS Content Checksum**.
2. Select **Create New**.
3. Enter a name for the list of checksums, and select **OK**.
You are taken to the edit screen for that new list.
4. Select **Create New** to add a checksum.
5. Enter the **Name** and **Checksum**, and select **OK**.
The checksum is added to the list.

To add more checksums to the list, repeat steps 4 and 5.

To remove a checksum from the list you can either delete the checksum or simply disable it and leave it in the list.

To enable MMS content checksums, expand **MMS Scanning** and select **MMS Content Checksum** for the selected MMS types. Select the checksum list to match.

Passing or blocking fragmented messages

Select to pass fragmented MM3 and MM4 messages. Fragmented MMS messages cannot be scanned for viruses. If you do not select these options, fragmented MM3 and MM4 messages are blocked.

The **Interval** is the time in seconds before client comforting starts after the download has begun, and the time between sending subsequent data.

The **Amount** is the number of bytes sent by client or server comforting at each interval.

Client comforting

In general, client comforting is available for MM1 and MM7 messaging and provides a visual display of progress for web page loading or HTTP or FTP file downloads. Client comforting does this by sending the first few packets of the file or web page being downloaded to the client at configured time intervals so that the client is not aware that the download has been delayed. The client is the web browser or FTP client. Without client comforting, clients and their users have no indication that the download has started until the Carrier-enabled FortiGate unit has completely buffered and scanned the download. During this delay users may cancel or repeatedly retry the transfer, thinking it has failed.

The appearance of a client comforting message (for example, a progress bar) is client-dependent. In some instances, there will be no visual client comforting cue.

During client comforting, if the file being downloaded is found to be infected, then the Carrier-enabled FortiGate unit caches the URL and drops the connection. The client does not receive any notification of what happened because the download to the client had already started. Instead the download stops, and the user is left with a partially downloaded file.

If the user tries to download the same file again within a short period of time, then the cached URL is matched and the download is blocked. The client receives the Infection cache message replacement message as a

notification that the download has been blocked. The number of URLs in the cache is limited by the size of the cache.

Client comforting can send unscanned (and therefore potentially infected) content to the client. Only enable client comforting if you are prepared to accept this risk. Keeping the client comforting interval high and the amount low will reduce the amount of potentially infected data that is downloaded.

MM1 and MM7 client comforting steps

Since MM1 and MM7 messages use HTTP, MM1 and MM7 client comforting operates like HTTP client comforting.

The following steps show how client comforting works for a download of a 1 Mbyte file with the client comforting interval set to 20 seconds and the client comforting amount set to 512 bytes.

1. The client requests the file.
2. The Carrier-enabled FortiGate unit buffers the file from the server. The connection is slow, so after 20 seconds about one half of the file has been buffered.
3. The Carrier-enabled FortiGate unit continues buffering the file from the server, and also sends 512 bytes to the client.
4. After 20 more seconds, the FortiGate unit sends the next 512 bytes of the buffered file to the client.
5. When the file has been completely buffered, the client has received the following amount of data:

$$ca * (T/ci) \text{ bytes} == 512 * (40/20) == 512 * 2 == 1024 \text{ bytes,}$$
 where *ca* is the client comforting amount, *T* is the buffering time and *ci* is the client comforting interval.
6. If the file does not contain a virus, the Carrier-enabled FortiGate unit sends the rest of the file to the client. If the file is infected, the FortiGate closes the data connection but cannot send a message to the client.

Server comforting

Server comforting can be selected for each protocol.

Similar to client comforting, you can use server comforting to prevent server connection timeouts that can occur while waiting for FortiOS Carrier to buffer and scan large `POST` requests from slow clients.

The **Interval** is the time in seconds before client and server comforting starts after the download has begun, and the time between sending subsequent data.

The **Amount** is the number of bytes sent by client or server comforting at each interval.

Handling oversized MMS messages

Select **Block** or **Pass** for files and email messages exceeding configured thresholds for each protocol.

The oversize threshold refers to the final size of the message, including attachments, after encoding by the client. Clients can use a variety of encoding types; some result in larger file sizes than the original attachment. As a result, a file may be blocked or logged as oversized even if the attachment is several megabytes smaller than the oversize threshold.

Sender notifications and logging

In most cases you will notify the sender that they are causing problems on the network — either by sending malware content, flooding the network, or some other unwanted activity. The notification assumes the sender is unaware of their activity and will stop or correct it when notified.

However, senders who are notified may use this information to circumvent administration's precautions. For example if flood notification is set to 1000 messages per minute, a notified user may simply reduce their message to 990 messages per minute if this flood is intentional. For this reason, not all problems include sender notifications.

There are two methods of notifying senders:

- [MMS notifications](#)
- [Replacement messages](#)

And three details to consider for logging and notifying administrators:

- [Logging and reporting](#)
- [MMS logging options](#)
- [SNMP](#)

MMS notifications

MMS notifications enable you to customize notifications for many different situations and differently for all the supported MMS message protocols — MM1, MM3, MM4, and MM7.

MMS notification types include:

- Content Filter
- File Block
- Carrier Endpoint Block
- Flood
- Duplicate
- MMS Content Checksum
- Virus Scan

Day of Week, **Window start time** and **Window Duration** define what days and what time of day alert notifications will be sent. This allows you to control what alerts are sent on weekends. It also lets you control when to start sending notifications each day. This can be useful if system maintenance is performed at the same time each night — you might want to start alert notifications after maintenance has completed. Another reason to limit the time alert messages are sent could be to limit message traffic to business hours.

Replacement messages

FortiGate units send replacement messages when messages or content is blocked, quarantined, or otherwise diverted from the receiver. In its place a message is sent to notify the receiver what happened.

With FortiOS Carrier MMS replacement messages, send and receive message types are supported separately and receive their own custom replacement messages. This allows the network to potentially notify both the sender and receiver of the problem.

For example the replacement message **MM1 send-req file block message** is sent to the device that sent one or more files that were banned. The default message that is sent is `This device has sent %%NUM_MSG%% messages containing banned files in the last %%DURATION%% hours. The two variables are replaced by the appropriate values.`

Replacement messages are not as detailed or specific as MMS notifications, but they are also not as complicated to configure. They are also useful when content has been removed from an MMS message that was still delivered.

Logging and reporting

With each virus infection, or file block, a syslog message is generated. The format of this syslog message is similar to:

```
2005-09-22 19:15:47 deviceid=FGT5001ABCDEF1234 logid=0211060ABC type=virus
  subtype=infected level=warning src=10.1.2.3 dst=10.2.3.4 srcintf=port1 dstintf=port2
  service=mm1 status=blocked from="<sending MSISDN>" to="<receiving MSISDN>"
```

```
file="eicar.com.txt" virus="EICAR_TEST_FILE" msg="The file eicar.com.txt is infected
with EICAR_TEST_FILE. ref
http://www.fortinet.com/VirusEncyclopedia/search/encyclopediaSearch.do?method=quickSea
rchDirectly&virusName=EICAR_TEST_FILE"
```

Note that the **from** and **to** fields are samples and not real values.

MMS logging options

You can enable logging in an MMS protection profile to write event log messages when the MMS protection profile options that you have enabled perform an action. For example, if you enable MMS antivirus protection, you could also use the MMS protection profile logging options to write an event log message every time a virus is detected.

To record these log messages you must first configure how the FortiOS Carrier unit stores log messages.

To configure MMS content archiving, go to **Security Profiles > MMS Profile**. Select **Create New** or select the **Edit** icon beside an existing profile. Expand **MMS Bulk AntiSpam Detection > Logging**. Complete the fields as described in the following table and select **OK**. For more a detailed list of options, see Logging.

SNMP

A simple SNMP trap will be generated to inform the operators' alerting system that a virus has been detected. This SNMP trap could contain the sending and receiving MSISDN, however the initial solution would reflect the current behavior, i.e. only the fact that a virus has been detected will be communicated.

MMS content-based Antispam protection

Expand **MMS Scanning** and select **Content Filter** in an MMS protection profile to create content filter black/white lists that block or allow MMS messages based on the content of the message.

Overview

A school computer lab may block age-inappropriate content. A place of business may block unproductive content. A public access internet cafe may block offensive and graphic content. Each installation has its own requirements for what content needs to be blocked, and in what language.

FortiOS Carrier provides the ability to create custom local dictionaries, black lists, and white lists in multiple languages enables you to protect your customers from malicious content around the world.

Configurable dictionary

You can create a dictionary of configurable terms and phrases using the CLI. The text of MMS messages will be searched for these terms and phrases. Add content filter lists that contain content that you want to match in MMS messages. For every match found, a score is added. If enough matches are found to set the total score above the configured threshold, the MMS message is blocked.

You can add words, phrases, wild cards and Perl regular expressions to create content patterns that match content in MMS messages. For more on wildcard and regular expressions, see Using wildcards and Perl regular expressions in the UTM guide.

For each pattern you can select **Block** or **Exempt**.

- Block adds an antispam black list pattern. A match with a block pattern blocks a message depending on the score of the pattern and the content filter threshold.

- Exempt adds an antispam white list pattern. A match with an exempt pattern allows the message to proceed through the FortiOS Carrier unit, even if other content patterns in the same content filter list would block it.

If a pattern contains a single word, the FortiOS Carrier unit searches for the word in MMS messages. If the pattern contains a phrase, the FortiOS Carrier unit searches for all of the words in the phrase. If the pattern contains a phrase in quotation marks, the FortiOS Carrier unit searches for the whole phrase.

You can create patterns with Simplified Chinese, Traditional Chinese, Cyrillic, French, Japanese, Korean, Spanish, Thai, or Western character sets.

Black listing

Black listing is the practice of banning entries on the list. For example if an IP address continuously sends viruses, it may be added to the black list. That means any computers that consult that list will not communicate with that IP address.

Sometimes computers or devices can be added to black lists for a temporary problem, such as a virus that is removed when notified. However, as a rule short of contacting the administrator in person to manually be removed from the black list, users have to wait and they generally will be removed after a period without problem.

White listing

White listing is the practice of adding all critical IP addresses to a list, such as company email and web servers. Then if those servers become infected and start sending spam or viruses, those servers are not blocked. This allows the critical traffic through, even if there might be some malicious traffic as well. Blocking all traffic from your company servers would halt company productivity.

Scores and thresholds

Each content pattern includes a score. When a MMS message is matched with a pattern the score is recorded. If a message matches more than one pattern or matches the same pattern more than once, the score for the message increases. When the total score for a message equals or exceeds the threshold the message is blocked.

The default score for a content filter list entry is 10 and the default threshold is 10. This means that by default a message is blocked by a single match. You can change the scores and threshold so that messages can only be blocked if there are multiple matches. For example, you may only want to block messages that contain the phrase "example" if it appears twice. To do this, add the "example" pattern, set action to block and score to 5. Keep the threshold at 10. If "example" is found twice or more in a message the score adds up 10 (or more) and the message is blocked.

Configuring content-based antispam protection

To apply content-based antispam protection - CLI

```
config webfilter content
  edit <filter_table_number>
    set name <filter_table_name>
    config entries
      edit <phrase or regexp you want to block>
        set action {block | exempt}
        set lang <phrase language>
        set pattern-type {wildcard | regexp}
        set score <phrase score>
        set status {enable | disable}
      end
    end
```

end

Configuring sender notifications

When someone on the MMS network sends an MMS message that is blocked, in most cases you will notify the sender. Typically an administrator is notified in addition to the sender so action can be taken if required. There are two types of sender notifications available in FortiOS Carrier: MMS notifications, and Replacement Messages.

MMS notifications

MMS notifications to senders are configured in **Security Profiles > MMS Profile**, under MMS Notifications.

In this section you can configure up to four different notification recipients for any combination of MM1/3/4/7 protocol MMS messages. Also for MM7 messages the message type can be `submit.REQ` or `deliver.REQ`.

Useful settings include:

- delay in message based on notification type
- limit on notifications per second to prevent a flood
- schedules for notifications
- log in details for MM7 messages.

For more information on MMS notifications, see Notifying message flood senders and receivers and MMS Notifications.

Replacement messages

Replacement messages are features common to both FortiOS and FortiOS Carrier, however FortiOS Carrier has additional messages for the MMS traffic.

While each MMS protocol has its own different replacement messages, the one common to all MMS protocols is the **MMS blocked content replacement message**. This is the message that the receiver of the message sees when their content is blocked.

MMS DLP archiving

You can use DLP archiving to collect and view historical logs that have been archived to a FortiAnalyzer unit or the FortiGuard Analysis and Management service. DLP archiving is available for FortiAnalyzer when you add a FortiAnalyzer unit to the FortiOS Carrier configuration. The FortiGuard Analysis and Management server becomes available when you subscribe to the FortiGuard Analysis and Management Service.

You can configure full DLP archiving and summary DLP archiving. Full DLP archiving includes all content, for example, full email DLP archiving includes complete email messages and attachments. Summary DLP archiving includes just the meta data about the content, for example, email message summary records include only the email header.

You can archive MM1, MM3, MM4, and MM7 content.

Configuring MMS DLP archiving

Select DLP archive options to archive MM1, MM3, MM4, and MM7 sessions. For each protocol you can archive just session metadata (**Summary**), or metadata and a copy of the associated file or message (**Full**).

In addition to MMS protection profile DLP archive options you can:

- Archive MM1 and MM7 message floods
- Archive MM1 and MM7 duplicate messages
- Select **DLP archiving** for carrier endpoint patterns in a **Carrier Endpoint List** and select the **Carrier Endpoint Block** option in the **MMS Scanning** section of an MMS Protection Profile

FortiOS Carrier only allows one sixteenth of its memory for transferring content archive files. For example, for Carrier-enabled FortiGate units with 128 MB RAM, only 8 MB of memory is used when transferring content archive files. Best practices dictate to not enable full content archiving if antivirus scanning is also configured because of these memory constraints.

To configure MMS DLP archiving - web-based manager

1. Go to **Security Profiles > MMS Profile**.
2. Select **Create New** or select the **Edit** icon beside an existing profile.
3. Expand **MMS Bulk AntiSpam Detection > Content Archive**.
4. Complete the fields as described in DLP Archive options.
5. Select **OK**.

Viewing DLP archives

You can view DLP archives from the Carrier-enabled FortiGate unit web-based manager. Archives are historical logs that are stored on a log device that supports archiving, such as a FortiAnalyzer unit.

These logs are accessed from either **Log & Report > DLP Archive** or if you subscribed to the FortiCloud service, you can view log archives from there.

The **DLP Archive** menu is only visible if one of the following is true.

- You have configured the FortiGate unit for remote logging and archiving to a FortiAnalyzer unit.
- You have subscribed to FortiCloud.

The following tabs are available when you are viewing DLP archives for one of these protocols.

- **E-mail** to view POP3, IMAP, SMTP, POP3S, IMAPS, SMTPS, and spam email archives.
- **Web** to view HTTP and HTTPS archives.
- **FTP** to view FTP archives.
- **IM** to view AIM, ICQ, MSN, and Yahoo! archives.
- **MMS** to view MMS archives.
- **VoIP** to view session control (SIP, SIMPLE and SCCP) archives.

If you need to view log archives in Raw format, select **Raw** beside the **Column Settings** icon.

GTP basic concepts

GPRS currently supports data rates from 9.6 kbps to more than 100 kbps, and is best suited for burst forms of traffic. GPRS involves both radio and wired components. The mobile phone sends the message to a base station unit (radio based), and the base station unit sends the message to the carrier network and eventually the Internet (wired carrier network).

The network system then either sends the message back to a base station and to the destination mobile unit, or forwards the message to the proper carrier's network where it gets routed to the mobile unit.

PDP Context

The packet data protocol (PDP) context is a connection between a mobile station and the end address that goes through the SGSN and GGSN. It includes identifying information about the mobile customer used by each server or device to properly forward the call data to the next hop in the carrier network, typically using a GTP tunnel between the SGSN and GGSN.

When a mobile customer has an active voice or data connection open, both the SGSN and GGSN have the PDP context information for that customer and session.

When a mobile phone attempts to communicate with an address on an external packet network, either an IP or X.25 address, the mobile station that phone is connected to opens a PDP context through the SGSN and GGSN to the end address. Before any traffic is sent, the PDP context must first be activated.

The information included in the PDP context includes the customer's IP address, the IMSI number of the mobile handset, and the tunnel endpoint ID for both the SGSN and GGSN. The ID is a unique number, much like a session ID on a TCP/IP firewall. All this information ensures a uniquely identifiable connection is made.

Since one mobile device may have multiple connections open at one time, such as data connections to different Internet services and voice connections to different locations, there may be more than one PDP context with the same IP address making the extra identifying information required.

The endpoint that the mobile phone is connecting to only knows about the GGSN — the rest of the GPRS connection is masked by the GGSN.

Along the PDP context path, communication is accomplished in using three different protocols.

- The connection between the Mobile Station and SGSN uses the SM protocol.
- Between SGSN and GGSN GTP is used.
- Between GGSN and the endpoint either IP or X.25 is used.

FortiOS Carrier is concerned with the SGSN to GGSN part of the PDP context — the part that uses GTP.

For more about PDP context, see Tunnel Management Messages.

Creating a PDP context

While FortiOS Carrier is concerned mostly with the SGSN to GGSN part of the PDP Context, knowing the steps involved in creating a PDP context helps understand the role each device, protocol, and message type plays.

Both mobile stations and GGSNs can create PDP contexts.

A Mobile Station creates a PDP context

1. The Mobile Station (MS) sends a `PDP activation request` message to the SGSN including the MS PDP address, and APN.
2. Optionally, security functions may be performed to authenticate the MS.
3. The SGSN determines the GGSN address by using the APN identifier.
4. The SGSN creates a down link GTP tunnel to send IP packets between the GGSN and SGSN.
5. The GGSN creates an entry in its PDP context table to deliver IP packets between the SGSN and the external packet switching network.
6. The GGSN creates an uplink GTP tunnel to route IP-PDU from SGSN to GGSN.
7. The GGSN then sends back to the SGSN the result of the PDP context creation and if necessary the MS PDP address.

8. The SGSN sends an `Activate PDP context accept` message to the MS by returning negotiated the PDP context information and if necessary the MS PDP address.
9. Now traffic can pass from the MS to the external network endpoint.

A GGSN creates a PDP context

1. The network receives an IP packet from an external network.
2. The GGSN checks if the PDP Context has already been created.
3. If not, the GGSN sends a `PDU notification request` to the SGSN in order to initiate a PDP context activation.
4. The GGSN retrieves the IP address of the appropriate SGSN address by interrogating the HLR from the IMSI identifier of the MS.
5. The SGSN sends to the MS a request to activate the indicated PDP context.
6. The PDP context activation procedure follows the one initiated by the MS. See [“A Mobile Station creates a PDP context”](#).
7. When the PDP context is activated, the IP packet can be sent from the GGSN to the MS.

Terminating a PDP context

A PDP context remains open until it is terminated. To terminate the PDP context an MS sends a `Deactivate PDP context` message to the SGSN, which then sends a `Delete PDP Context` message to the GGSN. When the SGSN receives a PDP context deletion acknowledgment from the GGSN, the SGSN confirms to the MS the PDP context deactivation. The PDP can be terminated by the SGSN or GGSN as well with a slight variation of the order of the messages passed.

When the PDP Context is terminated, the tunnel it was using is deleted as well. If this is not completed in a timely manner, it is possible for someone else to start using the tunnel before it is deleted. This hijacking will result in the original customer being over billed for the extra usage. Anti-overbilling helps prevent this. See [Configuring Anti-overbilling in FortiOS Carrier](#).

GPRS security

The GPRS network has some built-in security in the form of GPRS authentication. However this is minimal, and is not sufficient for carrier network security needs. A GTP firewall, such as FortiOS Carrier, is required to secure the Gi, Gn, and Gp interfaces.

GPRS authentication

GPRS authentication is handled by the SGSN to prevent unauthorized GPRS calls from reaching the GSM network beyond the SGSN (the base station system, and mobile station). Authentication is accomplished using some of the customer's information with a random number and uses two algorithms to create ciphers that then allow authentication for that customer.

User identity confidentiality ensures that customer information stays between the mobile station and the SGSN — no identifying information goes past the SGSN. Past that point other numbers are used to identify the customer and their connection on the network.

Periodically the SGSN may request identity information from the mobile station to compare to what is on record, using the IMEI number.

Call confidentiality is achieved through the use of a cipher, similar to the GPRS authentication described earlier. The cipher is applied between the mobile station and the SGSN. Essentially a cipher mask is XORd with each outgoing frame, and the receiving side XORs with its own cipher to result in the original frame and data.

Parts of a GTPv1 network

A sample GTP network consists of the end handset sender, the sender's mobile station, the carrier's network including the SGSN and GGSN, the receiver's mobile station, and the receiver handset.

When a handset moves from one mobile station and SGSN to another, the handset's connection to the Internet using GTP tracks the user's location and information. For example, the handset could move from one cell to another, or between countries.

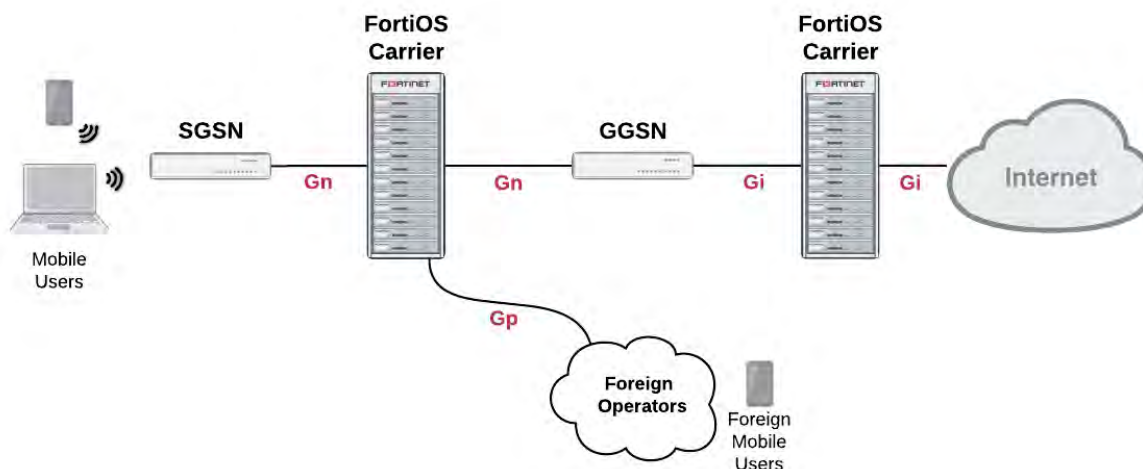

The parts of a GPRS network can be separated into the following groups according to the roles of the devices:

- Radio access to the GPRS network is accomplished by mobile phones and mobile stations (MS).
- Transport the GPRS packets across the GPRS network is accomplished by SGSNs and GGSNs, both local and remote, by delivering packets to the external services.
- Billing and records are handled by CDF, CFR, HLR, and VLR devices.

GPRS networks also rely on access points and PDP contexts as central parts of the communication structure. These are not actual devices, but they are still critical .

These devices, their roles, neighboring devices, the interfaces and protocols they use are outlined in the following table.

Carrier network showing the interfaces used (GTPv1)

Devices on a GTPv1 network

Device role	Neighboring Devices	Interfaces used	Protocols used
Mobile Users	Mobile Stations (MS)	Radio Access Technology (RAT)	

Device role	Neighboring Devices	Interfaces used	Protocols used
Mobile Stations (MS)	Mobile Users, SGSN	Gb	IP, Frame Relay
SGSN (local)	MS, SGSN (local or remote), GGSN (local and remote), CDR, CFR, HLR, VLR	Ga, Gb, Gn, Gp, Gz	IP, Frame Relay, GTP, GTP'
SGSN (remote)	SGSN (local)	Gn	GTP
GGSN (local)	SGSN (local or remote), GGSN (local and remote), CDR, CFR, HLR, VLR	Ga, Gi, Gn, Gp, Gz	IP, GTP, GTP'
GGSN (remote)	SGSN (local), WAP gateway, Internet, other external services	Gi, Gp	IP, GTPv1
CDR, CFR	SGSN (local), GGSN (local)	Ga, Gz	GTP'
HLR, VLR	SGSN (local), GGSN (local)	Ga, Gz	GTP'

Radio access

For a mobile phone to access the GPRS core network, it must first connect to a mobile station. This is a cellular tower that is connected to the carrier network.

How the mobile phone connects to the mobile station (MS) is determined by what Radio Access Technologies (RATs) are supported by the MS.

Transport

Transport protocols move data along the carrier network between radio access and the Internet or other carrier networks.

FortiOS Carrier should be present where information enters the Carrier network, to ensure the information entering is correct and not malicious. This means a Carrier-enabled FortiGate unit intercepts the data coming from the SGSN or foreign networks destined for the SSGN or GGSN onto the network, and after the GGSN as the data is leaving the network.

GTP

GPRS Tunnelling Protocol (GTP) is a group of IP-based communications protocols used to carry General Packet Radio Service (GPRS) within Global System for Mobile Communications (GSM) and Universal Mobile Telecommunications System (UMTS) networks. It allows carriers to transport actual cellular packets over a network via tunneling. This tunneling allows users to move between SGSNs and still maintain connection to the Internet through the GGSN.

GTP has three versions version 0, 1, and 2. GTP1 and GTP2 are supported by FortiOS Carrier. The only GTP commands that are common to all forms of GTP are the echo request/response commands that allow GSNs to verify up to once every 60 seconds that neighboring GSNs are alive.

GTPv0

There have been three versions of GTP to date. The original version of GTP (version 0) has the following differences from version GTPv1.

- the tunnel identification is not random
- there are options for transporting X.25
- the fixed port number 3386 is used for all functions, not just charging
- optionally TCP is allowed as a transport instead of UDP
- not all message types are supported in version 0

GTPv1

On a GPRS network, Packet Data Protocol (PDP) context is a data structure used by both the Serving GPRS Support Node (SGSN) and the Gateway GPRS Support Node (GGSN). The PDP context contains the subscribers information including their access point, IP address, IMSI number, and their tunnel endpoint ID for each of the SGSN and GGSN.

The Serving GPRS Support Node (SGSN) is responsible for the delivery of data packets from and to the mobile stations within its geographical service area. Its tasks include packet routing and transfer, mobility management (attach/detach and location management), logical link management, and authentication and charging functions. The location register of the SGSN stores location information (e.g., current cell, current VLR) and user profiles (e.g., IMSI, address(es) used in the packet data network) of all GPRS users registered with this SGSN.

GTPv1-C

GTPv1-C refers to the control layer of the GPRS Transmission network. This part of the protocol deals with network related traffic.

FortiOS Carrier handles GTPv1-C in GTPv1 by using the Tunnel Endpoint Identifier (TEID), IP address and a Network layer Service Access Point Identifier (NSAPI), sometimes called the application identifier, as an integer value that is part of the PDP context header information used to identify a unique PDP context in a mobile station, and SGSN.

For more information on GTPv1-C, see GTP-C messages.

GTPv1-U

GTPv1-U is defined in 3GPP TS 29.281 and refers to the user layer of the GPRS Tunneling network. This part of the protocol deals with user related traffic, user tunnels, and user administration issues.

A GTPv1-U tunnel is identified by a TEID, an IP address, and a UDP port number. This information uniquely identifies the limb of a GTPv1 PDP context. The IP address and the UDP port number define a UDP/IP path, a connectionless path between two endpoints (i.e. SGSN or GGSN). The TEID identifies the tunnel endpoint in the receiving GTPv1-U protocol entity; it allows for the multiplexing and demultiplexing of GTP tunnels on a UDP/IP path between a given GSN-GSN pair. For more information on GTPv1-U, see GTP-U messages.

The GTP core network consists of one or more SGSNs and GGSNs.

GGSN

The Gateway GPRS Support Node (GGSN) connects the GPRS network on one side via the SGSN to outside networks such as the Internet. These outside networks are called packet data networks (PDNs). The GGSN acts as an edge router between the two different networks — the GGSN forwards incoming packets from the external PDN to the addressed SGSN and the GGSN also forwards outgoing packets to the external PDN. The GGSN also converts the packets from the GPRS packets with SGSN to the external packets, such as IP or X.25.

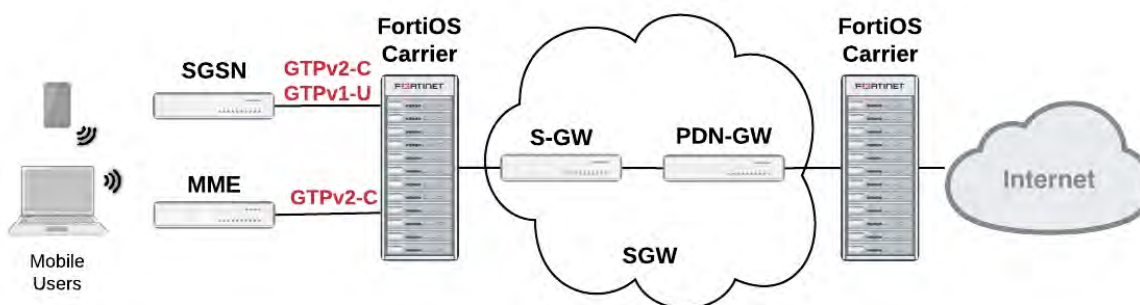

SGSN

The Serving GPRS Support Node (SGSN) connects the GPRS network to GTPv1 compatible mobile stations, and mobile units (such as UTRAN and ETRAN) on one side and to the gateway node (GGSN), which leads to external networks, on the other side. Each SGSN has a geographical area, and mobile phones in that area connect to the GPRS network through this SGSN. The SGSN also maintains a location register that contains customer's location and user profiles until they connect through a different SGSN at which time the customer information is moved to the new SGSN. This information is used for packet routing and transfer, mobility management also known as location management, logical link management, and authentication and billing functions.

GTPv2

GTPv2, defined in 3GPP TS 29.274, is dramatically different from GTPv1, defined in 3GPP TS 29.060. Where in GTPv1 the tunnel is between the SGSN and the GGSN, in GTPv2 The SGSN is between the MME and the LTE Serving Gateway (S-GW), beyond which is the PDN gateway (P-GW). Even tunnel management messages have changed significantly.

Network diagram for GTPv2

Device roles on a GTPv2 network

Device role	Neighboring Devices	Interfaces used	Protocols used
Mobile Users	Mobile Stations (MS)	Radio Access Technology (RAT)	--
GTPv1 Mobile Stations (MS)	Mobile Users, SGSN	Gb	IP, Frame Relay

Device role	Neighboring Devices	Interfaces used	Protocols used
GTPv2 Mobile Stations (MS)	Mobile Users, MME	???	IP, Frame Relay
SGSN (local)	GTPv1 MS, SGSN, S-GW	???	IP, Frame Relay, GTPv1, GTP'
S-GW	SGSN, MME, P-GW	???	IP, GTPv2, GTP'
P-GW	S-GW, Internet, other external services	???	IP, GTPv2

GTPv2-C

GTPv2-C is the control layer messaging for GTPv2. It is used by LTE mobile stations, SGSN units for backwards compatibility, and SGWs that are the gateway to other networks. The messaging is very different from GTPv1. GTPv2-C is required to communicate with the Mobility Management Entity (MME) to create, change and delete EPS bearers when handover events happen, and to create Forwarding tunnels. The protocol is also used to communicate with the Serving Gateway (SGW) which has the S-GW and PDN-GW interfaces, and the Serving GPRS Support Node (SGSN).

MME

MME essentially fills the role of the SGSN in a GTPv1 network — it is how the mobile stations gain access to the Carrier network. GTPv2 supports different mobile stations than GTPv1, so MME handles the GTPv2 MSes and SGSN handles the GTPv1 MSes

Billing and records

A major part of the GPRS network is devoted to billing. Customer billing requires enough information to identify the customer, and then billing specific information such as connection locations and times, as well as amount of data transferred. A modified form of GTP called GTP' is used for billing. The home location records and visitor location records store information about customers that is critical to billing.

GTP' (GTP prime)

GTP is used to handle tunnels of user traffic between SGSNs and GGSNs. However for billing purposes, other devices that are not supported by GTP are required. GTP' (GTP prime) is a modified form of GTP and is used to communicate with these devices such as the Charging Data Function (CDF) that communicates billing information to the Charging Gateway Function (CGF). In most cases, GTP' transports user records from many individual network elements, such as the GGSNs, to a centralism computer which then delivers the charging data more conveniently to the network operator's billing center, often through the CGF. The core network sends charging information to the CGF, typically including PDP context activation times and the quantity of data which the end user has transferred.

GTP' is used by the Ga and Gz interfaces to transfer billing information. GTP' uses registered UDP/TCP port 3386. GTP' defines a different header, additional messages, field values, as well as a synchronization protocol to avoid losing or duplicating CDRs on CGF or SGSN/GGSN failure. Transferred CDRs are encoded in ASN.1.

HLR

The Home Location Register (HLR) is a central database that contains details of each mobile phone subscriber that is authorized to use the GSM core network. There can be several logical, and physical, HLRs per public land mobile network (PLMN), though one international mobile subscriber identity (IMSI)/MSISDN pair can be associated with only one logical HLR (which can span several physical nodes) at a time. The HLRs store details of every SIM card issued by the mobile phone operator. Each SIM has a unique identifier called an IMSI which is the primary key to each HLR record.

VLR

The Visitor Location Register (VLR) is a database which stores information about all the mobile devices that are currently under the jurisdiction of the Mobile Switching Center which it serves. Of all the information the VLR stores about each Mobile Station, the most important is the current Location Area Identity (LAI). This information is vital in the call setup process.

Whenever an MSC detects a new MS in its network, in addition to creating a new record in the VLR, it also updates the HLR of the mobile subscriber, informing it of the new location of that MS.

For more information on GTP', see GTP-U and Charging Management Messages.

GPRS network common interfaces

There are interfaces for each connection on the GPRS network. An interface is an established standard form of communication between two devices. Consider a TCP/IP network. In addition to the transport protocol (TCP) there are other protocols on that network that describe how devices can expect communications to be organized, just like GPRS interfaces.

Interfaces between devices on the network

There are a series of interfaces that define how different devices on the carrier network communicate with each other. These interfaces are called Ga to Gz, and each one defines how a specific pair of devices will communicate. For example Gb is the interface between the base station and the SGSN, and Gn is one possible interface between the SGSN and GGSN.

The SGSN and GGSN keep track of the CDR information and forward it to the Charging Data Function (CDF) using the Gr interface between the SGSN and home location register (HLR), Gs interface between the SGSN and MSC (VLR), Gx interface between the GGSN and the Charging Rules Function (CRF), Gy between the GGSN and online charging system (OCS), and finally Gz which is the off-line (CDR-based) charging interface between the GSN and the CG that uses GTP'.

Each of these interfaces on the GPRS network has a name in the format of G_x where x is a letter of the alphabet that determines what part of the network the interface is used in. It is common for network diagrams of GPRS networks to include the interface name on connections between devices.

The Carrier-enabled FortiGate unit only provides protection on the Gn, Gp, and Gi interfaces.

GPRS network interfaces, their roles, and billing

Name	Device connections that use this interface	Traffic Protocol used	Its role or how it affects billing
Ga	CDR and GSN (SGSNs and GGSNs)	GTP ^a - GTP modified to include CDR role	CDR have the accounting records, that are compiled in the GSN and then sent to the Charging Gateway (CG)
Gb	MS and SGSN	Frame Relay or IP	When an IP address moves to a new MS, the old MS may continue to use and bill that IP address.
Gi	GGSN and public data networks (PDNs)	IP based	This is the connection to the Internet. If the GTP tunnel is deleted without notifying the Gi interface, the connection may remain open incurring additional charges. FortiOS Carrier adds this interface to a firewall. See Anti-overbilling with FortiOS Carrier.
Gn	SGSN and external SGSNs and internal GGSNs	GTP	When the GTP tunnel is deleted, need to inform other interfaces immediately to prevent misuse of connections remaining open. FortiOS Carrier adds this interface to a firewall.
Gp	Internal SGSN and external GGSNs	GTP	
Gz	GSN (SGSN and GGSN) and the charging gateway (CG)	GTP ^a	Used for the offline charging interface. Ga is used for online charging.

Corporate customers may have a direct connection to the Gi interface for higher security. The Gi interface is normally an IP network, though a tunnelling protocol such as GRE or IPsec may be used instead.

GTP Configuration

The GTP (GPRS Tunneling Protocol) is one of the major mobile core protocols used since to transfer data in the core mobile network. Mobility and data are exploding and this trend will continue with VoLTE, 5G, and the Internet of Things (IoT). The role of GTP in mobile networks will continue to remain critical.

With the mobile network ever growing importance as the communication channel for data rich application on mobile devices, connected intelligent devices and the IoT, comes the growing potential for attacks on the mobile infrastructure.

Introduction to GTP

GTP as a Potential Attack Vector

GTP's role in transferring data in the core mobile infrastructure makes it a potential ideal attack vector. To understand the security features for GTP we need to understand the risks that might compromise this protocol.

The business impact might vary in-between the different attacks from Denial of Service (DoS) attacks that hinders the capability of performing a legitimate operation due to resource starvation (for example - not being able to charge the customer for GPRS traffic use due to denial of service attack on the Charging GW) to remote compromise attacks that allows the hacker to have remote control of a critical device (for example – take control over a GGSN).

GTP-based attacks may have a wide range of business impact, based on the attacked devices' vulnerability, ranging from service unavailability, compromise customer information, and gaining control over infrastructure elements, just to give a few examples.

Listed below are the main categories of GTP-based attacks:

- **Protocol anomaly attacks** are packets and packets formats that should not be expected on the GTP protocol. These can include malformed packets, reserved packets' fields and types, etc.
- **Infrastructure attacks** are attempts to connect to restricted core elements, such as the GGSN, SGSN, PGW, etc.
- **Overbilling attacks** results in customers charged for traffic they did not use or the opposite of not paying for the used traffic.

Protecting Against GTP-Based Attacks: The Carrier Grade GTP Firewall

With the evolution of the mobile network so has GTP evolved. The awareness to the potential of GTP-based attacks has led mobile core vendors to harden their software to better deal with a potential attack. Alongside this evolution, network security vendors, such as Fortinet, has led the way in providing specific GTP aware firewalls to secure and protect the different versions of the GTP protocol from potential attacks.

A GTP firewall should be placed where GTP traffic and session originate and terminate, as shown in the below diagram, and has to inspect both the GTP-C (Control Plane) and GTP-U (Data Plane) packets that, together, constitute the GPRS Tunneling Protocol.

The GTP firewall in both cases is placed in line between the SGSN / SGW and the GGSN / PGW which are the initiator and terminator of the GTP traffic. One of the main roles of GTP firewall is also to be able to support the roaming between different versions of GTP without interrupting the service.

The GTP firewall must be carrier grade in its ability to scale and provide high availability without impact its ability to provide effective protection.

FortiGate with FortiCarrier – The Leading GTP Firewall

FortiGate is Fortinet's physical security platform, built specifically for high performance and scalability with the utilization of specialized FortiASIC technology. Fortinet Content Processors (CP) and Network Processors (NP) enable, offloading CPU intensive tasks and allowing the FortiGate to provide carrier grade performance and scalability. Utilizing the power of the FortiGate platform, FortiOS, Fortinet's security Operating System, provides threat intelligence and advanced functionalities to provide effective security, ranging from Carrier Grade NAT (CGNAT), firewalling, IPSec, etc.

FortiCarrier is the part of FortiOS which was specifically designed to provide security for specific carriers and mobile operators' protocols and requirements, such as awareness and security for GTP. The wide range of FortiGate platforms with FortiOS and FortiCarrier enables mobile operators to cost effectively secure their mobile network against GTP-based attacks, while ensuring unparalleled performance, availability and security effectiveness.

GTP Profile

You can configure multiple GTP profiles within the GTP menu. GTP profiles concern GTP activity flowing through the unit. These GTP profiles are then applied to a security policy.

GTP profile configuration settings

The following are GTP profile configuration settings in **Security Profiles > GTP Profiles**.

GTP Profile	
Lists each GTP profile that you have created. On this page, you can edit, delete or create a new GTP profile.	
Create New	Creates a new GTP profile. When you select Create New , you are automatically redirected to the New page.
Edit	Modifies settings within a GTP profile in the list. When you select Edit , you are automatically redirected to Edit page.
Delete	Removes a GTP profile from the list.
	To remove multiple GTP profiles from within the list, on the GTP Profile page, in each of the rows of the profiles you want removed, select the check box and then select Delete .
	To remove all GTP profiles from within the list, on the GTP Profile page, select the check box in the check box column and then select Delete .
Name	The name of the GTP profile.

Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a security policy; on the Profile page (**Security Profiles > Antivirus > Profiles**), 1 appears in **Ref.** .

To view the location of the referenced object, select the number in **Ref.**, and the Object Usage window appears displaying the various locations of the referenced object.

To view more information about how the object is being used, use one of the following icons that is available within the Object Usage window:

Ref.

- **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at.
- **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a security policy and so, when this icon is selected, the user is redirected to the Edit Policy page.
- **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a security policy, and that security policy's settings appear within the table.

New GTP Profile

Provides settings for configuring a GTP profile.

Name	Enter a name for the GTP profile.
General Settings	Configure general options for the GTP profile.
Message Type Filtering	Configure filtering for messages.
APN Filtering	Configure filtering options for APN.
Basic Filtering	Configure filtering options for IMSI.
Advanced Filtering	Configure advanced filtering options.
IE removal policy	Configure IE removal policy options.
Encapsulated IP Traffic Filtering	Configure filtering options for encapsulated IP traffic.
Encapsulated Non-IP End User Address Filtering	Configure filtering options for encapsulated non-IP end user addresses.

Protocol Anomaly	Configure protocol anomaly options.
Anti-Overbilling	Configure anti-overbilling options.
Log	Configure log options.

General settings options

The following are mostly house keeping options that appear in the General Settings area of the GTP configuration page.

General Settings section of the New GTP Profile	
GTP-in-GTP	<p>Select Allow to enable GTP packets to be allowed to contain GTP packets, or a GTP tunnel inside another GTP tunnel.</p> <p>To block all GTP-in-GTP packets, select Deny.</p>
Minimum Message Length	<p>Enter the shortest possible message length in bytes. Normally this is controlled by the protocol, and will vary for different message types. If a packet is smaller than this limit, it is discarded as it is likely malformed and a potential security risk.</p> <p>The default minimum message length is 0 bytes.</p>
Maximum Message Length	<p>Enter the maximum allowed length of a GTP packet in bytes.</p> <p>A GTP packet contains three headers and corresponding parts GTP, UDP, and IP. If a packet is larger than the maximum transmission unit (MTU) size, it is fragmented to be delivered in multiple packets. This is inefficient, resource intensive, and may cause problems with some applications.</p> <p>By default the maximum message length is 1452 bytes.</p>
Tunnel Limit	<p>Enter the maximum number of tunnels allowed open at one time. For additional GTP tunnels to be opened, existing tunnels must first be closed.</p> <p>This feature can help prevent a form of denial of service attack on your network. This attack involves opening more tunnels than the network can handle and consuming all the network resources doing so. By limiting the number of tunnels at any one time, this form of attack will be avoided.</p> <p>The tunnel limiting applies to the Handover Group, and Authorized SGSNs and GGSNs.</p>

General Settings section of the New GTP Profile

Tunnel Timeout	<p>Enter the maximum number of seconds that a GTP tunnel is allowed to remain active. After the timeout the unit deletes GTP tunnels that have stopped processing data. A GTP tunnel may hang for various reasons. For example, during the GTP tunnel tear-down stage, the "delete pdap context response" message may get lost. By setting a timeout value, you can configure the FortiOS Carrier firewall to remove the hanging tunnels.</p> <p>The default is 86400 seconds, or 24 hours.</p>
Control plane message rate limit	<p>Enter the number of packets per second to limit the traffic rate to protect the GSNs from possible Denial of Service (DoS) attacks. The default limit of 0 does not limit the message rate.</p> <p>GTP DoS attacks can include:</p> <ul style="list-style-type: none"> • Border gateway bandwidth saturation: A malicious operator can connect to your GRX and generate high traffic towards your Border Gateway to consume all the bandwidth. • GTP flood: A GSN can be flooded by illegitimate traffic
Handover Group	<p>Select the allowed list of IP addresses allowed to take over a GTP session when the mobile device moves locations.</p> <p>Handover is a fundamental feature of GPRS/UMTS, which enables subscribers to seamlessly move from one area of coverage to another with no interruption of active sessions. Session hijacking can come from the SGSN or the GGSN, where a fraudulent GSN can intercept another GSN and redirect traffic to it. This can be exploited to hijack GTP tunnels or cause a denial of service.</p> <p>When the handover group is defined it acts like a white list with an implicit default deny at the end — the GTP address must be in the group or the GTP message will be blocked. This stops handover requests from untrusted GSNs.</p>
Authorized SGSNs	<p>Use Authorized SGSNs to only allow authorized SGSNs to send packets through the unit and to block unauthorized SGSNs. Go to Firewall Objects > Address > Addresses and add the IP addresses of the authorized SGSNs to a firewall address or address group. Then set Authorized SGSNs to this firewall address or address group.</p> <p>You can use Authorized SGSNs to allow packets from SGSNs that have a roaming agreement with your organization.</p>

General Settings section of the New GTP Profile

Authorized GGSNs

Use **Authorized GGSNs** to only allow authorized GGSNs to send packets through the unit and to block unauthorized GGSNs. Go to **Firewall Objects > Address > Addresses** and add the IP addresses of the authorized GGSNs to a firewall address or address group. Then set **Authorized GGSNs** to this firewall address or address group.

You can use Authorized GGSNs to allow packets from SGSNs that have a roaming agreement with your organization.

Message type filtering options

On the **New GTP Profile** page, you can select to allow or deny the different types of GTP messages, which is referred to as message type filtering. You must expand the Message Type Filtering section to access the settings.

The messages types include Path Management, Tunnel Management, Location Management, Mobility Management, MBMS, and GTP-U and Charging Management messages.

For enhanced security, Fortinet best practices dictate that you set Unknown Message Action to deny. This will block all unknown GTP message types, some of which may be malicious.

To configure message type filter options, expand **Message Type Filtering** in the GTP profile.

APN filtering options

An Access Point Name (APN) is an Information Element (IE) included in the header of a GTP packet. It provides information on how to reach a network.

An APN has the following format:

```
<network_id>[.mnc<mnc_int>.mcc<mcc_int>.gprs]
```

Where:

- **<network_id>** is a network identifier or name that identifies the name of a network, for example, `example.com` or `internet`.
- **[.mnc<mnc_int>.mcc<mcc_int>.gprs]** is the optional operator identifier that uniquely identifies the operator's PLMN, for example `mnc123.mcc456.gprs`.

Combining these two examples results in a complete APN of `internet.mnc123.mcc456.gprs`.

By default, the unit permits all APNs. However, you can configure APN filtering to restrict roaming subscribers' access to external networks.

APN filtering applies only to the GTP **create pdp request** messages. The unit inspects GTP packets for both APN and selected modes. If both parameters match and APN filter entry, the unit applies the filter to the traffic.

Additionally, the unit can filter GTP packets based on the combination of an IMSI prefix and an APN.

You cannot add an APN when creating a new profile.

APN Filtering	
Enable APN Filter	Select to enable APN filtering.
Default APN Action	Select the default action for APN filtering. If you select Allow , all sessions are allowed except those blocked by individual APN filters. If you select Deny , all sessions are blocked except those allowed by individual APN filters.
Value	The APN to be filtered.
Mode	The type of mode chosen that indicates where the APN originated and whether the Home Location Register (HLR) has verified the user subscription:
Action	The type of action that will be taken.
Edit	Modifies the settings within the filter. When you select Edit , the Edit window appears, which allows you to modify the settings of the APN.
Delete	Removes the APN from the list within the table, in the APN Filtering section.
Add APN	Adds a new APN filter to the list. When you select Add APN , the New window appears, which allows you to configure the APN settings.
New APN page	
Value	Enter an APN to be filtered. You can include wild cards to match multiple APNs. For example, the value internet* would match all APNs that begin with internet .
Mode	Select one or more of the available modes to indicate where the APN originated and whether the Home Location Register (HLR) has verified the user subscription.
Mobile Station provided	MS-provided APN, subscription not verified, indicates that the mobile station (MS) provided the APN and that the HLR did not verify the user's subscription to the network.
Network provided	Network-provided APN, subscription not verified, indicates that the network provided a default APN because the MS did not specify one, and that the HLR did not verify the user's subscription to the network.
Subscription Verified	MS or Network-provided APN, subscription verified, indicates that the MS or the network provided the APN and that the HLR verified the user's subscription to the network.
Action	Select Allow or Deny .

Basic filtering options

The International Mobile Station Identity (IMSI) is used by a GPRS Support Node (GSN) to identify a mobile station. Three elements make up every IMSI:

- the mobile country code (MCC)
- the mobile network code (MNC)
- the mobile subscriber identification number (MSIN).

The subscriber's home network—the public land mobile network (PLMN)—is identified by the IMSI prefix, formed by combining the MCC and MNC.

By default, the unit allows all IMSIs. You can add IMSI prefixes to deny GTP traffic coming from non-roaming partners. Any GTP packets with IMSI prefixes not matching the prefixes you set will be dropped. GTP **Create pdp** request messages are filtered and only IMSI prefixes matching the ones you set are permitted. Each GTP profile can have up to 1000 IMSI prefixes set.

An IMSI prefix and an APN can be used together to filter GTP packets if you set an IMSI filter entry with a non-empty APN.

You cannot add an IMSI when creating a new profile. You must add it after the profile has been created and you are editing the profile.

IMSI Filtering section of the New GTP Profile

Enable IMSI Filter	Select to enable IMSI filtering.
Default IMSI Action	Select the default action for IMSI filtering. If you select Allow , all sessions are allowed except those blocked by individual IMSI filters. If you select Deny , all sessions are blocked except those allowed by individual IMSI filters.
APN	The APN that is part of the IMSI that will be filtered.
MCC-MNC	The MCC-MNC part of the IMSI that will be filtered.
Mode	The type of mode that indicates where the APN originated and whether the Home Location Register (HLR) has verified the user subscription.
Action	The type of action that will be taken.
Edit	Modifies settings to an IMSI filter. When you select Edit , the Edit window appears, which allows you to modify the IMSI filter's settings.
Delete	Removes an IMSI filter from within the table, in the IMSI Filtering section.
Add IMSI	Adds a new IMSI filter to the list. When you select Add IMSI , the New window appears, which allows you to configure IMSI filter settings.
New IMSI page	

APN	Enter the APN part of the IMSI to be filtered.
MCC-MNC	Enter the MCC-MCC part of the IMSI to be filtered.
Mode	Select one or more of the available modes to indicate where the APN originated and whether the Home Location Register (HLR) has verified the user subscription.
Mobile Station provided	MS-provided APN, subscription not verified, indicates that the mobile station (MS) provided the APN and that the HLR did not verify the user's subscription to the network.
Network provided	Network-provided APN, subscription not verified, indicates that the network provided a default APN because the MS did not specify one, and that the HLR did not verify the user's subscription to the network.
Subscription Verified	MS or Network-provided APN, subscription verified, indicates that the MS or the network provided the APN and that the HLR verified the user's subscription to the network.
Action	Select Allow or Deny .

Advanced filtering options

The FortiOS Carrier firewall supports advanced filtering against the attributes RAT, RAI, ULI, APN restriction, and IMEI-SV in GTP to block specific harmful GPRS traffic and GPRS roaming traffic. The following table shows some of the GTP context requests and responses that the firewall supports.

Attributes supported by FortiCarrier firewalls

	GTP Create PDP Context Request	GTP Create PDP Context Response	GTP Update PDP Context Request	GTP Update PDP Context Response
APN	yes	yes	-	
APN Restriction	yes	-	-	yes
IMEI-SV	yes	-	-	-
IMSI	yes	-	yes	-
RAI	yes	-	yes	-
RAT	yes	-	yes	-
ULI	yes	-	yes	-

When editing a GTP profile, select **Advanced Filtering > Create New** to create and add a rule. When the rule matches traffic it will either allow or deny that traffic as selected in the rule.

Advanced Filtering	
Enable	Select to enable advanced filtering.
Default Action	Select the default action for advanced filtering. If you select Allow , all sessions are allowed except those blocked by individual advanced filters. If you select Deny , all sessions are blocked except those allowed by individual advanced filters.
Messages	The messages, for example, Create PDP Context Request.
APN Restriction	The APN restriction.
RAT Type	The RAT types associated with that filter.
ULI	The ULI pattern.
RAI	The RAI pattern.
IMEI	The IMEI pattern.
Action	The action that will be taken.
Edit	Modifies the filter's settings. When you select Edit , the Edit window appears, which allows you to modify the filter's settings.
Delete	Removes a filter from the list.
Add	Adds a filter to the list. When you select Add , the New window appears, which allows you to configure settings for messages, APN, IMSI, MSISDN, RAT type, ULI, RAI, IMEI patterns as well as the type of action.
New Filtering page	
Messages	The PDP content messages this profile will match.
Create PDP Context Request	Select to allow create PDP context requests.
Create PDP Context Response	Select to allow create PDP context responses.
Update PDP Context Request	Select to allow update PDP context requests.

Update PDP Context Response	Select to allow update PDP context responses.
APN	Enter the APN.
APN Mode	<p>Select an APN mode as one or more of</p> <ul style="list-style-type: none"> • Mobile Station provided • Network provided • Subscription provided <p>This field is only available when an APN has been entered.</p>
Mobile Station provided	MS-provided PAN, subscription not verified, indicates that the mobile station (MS) provided the APN and that the HLR did not verify the user's subscription to the network.
Network provided	Network-provided APN, subscription not verified, indicates that the network provided a default APN because the MS did not specify one, and that the HLR did not verify the user's subscription to the network.
Subscription verified	MS or Network-provided APN, subscription verified, indicates that the MS or the network provided the APN and that the HLR verified the user's subscription to the network.
APN Restriction	<p>Select the type of restriction that you want. You can choose all of the types, or one of the types. You cannot choose multiple types. Types include:</p> <ul style="list-style-type: none"> • all • Public-1 • Public-2 • Private-1 • Private-2
IMSI	Enter the IMSI.
MSISDN	Enter the MSISDN.
RAT Type	<p>Optionally select the RAT type as any combination of the following:</p> <ul style="list-style-type: none"> • Any • UTRAN • GERAN • Wifi • GAN • HSPA <p>Some RAT types are GTPv1 specific.</p>

ULI pattern	Enter the ULI pattern.
RAI pattern	Enter the RAI pattern.
IMEI pattern	Enter the IMEI pattern.
Action	Select either Allow or Deny .

Adding an advanced filtering rule

When adding a rule, use the following formats:

- Prefix, for example, range 31* for MCC matches MCC from 310 to 319.
- Range, for example, range 310-319 for MCC matches MCC from 310 to 319.
- Mobile Country Code (MCC) consists of three digits. The MCC identifies the country of domicile of the mobile subscriber.
- Mobile Network Code (MNC) consists of two or three digits for GSM/UMTS applications. The MNC identifies the home PLMN of the mobile subscriber. The length of the MNC (two or three digits) depends on the value of the MCC. Best practices dictate not to mix two and three digit MNC codes within a single MCC area.
- Location Area Code (LAC) is a fixed length code (of 2 octets) identifying a location area within a PLMN. This part of the location area identification can be coded using a full hexadecimal representation except for the following reserved hexadecimal values: 0000 and FFFE. These reserved values are used in some special cases when no valid LAI exists in the MS (see 3GPP TS 24.008, 3GPP TS 31.102 and 3GPP TS 51.011).
- Routing Area Code (RAC) of a fixed length code (of 1 octet) identifies a routing area within a location.
- CI or SAC of a fixed length of 2 octets can be coded using a full hexadecimal expression.
- Type Allocation Code (TAC) has a length of 8 digits.
- Serial Number (SNR) is an individual serial number identifying each equipment within each TAC. SNR has a length of 6 digits.
- Software Version Number (SVN) identifies the software version number of the mobile equipment. SVN has a length of 2 digits.

You cannot add an advanced filtering rule when creating a new profile. You must add it after the profile has been created and you are editing the profile.

Information Element (IE) removal policy options

In some roaming scenarios, the unit is installed on the border of the PLMN and the GRX. In this configuration, the unit supports information element (IE) removal policies to remove any combination of R6 IEs (RAT, RAI, ULI, IMEI-SV and APN restrictions) from the types of messages described in “[Advanced filtering options](#)”, prior to forwarding the messages to the HGGSN (proxy mode).

IE removal policy	
Enable	Select to enable this option.

SGSN address of message IE	The firewall address or address group that contains the SGSN addresses.
IEs to be removed	The IE types that will be removed. These include APN Restriction, RAT, RAI, ULI, and IMEI.
Add	Adds an IE removal policy. When you select Add , the New window appears, which allows you to configure the IE policy.
Edit	Modifies settings from within the IE removal policy. When you select Edit , the Edit window appears, which allows you to modify the settings within the policy.
Delete	Removes the IE removal policy from the list.
New IE policy page	
SGSN address	Select a firewall address or address group that contains SGSN addresses.
IEs to be removed	Select one or more IE types to be removed. These include APN Restriction, RAT, RAI, ULI, and IMEI.

Encapsulated IP traffic filtering options

You can use encapsulated IP traffic filtering to filter GTP sessions based on information contained in the data stream. to control data flows within your infrastructure. You can configure IP filtering rules to filter encapsulated IP traffic from mobile stations by identifying the source and destination policies. For more information, see [When to use encapsulated IP traffic filtering](#).

Expand **Encapsulated IP Traffic Filtering** in the GTP profile to reveal the options.

Encapsulated IP Traffic Filtering	
Enable IP Filter	Select to enable encapsulated IP traffic filtering options.
Default IP Action	Select the default action for encapsulated IP traffic filtering. If you select Allow , all sessions are allowed except those blocked by individual encapsulated IP traffic filters. If you select Deny , all sessions are blocked except those allowed by individual encapsulated IP traffic filters.
Source	Select a source IP address from the configured firewall IP address or address group lists. Any encapsulated traffic originating from this IP address will be a match if the destination also matches.
Destination	Select a destination IP address from the configured firewall IP address or address group lists. Any encapsulated traffic being sent to this IP address will be a match if the destination also matches.

Action	The type of action that will be taken. Select to Allow or Deny encapsulated traffic between this source and Destination.
Edit	Modifies the source, destination or action settings.
Add IP Policy	Adds a new encapsulated IP traffic filter. When you select Add IP Policy , the New window appears which allows you to configure IP policy settings.
New (window)	
Source	Select the source firewall address or address group.
Destination	Select the destination firewall address or address group.
Action	Select Allow or Deny .

Encapsulated non-IP end user traffic filtering options

Depending on the installed environment, it may be beneficial to detect GTP packets that encapsulate non-IP based protocols. You can configure the FortiOS Carrier firewall to permit a list of acceptable protocols, with all other protocols denied.

The encoded protocol is determined in the PDP Type Organization and PDP Type Number fields within the End User Address Information Element. The PDP Type Organization is a 4-bit field that determines if the protocol is part of the ETSI or IETF organizations. Values are zero and one, respectively. The PDP Type field is one byte long. Both GTP specifications list only PPP, with a PDP Type value of one, as a valid ETSI protocol. PDP Types for the IETF values are determined in the "Assigned PPP DLL Protocol Numbers" sections of RFC1700. The PDP types are compressed, meaning that the most significant byte is skipped, limiting the protocols listed from 0x00 to 0xFF.

Encapsulated Non-IP End User Address Filtering	
Enable Non-IP Filter	Select to enable encapsulated non-IP traffic filtering.
Default Non-IP Action	Select the default action for encapsulated non-IP traffic filtering. If you select Allow , all sessions are allowed except those blocked by individual encapsulated non-IP traffic filters. If you select Deny , all sessions are blocked except those allowed by individual encapsulated non-IP traffic filters.
Type	The type chosen, AESTI or IETF .
Start Protocol	The beginning protocol port number range.
End Protocol	The end of the protocol port number range.
Action	The type of action that will be taken.

Edit	Modify a non-IP filter's settings in the list. When you select Edit , the Edit window appears, which allows you to modify the Non-IP policy settings.
Delete	Remove a non-IP policy from the list.
Add Non-IP Policy	Add a new encapsulated non-IP traffic filter. When you select Add Non-IP Policy , you are automatically redirected to the New page.
New (window)	
Type	Select AESTI or IETF .
Start Protocol End Protocol	Select a start and end protocol from the list of protocols in RFC 1700. Allowed range includes 0 to 255 (0x00 to 0xff). Some common protocols include: <ul style="list-style-type: none"> • 33 (0x0021) Internet Protocol • 35 (0x0023) OSI Network Layer • 63 (0x003f) NETBIOS Framing • 65 (0x0041) Cisco Systems • 79 (0x004f) IP6 Header Compression • 83 (0x0053) Encryption
Action	Select Allow or Deny .

Protocol Anomaly prevention options

Use protocol anomaly detection options to detect or deny protocol anomalies according to GTP standards and tunnel state. Protocol anomaly attacks involve malformed or corrupt packets that typically fall outside of the protocol specifications. Packets cannot pass through if they fail the sanity check.

Protocol Anomaly	
Invalid Reserved Field	GTP version 0 (GSM 09.60) headers specify a number of fields that are marked as "Spare" and contain all ones (1). GTP packets that have different values in these fields are flagged as anomalies. GTP version 1 (GSM 29.060) makes better use of the header space and only has one, 1-bit, reserved field. In the first octet of the GTP version1 header, bit 4 is set to zero.
Reserved IE	Both versions of GTP allow up to 255 different Information Elements (IE). However, a number of Information Elements values are undefined or reserved. Packets with reserved or undefined values will be filtered.
Miss Mandatory IE	GTP packets with missing mandatory Information Elements (IE) will not be passed to the GGSN.

Out of State Message	<p>The GTP protocol requires a certain level of state to be kept by both the GGSN and SGSN. Some message types can only be sent when in a specific GTP state. Packets that do not make sense in the current state are filtered or rejected</p> <p>Both versions of GTP allow up to 255 different message types. However, a number of message type values are undefined or reserved.</p> <p>Best practices dictate that packets with reserved or undefined values will be filtered.</p>
Out of State IE	GTP Packets with out of order Information Elements are discarded.
Spoofed Source Address	<p>The End User Address Information Element in the PDP Context Create & Response messages contain the address that the mobile station (MS) will use on the remote network. If the MS does not have an address, the SGSN will set the End User Address field to zero when sending the initial PDP Context Create message. The PDP Context Response packet from the GGSN will then contain an address to be assigned to the MS. In environments where static addresses are allowed, the MS will relay its address to the SGSN, which will include the address in the PDP Context Create Message. As the MS address is negotiated within the PDP Context creation handshake, any packets originating from the MS that contain a different source address are detected and dropped.</p>

Anti-Overbilling options

You can configure the FortiOS Carrier firewall to prevent over billing subscribers for traffic over the. To enable anti-overbilling, you must configure both the Gn/Gp firewall and the Gi firewall.

Expand **Anti-Overbilling** in the GTP profile to reveal these settings.

Anti-Overbilling	
Gi Firewall IP Address	The IP address of the unit's interface configured as a Gi gateway.
Port	The SG security port number. The default port number is port 21123. Change this number if your system uses a different SG port.
Interface	Select the unit interface configured as a Gi gateway.
Security Context ID	Enter the security context ID. This ID must match the ID entered on the server Gi firewall. The default security context ID is 696.

Log options

All the GTP logs are treated as a subtype of the event logs. To enable GTP logging, you must:

- configure the GTP log settings in a GTP profile

Log	
Log Frequency	<p>Enter the number of messages to drop between logged messages.</p> <p>An overflow of log messages can sometimes occur when logging rate-limited GTP packets exceed their defined threshold. To conserve resources on the syslog server and the Carrier-enabled FortiGate unit, you can specify that some log messages are dropped. For example, if you want only every twentieth message to be logged, set a logging frequency of 20. This way, 20 messages are skipped and the next logged.</p> <p>Acceptable frequency values range from 0 to 2147483674. When set to '0', no messages are skipped.</p>
Forwarded Log	Select to log forwarded GTP packets.
Denied Log	Select to log GTP packets denied or blocked by this GTP profile.
Rate Limited Log	Select to log rate-limited GTP packets.
State Invalid Log	Select to log GTP packets that have failed stateful inspection.
Tunnel Limit Log	Select to log packets dropped because the maximum limit of GTP tunnels for the destination GSN is reached.
Extension Log	<p>Select to log extended information about GTP packets. When enabled, this additional information will be included in log entries:</p> <ul style="list-style-type: none"> • IMSI • MSISDN • APN • Selection Mode • SGSN address for signaling • SGSN address for user data • GGSN address for signaling • GGSN address for user data

Traffic count Log

Select to log the total number of control and user data messages received from and forwarded to the GGSNs and SGSNs that the unit protects.

The unit can report the total number of user data and control messages received from and forwarded to the GGSNs and SGSNs it protects.

Alternately, the total size of the user data and control messages can be reported in bytes. The unit differentiates between traffic carried by each GTP tunnel, and also between GTP-User and GTP-Control messages.

The number of messages or the number of bytes of data received from and forwarded to the SGSN or GGSN are totaled and logged if a tunnel is deleted.

When a tunnel is deleted, the log entry contains:

- Timestamp
- Interface name (if applicable)
- SGSN IP address
- GGSN IP address
- TID
- Tunnel duration time in seconds
- Number of messages sent to the SGSN
- Number of messages sent to the GGSN

Specifying logging types

You can configure the unit to log GTP packets based on their status with GTP traffic logging.

The status of a GTP packet can be any of the following 5 states:

- **Forwarded** - a packet that the unit transmits because the GTP policy allows it
- **Prohibited** - a packet that the unit drops because the GTP policy denies it
- **Rate-limited** - a packet that the unit drops because it exceeds the maximum rate limit of the destination GSN
- **State-invalid** - a packet that the unit drops because it failed stateful inspection
- **Tunnel-limited** - a packet that the unit drops because the maximum limit of GTP tunnels for the destination GSN is reached.

The following information is contained in each log entry:

- Timestamp
- Source IP address
- Destination IP address
- Tunnel Identifier (TID) or Tunnel Endpoint Identifier (TEID)
- Message type
- Packet status: forwarded, prohibited, state-invalid, rate-limited, or tunnel-limited
- Virtual domain ID or name
- Reason to be denied if applicable.

GTP performance

There are independent Receive and Transmit queues for `gtp-u` process. These queues are and their associated resources are initialized when the `ftp-enhance-mode` is enabled.

CLI changes under system npu

gtp-enhance-mode

```
config system npu
  set gtp-enhance-mode [enable|disable]
end
```

This configuration requires a reboot of the device to initialize the changes.

gtp-enhance-cpu-range

This is used to set the CPUs which can process the GTP-U packet inspection.

```
config system npu
  set gtp-enhance-cpu-range [0|1|2]
end
```

Option	Description
0	Inspect GTPU packets by all CPUs
1	Inspect GTPU packets by Master CPUs
2	Inspect GTPU packets by Slave CPUs

Diagnose commands

```
diagnose npu np6 hbq-stats [all|np xx]
```

Used to see the GTP-U packet counter by all NP or the corresponding np.

```
diagnose npu np6 hbq-stats-clear all /np xx
```

Used to clear the GTP-U packet counter by all NP or the corresponding np.

Verifying the enhance-mode is disabled

Before execute the test or enable/disable the gtp enhance, first check the `gtp-enhance-mode` status as in the example below:

```
config system npu
  get
  gtp-enhance-mode: disable
  gtp-enhance-cpu-range: 0
end
```

If the `gtp-enhance-mode` is disable, use the command `diagnose npu np6 hbq-stats all`.

The output will be similar to below:

```
# diagnose npu np6 hbq-stats all
Total :0
```

If the `gtp-enhance-mode` is enable, use the command `diagnose npu np6 hbq-stats all`

The output will be similar to below:

```
# diagnose npu np6 hbq-stats all
cpu_ 0:0
cpu_ 1:0
cpu_ 2:0
cpu_ 3:0
cpu_ 4:0
cpu_ 5:0
cpu_ 6:0
cpu_ 7:0
cpu_ 8:0
cpu_ 9:0
cpu_10:0
cpu_11:0
cpu_12:0
cpu_13:0
cpu_14:0
cpu_15:0
cpu_16:0
cpu_17:0
cpu_18:0
cpu_19:0
cpu_20:0
cpu_21:0
cpu_22:0
cpu_23:0
cpu_24:0
cpu_25:0
cpu_26:0
cpu_27:0
cpu_28:0
cpu_29:0
cpu_30:0
cpu_31:0
cpu_32:0
cpu_33:0
cpu_34:0
cpu_35:0
cpu_36:0
cpu_37:0
cpu_38:0
cpu_39:0
Total :0
```

Sometimes, when loading the new configure file, and the new configure file does not match the old configure file, the `gtp-enhance-mode` status will be confused.

You can see :

```
#config system npu
#get
gtp-enhance-mode: enable
```

but you can also see that

```
diagnose npu np6 hbq-stats all
Total :0
```

This means the `gtp-enhance-mode` is actually set to `disable`.

The inverse is also possible, when you see

```
#config system npu
#get
gtp-enhance-mode: disable
```

but you also see that

```
# diagnose npu np6 hbq-stats all
cpu_ 0:0
...
cpu_39:0
Total :0
```

This means the `gtp-enhance-mode` is actually set to `enable`.

If these combinations occur, just run the command below:

```
config system npu
  set gtp-enhance-mode enable
end
```

or

```
config system npu
  set gtp-enhance-mode disable
end
```

Once this is done, reboot the device to let the 2 statuses match.

Configuring GTP on FortiOS Carrier

Configuring GTP support on FortiOS Carrier involves configuring a number of areas of features.

GTP support on the Carrier-enabled FortiGate unit

The FortiCarrier unit needs to have access to all traffic entering and exiting the carrier network for scanning, filtering, and logging purposes. This promotes one of two configurations — hub and spoke, or bookend.

A hub and spoke configuration with the Carrier-enabled FortiGate unit at the hub and the other GPRS devices on the spokes is possible for smaller networks where a lower bandwidth allows you to divide one unit into multiple virtual domains to fill multiple roles on the carrier network. It can be difficult with a single FortiOS Carrier as the hub to ensure all possible entry points to the carrier network are properly protected from potential attacks such as relayed network attacks.

A bookend configuration uses two Carrier-enabled FortiGate units to protect the carrier network between them with high bandwidth traffic. One unit handles traffic from mobile stations, SGSNs, and foreign carriers. The other handles GGSN and data network traffic. Together they ensure the network is secure.

The Carrier-enabled FortiGate unit can access all traffic on the network. It can also verify traffic between devices, and verify that the proper GPRS interface is being used. For example there is no reason for a Gn interface to be used to communicate with a mobile station — the mobile station will not know what to do with the data — so that traffic is blocked.

When you are configuring your Carrier-enabled FortiGate unit's GTP profile, you must first configure the APN. It is critical to GTP communications — no traffic will flow without the APN.

The Carrier-enabled FortiGate unit does more than just forward and route GTP packets over the network. It also performs:

- [GTP support on the Carrier-enabled FortiGate unit](#)
- [GTP support on the Carrier-enabled FortiGate unit](#)
- [GTP support on the Carrier-enabled FortiGate unit](#)
- [GTP support on the Carrier-enabled FortiGate unit](#)
- [GTP support on the Carrier-enabled FortiGate unit](#)

Packet sanity checking

The FortiOS Carrier firewall checks the following items to determine if a packet conforms to the UDP and GTP standards:

- GTP release version number — must be 0, 1, or 2
- Settings of predefined bits
- Protocol type
- UDP packet length

If the packet in question does not confirm to the standards, the FortiOS Carrier firewall drops the packet, so that the malformed or forged traffic will not be processed.

GTP stateful inspection

Apart from the static inspection (checking the packet header), the FortiOS Carrier firewall performs stateful inspection.

Stateful inspection provides enhanced security by keeping track of communications sessions and packets over a period of time. Both incoming and outgoing packets are examined. Outgoing packets that request specific types of incoming packets are tracked; only those incoming packets constituting a proper response are allowed through the firewall.

The FortiOS Carrier firewall can also index the GTP tunnels to keep track of them.

Using the enhanced Carrier traffic policy, the FortiOS Carrier firewall can block unwanted encapsulated traffic in GTP tunnels, such as infrastructure attacks. Infrastructure attacks involve attempts by an attacker to connect to restricted machines, such as GSN devices, network management systems, or mobile stations. If these attempts to connect are detected, they are to be flagged immediately by the firewall .

Protocol anomaly detection and prevention

The FortiOS Carrier firewall detects and optionally drops protocol anomalies according to GTP standards and specific tunnel states. Protocol anomaly attacks involve malformed or corrupt packets that typically fall outside of protocol specifications. These packets are not seen on a production network. Protocol anomaly attacks exploit poor programming practices when decoding packets, and are typically used to maliciously impair system performance or elevate privileges.

FortiOS Carrier also detects IP address spoofing inside GTP data channel.

See [Protocol anomaly detection and prevention](#).

HA

FortiOS Carrier active-passive HA provides failover protection for the GTP tunnels. This means that an active-passive cluster can provide FortiOS Carrier firewall services even when one of the cluster units encounters a problem that would result in complete loss of connectivity for a stand-alone FortiOS Carrier firewall. This failover protection provides a backup mechanism that can be used to reduce the risk of unexpected downtime, especially for mission-critical environments.

FortiOS HA synchs TCP sessions by default, but UDP sessions are not synchronized by default. However synchronizing a session is only part of the solution if the goal is to continue GTP processing on a synchronized session after a HA switch. For that to be successful we also need to synch the GTP tunnel state. So, once the master completes tunnel setup then the GTP tunnel is synchronized to the slave.

GTP traffic will only flow without interruption on a HA switch if bidirectional GTP policies have been configured: an internal (GTP server) to external (all) UDP port GTP policy, and an external (all) to internal (GTP server) UDP port GTP policy. If either policy is missing then traffic may be interrupted until traffic flows in the opposite direction.

For more information on HA in FortiOS, see the High Availability (HA) Guide or the FortiOS Administration Guide.

Virtual domain support

FortiOS Carrier is suited to both large and smaller carriers. A single Carrier-enabled FortiGate unit can serve either one large carrier, or several smaller ones through virtual domains. As with any FortiGate unit, Carrier-enabled units have the ability to split their resources into multiple virtual units. This allows smaller carriers to use just the resources that they need without wasting the extra. For more information on HA in FortiOS, see the Virtual Domains (VDOMs) Guide.

Configuring General Settings on the Carrier-enabled FortiGate unit

To configure the GTP General Settings, go to **Security Profiles > GTP Profile**, and edit a GTP profile. Expand **General Settings** to configure settings. See General settings options.

GTP Monitor Mode

The `monitor-mode` setting is part of the GTP profile. The setting shows on all GTP profiles and works for all GTP versions.

When this setting is enabled, if a GTP packet is to be dropped due to a GTP deny case such as:

- GTP_DENY
- GTP_RATE_LIMIT
- GTP_STATE_INVALID
- GTP_TUNNEL_LIMIT

instead of being dropped, it will be forwarded and logged with the original deny log message and a "-monitor" suffix (e.g., state-invalid-monitor).

This setting is found in the CLI.

```
config firewall gtp
  edit profile_name
    ...
    set monitor-mode [disable*|enable]
    ...
  end
```

end

Configuring Encapsulated Filtering in FortiOS Carrier

Encapsulated traffic on the GPRS network can come in a number of forms as it includes traffic that is “wrapped up” in another protocol. This detail is important for firewalls because it requires “unwrapping” to properly scan the data inside. If encapsulated packets are treated as regular packets, that inside layer will never be scanned and may allow malicious data into your network.

On Carrier-enabled FortiGate units, GTP related encapsulated filtering falls under encapsulated IP traffic filtering, and encapsulated non-IP end user address filtering.

Configuring Encapsulated IP Traffic Filtering

Generally there are a very limited number of IP addresses that are allowed to encapsulate GPRS traffic. For example GTP tunnels are a valid type of encapsulation when used properly. This is the GTP tunnel which uses the Gp or Gn interfaces between SGSNs and GGSNs. However, a GTP tunnel within a GTP tunnel is not accessible — FortiOS Carrier will either block or forward the traffic, but is not able to open it for inspection.

The ability to filter GTP sessions is based on information contained in the data stream and provides operators with a powerful mechanism to control data flows within their infrastructure. You can also configure IP filtering rules to filter encapsulated IP traffic from Mobile Stations.

To configure the Encapsulated IP Traffic Filtering, go to **Security Profiles > GTP Profile**, and edit a GTP profile. Expand **Encapsulated IP Traffic Filtering** to configure settings. See Encapsulated IP traffic filtering options.

When to use encapsulated IP traffic filtering

The following are the typical cases that need encapsulated IP traffic filtering:

Mobile station IP pools

In a well-designed network, best practices dictate that the mobile station address pool is to be completely separate from the GPRS network infrastructure range of addresses. Encapsulated IP packets originating from a mobile station will not contain source or destination addresses that fall within the address range of GPRS infrastructures. In addition, traffic originating from the users handset will not have destination/source IP addresses that fall within any Network Management System (NMS) or Charging Gateway (CG) networks.

Communication between mobile stations

Mobile stations on the same GPRS network are not able to communicate with other mobile stations. Best practices dictate that packets containing both source and destination addresses within the mobile station's range of addresses are to be dropped.

Direct mobile device or internet attacks

It may be possible for attackers to wrap attack traffic in GTP protocols and submit the resulting GTP traffic directly to a GPRS network element from their mobile stations or a node on the Internet. It is possible that the receiving SGSN or GGSN would then strip off the GTP header and attempt to route the underlying attack. This underlying attack could have any destination address and would probably have a source address spoofed as if it were valid from that PLMN.

You cannot add an IE removal policy when you are creating a new profile.

Relayed network attacks

Depending on the destination the attack could be directly routed, such as to another node of the PLMN, or re wrapped in GTP for transmission to any destination on the Internet outside the PLMN depending on the routing table of the GSN enlisted as the unwitting relay.

The relayed attack could have any source or destination addresses and could be any of numerous IP network attacks, such as an attack to hijack a PDP context, or a direct attack against a management interface of a GSN or other device within the PLMN. Best practices dictate that any IP traffic originating on the Internet or from an MS with a destination address within the PLMN is to be filtered.

Configuring Encapsulated Non-IP End User Address Filtering

Much of the traffic on the GPRS network is in the form of IP traffic. However some parts of the network do not use IP based addressing, so the Carrier-enabled FortiGate unit is unable to perform Encapsulated IP Traffic Filtering.

Depending on the installed environment, it may be beneficial to detect GTP packets that encapsulate non-IP based protocols. You can configure the FortiOS Carrier firewall to permit a list of acceptable protocols, with all other protocols denied.

The encoded protocol is determined in the PDP Type Organization and PDP Type Number fields within the End User Address Information Element. The PDP Type Organization is a 4-bit field that determines if the protocol is part of the ETSI or IETF organizations. Values are zero and one, respectively. The PDP Type field is one byte long. Both GTP specifications only list PPP, with a PDP Type value of one, as a valid ETSI protocol. PDP Types for the IETF values are determined in the "Assigned PPP DLL Protocol Numbers" sections of RFC 1700. The PDP types are compressed, meaning that the most significant byte is skipped, limiting the protocols listed from 0x00 to 0xFF.

To configure the Encapsulated Non-IP End User Address Filtering, go to **Security Profiles > GTP Profile**, and edit a GTP profile. Expand **Encapsulated Non-IP End User Address Filtering** to configure settings. See Encapsulated non-IP end user traffic filtering options.

Configuring the Protocol Anomaly feature in FortiOS Carrier

When anomalies do happen, it is possible for the anomaly to interrupt network traffic or consume network resources — if precautions are not taken. Anomalies can be generated by accident or maliciously, but both methods can have the same results — degrading the performance of the carrier network, or worse.

To configure GTP protocol anomalies, go to **Security Profiles > GTP Profile**, and edit a GTP profile. Expand the **Protocol Anomaly** option. See Protocol Anomaly prevention options.

The following are some examples:

- The GTP header specifies the length of the packet excluding the mandatory GTP header. In GTP version 0 (GSM 09.60), the mandatory GTP header size is 20 bytes, whereas GTP version 1 (GSM 29.060) specifies that the minimum length of the GTP header is 8 bytes. The GTP packet is composed of the header, followed by Information Elements typically presented in a Type-Length-Value format. It is possible for an attacker to create a GTP packet with a GTP header field length that is incompatible with the length of the necessary information elements.

- The same concepts are true for GTP version 2 headers even though there are different fields in them.
- It is similarly possible for an attacker to create a packet with an invalid IE length. Invalid lengths may cause protocol stacks to allocate incorrect amounts of memory, and thereby cause crashes or buffer overflows.

By default the FortiOS Carrier firewall detects these problems, as well as other protocol anomalies, and drops the packets. All protocol anomaly options are set to **Deny** by default. However, you can change the policy to allow them.

Configuring Anti-overbilling in FortiOS Carrier

GPRS over billing attacks can be prevented with a properly configured Carrier-enabled FortiGate unit.

Over billing can occur when a subscriber returns his IP address to the IP pool. Before the billing server closes it, the subscriber's session is still open and vulnerable. If an attacker takes control of the subscriber's IP address, he can send or receive data and the subscriber will be billed for the traffic.

Over billing can also occur when an available IP address is reassigned to a new mobile station (MS). Subsequent traffic by the previous MS may be forwarded to the new MS. The new MS would then be billed for traffic it did not initiate.

Anti-overbilling with FortiOS Carrier

The Carrier-enabled FortiGate unit can be configured to assist with anti-overbilling measures. These measures ensure that the customer is only billed for connection time and data transfer that they actually use.

Anti-overbilling on the Carrier-enabled FortiGate unit involves:

- the administrator configuring the over billing settings in the GTP profile to notify the Gi firewall when a GTP tunnel is deleted
- the unit clearing the sessions when the Gi firewall receives a notification from the Gn/Gp firewall about a GTP tunnel being deleted This way, the Gi firewall prevents over billing by blocking traffic initiated by other users.

The three locations to configure anti-overbilling options include:

- **Network > Interface** — Edit a specific interface. Towards the bottom of the **Edit Interface** page, in the **Status** section, you can toggle **Gi Gatekeeper**.
- **System > Settings** — In the **Gi Gatekeeper Settings** section, set the **Context ID** and **Port** that anti-overbilling will take place on.
- **Security Profiles > GTP Profile** — Edit a specific GTP Profile. In the **Anti-Overbilling** section, edit the **Gi Firewall IP address**, **Port**, **Interface** and **Security Context ID**, to use for anti-overbilling measures.

For detailed options, see [Anti-Overbilling options](#).

Logging events on the Carrier-enabled FortiGate unit

Logging on the Carrier-enabled FortiGate unit is just like logging on any other FortiOS unit. The only difference with FortiOS Carrier is that there are a few additional events that you can log beyond the regular ones. These additional events are covered here.

To change FortiOS Carrier specific logging event settings, go to **Security Profiles > GTP Profile** and edit a GTP profile. Expand the **Log** section to change the settings. For detailed options, see Log options.

The following information is contained in each log entry:

Timestamp	The time and date when the log entry was recorded
Source IP address	The sender's IP address.
Destination IP address	The receiver's IP address. The sender-receiver pair includes a mobile phone on the GPRS local network, and a device on a network external to the GPRS network, such as the Internet.
Tunnel Identifier (TID) Tunnel Endpoint Identifier (TEID)	An identifier for the start and endpoints of a GTP tunnel. This information uniquely defines all tunnels. It is important for billing information based on the length of time the tunnel was active and how much data passed over the tunnel.
Message type	For available message types, see Common message types on carrier networks.
Packet status	<p>What action was performed on the packet. This field matches the logging options while you are configuring GTP logging. See Logging events on the Carrier-enabled FortiGate unit on page 876.</p> <p>The status can be one of forwarded, prohibited, state-invalid, rate-limited, or tunnel-limited</p>
Virtual domain ID or name	A Carrier-enabled FortiGate unit can be divided into multiple virtual units, each being a complete and self-contained virtual FortiCarrier unit. This field indicates which virtual domain (VDOM) was responsible for the log entry. If VDOMs are not enabled on your unit, this field will be <code>root</code> .
Reason to be denied if applicable	If the packet that generated this log entry was denied or blocked, this field will include what part of FortiOS denied or blocked that packet. Such as firewall, antivirus, webfilter, or spamfilter.

An example of the above log message format is for a Tunnel deleted log entry. When a tunnel is deleted, the log entry contains the following information:

- Timestamp
- Interface name (if applicable)
- SGSN IP address (source IP)
- GGSN IP address (destination IP)
- Tunnel ID
- Tunnel duration time in seconds
- Number of messages sent to the SGSN
- Number of messages sent to the GGSN

GTP message type filtering

FortiOS Carrier supports message filtering in GTP by the type of message.

This section includes:

Common message types on carrier networks

Carrier networks include many types of messages — some concern the network itself, others are content moving across the network, and still others deal with handshaking, billing, or other administration based issues.

GTP contains two major parts GTP for the control plane (GTP-C) and GTP for user data tunnelling (GTP-U). Outside of those areas there are only unknown message types.

GTP-C messages

GTP-C contains the networking layer messages. These address routing, versioning, and other similar low level issues.

When a subscriber requests a Packet Data Protocol (PDP) context, the SGSN will send a create PDP context request GTP-C message to the GGSN giving details of the subscriber's request. The GGSN will then respond with a create PDP context response GTP-C message which will either give details of the PDP context actually activated or will indicate a failure and give a reason for that failure. This is a UDP message on port 212.

GTP-C message types include Path Management Messages, Location Management Messages, and Mobility Management Messages.

Path Management Messages

Path management is used by one GSN to detect if another GSN is alive, or if it has restarted after a failure.

The path management procedure checks if a given GSN is alive or has been restarted after a failure. In case of SGSN restart, all MM and PDP contexts are deleted in the SGSN, since the associated data is stored in a volatile memory. In the case of GGSN restart, all PDP contexts are deleted in the GGSN.

Tunnel Management Messages

The tunnel management procedures are used to create, update, and delete GTP tunnels in order to route IP PDUs between an MS and an external PDN via the GSNs.

The PDP context contains the subscriber's session information when the subscriber has an active session. When a mobile wants to use GPRS, it must first attach and then activate a PDP context. This allocates a PDP context data structure in the SGSN that the subscriber is currently visiting and the GGSN serving the subscriber's access point.

Tunnel management procedures are defined to create, update, and delete tunnels within the GPRS backbone network. A GTP tunnel is used to deliver packets between an SGSN and a GGSN. A GTP tunnel is identified in each GSN node by a TEID, an IP address, and a UDP port number.

Location Management Messages

The location-management procedure is performed during the network-requested PDP context activation procedure if the GGSN does not have an SS7 MAP interface (i.e., Gc interface). It is used to transfer location

messages between the GGSN and a GTP-MAP protocol-converting GSN in the GPRS backbone network.

Location management subprocedures are used between a GGSN that does not support an SS7 MAP interface (i.e., Gc interface) and a GTP-MAP protocol-conversing GSN. This GSN supports both Gn and Gc interfaces and is able to perform a protocol conversing between GTP and MAP.

Mobility Management Messages

The MM procedures are used by a new SGSN in order to retrieve the IMSI and the authentication information or MM and PDP context information in an old SGSN. They are performed during the GPRS attach and the inter-SGSN routing update procedures.

The MM procedures are used between SGSNs at the GPRS-attach and inter-SGSN routing update procedures. An identity procedure has been defined to retrieve the IMSI and the authentication information in an old SGSN. This procedure may be performed at the GPRS attach. A recovery procedure enables information related to MM and PDP contexts in an old SGSN to be retrieved. This procedure is started by a new SGSN during an inter-SGSN RA update procedure.

GTP-U messages

GTP-U is focused on user related issues including tunneling, and billing. GTP-U message types include MBMS messages, and GTP-U and Charging Management Messages

MBMS messages

Multimedia Broadcast and Multicast Services (MBMS) have recently begun to be offered over GSM and UMTS networks on UTRAN and GERAN radio access technologies. MBMS is mainly used for mobile TV, using up to four GSM timeslots for one MBMS connection. One MBMS packet flow is replicated by GGSN, SGSN and RNCs.

MBMS is split into the MBMS Bearer Service and the MBMS User Service. The MBMS User Service is basically the MBMS Service Layer and offers a Streaming- and a Download Delivery Method. The Streaming Delivery method can be used for continuous transmissions like Mobile TV services. The Download Method is intended for "Download and Play" services.

GTP-U and Charging Management Messages

SGSNs and GGSNs listen for GTP-U messages on UDP port 2152.

GTP' (GTP prime) is used for billing messages. It uses the common GTP messages (GTP Version Not Supported, Echo Request and Echo Response) and adds additional messages related to billing procedures.

Unknown Action messages

If the system doesn't know what type of message it is, it falls into this category. This is an important category of message because malformed messages may appear and need to be handled with security in mind.

Fortinet best practices dictate that you set **Unknown Action messages** to deny for security reasons.

Configuring message type filtering in FortiOS Carrier

GPRS Tunneling Protocol (GTP) is a group of IP-based communications protocols used to carry General Packet Radio Service (GPRS) traffic within Global System for Mobile Communications (GSM) and Universal Mobile Telecommunications System (UMTS) networks. It allows carriers to transport actual cellular packets over their network via tunneling.

In the CLI, there is a keyword for each type of GTP message for both message filtering, and for message rate limiting.

GTP message rate limiting is only accessible from the CLI using the command `configure firewall gtp`.

To configure GTP message type filtering - web-based manager

1. Go to **Security Profiles > GTP Profile**.
2. Select **Create New**.
3. Enter a name for this profile such as `msg_type_filtering`.
4. Select **Message Type Filtering** to expand it.
5. For each type of message in the list, select Allow or Deny. All messages are set to Allow by default.

Fortinet best practices dictate that the unknown message action should be set to **Deny** for security reasons as this will block malformed messages.

6. Optionally select and configure any other GTP features for this profile, such as logging.
7. Select **OK** to save the profile.
8. Apply the `msg_type_filtering` profile a security policy configured for GTP tunnel traffic.

To configure GTP message filtering and block Unknown Message Action messages- CLI

```
config firewall gtp
  edit msg_type_filtering
    config message-filter
      set unknown-message-action deny
    next
  end
end
```

Message Type Fields

Each of the following message types can be allowed or denied by your Carrier-enabled FortiGate unit depending on your carrier network and GTP traffic.

Unknown Message Action

Set this message type to deny.

Many attempts to hack into a carrier network will result in this unknown message type and therefore it is denied for security reasons.

Path Management Messages

Message Type	Used by	Description
Echo Request/Response	GTP-C, GTP-U, GTP'	Echo Request is sent on a path to another GSN to determine if the other node is alive. Echo Response is the reply.
Version not Supported	GTP-C, GTP-U, GTP'	There are multiple versions of GTP. Both devices communicating must use the same version of GTP, or this message will be the response.
Support Extension Headers Notification		Extensions are optional parts that a device can choose to support or not. If a device includes these extensions, it must include headers for the extensions to sure ensure proper formatting.

Tunnel Management Messages

Message Type	Used by	Description
Create PDP Context Request/ Response	GTP-C	Sent from an SGSN to a GGSN node as part of a GPRS PDP Context Activation procedure or the Network-Requested PDP Context Activation procedure. A valid request initiates the creation of a tunnel.
Update PDP Context Request/ Response	GTP-C	Used when PDP Context information changes, such as when a mobile device changes location.
Delete PDP Context Request/ Response	GTP-C	Used to terminate a PDP Context, and confirm the context has been deleted.
Create AA PDP Context Request/ Response	GTP-C	Sent as part of the GPRS Anonymous Access PDP Context Activation. It is used to create a tunnel between a context in the SGSN and a context in the GGSN.
Delete AA PDP Context Request/ Response	GTP-C	Sent as part of the GPRS PDP Anonymous Access Context Deactivation procedure to deactivate an activated PDP Context. It contains Cause and Private Extension Information Elements

Message Type	Used by	Description
Error Indication	GTP-U	<p>Sent to the GGSN when a tunnel PDU is received for the following conditions:</p> <ul style="list-style-type: none"> — No PDP context exists — PDP context is inactive — No MM context exists — GGSN deletes its PDP context when the message is received.
PDU Notification Request/ Response/ Reject Request/ Reject Response	GTP-C	<p>When receiving a Tunneled PDU (T-PDU), the GGSN checks if a PDP context is established for the given PDP address. If no PDP context has been established, the GGSN may initiate the Network-requested PDP Context Activation procedure by sending a PDU Notification Request to the SGSN.</p> <p>Reject Request - Sent when the PDP context requested by the GGSN cannot be established.</p>

Location Management Messages

Message Type	Used By	Description
Send Routing Information for GPRS Request/ Response	GTP-C	Sent by the GGSN to obtain location information for the MS. This message type contains the IMSI of the MS and Private Extension.
Failure Report Request/ Response	GTP-C	<p>Sent by the GGSN to the HLR when a PDU reject message is received.</p> <p>The GGSN requests the HLR to set the flag and add the GGSN to the list of nodes to report to when activity from the subscriber that owns the PDP address is detected.</p> <p>The message contains the subscriber IMSI and Private Extension</p>
Note MS GPRS Present Request/ Response	GTP-C	<p>When the HLR receives a message from a mobile with MDFG set, it clears the MDFG and sends the Note MS Present message to all GGSN's in the subscriber's list.</p> <p>This message type contains subscriber IMSI, GSN Address and Private Extension</p>

Mobility Management Messages

Message Type	Used By	Description
Identification Request/Response	GTP-C	Sent by the new SGSN to the old SGSN to request the IMSI for a MS when a GPRS Attach is done with a P-TMSI and the MS has changed SGSNs since the GPRS Detach was done.
SGSN context Request/ Response/ Acknowledge	GTP-C	Sent by the new SGSN to the old SGSN to request the MM and PDP Contexts for the MS.
Forward Relocation Request/ Response/ Complete/ Complete Acknowledge	GTP-C	Indicates mobile activation/deactivation within a Routing Area. This prevents paging of a mobile that is not active (visited VLR rejects calls from the HLR or applies Call Forwarding). Note that the mobile station does not maintain an attach/detach state. SRNS contexts contain for each concerned RAB the sequence numbers of the GTP-PDUs next to be transmitted in uplink and downlink directions.
Relocation Cancel Request/ Response	GTP-C	Send to cancel the relocation of a connection.
Forward SRNS Context/ Context Acknowledge	GTP-C	This procedure may be used to trigger the transfer of SRNS contexts from RNC to CN (PS domain) in case of inter system forward handover.
RAN Information Relay	GTP-C	Forward the Routing Area Network (RAN) information. A Routing Area (RA) is a subset of a GSM Location Area (LA). A RA is served by only one SGSN. Ensures that regular radio contact is maintained by the mobile

MBMS messages

Message Type	Used By	Description
MBMS Notification Request/ Response/ Reject Request/ Reject Response	GTP-C	Notification of the radio access devices.
Create MBMS Context Request/ Response	GTP-C	Request to create an active MBMS context. The context will be pending until the response is received. Once active, the MBMS context allows the MS to receive data from a specific MBMS source

Message Type	Used By	Description
Update MBMS Context Request/ Response	GTP-C	
Delete MBMS Context Request/ Response	GTP-C	Request to deactivate the MBMS context. When the response is received, the MBMS context will be inactive.

GTP-U and Charging Management Messages

Message Type	Used By	Description
G-PDU	GTP-C, GTP-U	GPRS Packet data unit delivery message.
Node Alive Request/Response	GTP-C, GTP-U	Used to inform rest of network when a node starts service.
Redirection Request/Response	GTP-C, GTP-U	Used to divert the flow of CDRs from the CDFs to another CGF when the sender is being removed, or they are used when the CGF has lost its connection to a downstream system.
Data Record Transfer Request/Response	GTP-C, GTP-U	Used to reliably transport CDRs from the point of generation (SGSN/GGSN) to non-volatile storage in the CGF

GTP identity filtering

FortiOS Carrier supports a number of filtering methods based on subscriber identity such as APN filtering, IMSI filtering, and advanced filtering.

This section includes:

IMSI on carrier networks

The International Mobile Subscriber Identity (IMSI) number is central to identifying users on a carrier network. It is a unique number that is assigned to a cell phone or mobile device to identify it on the GSM or UTM network.

Typical the IMSI number is stored on the SIM card of the mobile device and is sent to the network as required.

An IMSI number is 15 digits long, and includes the Mobile Country Code (MCC), Mobile Network Code (MNC), and Mobile Station Identification Number (MSIN).

IMSI codes

The Home Network Identity (HNI) is made up of the MCC and MNC. The HNI is used to fully identify a user's home network. This is important because some large countries have more than one country code for a single carrier. For example a customer with a mobile carrier on the East Coast of the United States would have a different MCC than a customer on the West Coast with the same carrier because even though the MNC would be the same the MCC would be different — the United States uses MCCs 310 to 316 due to its size.

If an IMSI number is not from the local carrier's network, IMSI analysis is performed to resolve the number into a Global Title which is used to access the user's information remotely on their home carrier's network for things like billing and international roaming.

Other identity and location based information elements

IMSI focuses on the user, their location, and carrier network. There are other numbers used to identify different user related Information Elements (IE).

These identity and location based elements include:

- Access Point Number (APN)
- Mobile Subscriber Integrated Services Digital Network (MSISDN)
- Radio Access Technology (RAT) type
- User Location Information (ULI)
- Routing Area Identifier (RAI)
- International Mobile Equipment Identity (IMEI)

Access Point Number (APN)

The Access Point Number (APN) is used in GPRS networks to identify an IP packet data network that a user wants to communicate with. The Network Identifier describes the network and optionally the service on that network that the GGSN is connected to. The APN also includes the MCC and MCN, which together locate the network the GGSN belongs to. An example of an APN in the Barbados using Digicel as the carrier that is connecting to the Internet is `internet.mcc342.mnc750.gprs`.

When you are configuring your Carrier-enabled FortiGate unit's GTP profiles, you must first configure the APN. It is critical to GTP communications and without it no traffic will flow.

The access point can then be used in a DNS query to a private DNS network. This process (called APN resolution) gives the IP address of the GGSN which serves the access point. At this point a PDP context can be activated.

Mobile Subscriber Integrated Services Digital Network (MSISDN)

This is a 15-digit number that, along with the IMSI, uniquely identifies a mobile user. Normally this number includes a 2-digit country code, a 3-digit national destination code, and a 10-digit subscriber number or the phone number of the mobile device, and because of that may change over time if the user changes their phone number. The MSISDN number follows the ITU-T E.164 numbering plan.

Radio Access Technology (RAT) type

The RAT type represents the radio technology used by the mobile device. This can be useful in determining what services or content can be sent to a specific mobile device. FortiOS Carrier supports:

- **UMTS Terrestrial Radio Access Network (UTRAN)**, commonly referred to as 3G, routes many types of traffic including IP traffic. This is one of the faster types.
- **GSM EDGE Radio Access Network (GERAN)** is a key part of the GSM network which routes both phone calls and data.
- **Wireless LAN (WLAN)** is used but not as widely as the other types. It is possible for the mobile device to move from one WLAN to another such as from an internal WLAN to a commercial hot spot.
- **Generic Access Network (GAN)** can also be called unlicensed mobile access (UMA). It routes voice, data, and SIP over IP networks. GAN is commonly used for mobile devices that have a dual-mode and can hand-off between GSM and WLANs.
- **High Speed Packet Access (HSPA)** includes two other protocols High Speed Downlink and Uplink Packet Access protocols (HSDPA and HSUPA respectively). It improves on the older WCDMA protocols by better using the radio bandwidth between the mobile device and the radio tower. This results in an increased data transfer rate for the user.

RAT type is part of advanced filtering configuration. See [Configuring advanced filtering in FortiOS Carrier](#).

User Location Information (ULI)

Gives Cell Global Identity/Service Area Identity (CGI/SAI) of where the mobile station is currently located. The ULI and the RAI are commonly used together to identify the location of the mobile device.

ULI is part of advanced filtering configuration. See [Configuring advanced filtering in FortiOS Carrier](#).

Routing Area Identifier (RAI)

Routing Areas (RAs) divide the carrier network and each has its own identifier (RAI). When a mobile device moves from one routing area to another, the connection is handled by a different part of the network. There are normally multiple cells in a routing area. There is only one SSGN per routing area. The RAI and ULI are commonly used to determine a user's location.

RAI is part of advanced filtering configuration. See [Configuring advanced filtering in FortiOS Carrier](#).

International Mobile Equipment Identity (IMEI)

IMEI is a unique 15-digit number used to identify mobile devices on mobile networks. It is very much like the MAC address of a TCP/IP network card for a computer. It can be used to prevent network access by a stolen phone — the carrier knows the mobile phone's IMEI, and when it is reported stolen that IMEI is blocked from accessing the carrier network no matter if it has the same SIM card as before or not. It is important to note that the IMEI stays with the mobile phone or device where the other information is either location based or stored on the removable SIM card.

IMEI type is part of advanced filtering configuration. See [Configuring advanced filtering in FortiOS Carrier](#).

When to use APN, IMSI, or advanced filtering

At first glance APN, IMSI, and advanced filtering have parts in common. For example two can filter on APN, and another two can filter on IMSI. The difficulty is knowing when to use which type of filtering.

Identity filtering comparison

Filtering type	Filter on the following data:	When to use this type of filtering
APN	APN	Filter based on GTP tunnel start or destination
IMSI	IMSI, MCC-MNC	Filter based on subscriber information
Advanced	PDP context, APN, IMSI, MSISDN, RAT type, ULI, RAI, IMEI	When you want to filter based on: <ul style="list-style-type: none"> • user phone number (MSISDN) • what wireless technology the user employed • to get on the network (RAT type) • user location (ULI and RAI) • handset ID, such as for stolen phones (IMEI)

APN filtering is very specific — the only identifying information that is used to filter is the APN itself. This will always be present in GTP tunnel traffic, so all GTP traffic can be filtered using this value.

IMSI filtering can use a combination of the APN and MCC-MNC numbers. The MCC and MNC are part of the APN, however filtering on MCC-MNC separately allows you to filter based on country and carrier instead of just the destination of the GTP Tunnel.

Advanced filtering can go into much deeper detail covering PDP contexts, MSISDN, IMEI, and more not to mention APN, and IMSI as well. If you can't find the information in APN or IMSI that you need to filter on, then use Advanced filtering.

Configuring APN filtering in FortiOS Carrier

To configure APN filtering go to **Security Profiles > GTP Profile**. Select a profile or create a new one, and expand **APN filtering**.

When you are configuring your Carrier-enabled FortiGate unit's GTP profiles, you must first configure the APN. It is critical to GTP communications and without it no traffic will flow.

Enable APN Filter	Select to enable filtering based on APN value.
Default APN Action	Select either Allow or Deny for all APNs that are not found in the list. The default is Allow.
Value	Displays the APN value for this entry. Partial matches are allowed using wildcard. For example <code>*.mcc333.mcn111.gprs</code> would match all APNs from country 333 and carrier 111 on the gprs network.
Mode	<p>Select one or more of the methods used to obtain APN values.</p> <p>Mobile Station provided - The APN comes from the mobile station where the mobile device connected. This is the point of entry into the carrier network for the user's connection.</p> <p>Network provided - The APN comes from the carrier network.</p> <p>Subscription Verified - The user's subscription has been verified for this APN. This is the most secure option.</p>
Action	One of allow or deny to allow or block traffic associated with this APN.
Delete icon	Select to remove this APN entry from the list.
Edit icon	Select to change the information for this APN entry.
Add APN	<p>Select to add an APN to the list. Not active while creating GTP profile, only when editing an existing GTP profile.</p> <p>Save all changes before adding APNs. A warning to this effect will be displayed when you select the Add APN button.</p>

The Add APN button is not activated until you save the new GTP profile. When you edit that GTP profile, you will be able to add new APNs.

Configuring IMSI filtering in FortiOS Carrier

In many ways the IMSI on a GPRS network is similar to an IP address on a TCP/IP network. Different parts of the number provide different pieces of information. This concept is used in IMSI filtering on FortiOS Carrier.

To configure IMSI filtering go to **Security Profiles > GTP Profile** and expand **IMSI filtering**.

While both the APN and MCC-MCN fields are optional, without using one of these fields the IMSI entry will not be useful as there is no information for the filter to match.

Enable IMSI Filter	Select to turn on IMSI filtering.
Default IMSI Action	<p>Select Allow or Deny. This action will be applied to all IMSI numbers except as indicated in the IMSI list that is displayed.</p> <p>The default value is Allow.</p>
APN	<p>The Access Point Number (APN) to filter on.</p> <p>This field is optional.</p>
MCC-MNC	<p>The Mobile Country Code (MCC) and Mobile Network Code (MNC) to filter on. Together these numbers uniquely identify the carrier and network of the GGSN being used.</p> <p>This field is optional.</p>
Mode	<p>Select the source of the IMSI information as one or more of the following:</p> <p>Mobile Station provided - the IMSI number comes from the mobile station the mobile device is connecting to.</p> <p>Network provided - the IMSI number comes from the GPRS network which could be a number of sources such as the SGSN, or HLR.</p> <p>Subscription Verified - the IMSI number comes from the user's home network which has verified the information.</p> <p>While Subscription Verified is the most secure option, it may not always be available. Selecting all three options will ensure the most complete coverage.</p>
Action	Select the action to take when this IMSI information is encountered. Select one of Allow or Deny.
Delete Icon	Select the delete icon to remove this IMSI entry.
Edit Icon	Select the edit icon to change information for this IMSI entry.
Add IMSI	<p>Select to add an IMSI to the list. Not active while creating GTP profile, only when editing an existing GTP profile.</p> <p>Save all changes before adding IMSIs. A warning to this effect will be displayed when you select the Add IMSI button.</p>

Configuring advanced filtering in FortiOS Carrier

Compared to ADN or IMSI filtering, advanced filtering is well named. Advanced filtering can be viewed as a catch-all filtering option — if ADN or IMSI filtering doesn't do what you want, then advanced filtering will. The advanced filtering can use more information elements to provide considerably more granularity for your filtering.

Enable	Select to turn on advanced filtering.
Default Action	Select Allow or Deny as the default action to take when traffic does not match an entry in the advanced filter list .
Messages	<p>Optionally select one or more types of messages this filter applies to:</p> <p>Create PDP Context Request, Create PDP Context Response, Update PDP Context Request, or Update PDP Context Response.</p> <p>Selecting Create PDP Context Response or Update PDP Context Response limits RAT type to only GAN and HSPA, and disables the APN, APN Mode, IMSI, MSISDN, ULI, RAI, and IMEI fields.</p> <p>To select Update PDP Context Request, APN Restriction must be set to all. Selecting Update PDP Context Request disables the APN, MSISDN, and IMEI fields.</p> <p>if all message types are selected, only the RAT Types of GAN and HSPA are available to select.</p>
APN Restriction	APN Restriction either allows all APNs or restricts the APNs to one of four categories — Public-1, Public-2, Private-1, or Private-2. This can also be combined with a specific APN or partial APN as well as specifying the APN mode.
RAT Type	Select one or more of the Radio Access Technology Types listed. These fields control how a user accesses the carrier's network. You can select one or more of UTRAN, GERAN, WLAN, GAN, HSPA, or any.
ULI	<p>The user location identifier. Often the ULI is used with the RAI to locate a user geographically on the carrier's network.</p> <p>The ULI is disabled when Create PDP Context Response or Update PDP Context Response messages are selected.</p>
RAI	<p>The router area identifier. There is only one SGSN per routing area on a carrier network. This is often used with ULI to locate a user geographically on a carrier network.</p> <p>The RAI is disabled when Create PDP Context Response or Update PDP Context Response messages are selected.</p>

IMEI	<p>The International Mobile Equipment Identity. The IMEI uniquely identifies mobile hardware, and can be used to block stolen equipment.</p> <p>The IMEI is only available when Create PDP Context Request or no messages are selected.</p>
Action	<p>Select Allow or Deny as the action when this filter matches traffic.</p> <p>The default is Allow.</p>
Delete Icon	Select to delete this entry from the list.
Edit Icon	Select to edit this entry.
Add	<p>Select to add an advanced filter to the list. Not active while creating GTP profile, only when editing an existing GTP profile.</p> <p>Save all changes before adding advanced filters. A warning to this effect will be displayed when you select the Add button.</p>

SCTP Concepts

As of FortiOS version 5.0, the FortiGate natively handles SCTP (Stream Control Transport Protocol) traffic, as an alternative to TCP and UDP for use in Carrier networks. The FortiGate handles SCTP as if it would any other traffic.

Overview

SCTP is a connection-oriented transport protocol that overcomes some of the limitations of both TCP and UDP that prevent reliable transfer of data over IP-based networks (such as those used by telephony systems and carrier networks). The 'Stream' in SCTP refers to the sequence of user messages or packets that are considered at the same time to be individual objects and also treated as a whole by networked systems. SCTP is less vulnerable to congestion and flooding due to more advanced error handling and flood protection built into the protocol.

SCTP features as compared to TCP and UDP

Feature	SCTP	TCP	UDP
State required at each endpoint	yes	yes	no
Reliable data transfer	yes	yes	no
Congestion control and avoidance	yes	yes	no
Message boundary conservation	yes	no	yes

Feature	SCTP	TCP	UDP
Path MTU discovery and message fragmentation	yes	yes	no
Message bundling	yes	yes	no
Multi-homed hosts support	yes	no	no
Multi-stream support	yes	no	no
Unordered data delivery	yes	no	yes
Security cookie against SYN flood attack	yes	no	no
Built-in heartbeat (reachability check)	yes	no	N/A

All of these features are built into the design of the Protocol, and the structure of SCTP packets and networks. The FortiGate unit interprets the traffic and provides the necessary support for maintenance and verification features, but the features are not FortiGate specific. These features are documented in greater detail below.

State required at each endpoint

Constant back and forth acknowledgement and content verification messages are sent between all SCTP peer endpoints, and all endpoints' state machine actions must be synchronized for traffic to flow.

Reliable data transfer

SCTP places data and control information (eg. source, destination, verification) into separate messages, both sharing the same header in the same SCTP packet. This allows for constant verification of the contained data at both ends and along the path, preventing data loss or fragmentation. As well, data is not sent in an interruptible stream as in TCP.

Congestion control and avoidance

Built-in, constantly updating path detection and monitoring automatically redirect packets along alternate paths in case of traffic congestion or inaccessible destinations. For deliberate/malicious congestion control, see the below section on [Security cookie against SYN flood attack](#).

Message boundary conservation

SCTP is designed in such a way that no matter how messages are divided, redirected, or fragmented, the message boundaries will be maintained within the packets, and all messages cannot be appended without tripping verification mechanisms.

Path MTU discovery and message fragmentation

SCTP is capable of Path Maximum Transmission Unit discovery, as outlined in RFC4821. Two specific alterations have been made to how SCTP handles MTU. First, that endpoints will have separate MTU estimates for each possible multi-homed endpoint. Second, that bundled message fragments (as explained below) will be directed based on MTU calculations, so that retransmissions (if necessary) will be sent without delay to alternate addresses.

Message bundling

SCTP is a message-oriented protocol, which means that despite being a streaming data protocol, it transports a sequence of specific messages, rather than transporting a stream of bytes (like TCP). Since some data transmissions are small enough to not require a complete message's worth of content, so multiple pieces of content will be transmitted simultaneously within the messages.

Multi-homed hosts support

SCTP supports multi-homing, which is a network structure in which one or multiple sources/destinations has more than one IP address. SCTP can adapt to multi-homing scenarios and redirect traffic to alternate IP addresses in case of failure.

Multi-stream support

Due to the message bundling feature allowing for multiple pieces of content to be sent in messages at once, SCTP can 'multi-stream' content, by deliberately dividing it among messages at a fixed rate, so that multiple types of content (eg. both images and text) can be loaded at once, at the same pace.

Unordered data delivery

With control messages in every packet to provide verification of any packet's data and its place in the stream, the data being transmitted can actually arrive in any order, and verify that all has arrived or that some is missing.

Security cookie against SYN flood attack

Since every packet contains verification of its place in the stream, it makes it easy for the protocol to detect when redundant, corrupted or malicious packets flood the path, and they are automatically dropped when necessary.

Built-in heartbeat (reachability check)

Endpoints automatically send specific control chunks among the other SCTP packet information to peer endpoints, to determine the reachability of the destination. Heartbeat acknowledgement packets are returned if the destination is available.

SCTP Firewall

FortiGate stateful firewalls will protect and inspect SCTP traffic, according to RFC4960. SCTP over IPsec VPN is also supported. The FortiGate device is inserted as a router between SCTP endpoints. It checks SCTP Syntax for the following information:

- Source and destination port
- Verification Tag
- Chunk type, chunk flags, chunk length
- Sequence of chunk types
- Associations

The firewall also oversees and maintains several SCTP security mechanisms:

- SCTP four-way handshake
- SCTP heartbeat
- NAT over SCTP

The firewall has IPS DoS protection against known threats to SCTP traffic, including INIT/ACK flood attacks, and SCTP fuzzing.

Troubleshooting

This section offers troubleshooting options for Carrier-related issues.

This section includes:

FortiOS Carrier diagnose commands

This section includes diagnose commands specific to FortiOS Carrier features such as GTP.

GTP related diagnose commands

This CLI command allows you to gain information on GTP packets, logs, statistics, and other information.

```
diag firewall gtp <command>
```

apn list <gtp_profile>	The APN list entries in the specified GTP profile
auth-ggsns show <gtp_profile>	The authorized GGSNs entries for the specified GTP profile. Any GGSNs not on this list will not be recognized.
auth-sgsns show <gtp_profile>	The authorized SGSNs list entries for the specified GTP profile. Any SGSNs not on this list will not be recognized.
handover-grp show <gtp_profile>	The handover group showing the range of allowed handover group IP addresses. The handover group acts like a white list of allowed GTP addresses with a default deny at the end — if the GTP address is not on the list, it is denied.
ie-remove-policy list <gtp_profile>	List of IE policies in the IE removal policy for this GTP profile. The information displayed includes the message count for this policy, the length of the SGSN, the list of IEs, and list of SGSN IP addresses.
imsi list <gtp_profile>	IMSI filter entries for this GTP profile. The information displayed includes the message count for this filter, length of the IMSI, the length of the APN and IMSI, and of course the IMSI and APN values.
invalid-sgsns-to-long list <gtp_profile>	List of SGSNs that do not match the filter criteria. These SGSNs will be logged.
ip-policy list <gtp_profile>	List the IP policies including message count for each policy, the action to take, the source and destination IP addresses or ranges, and masks.
noip-policy <gtp_profile>	List the non-IP policies including the message count, which mode, the action to take, and the start and end protocols to be used by decimal number.

	Select list or flush.
path {list flush}	List the GTP related paths in FortiOS Carrier memory. Flush the GTP related paths from memory.
policy list <gtp_policy>	The GTP advanced filter policy information for this GTP profile. The information displayed for each entry includes a count for messages matching this filter, a hexadecimal mask of which message types to match, the associated flags, action to take on a match, APN selection mode, MSISDN, RAT types, RAI, ULI, and IMEI.
profile list	Displays information about the configured GTP profiles. You will not be able to see the bulk of the information if you do not log the output to a file.
runtime-stat flush	Select to flush the GTP runtime statistics from memory.
stat	Display the GTP runtime statistics — details on current GTP activity. This information includes how many tunnels are active, how many GTP profiles exist, how many IMSI filter entries, how many APN filter entries, advanced policy filter entries, IE remove policy filter entries, IP policy filter entries, clashes, and dropped packets.
tunnel {list flush}	Select one of list or flush. List lists all the GTP tunnels currently active. Flush clears the list of active GTP tunnels. This does not clear the clash counter displayed in the <code>stat</code> command.

Applying IPS signatures to IP packets within GTP-U tunnels

GTP-U (GTP user data tunneling) tunnels carry user data packets, signaling messages and error information. GTP-U uses UDP port 2152. Carrier-enabled FortiGate units can apply IPS intrusion protection and detection to GTP-U user data sessions.

To apply IPS to GTP-U user data sessions, add an IPS Sensor to a profile and add the profile to a security policy that accepts GTP-U tunnels. The security policy Service field must be set to GTP or ALL to accept GTP-U packets.

The Carrier-enabled FortiGate unit intercepts packets with destination port 2152, removes the GTP header and handles the packets as regular IP packets. Applying an IPS sensor to the IP packets, the Carrier-enabled FortiGate unit can log attacks and pass or drop packets depending on the configuration of the sensor.

If the packet is GTP-in-GTP, or a nested tunnel, the packets are passed or blocked without being inspected.

To apply an IPS sensor to GTP-U tunnels

1. Go to **Security Profiles > Intrusion Protection** and select Create New (+) to add an IPS Sensor.
2. Configure the IPS Sensor to detect attacks and log, drop, or pass attack packets.

3. Go to **Policy & Objects > IPv4 Policy** and apply the IPS sensor to the security policy.
4. Go to **Policy & Objects > IPv4 Policy** and select Create New to add a security policy or select a security policy.
5. Configure the security policy to accept GTP traffic.
In the security policy configure the source and destination settings to match the GTP traffic. Service to GTP or ALL so that the security policy accepts GTP traffic.
6. Select the GTP profile within the security policy.
7. Configure any other required security policy settings.
8. Select **OK** to save the security policy.

GTP packets are not moving along your network

When GTP packets are not getting to their destination, this could be caused by any one of a number of issues. General troubleshooting principals apply here.

The following sections provide some suggestions on how to troubleshoot this issue:

- [Attempt to identify the section of your network with the problem](#)
- [Ensure you have an APN configured](#)
- [Check the logs and adjust their settings if required](#)
- [Check the routing table](#)
- [Perform a sniffer trace](#)
- [Generate specific packets to test the network](#)

Attempt to identify the section of your network with the problem

The first step is to determine how widespread this problem is. Does it affect the whole GPRS network, or just one or two devices?

If the entire network is has this problem, the solution is likely a more general one such as ensuring the security policies allow GTP traffic to pass, the GTP profile specifies SSGNs and GSGNs, or ensuring the GTP general settings are not overly limiting.

If one part of the network is affected, the problem is more likely centered around configurations with those network devices specified such as the handover group, or authorized SSGNs/GSGNs. It is also possible that small portions of the network may have hardware related issues such as cabling or faulty hardware. This section does not address those issues, and assumes hardware is not the problem.

The handover group is a white list of GTP addresses allowed to handle GTP messages. If a device's address is not on this list, it will be denied.

Ensure you have an APN configured

When you configure your GTP profile, ensure you first configure the APN. Without it, there will be no flow of traffic. The APN is used in nearly all GTP communications and without it, the Carrier-enabled FortiGate unit doesn't have the information it needs.

Check the logs and adjust their settings if required

During normal operation, the log settings will show any problems on the network but may not provide the level of details required to fully troubleshoot the problem. The reason for this is that the level of detail required for troubleshooting would quickly overwhelm the daily logs without any real benefit.

GTP related events in the event log will have message IDs in the range 41216 to 41222. For more information on GTP log messages, see the Log Message Reference. For more information on logging in general, see the Logging and Reporting guide.

Once there is a problem to troubleshoot, check the logs to trace the traffic patterns and narrow down the possible sources of the problem. There may be enough detail for you to locate and fix the problem without changing the log settings.

Remember to set any changes you made to the log settings back to their original values when you are done troubleshooting. Otherwise, the amount of detail will overwhelm your logging.

However, if more detail is required you can change settings such as:

- Lower the Log Frequency number in GTP Profiles so fewer or no log messages are dropped. This will allow a more accurate picture of everything happening on the network, where you may have had only a partial picture before.
- Ensure all the GTP log events are enabled to provide you with a complete picture.
- Ensure that all relevant event types are enabled under **Log & Report > Log Config > Log Settings**.

For more information on GTP related logging, see Logging events on the Carrier-enabled FortiGate unit.

General information to look for in the logs includes:

- Are all packets having problems or just certain types?
- Are all devices on the network having problem, or just certain devices?
- Is it just GTP traffic that is having problems or are all types of traffic having the same problem?

Check the routing table

On any network, the routing table determines how packets reach their destination. This is also true on a carrier network.

If the Carrier-enabled FortiGate unit is running in NAT mode, verify that all desired routes are in the routing table — local subnets, default routes, specific static routes, and dynamic routing protocols. For complete information, it is best to check the routing table in the CLI. This method provides more complete information.

If VDOMs are enabled on your Carrier-enabled FortiGate unit, all routing related CLI commands must be performed within a VDOM and not in the global context.

To check the routing table using the CLI

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default

S* 0.0.0.0/0 [10/0] via 192.168.183.254, port2
S 1.0.0.0/8 [10/0] via 192.168.183.254, port2
S 2.0.0.0/8 [10/0] via 192.168.183.254, port2
C 10.142.0.0/23 is directly connected, port3
```

```

B 10.160.0.0/23 [20/0] via 10.142.0.74, port3, 2d18h02m
C 192.168.182.0/23 is directly connected, port2

```

Examining an entry from the routing table above:

```

B 10.160.0.0/23 [20/0] via 10.142.0.74, port3, 2d18h02m

```

B	BGP. The routing protocol used.
10.160.0.0/23	The destination of this route including netmask.
[20/0]	20 indicates administrative distance of 20 out of a range of 0 to 255. 0 is an additional metric associated with this route, such as in OSPF
10.142.0.74	The gateway, or next hop.
port3	The interface used by this route.
2d18h02m	How old this route is, in this case almost three days old.

Perform a sniffer trace

When troubleshooting network traffic, it helps to look inside the headers of packets to determine if they are traveling along the route you expect. Packet sniffing can also be called a network tap, packet capture, or logic analyzing.

If your Carrier-enabled FortiGate unit has NP interfaces that are offloading traffic, this will change the sniffer trace. Before performing a trace on any NP interfaces, disable offloading on those interfaces.

What can sniffing packets tell you

If you are running a constant traffic application such as ping, packet sniffing can tell you if the traffic is reaching the destination, what the port of entry is on the Carrier-enabled FortiGate unit, if the ARP resolution is correct, and if the traffic is being sent back to the source as expected.

Sniffing packets can also tell you if the Carrier-enabled FortiGate unit is silently dropping packets for reasons such as RPF (Reverse Path Forwarding), also called Anti Spoofing. This prevents an IP packet from being forwarded if its source IP address either does not belong to a locally attached subnet (local interface), or be a hop on the routing between the FortiOS Carrier and another source (static route, RIP, OSPF, BGP). Note that RPF can be disabled by turning on asymmetric routing in the CLI (`config system setting, set asymmetric enable`), however this will disable stateful inspection on the Carrier-enabled FortiGate unit and consequently cause many features to be turned off.

If you configure virtual IP addresses on your Carrier-enabled FortiGate unit, the unit will use those addresses in preference to the physical IP addresses. If not configured properly, secondary IP addresses can cause a broadcast storm. You will notice the secondary address being preferred when you are sniffing packets because all the traffic will be using the virtual IP addresses. This is due to the ARP update that is sent out when the VIP address is configured.

How to sniff packets

The general form of the internal FortiOS packet sniffer command is:

```
diag sniffer packet <interface_name> <'filter'> <verbose> <count>
```

To stop the sniffer, type `CTRL+C`.

<interface_name>	The name of the interface to sniff, such as <code>port1</code> or <code>internal</code> . This can also be <code>any</code> to sniff all interfaces.
<'filter'>	What to look for in the information the sniffer reads. <code>none</code> indicates no filtering, and all packets will be displayed as the other arguments indicate. The filter must be inside single quotes (').
<verbose>	The level of verbosity as one of: 1 - print header of packets 2 - print header and data from IP of packets 3 - print header and data from Ethernet of packets
<count>	The number of packets the sniffer reads before stopping. If you don't put a number here, the sniffer will run forever until you stop it with <code><CTRL C></code> .

For a simple sniffing example, enter the CLI command `diag sniffer packet port1 none 1 3`. This will display the next 3 packets on the `port1` interface using no filtering, and using verbose level 1. At this verbosity level you can see the source IP and port, the destination IP and port, action (such as `ack`), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets, and 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diag sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]
0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757

0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808

0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

Generate specific packets to test the network

If some packets are being delivered as expected while others are not, or after you believe you have fixed the problem, it is a good idea to generate specific traffic to test your network.

For example if you discover through log messages and packet sniffing that Create PDP Context Request messages are not being delivered between two SGSNs, you can generate those specific messages on your network to confirm they are the problem, and later that you have solved the problem and they are now being delivered as expected.

This step requires a third party traffic generation tool, either hardware or software. This is not supported by Fortinet.

Chapter 8 - PCI DSS Compliance

Compliance

This document describes how FortiOS is compliant with Payment Card Industry Data Security Standard (PCI DSS).

Before you begin

Before you begin using this guide, please ensure that:

- You have administrative access to the web-based manager and/or CLI.
- The FortiGate unit is integrated into your network.
- The operation mode has been configured.
- The system time, DNS settings, administrator password, and network interfaces have been configured.
- Firmware, FortiGuard Antivirus and FortiGuard Antispam updates are completed.
- FortiGuard Analysis & Management Service is properly configured.

While using the instructions in this guide, note that administrators are assumed to be super_admin administrators unless otherwise specified. Some restrictions will apply to other administrators.

How this guide is organized

This FortiOS Handbook chapter contains the following sections:

[Configuring FortiGate units for PCI DSS compliance on page 902](#) explains the Payment Card Industry Data Security Standard (PCI DSS). It provides information about configuring your network and FortiGate unit to help you comply with PCI DSS requirements.

FortiOS 5.4 PCI DSS compliance new features

()

Configuring FortiGate units for PCI DSS compliance

This chapter provides information about configuring your network and FortiGate unit to help you comply with PCI DSS requirements. There is also some description of other Fortinet products that can help you with PCI DSS compliance.

Introduction to PCI DSS

The primary source of information for your PCI DSS compliance program is the Payment Card Industry (PCI) Data Security Standard itself. [Version 3.1](#) of the standard was published in April 2015. The following is a brief summary of PCI DSS.

What is PCI DSS?

The Payment Card Industry Data Security Standard (PCI DSS) sets data handling requirements for organizations that hold, process, or exchange cardholder information.

What is the Cardholder Data Environment

Throughout the PCI DSS requirements, there are references to the Cardholder Data Environment (CDE). The CDE is the computer environment wherein cardholder data is transferred, processed, or stored, and any networks or devices directly connected to that environment.

PCI DSS objectives and requirements

PCI DSS consists of 7 control objectives and 12 requirements.

PCI DSS Control Objectives and Requirements

Control Objective	Requirement	Fortinet Solution
Build and Maintain a Secure Network and Systems	1. Install and maintain a firewall configuration to protect cardholder data	FortiGate firewall functionality. See Security policies for the CDE network on page 908
	2. Do not use vendor - supplied defaults for system passwords and other security parameters	FortiDB vulnerability assessment and auditing FortiWeb web application password checking See Password complexity and change requirements on page 914

Control Objective	Requirement	Fortinet Solution
Protect Cardholder Data	3. Protect stored cardholder data	FortiDB vulnerability assessment and monitoring FortiWeb web application firewall See Protecting stored cardholder data on page 911
	4. Encrypt transmission of cardholder data across open, public networks	FortiGate IPsec VPN. See Protecting communicated cardholder data on page 911
Maintain a Vulnerability Management Program	5. Protect all systems against malware and regularly update antivirus software or programs	FortiGate integrated AV FortiClient integrated AV FortiMobile integrated AV FortiMail integrated AV FortiGuard automated AV updates See Protecting the CDE network from viruses on page 912
	6. Develop and maintain secure systems and applications	FortiDB vulnerability assessment, auditing and monitoring FortiWeb web application security FortiGate Application Control
Implement Strong Access Control Measures	7. Restrict access to cardholder data by business need-to-know	FortiDB vulnerability assessment, auditing and monitoring. See Restricting access to cardholder data on page 913
	8. Identify and authenticate access to system components	FortiGate integrated database or hooks to Active Directory. See Controlling access to the CDE network on page 914
	9. Restrict physical access to cardholder data	Fortinet professional services in partnership with partner solutions

Control Objective	Requirement	Fortinet Solution
Regularly Monitor and Test Networks	10. Track and monitor all access to network resources and cardholder data	FortiDB auditing and monitoring FortiAnalyzer event reporting See Monitoring the network for vulnerabilities .
	11. Regularly test security systems and processes	FortiDB vulnerability assessment See Monitoring the network for vulnerabilities .
Maintain an Information Security Policy	12. Maintain a policy that addresses information security for all personnel	FortiManager security policy management appliance

This chapter describes how the FortiGate's features can help your organization to be compliant with PCI DSS. Requirements that the FortiGate cannot enforce need to be met through organization policies with some means determined for auditing compliance.

Be sure to read the following wireless guidelines. Even if your organization does not use wireless networking, PCI DSS requires you to verify periodically that wireless networking has not been introduced into the CDE.

Wireless guidelines

While wired networks usually connect fixed known workstations, wireless networks are more dynamic, introducing a different set of security concerns.

Even if your organization does not use wireless networking, PCI DSS requires you to verify periodically that unauthorized wireless networking has not been introduced into the CDE. Wireless networking could be introduced quite casually by adding a wireless device to a PC on the CDE network.

For all PCI DSS networks, whether they use wireless technology or not, the following requirement applies:

- Test for the presence of wireless access points by using a wireless analyzer at least quarterly or deploying a wireless IDS/IPS to identify all wireless devices in use. (11.1)

If your organization uses wireless networking outside the CDE network and the firewall prevents communication with the CDE network, the wireless network is outside the PCI DSS scope, but the firewall configuration must meet PCI DSS requirements.

If your organization uses wireless networking inside the CDE network, the wireless network is within the PCI DSS scope. For information about wireless network requirements, see [Wireless network security on page 909](#).

Running PCI DSS compliance checks

FortiOS 5.4 allows you to run a compliance check either on demand or according to a schedule that automatically checks PCI DSS compliance at the global and/or VDOM level. The compliance check determines whether the FortiGate is compliant with each PCI DSS requirement by displaying an 'X' next to the non-compliant entries in the GUI logs.

The FortiGate runs at least 50 compliance checks that report on the status of a number of things including:

- Checking that out of stet ICMP packets are dropped
- The TCP end timeout is set
- SSH and SSL deep inspection with web filtering drops traffic from servers with invalid server certificates
- Verifying that IPS signatures, Application Control signatures, and Antivirus signatures are up to date
- Determining if Spyware/Malicious sites are being blocked by a web filtering policy
- Verifying that administrators are locked out after 3 login failures

For a complete list of compliance checks go to **Log & Report > Compliance Events**.

Configuring PCI DSS compliance checking

Go to **System > Advanced > Compliance**, turn on compliance checking and configure a daily time to run the compliance check. Or you can select **Run Now** to run the compliance check on demand.

Go to **Log & Report > Compliance Events** to view compliance checking log messages that show the results of running compliance checks.

#	Date/Time	Level	Messages	Log Details
1	13:14:38	*****	Check SSH-SSL deep inspection with WF enabled drops traffic from servers with invalid	<div>Log location: Disk Details</div> <div> General Date 05/16/2016 Time 13:14:38 Virtual Domain root Log Description PCI DSS compliance check failed </div> <div> Action Action comp-check Status high Result ✗ Reason FTNT-050142 </div> <div> Security Level ***** </div> <div> Compliance Module WF </div>
2	13:14:38	*****	Check that Spyware / Malicious sites are being blocked by a WF policy	
3	13:14:38	*****	Check that Phishing-related sites are being blocked by a WF policy	
4	13:14:38	*****	Check that Bot net-related sites are being blocked by a WF policy	
5	13:14:38	*****	Check that proxy related sites are being blocked by a WF policy	
6	13:14:38	*****	Check that Hacking-related sites are being blocked by a WF policy	
7	13:14:38	*****	Check that Spam-related sites are being blocked by a WF policy	
8	13:14:38	*****	Check that P2P file sharing sites-related sites are being blocked by a WF policy	
9	13:14:38	---	Check that the IPS module has an updated IPS signature package	
10	13:14:38	*****	Check that FGT performs IPS inspection on all traffic	
11	13:14:38	*****	Check that there are no general exclusions to the activated IPS protections	
12	13:14:38	*****	Check that the IPS Profile includes Protocol Anomalies protections	
13	13:14:38	*****	Check the Severity-based Protections in the IPS Policy	
14	13:14:38	*****	Check the IPS protection is enabled on Firewall policy	
15	13:14:38	*****	Check the default IPS profiles have the default action set to block	

You can also configure compliance checking and set up the schedule from the CLI:

```
config system global
    set compliance-check {disable| enable}
    set compliance-check-time <time>
end
```

Use the following command to run on-demand compliance checking:

```
execute dsscc
```

Per-VDOM compliance checking

If you have multiple VDOMs enabled compliance checking can be run separately for each VDOM.

Begin from the Global view by going to **System > Advanced > Compliance** and turning on compliance checking and configuring a daily time to run the compliance check. This compliance check daily schedule will be used to run compliance checks on individual VDOMs where compliance checking is enabled them.

You can also enable global compliance checking from the CLI:

```
config global
  config system global
    set compliance-check {disable| enable}
    set compliance-check-time <time>
  end
```

Then log onto each VDOM for which to enable compliance checking and go to **System > Advanced > Compliance**, and turn on compliance checking . You can also select **Run Now** to run a compliance check on that VDOM on demand.

From the CLI edit a VDOM and use the following command to enable compliance checking for that VDOM. The following example shows how to enable compliance checking for the root VDOM:

```
config vdom
  edit root
    config system settings
      set compliance-check enable
    end
```

From the CLI you can also log into a VDOM and use the following command to run on-demand compliance checking:

```
execute dsscc
```

From a VDOM GUI go to **Log & Report > Compliance Events** to view compliance checking log messages that show the results of running compliance checks.

Compliance checking diagnose command

Use the following command to display diagnostic information about compliance checking:

```
diagnose debug application dssccd <debug_level>
```

Network topology

The cardholder data environment must be protected against unauthorized access from the Internet and from other networks in your organization. FortiGate unit firewall functionality provides tight control over the traffic that can pass between the following network interfaces:

- Internet
- CDE wired LAN
- CDE wireless LAN
- Other internal networks

The figure below shows how the Cardholder Data Environment can be delineated in a typical network.

Enterprise network with a cardholder data environment

Internet

The FortiGate unit has at least one network interface connected to the Internet. If your organization uses more than one Internet service provider, there could be additional network interfaces that function as a route to the Internet.

The CDE wired LAN

The CDE network typically contains point-of-sale (POS) terminals, databases, and servers. The only security policies between the CDE network and the Internet should be for encrypted connections. For remote point-of-sale terminals or off-site databases, VPN connections are required and they should use strong encryption. For a web server that handles online purchases, only HTTPS (SSL or TLS) connections can be permitted. The security

policies that enable these connections should have the narrowest possible definitions for source address, destination address and service.

PCI DSS does not require the CDE network to be isolated from the rest of your corporate LAN. But isolating the CDE network reduces the scope of required data protection measures and may reduce the scope of PCI DSS assessments that are periodically required.

The CDE wireless LAN

Wireless networking is a special issue. Even if you do not use wireless technology you must monitor to ensure that unauthorized wireless access has not been added to the CDE network. For this purpose, the figure above shows a FortiAP device in the CDE. The FortiAP device can provide dedicated wireless monitoring, an access point, or both.

A small retail outlet could reduce costs by using a FortiWiFi unit, a FortiGate unit with integrated wireless networking. The FortiWiFi unit would have to be located where it could provide sufficient wireless monitoring (or access point) coverage for the entire premises.

Other internal networks

Other internal networks such as your office LAN, unless they provide connection to the CDE, are not subject to PCI DSS requirements.

Security policies for the CDE network

The FortiGate unit's firewall functionality is ideally suited to PCI DSS requirement 1.2.1, "Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic." Security policies control the source, destination, and type of traffic passing between networks.

The PCI DSS standard includes requirements to document your network topology and configuration. As part of that requirement, and to assist the auditing of your network, make use of the **Comment** field available in FortiGate security policies. Describe the purpose of each policy.

Controlling the source and destination of traffic

The source and destination are the first parameters you specify in a security policy. (Go to **Policy & Objects > IPv4 Policy** and select **Create New**.)

Name	<input type="text"/>
Incoming Interface	<input type="text" value="+"/>
Outgoing Interface	<input type="text" value="+"/>
Source	<input type="text" value="+"/>
Destination Address	<input type="text" value="+"/>

The **Interface** settings depend on network topology. The **Source** and **Destination Address** settings define the IP addresses to which the policy applies. These should be as narrow as possible, so that only the appropriate hosts are included. For example, if the destination is a server with a single IP address, the named **Destination Address** should be defined as that single address, not the entire subnet on which the server resides.

Addresses are defined in **Policy & Objects > Addresses**. Some addresses will be used in several security policies, so it is best to plan ahead and define the addresses first.

Controlling the types of traffic in the CDE

The **Policy & Objects > Service** setting determines which types of traffic can pass based on protocol.

You can select a single protocol from the **Service** drop-down list. To add another protocol, select the green “+” button to access the **Service** drop-down list again. If several security policies will need the same list of services, consider creating a named service group. (Go to **Firewall Objects > Service > Groups**.) In the security policy, service groups are available at the bottom of the **Service** drop-down list.

The default deny policy

All traffic not specifically allowed by a security policy that you create is blocked by the Implicit policy listed at the bottom of the **Policy & Objects > IPv4 Policy** page.

You cannot delete this policy and you can edit the policy only to enable or disable logging of the traffic that it handles.

Wireless network security

Scanning for rogue access points is the minimum requirement for wireless security. Even if your organization does not use wireless networking, PCI DSS requires you to verify periodically that wireless networking has not been introduced into the CDE.

If you use wireless networking, the wireless network is only within the PCI DSS scope if it can connect to the CDE.

On-wire detection of rogue APs

FortiGate units include an “on-wire” detection technique that correlates the SSID MAC addresses of the unknown access points with MAC addresses detected on your wired networks. This helps to differentiate unrelated neighboring APs from security-compromising unauthorized APs connected to your network.

Setting up rogue access point scanning

A FortiGate unit with a connected FortiAP unit can perform wireless scanning. Each of the FortiAP radios can act as a dedicated monitor or can perform scanning in the background while acting as a wireless access point.

Radio 1 operates in the 2.4GHz band and Radio 2 operates in the 5GHz band. Both bands should be monitored. The FortiAP unit(s) used for scanning must be located within the coverage area that would result if an access point were added to the CDE.

To configure rogue AP scanning in a FortiAP profile

1. Go to **WiFi & Switch Controller > WIDS Profiles**.
On some models, the menu is **WiFi & Switch Controller**.
2. Select an existing WIDS profile and edit it, or select **Create New**.
3. Make sure that **Enable Rogue AP Detection** is selected.

4. Select **Enable On-Wire Rogue AP Detection**.
5. Optionally, enable **Auto Suppress Rogue APs in Foreground Scan**.
6. Select **OK**.

Viewing the results of rogue AP scanning

Go to **Monitor > Rogue AP Monitor** to view information about detected rogue wireless access points.

Logging the results of rogue AP scanning

To ensure that detection of rogue access points is logged, go to **Log & Report > Log Settings**, enable **Event Logging** and select **WiFi activity event**.

Securing a CDE network wireless access point

If your wireless network is within PCI DSS scope, it must meet the following requirements:

- Default settings such as SSID and passphrases must be changed.
- Use WPA/WPA2 security.
- Log wireless activity.

Setting wireless security

On FortiGate units, go to **WiFi & Switch Controller > SSID** to configure wireless security settings for either a new or existing virtual access point.

WiFi Settings

SSID	<input type="text" value="fortinet"/>	
Security Mode	<input type="text" value="WPA2 Personal"/>	▼
Pre-shared Key	<input type="text"/>	(8 - 63 characters)
Broadcast SSID	<input checked="" type="checkbox"/>	
Schedule ⓘ	<input type="text" value="always"/>	▼

The default SSID for the FortiAP is “fortinet”. You must change this.

The **Security Mode** must be set to one of the WPA2 modes. Both WPA or WPA2 clients can be served. In the CLI, you can optionally select exclusively WPA or WPA2 operation.

WPA/WPA2-Enterprise **Authentication** uses separate logon credentials for each user. Either FortiGate user group security or an external RADIUS server performs the authentication. Optionally, certificate-based security can also be applied. WPA/WPA2-Personal authentication requires a single pre-shared key that is used by all clients and is thus less secure.

For detailed information about wireless access points, see the Deploying Wireless Networks chapter of the FortiOS Handbook.

Logging wireless network activity

To ensure that wireless network activity is logged, go to **Log & Report > Log Settings**, enable **Event Logging** and select **WiFi activity event**.

Protecting stored cardholder data

The Fortinet FortiDB and FortiWeb products can provide security for your sensitive cardholder data.

The Fortinet Database Security (FortiDB) device provides vulnerability assessment, database activity monitoring, auditing and monitoring.

The Fortinet FortiWeb Web Application Firewall deployed in front of public-facing web applications protects Web applications, databases, and the information exchanged between them. In particular, it addresses the PCI DSS requirements 6.5 and 6.6 regarding web application vulnerabilities such as cross-site scripting, SQL injection, and information leakage.

FortiGates support some web application firewall security features and allow you to offload selected HTTP and HTTPS traffic to an external FortiWeb device. To offload HTTP traffic to go **Security Fabric > Settings**, enable **HTTP service** and select FortiWeb.

Protecting communicated cardholder data

If cardholder data must be communicated over an untrusted network, such as the Internet, use the FortiGate unit's IPsec VPN capability to exchange the data securely. If you support customer online transactions, use HTTPS (SSL or TLS encryption) for security. The relevant PCI DSS requirement is:

- Use strong cryptography and security protocols (for example, SSL/TLS, IPSEC, SSH, etc.) to safeguard sensitive cardholder data during transmission over open, public networks. (4.1)

This does not prescribe particular cryptography, but it can be interpreted as a requirement to follow industry best practices.

Configuring IPsec VPN security

The security considerations for IPsec VPNs are encryption and authentication.

Encryption

Go to **VPN > IPsec Tunnels** to configure an IPsec VPN. In both Phase 1 and Phase 2 parts of the configuration, you select the encryption to use.

These are advanced settings, overriding defaults that are not necessarily the strongest algorithms. VPNs negotiate over standards, so you can list multiple proposed algorithms. The VPN will use the strongest encryption that both ends support.

Choose strong encryption. The available encryption algorithms in descending order of strength are AES256, AES192, AES128, 3DES, DES. DES encryption is the weakest with only a 64-bit key and does not meet the 80-bit key length minimum that PCI DSS requires.

The message digest (authentication) algorithms in descending order of strength are SHA512, SHA384, SHA256, SHA1 and MD5. MD5 is particularly weak and should be avoided.

Authentication

VPN peers authenticate each other before establishing a tunnel. FortiGate units support two different authentication methods: pre-shared key and RSA signature (certificate). Certificates provide the best security. PCI DSS does not prohibit pre-shared keys, but you should limit access to the keys to the personnel who are responsible for the FortiGate units or other equipment at either end of the VPN.

Configuring SSL VPN security

The SSL VPN configuration includes a choice of encryption algorithm. You can only configure encryption key algorithms for SSL VPN in the CLI:

```
config vpn ssl settings
    set algorithm {low | medium | high}
end
```

The default option of Medium at RC4 (128 bits) is acceptable, but the High option, AES (128/256 bits) and 3DES is more secure. The Low option, RC4 (64 bits), DES and higher does not meet PCI DSS requirements.

Protecting the CDE network from viruses

PCI DSS requires the use of regularly updated antivirus protection. The antivirus functionality of the FortiGate unit protects both the FortiGate unit and the networks it manages. Workstations on these networks can be protected using FortiClient Endpoint Security. Both FortiGate and FortiClient antivirus protection can receive updates from Fortinet's FortiGuard service. Workstations can also use third-party antivirus applications with update services.

The FortiGate unit can enforce the use of antivirus software, denying unprotected workstations access to the network.

Enabling FortiGate antivirus protection

The antivirus profile must apply AV scanning to all protocols. You also need to enable SSL inspection to include secure protocols in antivirus scanning. The extended AV database contains the largest number of virus signatures.

To enable SSL inspection

1. Go to **Security Profiles > SSL/SSH Inspection**.
2. Set **Inspection Method** to **Full SSL Inspection**.
3. Set each listed protocol to **On** and then select **Apply**.

To select the extended antivirus database

The antivirus database is selectable using the CLI:

```
config antivirus settings
    set default-db extended
```

end

For detailed information about the Antivirus feature, see the Security Profiles chapter of the FortiOS Handbook.

Configuring antivirus updates

On the dashboard, check the **License Information** widget. The **Support Contract** section should indicate that the FortiGate is registered and show future expiry dates for the FortiGuard Antivirus license. If your FortiGate unit is not registered, you can register it from the License Information widget.

In the **FortiGuard Services** section, check the **Antivirus** field. If the service is unreachable, see the online Help for information about troubleshooting your connectivity to FortiGuard Services.

Enforcing firewall use on endpoint PCs

PCI DSS requires you to “install personal firewall software on any mobile and/or employee-owned devices that connect to the Internet when outside the network (for example, laptops used by employees), and which are also used to access the network. (1.4)” Consider using the Endpoint Control feature of the FortiGate unit to enforce use of this software.

Monitoring the network for vulnerabilities

There are several tools that can assist you in monitoring your network for vulnerabilities and provide evidence to the PCI DSS auditor of such monitoring.

FortiGate logs

FortiGate units can be configured to send logs to FortiAnalyzer unit. In a larger network, this enables you to collect log information in a central location from several FortiGate units. You can also send logs to FortiCloud and to multiple syslog servers.

Monitoring with other Fortinet products

In addition to your FortiGate unit and its FortiOS firmware, there are several other Fortinet products that can assist your organization to comply with PCI DSS requirements.

Fortinet Database Security (FortiDB)

A FortiDB appliance or FortiDB software can provide vulnerability scanning and activity monitoring for your databases. For more information about this product, see the Fortinet website, www.fortinet.com.

FortiWeb Web Application Security

If your organization engages in e-Commerce, you can use FortiWeb Application Security to protect your web servers against attack. The FortiWeb application protects against HTTP and XML-based attacks, guards against attempts to deface your websites, and scans web servers for vulnerabilities. For more information about this product, see the Fortinet website, www.fortinet.com.

Restricting access to cardholder data

In addition to security policies and authentication governing access to the CDE, you can deploy the Fortinet Database Security (FortiDB) device, which provides vulnerability assessment, database activity monitoring, auditing and monitoring. You can also deploy FortiAuthenticator to increase authentication options.

Controlling access to the CDE network

PCI DSS requires each user to be uniquely identified and authenticated. On the FortiGate unit, this applies to administrators and to users of SSL VPN and IPsec VPNs.

Password complexity and change requirements

By default, the FortiGate unit admin account has no password. Be sure to define a password.

PCI DSS password requirements are:

- Require a minimum length of at least seven characters. (8.2.3)
- Contain both numeric and alphabetic characters. (8.2.3)
- Change user passwords/passphrases at least every 90 days. (8.2.4)

To facilitate creation of compliant administrator passwords, you can set a password policy. Go to **System > Settings** Select **Enable Password Policy**, enter the following and then select **Apply**.

The password policy does not apply to user passwords. Both password complexity and password expiry for users would need to be addressed by making them a policy in your organization.

☒ **Enable Password Policy**

Minimum Length (8-128 characters)

Must Contain at Least ☒

Upper Case Letters Lower Case Letters

Numbers (0-9) Special Characters

Apply Password Policy to ☒ Administrator Password ☐ IPsec Pre-shared Key

Enable Password Expiration ☒ (days)

Minimum Length	8 or more. (Field does not accept a value less than 8.)
Must Contain	At minimum, set a required number of Numerical Digits and either Upper Case Letters or Lower Case Letters . Also setting a required number of Non-alphabetic Letters is acceptable.
Apply Password Policy to	Select Administrator Password .
Enable Password Expiration	Set to 90 days or less. The default is 90 days.

Password non-reuse requirement

PCI DSS requires that passwords are not re-used to satisfy the change requirement:

- Do not allow an individual to submit a new password/phrase that is the same as any of the last four passwords/phrases he or she has used. (8.2.5)

FortiGate users don't set their own passwords. The super_admin administrators can and so can admins with appropriate access. There is, however, no FortiGate-based mechanism to limit re-use of passwords.

Administrator lockout requirement

PCI DSS requires a user account lockout for administrators to guard against unauthorized access attempts:

- Limit repeated access attempts by locking out the administrator after not more than six attempts. (8.1.6),
- Set the lockout duration to a minimum of 30 minutes or until an administrator enables the user ID. (8.1.7)

You can meet these requirements with the following CLI commands:

```
config system global
    set admin-lockout-threshold 6
    set admin-lockout-duration 1800
end
```

The threshold can be less than 6 and the lockout duration can be more than 1800.

Administrator timeout requirement

PCI DSS requires:

- If a session has been idle for more than 15 minutes, require the user to re-authenticate to re-activate the terminal or session. (8.1.8)

By default, the idle timeout is five minutes. You can go to **System > Settings** and change the **Idle Timeout** timeout to any value up to the permitted value of 15 minutes.

Administrator access security

To accommodate the requirement for unique identification of each user, the generic admin account should either be assigned to only one administrator or not used at all. You can create an administrator account for each administrator in **System > Administrators**.

You can also rename the admin administrator account to something that attackers are less likely to guess. To rename the admin administrator account you must go to **System > Administrators** and create a new administration account with the super_admin administrator profile and then login with this new account and change the name of the admin administrator account.

If an administrator always works from the same workstation, consider using the Trusted Host feature. The administrator will be able to log in only from a trusted IP address. You can define up to three trusted IP addresses per administrator.

Administrative access must also be enabled per network interface. Go to **Network > Interfaces** to edit the interface settings. Enable administrative access only on interfaces where you would expect the administrator to connect. Allow only secure connection protocols, HTTPS for web-based access, SSH for CLI access.

Remote access security

For remote access, PCI DSS requires two-factor authentication: a password and some other authentication, such as a smart token or certificate. This applies to employees, administrators, and third parties.

For remote access from the Internet, if possible you should also use the trusted hosts feature to limit the source addresses from which administrators can log into the FortiGate.

SSL VPN users

For SSL VPN users, implement two-factor authentication by requiring users to have a certificate in addition to the correct password. Go to **VPN > SSL-VPN Settings**, enable **Require Client Certificate**.

IPsec VPN users

If remote Users access your network using an IPsec VPN, you can implement two-factor authentication by adding a user group to a Remote Access IPsec VPN tunnel that requires two-factor authentication with FortiToken. This adds extended authentication (XAUTH) to the VPN and requires the user to use two-factor authentication in addition to the VPN authentication provided by the certificate or pre-shared key. As PCI DSS requires each user to have a unique identifier, you should already have user accounts and user groups defined.

Chapter 9 - Firewall

Firewall

Welcome and thank you for selecting Fortinet products for your network protection. This document is intended to provide the concepts and techniques that will be needed to configure the FortiGate firewall on your FortiGate unit.

Before you start administrating your FortiGate device, certain assumptions have been made in the writing of this manual:

- You have administrative access to the Web based GUI or to the Command Line Interface.
- The FortiGate unit is integrated into your network.
- The operation mode (NAT or Transparent) has been configured.
- Network Interfaces have been configured.
- DNS settings have been configured.
- The system time settings have been configured.
- Firmware is up to date.
- FortiGuard Service licences are current and the device is able to connect to the FortiGuard Servers.
- If you are using FortiCloud, it is properly configured.

How this Guide is Organized

This guide contains a number of different topics that, at its simplest, can be grouped into fundamental firewall topics such as policies, objects and network defense and topics that have to do with the optimization of the firewall such as WAN optimization, proxies and caching.

Fundamentals

"Firewall concepts" on page 940 explains the ideas behind the components, techniques and processes that are involved in setting up and running a firewall in general and the FortiGate firewall in particular. The premise here is that regardless of how experienced someone is with firewalls as they go through the process of configuring a firewall that is new to them they are likely to come across a term or setting that they may not be familiar with even if it is only in the context of the setting they are working in at the moment. FortiGate firewalls are quite comprehensive and can be very granular in the functions that they perform, so it makes sense to have a consistent frame of reference for the ideas that we will be working with.

Some examples of the concepts that will be addressed here are:

- "What is a Firewall?"
- "NAT"
- "IPv6"

"Firewall objects" describes the following firewall objects:

- Addressing
- Services

- Firewall Policies

"[Network defense](#)" on [page 1025](#) describes various methods of defending your Network using the abilities of the FortiGate Firewall.

"[Object Configuration](#)" on [page 1063](#) is similar to a cookbook in that it will refer to a number of common tasks that you will likely perform to get the full functionality out of your FortiGate firewall. Because of the way that firewalls are designed, performing many of the tasks requires that firewall components be set up in a number of different sections of the interface and be configured to work together to achieve the desired result. This section will bring those components all together as a straight forward series of instructions.

FortiGate Firewall Components

The FortiGate firewall is made up of a number of different components that are used to build an impressive list of features that have flexibility of scope and granularity of control that provide protection that is beyond that provided by the basic firewalls of the past.

Some of the components that FortiOS uses to build features are:

- Interfaces
- VLANs
- Soft Switches
- Zones
- Predefined Addresses
- IP address based
- FQDN based
- Geography based
- Access Schedules
- Authentication
- Local User based
- Authentication Server based (Active Directory, Radius, LDAP)
- Device Based
- Configureable Services
- IPv4 and IPv6 protocol support

The features of FortiOS include but are not limited to:

- Security profiles, sometimes referred to as Unified Threat Management (UTM) or Next Generation Firewall (NGFW)
- Predefined firewall addresses (this includes IPv4 and IPv6, IP pools, . wildcard addresses and netmasks, and geography-based addresses)
- Monitoring traffic
- Traffic shaping and per-IP traffic shaping (advanced)
- Firewall schedules
- Services (such as AOL, DHCP and FTP)
- Logging traffic
- Quality of Service (QoS)
- Identity-based policies
- Endpoint security

Firewall Optimization

There are a few different methodologies of optimization and most of these methodologies has been divided into:

- Concepts section - This will have the basic ideas behind the how and why of the topic. Because the number of topics is larger, the ideas are not as pervasive and the content is not so extensive as in the Fundamental section, some of the topics will include instructions on the configuration for that individual topic in order to keep the information fo granular topics together.
- Configuration section- Just like the Configuration section of the Fundamentals, this will be a cookbook style of documentation showing how to configure something that achieves a specific functionality from the FortiGate.

The optimization topics include:

- [Secure Web Gateway, WAN Optimization, Web Caching and WCCP](#)
- [Example topologies relevant to WAN Optimization](#)
- [Inside FortiOS: WAN Optimization](#)
- [WAN Optimization Concepts](#)
- [WAN Optimization Configuration](#)
- [Peers and authentication groups](#)
- [Web Cache Concepts](#)
- [Web Cache Configuration](#)
- [WCCP Concepts](#)
- [WCCP Configuration](#)
- [Web Proxy Concepts](#)
- [Web Proxy Configuration](#)
- [Explicit Proxy Concepts](#)
- [Explicit Proxy Configuration](#)
- [Transparent Proxy Concepts](#)
- [Transparent Proxy Configuration](#)
- [FTP Proxy Concepts](#)
- [FTP Proxy Configuration](#)
- [Diagnose commands for WAN Optimization](#)

How does a FortiGate Protect Your Network?

The FortiGate firewall protects your network by taking the various components and using them together to build a kind of wall or access control point so that anyone that is not supposed to be on your network is prevented from accessing your network in anyway other than those approved by you. It also protects your network from itself by keeping things that shouldn't happen from happening and optimizing the flow of traffic so that the network is protected from traffic congestion that would otherwise impede traffic flow.

Most people have at one time or another played with the children's toy system that is made up of interlocking blocks. The blocks come in different shapes and sizes so that you can build structures to suit your needs and in your way. The components of the FortiGate firewall are similar. You are not forced to use all of the blocks all of the time. You mix and match them to get the results that you are looking for. You can build a very basic structure that's only function is to direct traffic in and out to the correct subnets or you can build a fortress that only allows specific traffic to specific hosts from specific hosts at specific times of day and that is only if they provide the

credentials that have been pre-approved and all of the traffic is encrypted so that even when the traffic is out on the Internet it is private from the world. Just like the interlocking blocks, what you build is up to you, but chances are if you put them together the right way there isn't much that can't be built.

Here is one example of how the components could be put together to support the requirements of a network infrastructure design.

- Off the Internal interface you could have separate VLANs. One for each for the departments of Sales, Marketing and Engineering so that the traffic from the users on one VLAN does not intrude upon the hosts of the other VLANs and the department are isolated from one another for security reasons.
- To ease in the administration each of the VLAN sub-interfaces is made a member of a zone so that security policies that apply to all of the hosts on all of the VLANs can be applied to all of them at once.
- Using the addresses component each of the IP address ranges could be assigned a user friendly name so that they could be referred to individually and then for policies that would refer to them all as a whole the individual ranges to be made members of an address group.
- Firewall schedules could be created to address the differing needs of each of the groups so that Sales and Marketing could be allowed access to the Internet during regular business hours and the Engineering department could be allowed access during the lunch break.
- By setting up the outgoing policies to use FortiGuard Web-filtering the employees could be prevented from visiting inappropriate sites and thus enforcing the policies of the HR department.
- A couple of virtual IP addresses with port forwarding could be configured to allow users on the Internet to access a web server on the DMZ subnet using the company's only Public IP address without affecting the traffic that goes to the company's mail server that is hosted on a complete different computer.
- Even though the Web server on the same DMZ has an FTP service to allow for the uploading of web pages to the web server from the Marketing and Engineer teams, by placing a DENY policy on any FTP traffic from the Internet malicious users are prevented from abusing the FTP service.
- By monitoring the traffic as it goes through the policies you can verify that the policies are in working order.
- By using a combination of ALLOW and DENY policies and placing them in the correct order you could arrange for an outside contractor to be allowed to update the web site as well

These set of configurations is not extensive but it does give an idea of how different components can be mixed and matched to build a configuration that meets an organization's needs but at the same time protect it from security risks.

What's new for Firewall in 5.6

New Firewall Features in 5.6.4

The following list contains new firewall features added in FortiOS 5.6.4. Click on a link to navigate to that section for further information.

- [Using a FortiCache as a cache service on page 1174](#)

Using a FortiCache as a cache service

Some FortiGate devices don't have sufficient memory or disk space to run a cache service. This feature allows a FortiGate to connect to a FortiCache that has a higher cache capability than most FortiGates.

New Firewall Features in 5.6.3

Multi-port support for Explicit Proxy (402775)

Support has been added for the use of multiple ports and port range in the explicit FTP or Web proxies. These changes have been added in both CLI and GUI.

CLI changes:

```
set http-incoming-port <port_low>[-<port_high>]
```

Where:

- `port_low` - the low value of the port
- `port_high` - the high value of the port

The `port_high` value can be omitted if `port_low` and `port_high` are the same.

Nturbo support CAPWAP traffic and fix IPsec IPv6 firewall policy code typo (290708) (423323)

NTurbo is used for IPSEC+IPS case. The IPSEC SA info is passed to NTURBO as part of VTAG for control packet and will be used for the xmit.

If the packets need to go through IPSEC interface, the traffic will be always offloaded to Nturbo. But for the case that SA has not been installed to NP6 because of hardware limitation or SA offload disable, the packets will be sent out through raw socket by IPS instead of Nturbo, since the software encryption is needed in this case.

CLI Changes:

Previously, NTurbo could only be enabled or disabled globally. The setting of `np-acceleration` has been added to the firewall policy context instead of just the global context.

Add: Added a CLI command in the firewall policy to enable/disable NTurbo acceleration.

```
config firewall policy
edit 1
set np-acceleration [enable|disable]
end
```

When IPS is enabled for VPN IPsec traffic, the data can be accelerated by NTurbo now.

Toggling SNAT in Central SNAT policies (434981)

The central NAT feature is not enabled by default. When `central-nat` is enabled, `nat` option under IPv4 policies is skipped and SNAT must be done via `central-snat-map`.

- Info messages and redirection links have been added to IPv4 policy list and dialog to indicate the above
- If NGFW mode is policy-based, then it is assumed that `central-nat` (specifically SNAT) is enabled implicitly
- The option to toggle NAT in `central-snat-map` policies has been added (previously it was only shown in NGFW policy-based mode).
- In `central-snat` policy dialog, the port-mapping fields for the original port have been updated to accept ranges.
- Nat will be skipped in firewall policy if per vdom `central nat` is enabled.

Example scenarios to show changes in how CLI treats central-nat

Change: make nat available regardless of NGFW mode.

```
config firewall central-snat-map
edit 1
    set orig-addr "192-86-1-86"
    set srcintf "port23"
    set dst-addr "192-96-1-96"
    set dstintf "port22"
    set nat-ippool "pool1"
    set protocol 17
    set orig-port 2896-2897
    set nat enable
end
```

Change: hide nat-port if nat-ippool is not set or NAT is disabled.

```
config firewall central-snat-map
edit 1
    set orig-addr "192-86-1-86"
    set srcintf "port23"
    set dst-addr "192-96-1-96"
    set dstintf "port22"
    set nat-ippool "pool1"
    set protocol 17
    set orig-port 2896-2897
    set nat disable
end
```

Change:change orig-port to accept range

```
config firewall central-snat-map
edit 1
    set orig-addr "192-86-1-86"
    set srcintf "port23"
    set dst-addr "192-96-1-96"
    set dstintf "port22"
    set nat-ippool "pool1"
    set protocol 17
    set orig-port 2896-2897 (help text changed to: Original port or port range).
    set nat-port 35804-35805
end
```

Improved wildcard support for firewall fqdn (444646)

The following wildcard character instances are now supported in wildcard FQDN addresses:

- "?" character
- "*" character in the middle of a phrase
- The "?*" combination

Policy Matching based on Referrer Headers and Query Strings (446257)

Web proxy policies support creating web proxy addresses to match referrer headers and query strings.

Matching referrer headers

For example, to create a web proxy address to match the referrer header to block access to the following YouTube URL `http://youtube.com/user/test321`. The http request will have the following format:

```
GET /user/test321 HTTP/1.1
Host: www.youtube.com
User-Agent: curl/7.52.1
Accept: */*
```

Create the following web proxy addresses to match this page:

```
config firewall proxy-address
edit youtube
set type host-regex
set host-regex ".*youtube.com"
next
edit test321
set host "youtube"
set path "/user/test321"
set referrer enable
end
```

Then create two proxy policies, one that allows access to all traffic and a second one that blocks access to the page that matches the referrer header:

```
config firewall proxy-policy
edit 1
set uuid 92273e4e-8c53-51e7-a7bd-f26e6e15fc98
set proxy explicit-web
set dstintf "wan2"
set srcaddr "all"
set dstaddr "all"
set service "webproxy-connect"
set action accept
set schedule "always"
set utm-status enable
set profile-protocol-options "test"
set ssl-ssh-profile "test"
next
edit 2
set uuid d35ad06a-8c53-51e7-8511-17200f682a4a
set proxy explicit-web
set dstintf "wan2"
set srcaddr "all"
set dstaddr "test321"
set service "webproxy"
set action accept
set schedule "always"
set utm-status enable
set av-profile "default"
set profile-protocol-options "test"
set ssl-ssh-profile "test"
end
```

Matching query strings

To match the video with URL `youtube.com/watch?v=XXXXXXXXXX`, (where `XXXXXXXXXX` is an example YouTube query string) you need to match an HTTP request with the following format:

```
GET /user/watch?v=GLCHldlwQsg HTTP/1.1
Host: www.youtube.com
User-Agent: curl/7.52.1
Accept: */*
```

Create the following web proxy addresses to match this video or query string:

```
config firewall proxy-address
edit "youtube"
    set uuid 4ad63880-971e-51e7-7b2e-c69423ac6314
    set type host-regex
    set host-regex ".*youtube.com"
next
edit "query-string"
    set uuid 7687a8c0-9727-51e7-5063-05edda03abbf
    set host "youtube"
    set path "/watch"
    set query "v=XXXXXXXXXX"
end
```

Then create two proxy policies, one that allows access to all traffic and a second one that blocks access to the page that matches the query string

```
config firewall proxy-policy
edit 1
    set uuid 92273e4e-8c53-51e7-a7bd-f26e6e15fc98
    set proxy explicit-web
    set dstintf "wan2"
    set srcaddr "all"
    set dstaddr "all"
    set service "webproxy-connect"
    set action accept
    set schedule "always"
    set utm-status enable
    set profile-protocol-options "test"
    set ssl-ssh-profile "test"
next
edit 2
    set uuid d35ad06a-8c53-51e7-8511-17200f682a4a
    set proxy explicit-web
    set dstintf "wan2"
    set srcaddr "all"
    set dstaddr "query-string"
    set service "webproxy"
    set action accept
    set schedule "always"
    set utm-status enable
    set av-profile "default"
    set profile-protocol-options "test"
    set ssl-ssh-profile "test"
next
end
```

New Firewall Features in 5.6.1

Improvement to NAT column in Policy List Display (305575)

The NAT column in the listing of Policy can provide more information than before.

Previously the field for the policy in the column only showed whether NAT was **Enabled** or **Disabled**.

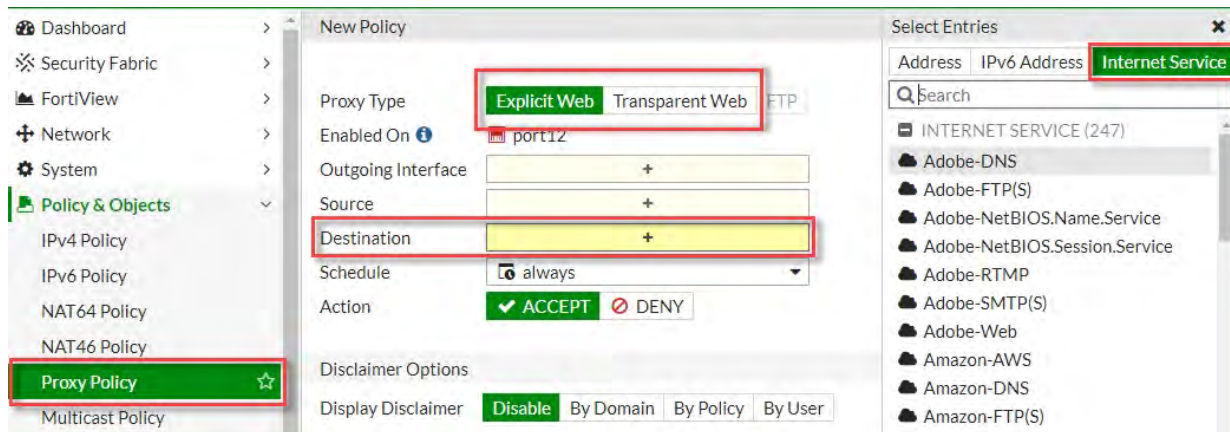

With the new improvements, not only does the field show the name of the Dynamic Pool, if one is being used, but the tool-tip feature is engaged if you hover the cursor over the icon in the field and provides even more specific information.

GUI support for adding Internet-services to proxy-policies (405509)

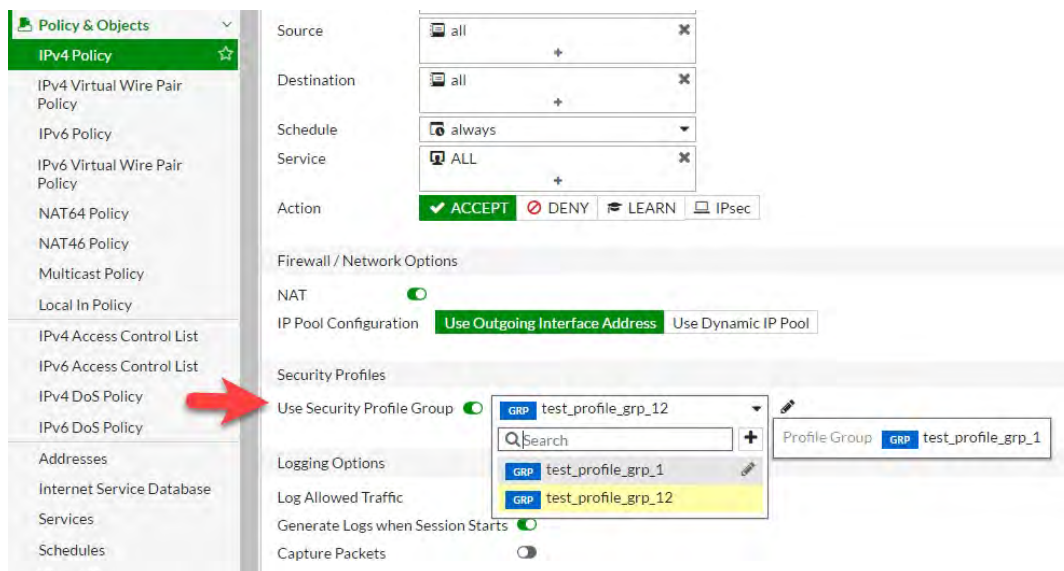

There is now GUI support for the configuration of adding Internet services to proxy policies. When choosing a destination address for a Proxy Policy, the Internet Service tab is visible and the listed objects can be selected.

By choosing an **Internet Service** object as the **Destination**, this sets `internet-service` to enable and specifying either an **Address** or **IPv6 Address** object will set `internet-service` to disable.

Inline editing of profile groups on policy (409485)

There can now be editing to the profile groups within the policy list display window. Before, you had to go into the edit window of the policy, such as in the image below:

However, now the editing can be done from the list display of policies and clicking on the GRP icon. Right clicking on the icon will slide a window out from the left and left clicking will give you a drop-down menu.

Rename "action" to "nat" in firewall.central-snat-map (412427)

The `action` field option in the context of `firewall central-snat-map` in the CLI was considered by some to be a little ambiguous, so it has been renamed to `nat`, an option that can either be `enabled` or `disabled`.

Explicit proxy supports session-based Kerberos authentication (0437054)

- Explicit proxy supports session-based Kerberos authentication
- Transparent proxy will create an anonymous user if the an attempt to create a NTLM connection fails.
- When FSSO authentication fails for the explicit FTP proxy, the FortiGate responses with the error message "match policy failed".

New Firewall Features in 5.6.0

Optimization of the firewall Service cache (355819)

In order to improve the efficiency and performance of the firewall Service cache, the following improvements have been made:

- The logic behind the structure of the cache has been simplified. Instead of storing ranges of port numbers, we store each individual port number in the cache
- Separate caches are created for each VDOM so that cache searches are faster.
- The performance of more frequently used cases has been increased
- Hash tables are used to improve the performance of complex cases. These could include such instances as:
 - service names tied to specific IP Ranges
 - redefinition (one port number with multiple service names)

New CLI option to prevent packet order problems for sessions offloaded to NP4 or NP6 (365497)

In order to prevent the issue of a packet, on FortiGate processing a heavy load of traffic, from being processed out of order, a new setting has been added to better control the timing of pushing the packets being sent to NP units.

The new option, `delay-tcp-npc-session`, has been added into the context of config firewall policy within the CLI

```
config firewall policy
  edit <Integer for policy ID>
    set delay-tcp-npc-session
  end
```

Policy may not be available on units not using NP units.

GUI changes to Central NAT (371516)

The Central NAT configuration interface prevents the accidental occurrence of being able to select "all" and "none" as two objects for the same field. It only allows the selecting of a single IP pool, though it is still possible to select multiple IP pools within the CLI.

Max value for Firewall User authentication changed (378085)

Previously, the maximum time that a member of a firewall user group could remain authenticated without any activity was 24 hours (1440 minutes). The maximum value for this setting has been changed to 72 hours (4320 minutes). This allow someone to log in but not be kicked off the system due to inactivity over the course of a weekend.

The syntax in the CLI for configuring this setting is:

```
config user group
  edit <name of user group>
    set authtimeout 4320
  end
```

Changes to default SSL inspection configuration (380736)

SSL is such a big part of normal traffic that SSL certificate inspection is no longer disabled by default. SSL inspection is now mandatory in firewall policies whenever a policy includes a security profile. The default setting is the Certificate Inspection level. As a result there have been a few changes within the CLI and the GUI.

CLI

The setting SSL-SSH-Profile, is a required option, with the default value being "certificate-inspection", when it is applicable in the following tables:

- firewall.profile-group
- firewall.policy
- firewall.policy6,
- firewall.proxy-policy

The following default profiles are read-only:

- certificate-inspection
- deep-ssl-inspection

GUI

IPv4/IPv6 Policy and Explicit Proxy Policy edit window

- The configuration and display set up for SSL/SSH Inspection is now similar to "profile-protocol-option" option
- The disable/enable toggle button is no longer available for the Profile Protocol Option
- The default profile is set to "certificate-inspection"

IPv4/IPv6 Policy, Explicit Proxy Policy list page

- There is validation for SSL-SSH-Profile when configuring UTM profiles

SSL/SSH Inspection list page

- There is no delete menu on GUI for default ssl profiles
- The "Edit" menu has been changed to "View" for default SSL profiles
- The default SSL profile entries are considered an implicit class and are grayed out

SSL/SSH Inspection edit window

- The only input for default SSL profiles is now download/view trusted certificate links
- To return to the List page from default SSL profiles, the name of the button is now "Return"

Profile Group edit window

- There is no check box for SSL-SSH-Profile. It is always required.

Name change conventions due to upgrade

Starting in 5.6, the profiles "certificate-inspection" and "deep-inspection" are set up by the firmware as default read-only profiles. If you have profiles with these names that were configured in a previous version of FortiOS, rather than overwrite the firmware's default profile, profiles with these names will be upgraded to reflect the configuration conventions of the new firmware but the profile names will be changed by adding a prefix of "_upg_".

Add firewall policy comment field content to log messages (387865)

There has been a need by some customer to have some information in the logs that includes specific information about the traffic that produced the log. The rather elegant solution is that when the log-policy-comment option is enabled, the comment field from the policy will be included in the log. In order to make the logs more useful regarding the traffic just include a customized comment in the policy and enable this setting.

Syntax

```
config system settings
    set log-policy-comment [enable | disable]
end
```

- This setting is for all traffic and security logs.
- It can be select on a per VDOM basis

Learning mode changes profile type to single (387999)

The Learning mode does not function properly when it is applied to a policy that has a UTM profile group applied to it. The logging that should be taking place from the Learning Mode profiles does not occur as intended, and the

Automatically switching the profile type to single on a policy with Learning mode enabled prevents it from being affected by the UTM policy groups.

MAC address authentication in firewall policies and captive portals (391739)

When enabled, a MAC authentication request will be sent to `fnbamd` on any traffic. If the authentication receives a positive response, login becomes available. If the response is negative the normal authentication process takes over.

CLI

New option in the firewall policy setting

```
config firewall policy
    edit <policy ID>
        set radius-mac-auth-bypass [enable |disable]
    end
```

New option in the interface setting

```
config system interface
edit <interface>
set security-mode captive-portal
set security-mac-auth-bypass
end
```

Display resolved IP addresses for FQDN in policy list (393927)

If a FQDN address object is used in a policy, hovering the cursor over the icon for that object will show a tool tip that lists the parameters of the address object. This tool tip now includes the IP address that the FQDN resolves to.

Added comment for acl-policy, interface-policy and DoS-policy (396569)

A comment field has been added to the following policy types:

- acl-policy
- interface-policy
- DoS-policy

Comments of up to 1023 characters can be added through the CLI.

Examples:

DoS policy

```
config firewall DoS-policy
edit 1
set comment "you can put a comment here(Max 1023)."
```

Interface policy

```
config firewall interface-policy
edit 1
set comment "you can put a comment here(max 1023)."
```

Firewall ACL

```
config firewall acl
edit 1
set status disable
set comment "you can put a comment here(max 1023)."
```

```
set interface "port5"
set srcaddr "all"
set dstaddr "all"
set service "ALL"
end
```

Internet service settings moved to more logical place in CLI (397029)

The following settings have moved from the application context of the CLI to the firewall context:

- `internet-service`
- `internet-service-custom`

Example of `internet-service`

```
config firewall internet-service 1245324
set name "Fortinet-FortiGuard"
set reputation 5
set icon-id 140
set offset 1602565
config entry
edit 1
set protocol 6
set port 443
set ip-range-number 27
set ip-number 80
next
edit 2
set protocol 6
set port 8890
set ip-range-number 27
set ip-number 80
next
edit 3
set protocol 17
set port 53
set ip-range-number 18
set ip-number 31
next
edit 4
set protocol 17
set port 8888
set ip-range-number 18
set ip-number 31
next
end
```

Example of `internet-service-custom`

```
config firewall internet-service-custom
edit "custom1"
set comment "custom1"
config entry
edit 1
set protocol 6
config port-range
edit 1
set start-port 30
```

```

        set end-port 33
      next
    end
    set dst "google-drive" "icloud"
  next
end
next
end

```

Example of get command:

```

get firewall internet-service-summary
Version: 00004.00002
Timestamp: 201611291203
Number of Entries: 1349

```

Certificate key size selection (397883)

FortiOS will now support different SSL certificate key lengths from the HTTPS server. FortiOS will select a key size from the two options of 1024 and 2048, to match the key size (as close as possible, rounding up) on the HTTPS server. If the size of the key from the server is 512 or 1024 the proxy will select a 1024 key size. If the key size from the servers is over 1024, the proxy will select a key size of 2048.

CLI changes:

In `ssl-ssh-profile` remove:

- `certname-rsa`
- `certname-dsa`
- `certname-ecdsa`

In `vpn certificate` setting, add the following options :

- `certname-rsa1024`
- `certname-rsa2048`
- `certname-dsa1024`
- `certname-dsa2048`
- `certname-ecdsa256`
- `certname-ecdsa384`

AWS API integration for dynamic firewall address object (400265)

Some new settings have been added to the CLI that will support instance information being retrieved directly from the AWS server. The IP address of a newly launched instance can be automatically added to a certain firewall address group if it meets specific requirements. The new address type is: `ADDR_TYPE_AWS`

New CLI configuration settings:**The AWS settings**

```

config aws
  set access-key
  set secret-key
  set region

```

```
set vpc-id
set update-interval
```

- access-key - AWS access key.
- secret-key - AWS secret key.
- region - AWS region name.
- vpc-id - AWS VPC ID.
- update-interval - AWS service update interval (60 - 600 sec, default = 60).

The AWS address:

```
config firewall address
edit <address name>
set type aws
set filter <filter values>
```

The filter can be a combination of any number of conditions, as long as the total length of filter is less than 2048 bytes. The syntax for the filter is:

```
<key1=value1> [& <key2=value2>] [| <key3=value3>]
```

For each condition, it includes a key and value, the supported keys are:

1. instanceId, (e.g. instanceId=i-12345678)
2. instanceType, (e.g. instanceType=t2.micro)
3. imageId, (e.g. imageId=ami-123456)
4. keyName, (e.g. keyName=aws-key-name)
5. architecture, (e.g. architecture=x86)
6. subnetId, (e.g. subnetId=sub-123456)
7. placement.availabilityzone, (e.g. placement.availabilityzone=us-east-1a)
8. placement.groupname, (e.g. placement.groupname=group-name)
9. placement.tenancy, (e.g. placement.tenancy=tenancy-name)
10. privateDnsName, (e.g. privateDnsName=ip-172-31-10-211.us-west-2.compute.internal)
11. publicDnsName, (e.g. publicDnsName=ec2-54-202-168-254.us-west-2.compute.amazonaws.com)
12. AWS instance tag, each tag includes a key and value, the format of tag set is: tag.Name=Value, maximum of 8 tags are supported.

Internet service configuration (405518)

To make the CLI configuration of Internet service configuration more intuitive, the settings for Internet service in Explicit Web proxy are closer to those in the Firewall police. An Internet service enable switch has been added to the Explicit Web proxy with the same text description as the Firewall policy.

CLI:

The relevant options in the firewall policy are:

```
config firewall policy
edit 1
set internet-service enable
set internet-service-id 327681 1572864 917519 393225 1572888 1572877 917505
```

```
next
end
```

The Explicit Web proxy is now has these options:

```
config firewall proxy-policy
edit 1
set uuid f68e0426-dda8-51e6-ac04-37fc3f92cadf
set proxy explicit-web
set dstintf "port9"
set srcaddr "all"
set internet-service 2686980
set action accept
set schedule "always"
set logtraffic all
next
end
```

Changes to SSL abbreviate handshake (407544)

The SSL handshake process has changed to make troubleshooting easier.

- In order to better identify which clients have caused SSL errors, the WAD SSL log will use the original source address rather than the source address of packets.
- The return value of `wad_ssl_set_cipher` is checked.
- The `wad_ssl_session_match` has been removed because it will add the connection into bypass cache and bypass further inspection.
- DSA and ECDSA certificates are filtered for `admin-server-cert`
- `cert-inspect` is reset after a WAD match to a Layer 7 policy
- An option to disable the use of SSL abbreviate handshake has been added

CLI addition

```
config firewall ssl setting
set abbreviate-handshake [enable|disable]
```

NGFW mode in the VDOM - NAT & SSL Inspection considerations (407547)

Due to how the NGFW Policy mode works, it can get complicated in the two areas of NAT and SSL Deep Inspection. To match an application against a policy, some traffic has to pass through the FortiGate in order to be properly identified. Once that happens may end up getting mapped to a different policy, where the new policy will be appropriately enforced.

NAT

In the case of NAT being used, the first policy that is triggered to identify the traffic might require NAT enabled for it to work correctly. i.e., without NAT enabled it may never be identified, and thus not fall through. Let's use a very simple example:

Policy 1: Block Youtube

Policy 2: Allow everything else (with NAT enabled)

Any new session established will never be identified immediately as Youtube, so it'll match policy #1 and let some traffic go to try and identify it. Without NAT enabled to the Internet, the session will never be setup and thus stuck here.

Solution:

- NAT for NGFW policies must be done via Central SNAT Map
- Central SNAT Map entries now have options for 'srcintf', 'dstintf' and 'action'.
- If no IP-pools are specified in the Central SNAT entry, then the outgoing interface address will be used.
- NGFW policies now must use a single default ssl-ssh-profile. The default ssl-ssh-profile can be configured under the system settings table.

SSL

In the case of SSL inspection, the issue is a bit simpler. For each policy there are 3 choices:

1. No SSL,
2. Certificate Only
3. Deep Inspection.

For 1. and 2. there is no conflict and the user could enable them inter-changeably and allow policy fallthrough.

The issue happens when:

- The first policy matched, uses **Certificate Only**
- After the application is detected, it re-maps the session to a new policy which has **Deep Inspection** enabled

This switching of behavior is the main cause of the issue.

Solution:

- Multiple SSL profiles have been replaced with a single page of settings
- The user can setup exemptions for destination web category, source IP or etc.

CLI**Changes**

```
config system settings
  set inspection-mode flow
  set policy-mode [standard | ngfw]
```

Has been changed to:

```
config system settings
  set inspection-mode flow
  set ngfw-mode [profile-based | policy-based]
```

- ngfw-mode - Next Generation Firewall mode.
- profile-based - Application and web-filtering is configured using profiles applied to policy entries.
- policy-based - Application and web-filtering is configured as policy match conditions.

Additions

Setting the vdom default ssl-ssh-profile

```
config system settings
  set inspection-mode flow
  set ngfw-mode policy-based
  set ssl-ssh-profile <profile>
```

ssl-ssh-profile - VDOM SSL SSH profile.

Setting srcintf, dstintf, action on the central-snat policy

```
config firewall central-snat-map
  edit <id>
    set srcintf <names or any>
    set dstintf <names or any>
    set action (permit | deny)
```

- `srcintf` - Source interface name.
- `dstintf` - Destination interface name.
- `action` - Action of central SNAT policy.

GUI

System settings, VDOM settings list/dialog:

- A field has been added to show the default `ssl-ssh-profile`

IPv4/v6 Policy list and dialogs:

- In NGFW policy-based mode, there are added tool tips under NAT columns/fields to indicate that NAT must be configured via Central SNAT Map. Additionally, links to redirect to Central SNAT list were added.
- Default `ssl-ssh-profile` is shown in the policy list and dialog for any policies doing NGFW (`application, application-categories, url-categories`) or UTM (`av-profile etc.`) inspection.
 - Default `ssl-ssh-profile` is disabled from editing in policy list dialog

Central SNAT Policy list and dialogs:

- In both `profile-based` & `policy-based ngfw-mode`, fields for `srcintf`, `dstintf` were added to Central SNAT policies entries.
- In `policy-based` mode only, a toggle-switch for **NAT Action** was added in Central SNAT policy dialog. The action is also configurable from the **Action** column in Central SNAT policy list.

SSL/SSH Inspection list:

- In policy-based mode only, the navigation bar link to **SSL/SSH Inspection** redirects to the profiles list
- In policy-based mode only, the **SSL/SSH Inspection** list table indicates which profile is the current VDOM default. Additionally, options are provided in the list menu and context menu to change the current VDOM default.

Support HTTP policy for flow-based inspection (411666)

It is possible to implement an HTTP-policy in a VDOM that is using the Flow-based inspection mode. Enabling the HTTP-policy causes the traffic to be redirected to WAD so that the traffic can be properly matched and processed.

Support for CA chain downloading to improve certificate verification (369270)

During certificate verification, if the certificate chain is not complete and CA issuer information exists in the certificate, FortiOS attempts to download intermediate/root CAs from the HTTP server and attempts to perform chain verification. The downloaded CAs are saved in a cache (max 256) to be re-used for future certificate validation. CAs are removed from the cache if they are inactive or not needed for more than 1 hour.

CA chain downloading is used to improve verification results for certificates that are difficult to verify. The CAs are kept in the cache to improve performance.

New WAN Optimization Features in 5.6

WAN Optimization GUI changes (283422)

Improvements have been made to the WAN Optimization **Profiles** and **Authentication Group** pages.

New Proxy Features in 5.6

Explicit proxy supports multiple incoming ports and port ranges (402775, 398687)

Explicit proxy can now be configured to listen on multiple ports on the same IP as well as listen for HTTP and HTTPS on those same (or different) ports.

Define the IP ranges using a hyphen (-). As shown below, `port_high` is not necessary to specify if `port_low` is equal to `port_high`.

CLI syntax

```
config web-proxy explicit
  set http-incoming-port <port_low> [-<port_high>]
end
```

Explicit proxy supports IP pools (402221)

Added a new command, `poolname`, to `config firewall proxy-policy`. When setting the IP pool name with this command, the outgoing IP will be selected.

CLI syntax

```
config firewall proxy-policy
  edit <example>
    set poolname <name>
  end
```

Option to remove unsupported encoding from HTTP headers (392908)

Added a new command to `config web-proxy profile` that, when enabled, allows the FortiGate to strip out unsupported encoding from request headers, and correctly block banned words. This is to resolve issues when attempting to successfully block content using Google Chrome.

CLI syntax:

```
config web-proxy profile
  edit <example>
    set strip-encoding {enable | disable}
  end
```

New authentication process for explicit web proxying (386474, 404355)

While in Proxy inspection mode, explicit proxy options can be set under **Network > Explicit Proxy**. These settings will affect what options are available for creating proxy policies under **Policy & Objects > Proxy Policy**. From here you may create new policies with **Proxy Type** set to either **Explicit Web**, **Transparent Web**, or **FTP**.

Authentication will be triggered differently when configuring a transparent HTTP policy. Before such a policy can be configured, you must enable **HTTP Policy Redirect** under **Security Profiles > Proxy Options**.

Added Internet services to explicit proxy policies (386182)

Added two new commands to `config firewall proxy-policy`. FortiOS can use the Internet Service Database (introduced in 5.4.1) as the web-proxy policy matching factor.

CLI syntax:

```
config firewall proxy-policy
  edit <example>
    set internet-service <application-id>
    set internet-service-custom <application-name>
```

Virtual WAN link in an explicit proxy firewall policy (385849, 396780)

Virtual WAN link (VWL) interfaces may now be set as the destination interface in an explicit proxy policy, routing traffic properly using basic virtual WAN link load balance settings. This is now configurable through both the CLI under `firewall proxy-policy` and the GUI.

Added application ID and category setting on the explicit proxy enabled service (379330)

This feature introduces support for application ID/category in the service of explicit proxy as one policy selection factor. The intent is to identify the application type based on the HTTP request with IPS application type detection function. It is similar to the current firewall explicit address, but it is implemented as a service type, and you can select the application ID/ category to define explicit service. Of course, now it must be an HTTP-based application.

CLI syntax

```
config firewall service custom
  edit "name"
    set app-service-type [disable|app-id|app-category]
  next
```

```
end
```

Explicit Proxy - populate pac-file-url in transparent mode (373977)

You can now use manageip to populate pac-file-url in transparent opmode. Previously, in the CLI, when displaying pac-file-url, the code only tries to get interface IP to populate pac-file-url.

CLI syntax

```
config vdom
  edit root
    config system settings
      set opmode transparent
      set manageip 192.168.0.34/24
    end
    config web-proxy explicit
      set pac-file-server-status enable
      get pac-file-url [url.pac]
    end
  end
```

SSL deep inspection OCSP support for Explicit Proxy (365843)

OCSP support for SSL deep inspection added for Explicit Proxy.

CLI syntax

```
config vpn certificate setting
  set ssl-ocsp-status [enable|disable]
  set ssl-ocsp-option [certificate|server]
end
```

Timed out authentication requests are now logged (357098)

CLI syntax

```
config web-proxy explicit
  set trace-auth-no-rsp [enable|disable]
end
```

Firewall concepts

There are a number of foundational concepts that are necessary to have a grasp of before delving into the details of how the FortiGate firewall works. Some of these concepts are consistent throughout the firewall industry and some of them are specific to more advanced firewalls such as the FortiGate. Having a solid grasp of these ideas and terms can give you a better idea of what your FortiGate firewall is capable of and how it will be able to fit within your networks architecture.

This chapter describes the following firewall concepts:

- [What is a Firewall?](#)
- [FortiGate Modes](#)
- [How Packets are handled by FortiOS](#)
- [Interfaces and Zones](#)
- [Access Control Lists](#)
- [IPv6](#)
- [NAT](#)
- ["IP Pools" on page 984](#)
- [Services and TCP ports](#)

- ["Traffic Logging" on page 1023](#)

What is a Firewall?

The term firewall originally referred to a wall intended to confine a fire or potential fire within a building. Later uses refer to similar structures, such as the metal sheet separating the engine compartment of a vehicle or aircraft from the passenger compartment.

A firewall can either be software-based or hardware-based and is used to help keep a network secure. Its primary objective is to control the incoming and outgoing network traffic by analyzing the data packets and determining whether it should be allowed through or not, based on a predetermined rule set. A network's firewall builds a

bridge between an internal network that is assumed to be secure and trusted, and another network, usually an external (inter)network, such as the Internet, that is not assumed to be secure and trusted.

Network Layer or Packet Filter Firewalls

Stateless Firewalls

Stateless firewalls are the oldest form of these firewalls. They are faster and simple in design requiring less memory because they process each packet individually and don't require the resources necessary to hold onto packets like stateful firewalls. Stateful firewalls inspect each packet individually and check to see if it matches a predetermined set of rules. According to the matching rule the packet is either be allowed, dropped or rejected. In the case of a rejection an error message is sent to the source of the traffic. Each packet is inspected in isolation and information is only gathered from the packet itself. Simply put, if the packets were not specifically allowed according to the list of rules held by the firewall they were not getting through.

Stateful Firewalls

Stateful firewalls retain packets in memory so that they can maintain context about active sessions and make judgments about the state of an incoming packet's connection. This enables Stateful firewalls to determine if a packet is the start of a new connection, a part of an existing connection, or not part of any connection. If a packet is part of an existing connection based on comparison with the firewall's state table, it will be allowed to pass without further processing. If a packet does not match an existing connection, it will be evaluated according to the rules set for new connections. Predetermined rules are used in the same way as a stateless firewall but they can now work with the additional criteria of the state of the connection to the firewall.

Best Practices Tip for improving performance:

Blocking the packets in a denied session can take more cpu processing resources than passing the traffic through. By putting denied sessions in the session table, they can be kept track of in the same way that allowed session are so that the FortiGate unit does not have to redetermine whether or not to deny all of the packets of a session individually. If the session is denied all packets of that session are also denied.

In order to configure this you will need to use 2 CLI commands

```
config system setting
    set ses-denied-traffic enable
    set block-session-timer <integer 1 - 300> (this determines in
seconds how long, in seconds, the session is kept in the table)
end
```

Application Layer Firewalls

Application layer filtering is yet another approach and as the name implies it works primarily on the Application Layer of the OSI Model.

Application Layer Firewalls actually, for lack of a better term, understand certain applications and protocols. Examples would be FTP, DNS and HTTP. This form of filtration is able to check to see if the packets are actually behaving incorrectly or if the packets have been incorrectly formatted for the protocol that is indicated. This process also allows for the use of deep packet inspection and the sharing of functionality with Intrusion Prevention Systems (IPS).

Application-layer firewalls work on the application level of the TCP/IP stack (i.e., all browser traffic, or all telnet or ftp traffic), and may intercept all packets traveling to or from an application. They block other packets (usually dropping them without acknowledgment to the sender). Application firewalls work much like a packet filter but application filters apply filtering rules (allow/block) on a per process basis instead of filtering connections on a per port basis.

On inspecting all packets for improper content, firewalls can restrict or prevent outright the spread of networked computer worms and trojans. The additional inspection criteria can add extra latency to the forwarding of packets to their destination.

Proxy Servers

A proxy server is an appliance or application that acts as an intermediary for communicating between computers. A computer has a request for information. The packets are sent to the designated resource but before they can get there they are blocked by the proxy server saying that it will take the request and pass it on. The Proxy Server processes the request and if it is valid it passes onto the designated computer. The designated computer gets the packet and processes the request, sending the answer back to the proxy server. The proxy server sends the information back to the originating computer. It's all a little like a situation with two people who refuse to talk directly with each other using someone else to take messages back and forth.

From a security stand point a Proxy Server can serve a few purposes:

- Protects the anonymity of the originating computer
- The two computers never deal directly with each other
- Packets that are not configured to be forwarded are dropped before reaching the destination computer.
- If malicious code is sent it will affect the Proxy server with out affecting the originating or sending computer.

Proxies can perform a number of roles including:

- Content Filtering
- Caching
- DNS proxy
- Bypassing Filters and Censorship
- Logging and eavesdropping
- Gateways to private networks
- Accessing service anonymously

UTM/ NGFW

Unified Threat Management and Next Generation Firewall are terms originally coined by market research firms and refer to the concept of a comprehensive security solution provided in a single package. It is basically combining of what used to be accomplished by a number of different security technologies all under a single umbrella or in this case, a single device. On the FortiGate firewall this is achieved by the use of Security Profiles and optimized hardware.

In effect it is going from a previous style of firewall that included among its features:

- Gateway Network Firewall
- Routing
- VPN

To a more complete system that includes:

- Gateway Network Firewall
- Routing
- VPN
- Traffic Optimization
- Proxy Services
- Content Filtering
- Application Control
- Intrusion Protection
- Denial of Service Attack Protection
- Anti-virus
- Anti-spam
- Data Leak Prevention
- Endpoint Control of Security Applications
- Load Balancing
- WiFi Access Management
- Authentication Integration into Gateway Security
- Logging
- Reporting

Advantages of using Security Profiles

- Avoidance of multiple installations.
- Hardware requirements are fewer.
- Fewer hardware maintenance requirements.
- Less space required.
- Compatibility - multiple installations of products increase the probability of incompatibility between systems.
- Easier support and management.
- There is only one product to learn therefore a reduced requirement of technical knowledge.
- Only a single vendor so there are fewer support contracts and Service Level Agreements.
- Easier to incorporated into existing security architecture.
- Plug and play architecture.
- Web based GUI for administration.

FortiGate Modes

The FortiGate unit has a choice of modes that it can be used in, either NAT mode or Transparent mode. The FortiGate unit is able to operate as a firewall in both modes, but some of its features are limited in Transparent mode. It is always best to choose which mode you are going to be using at the beginning of the set up. Once you start configuring the device, if you want to change the mode you are going to lose all configuration settings in the change process.

NAT Mode

NAT mode is the most commonly used mode by a significant margin and is thus the default setting on the device. As the name implies the function of NAT is commonly used in this mode and is easily configured but there is no

requirement to use NAT. The FortiGate unit performs network address translation before IP packets are sent to the destination network.

These are some of the characteristics of NAT mode:

- Typically used when the FortiGate unit is a gateway between private and public networks.
- Can act as a router between multiple networks within a network infrastructure.
- When used, the FortiGate unit is visible to the networks that it is connected to.
- Each logical interface is on a distinct subnet.
- Each Interface needs to be assigned a valid IP address for the subnet that it is connected to it.

Transparent Mode

Transparent mode is so named because the device is effectively transparent in that it does not appear on the network in the way that other network devices show as a nodes in the path of network traffic. Transparent mode is typically used to apply the FortiOS features such as Security Profiles etc. on a private network where the FortiGate unit will be behind an existing firewall or router.

These are some of the characteristics of Transparent mode:

- The FortiGate unit is invisible to the network.
- All of its interfaces are on the same subnet and share the same IP address.
- The FortiGate unit uses a Management IP address for the purposes of Administration.
- Still able to use NAT to a degree, but the configuration is less straightforward

In Transparent mode, you can also perform NAT by creating a security policy or policies that translates the source addresses of packets passing through the FortiGate unit as well as virtual IP addresses and/or IP pools.

How Packets are handled by FortiOS

To give you idea of what happens to a packet as it makes its way through the FortiGate unit here is a brief overview. This particular trip of the packet is starting on the Internet side of the FortiGate firewall and ends with the packet exiting to the Internal network. An outbound trip would be similar. At any point in the path if the packet is going through what would be considered a filtering process and if fails the filter check the packet is dropped and does not continue any further down the path.

This information is covered in more detail in other in the Troubleshooting chapter of the FortiOS Handbook in the Life of a Packet section.

The incoming packet arrives at the external interface. This process of entering the device is referred to as **ingress**.

Step #1 - Ingress

1. Denial of Service Sensor
2. IP integrity header checking
3. IPsec connection check
4. Destination NAT
5. Routing

Step #2 - Stateful Inspection Engine

1. Session Helpers
2. Management Traffic
3. SSL VPN
4. User Authentication
5. Traffic Shaping
6. Session Tracking
7. Policy lookup

Step #3 - Security Profiles scanning process

1. Flow-based Inspection Engine
2. IPS
3. Application Control
4. Data Leak Prevention
5. Email Filter
6. Web Filter
7. Anti-virus
8. Proxy-based Inspection Engine
9. VoIP Inspection
10. Data Leak Prevention
11. Email Filter
12. Web Filter
13. Anti-virus
14. ICAP

Step #4 - Egress

1. IPsec
2. Source NAT
3. Routing

Interfaces and Zones

A Firewall is a gateway device that may be the nexus point for more than 2 networks. The interface that the traffic is coming in on and should be going out on is a fundamental concern for the purposes of routing as well as security. Routing, policies and addresses are all associated with interfaces. The interface is essentially the connection point of a subnet to the FortiGate unit and once connected can be connected to other subnets.

The following types of interfaces are found on a FortiGate:

- Interface , this can refer to a physical or virtual interface
- Zone
- Virtual Wired Pair

Interfaces

Physical interfaces or not the only ones that need to be considered. There are also virtual interfaces that can be applied to security policies. VLANs are one such virtual interface. Interfaces if certain VPN tunnels are another.

Policies are the foundation of the traffic control in a firewall and the Interfaces and addressing is the foundation that policies are based upon. Using the identity of the interface that the traffic connects to the FortiGate unit tells the firewall the initial direction of the traffic. The direction of the traffic is one of the determining factors in deciding how the traffic should be dealt with. You can tell that interfaces are a fundamental part of the policies because, by default, this is the criteria that the policies are sorted by.

Zones

Zones are a mechanism that was created to help in the administration of the firewalls. If you have a FortiGate unit with a large number of ports and a large number of nodes in your network the chances are high that there is going to be some duplication of policies. Zones provide the option of logically grouping multiple virtual and physical FortiGate firewall interfaces. The zones can then be used to apply security policies to control the incoming and outgoing traffic on those interfaces. This helps to keep the administration of the firewall simple and maintain consistency.

For example you may have several floors of people and each of the port interfaces could go to a separate floor where it connects to a switch controlling a different subnet. The people may be on different subnets but in terms of security they have the same requirements. If there were 4 floors and 4 interfaces a separate policy would have to be written for each floor to be allowed out on to the Internet off the WAN1 interface. This is not too bad if that is all that is being done, but now start adding the use of more complicated policy scenarios with Security Profiles, then throw in a number of Identity based issues and then add the complication that people in that organization tend to move around in that building between floors with their notebook computers.

Each time a policy is created for each of those floors there is a chance of an inconsistency cropping up. Rather than make up an additional duplicate set of policies for each floor, a zone can be created that combines multiple interfaces. And then a single policy can be created that uses that zone as one side of the traffic connection.

You cannot add physical interfaces associated with VLANs to zones.

Virtual Wire Pair

The simplified explanation is that two interfaces are set up so that whatever traffic goes through one of the pair is replicated on the other. They are most commonly used when scanning is needed on an interface without interfering with the traffic. On interface "A", everything goes through unaffected. The replicated traffic on interface "B" is sent to an analyzer of some kind and the traffic can be thoroughly scanned without worry of impacting performance.

When two physical interfaces are setup as a Virtual Wire Pair, they will have no IP addressing and are treated similar to a transparent mode VDOM. All packets accepted by one of the interfaces in a virtual wire pair can only exit the FortiGate through the other interface in the virtual wire pair and only if allowed by a virtual wire pair firewall policy. Packets arriving on other interfaces cannot be routed to the interfaces in a virtual wire pair. A FortiGate can have multiple virtual wire pairs.

You cannot add VLANs to virtual wire pairs. However, you can enable wildcard VLANs for a virtual wire pair. This means that all VLAN-tagged traffic can pass through the virtual wire pair if allowed by virtual wire pair firewall policies.

Access Control Lists

Access Control Lists (ACLs) use NP6 offloading to drop IPv4 or IPv6 packets at the physical network interface before the packets are analyzed by the CPU. On a busy appliance this can really help the performance. This feature is available on FortiGates with NP6 processors and is not supported by FortiGates with NP6lite processors.

The ACL feature is available only on FortiGates with NP6-accelerated interfaces. ACL checking is one of the first things that happens to the packet and checking is done by the NP6 processor. The result is very efficient protection that does not use CPU or memory resources.

Use the following command to configure IPv4 ACL lists:

```
config firewall acl
  edit 0
    set status enable
    set interface <interface-name>
    set srcaddr <firewall-address>
    set dstaddr <firewall-address>
    set service <firewall-service>
  end
```

Use the following command to configure IPv6 ACL lists:

```
config firewall acl6
  edit 0
    set status enable
    set interface <interface-name>
    set srcaddr <firewall-address6>
    set dstaddr <firewall-address6>
    set service <firewall-service>
  end
```

Where:

<interface-name> is the interface on which to apply the ACL. There is a hardware limitation that needs to be taken into account. The ACL is a Layer 2 function and is offloaded to the ISF hardware, therefore no CPU resources are used in the processing of the ACL. It is handled by the inside switch chip which can do hardware acceleration, increasing the performance of the FortiGate. The ACL function is only supported on switch fabric driven interfaces.

<firewall-address> <firewall-address6> can be any of the address types used by the FortiGate, including address ranges. The traffic is blocked not on an either or basis of these addresses but the combination of the two, so that they both have to be correct for the traffic to be denied. To block all of the traffic from a specific address all you have to do is make the destination address ALL.

Because the blocking takes place at the interface based on the information in the packet header and before any processing such as NAT can take place, a slightly different approach may be required. For instance, if you are trying to protect a VIP which has an external address of x.x.x.x and is forwarded to an internal address of y.y.y.y, the destination address that should be used is x.x.x.x, because that is the address that will be in the packet's header when it hits the incoming interface.

<firewall-service> the firewall service to block. Use ALL to block all services.

Firewall policies

The firewall policy is the axis around which most of the other features of the FortiGate firewall revolve. A large portion of the settings in the firewall at some point will end up relating to or being associated with the firewall policies and the traffic that they govern. Any traffic going through a FortiGate unit has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it's processed, if it's processed and even whether or not it's allowed to pass through the FortiGate.

When the firewall receives a connection packet, it analyzes the packet's source address, destination address, and service (by port number). It also registers the incoming interface, the outgoing interface it will need to use and the time of day. Using this information the FortiGate firewall attempts to locate a security policy that matches the packet. If it finds a policy that matches the parameters it then looks at the action for that policy. If it is **ACCEPT** the traffic is allowed to proceed to the next step. If the Action is **DENY** or a match cannot be found the traffic is not allowed to proceed.

The 2 basic actions at the initial connection are either **ACCEPT** or **DENY**:

- If the **Action** is **ACCEPT**, the policy action permits communication sessions. There may be other packet processing instructions, such as requiring authentication to use the policy or restrictions on the source and destination of the traffic.
- If the **Action** is **DENY**, the policy action blocks communication sessions, and you can optionally log the denied traffic. If no security policy matches the traffic, the packets are dropped. A **DENY** security policy is needed when it is required to log the denied traffic, also called "violation traffic".

There are two other Actions that can be associated with the policy:

- **LEARN** - This is a specialized variation on the **ACCEPT** action. That is set up to allow traffic but to keep traffic logs so that the administrator can go through them to learn what kind of traffic has to be dealt with.
- **IPsec** - This is an **ACCEPT** action that is specifically for IPsec VPNs.

There can also be a number of instructions associated with a FortiGate firewall in addition to the **ACCEPT** or **DENY** actions, some of which are optional. Instructions on how to process the traffic can also include such things as:

- Logging Traffic
- Authentication
- Network Address Translation or Port Address Translation
- Use Virtual IPs or IP Pools
- Caching
- Whether the source of the traffic is based on address, user, device or a combination
- Whether to treat as regular traffic or IPsec traffic
- What certificates to use
- Security profiles to apply
- Proxy Options
- Traffic Shaping

Firewall policy parameters

As mentioned before, for traffic to flow through the FortiGate firewall there must be a policy that matches its parameters:

Incoming Interface(s)

This is the interface or interfaces that the traffic is first connection to the FortiGate unit by. The exception being traffic that the FortiGate generates itself. This is not limited to the physical Ethernet ports found on the device. The incoming interface can also be a logical or virtual interface such as a VPN tunnel, a Virtual WAN link or a wireless interface.

Outgoing Interface(s)

After the firewall has processed the traffic it needs to leave a port to get to its destination and this will be the interface or interfaces that the traffic leaves by. This interface, like the **Incoming Interface** is not limited to only physical interfaces.

Source Address(es)

The addresses that a policy can receive traffic from can be wide open or tightly controlled. For a public web server that the world at large should be able to access, the best choice will be "all". If the destination is a private web server that only the branch offices of a company should be able to access or a list of internal computers that are the only ones allowed to access an external resource then a group of preconfigured addresses is the better strategy.

Additional parameters under the Source Address, though they are not mandatory are:

- **Source User(s)**

This parameter is based on a user identity that can be from a number of authentication authorities. It will be an account or group that has been set up in advance that can be selected from the drop down menu. The exception to this is the feature that allows the importing of LDAP Users. When the feature is used, a small wizard window will appear to guide the user through the setup. The caveat is that the LDAP server object in the **User and Device > Authentication > LDAP Servers** section has to be already configured to allow the use of this import feature.

- **Source Device Type**

This parameter is for narrowing down the traffic sending devices to those that the FortiGate is familiar with. Again the contents of this parameter need to be a preconfigured object and these are defined at **User and Device > Custom Devices & Groups**. This parameter can limit the devices that can connect to this policy to those specific MAC addresses that are already known by the FortiGate and are approved for the policy.

Destination Address(es)

In the same way that the source address may need to be limited, the destination address can be used as a traffic filter. When the traffic is destined for internal resources the specific address of the resource can be defined to better protect the other resources on the network. One of the specialized destination address options is to use a Virtual IP address. The destination address doesn't need to be internal you can define policies that are only for connecting to specific addresses on the Internet.

Internet service(s)

In this context, and Internet service is a combination of one or more addresses and one or more services associated with a service found on the Internet such as an update service for software.

Schedule

The time frame that is applied to the policy. This can be something as simple as a time range that the sessions are allowed to start such as between 8:00 am and 5:00 pm. Something more complex like business hours that

include a break for lunch and time of the session's initiation may need a schedule group because it will require multiple time ranges to make up the schedule.

Service

The service or service chosen here represent the TCP/IP suite port numbers that will most commonly be used to transport the named protocols or group of protocols. This will be a little different than Application Control which looks more closely at the packets to determine the actual protocol used to create them.

Without all six (possibly 8) of these things matching, the traffic will be declined. Each traffic flow requires a policy and the direction is important as well. Just because packets can go from point A to point B on port X does not mean that the traffic can flow from point B to point A on port X. A policy must be configured for each direction.

When designing a policy there is often reference to the traffic flow, but most communication is a two way connection so trying to determine the direction of the flow can be somewhat confusing. If traffic is HTTP web traffic the user sends a request to the web site, but most of the traffic flow will be coming from the web site to the user. Is the traffic flow considered to be from the user to the web site, the web site to the user or in both directions? For the purposes of determining the direction for a policy the important factor is the direction of the initiating communication. The user is sending a request to the web site so this is the initial communication and the web site is just responding to it so the traffic will be from the users network to the Internet.

A case where either side can initiate the communication like between two internal interfaces on the FortiGate unit would be a more likely situation to require a policy for each direction.

What is not expressly allowed is denied

One of the fundamental ideas that can be found in just about any firewall is the rule that anything that is not expressly allowed is by default denied. This is the foundation for any strategy of protecting your network. Right out of the box, once you have your FortiGate device connected into your network and hooked up with your ISP your network is protected. Nothing is getting out or in so it is not very convenient, but you don't have to worry that between the time you hooked it up and the point that you got all of the policies in place that someone could have gotten in and done something to your resources. The reason that this needs to be kept in mind when designing policies is because you cannot assume that any traffic will be allowed just because it makes sense to do so. If you want any kind of traffic to make it past the FortiGate firewall you need to create a policy that will allow that traffic. To maintain the protection of the network should also make sure that the any policy you create allows only the traffic you intend to go only to where you specifically want it to go and when you want it to go there.

Example

You have a web server on your network that is meant to provide a collaborative work environment web site for your employees and a partner company for a project over the course of the next 3 months.

It is theoretically possible to allow connections into your network to any device on that network for any service and at any time. The problem with this is that we might not want just anybody looking at those resources. Sadly, no matter how much it is wished otherwise, not everybody on the Internet can be trusted. Which means we now have to be very specific in our instructions as to what traffic to allow into the network. Each step that we take towards being more specific as to what we allow means that there is that much more that is not allowed and the level of protection of a resources is directly proportional to the amount of traffic that is not allowed. If somebody can't get at it they can't damage or steal it.

Limiting where the traffic is allowed to go to means that other computers on your network besides the web-server are protected.

- Limiting where the traffic is allowed to come from means that, if feasible, you can limit the systems that can access the web server to just employees or the partner company computers.
- Limiting the services to just web traffic means that a malicious person, even if they were connection from a computer at the partner organization could only use the features of web traffic to do anything malicious.
- Limiting the policy to the time span of the project would mean that even if the IT department forgot to remove the policy after the end of the project than no computer from the other company could be used to do anything malicious through the policy that allowed the traffic.

This is just a very basic example but it shows the underlying principles of how the idea that anything not expressly allowed is by default denied can be used to effectively protect your network.

Policy order

Another important factor in how firewall policies work is the concept of precedence of order or if you prefer a more recognizable term, “first come, first served”.

It is highly likely that even after only a relatively small number of policies have been created that there will be some that overlap or are subsets of the parameters that the policies use to determine which policy should be matched against the incoming traffic. When this happens there has to be a method to determine which policy should be applied to the packet. The method which is used by most firewalls is based on the order of the sequence of the policies.

If all of the policies were placed in a sequential list the process to match up the packet would start at the top of the list and work its way down. It would compare information about the packet, specifically these points of information:

1. The interface the packet connected to the FortiGate firewall
2. The source of the packet. This can include variations of the address, user credentials or device
3. The destination of the packet. This can include address or Internet service
4. The interface the packet would need to use to get to the destination address based on the routing table
5. The service or port the packet is destined for
6. The time that the packet connected to the FortiGate

As soon as the a policy is reached that matches all of the applicable parameters, the instructions of that policy are applied and the search for any other matching policies is stopped. All subsequent policies are disregarded. Only 1 policy is applied to the packet.

If there is no matching policy among the policies that have been configured for traffic the packet finally drops down to what is always the last policy. It is an implicit policy. One of a few that are referred to by the term “policy0”. This policy denies everything.

The implicit policy is made up of the following settings:

- Incoming Interface: any
- Source Address: any
- Outgoing Interface: any
- Destination Address: any
- Action: DENY

The only setting that is editable in the implicit policy is the logging of violation traffic.

A logical best practice that comes from the knowledge of how this process works is to make sure that the more specific or specialized a policy is, the closer to the beginning of the sequence it should be. The more general a policy is the higher the likelihood that it could include in its range of parameters a more specifically targeted

policy. The more specific a policy is, the higher the probability that there is a requirement for treating that traffic in a specific way.

Example

For security reasons there is no FTP traffic allowed out of a specific subnet so there is a policy that states that any traffic coming from that subnet is denied if the service is FTP, so the following policy was created:

Policy #1

Source Interface	Internal1
Source Address	192.168.1.0/24
Source User(s)	<left at default setting>
Source Device Type	<left at default setting>
Outgoing Interface	WAN1
Destination Address	0.0.0.0/0.0.0.0
Service	FTP
Schedule	always
Action	deny

Now as these things usually go it turns out that there has to be an exception to the rule. There is one very secure computer on the subnet that is allowed to use FTP and once the content has been checked it can then be distributed to the other computer on the subnet. So a second firewall policy is created.

Policy #2

Source Interface	Internal1
Source Address	192.168.1.38/32
Source User(s)	<left at default setting>
Source Device Type	<left at default setting>
Outgoing Interface	WAN1
Destination Address	0.0.0.0/0.0.0.0

Service	FTP
Schedule	always
Action	Allow

By default, a policy that has just been created will be placed last in the sequence so that it is less likely to interfere with existing policies before it can be moved to its intended position. If you look at Policy #2 you will notice that it is essentially the same as Policy #1 exempt for the Source Address and the Action. You will also notice that the Source Address of the Policy #2 is a subset of the Source address in policy #1. This means that if nothing further is done, Policy #2 will never see any traffic because the traffic will always be matched by Policy #1 and processed before it has a chance to reach the second policy in the sequence. For both policies to work as intended Policy #2 needs to be moved to before Policy #1 in the sequence.

Policy Identification

There are two ways to identify a policy. The most obvious is the policy name and this is easily read by humans, but with a little effort it is possible to have a policy without a name, therefore every policy has an ID number.

When looking at the policy listing it can appear as if the policies are identified by the sequence number in the far left column. The problem is that this number changes as the position of the policy in the sequence changes. The column that correctly identifies the policy, and the value sticks with the policy is the "ID" column. This column is not shown by default in the listing but can be added to the displayed columns by right clicking on the column heading bar and selecting it from the list of possible columns.

When looking in the configuration file the sequence is based upon the order of the policies as they are in the file just as they are in the list in the GUI. However, if you need to edit the policy in the CLI you must use the ID number.

UUID Support

Universally Unique Identifier (UUID) attributes have been added to policies to improve functionality when working with FortiManager or FortiAnalyzer units. If required, the UUID can be set manually through the CLI.

CLI Syntax:

```
config firewall {policy/policy6/policy46/policy64}
  edit 1
    set uuid <example uuid: 8289ef80-f879-51e2-20dd-fa62c5c51f44>
  next
end
```

Nturbo support CAPWAP traffic

NTurbo is used for IPSEC+IPS case. The IPSEC SA info is passed to NTURBO as part of VTAG for control packet and will be used for the xmit.

If the packets need to go through IPSEC interface, the traffic will be always offloaded to Nturbo. But for the case that SA has not been installed to NP6 because of hardware limitation or SA offload disable, the packets will be sent out through raw socket by IPS instead of Nturbo, since the software encryption is needed in this case.

CLI :

Previously, NTurbo could only be enabled or disabled globally. The setting of np-acceleration has been added to the firewall policy context instead of just the global context.

CLI command in the firewall policy to enable/disable NTurbo acceleration.

```
config firewall policy
edit 1
set np-acceleration [enable|disable]
end
```

When IPS is enabled for VPN IPsec traffic, the data can be accelerated by NTurbo.

Learning mode for policies

The learning mode feature is a quick and easy method for setting a policy to allow everything but to log it all so that it can later be used to determine what restrictions and protections should be applied. The objective is to monitor the traffic not act upon it while in Learning mode.

Once the **Learn** action is enabled, functions produce hard coded profiles that will be enabled on the policy. The following profiles are set up:

- AntiVirus (av-profile)
 - Web Filter (webfilter-profile)
 - Anti Spam(spamfilter-profile)
 - Data Leak Prevention (dlp-sensor)
 - Intrusion Protection (ips-sensor)
 - Application Control (application-list)
 - Proxy Options (profile-protocol-options)
-
- These UTM profiles are all using Flow mode
 - SSL inspection is always disable for the Learn option
 - These profiles are static and cannot be edited.
-

Profiles that are not being used are:

- DNS Filter (Does not have a Flow mode)
- Web Application Firewall(Does not have a Flow mode)
- CASI(Almost all signatures in CASI require SSL deep inspection. Without SSL inspection, turning on CASI serves little purpose)

The ability to allow policies to be set to a learning mode is enabled on a per VDOM basis.

```
config system settings
set gui-policy-learning [enable | disable]
end
```

Once the feature is enabled on the VDOM, Learn is an available **Action** option when editing a policy.

Because this feature requires a minimum level of logging capabilities, it is only available on FortiGates with hard drives. Smaller models may not be able to use this feature.

Once the Learning policy has been running for a sufficient time to collect needed information a report can be looked at by going to **Log & Report > Learning Report**.

The Report can be either a **Full Report** or a **Report Summary**

The time frame of the report can be **5 minutes**, **1 hour**, or **24 hours**.

The Learning Report includes:

Deployment Methodology

- Test Details
 - Start time
 - End time
 - Model
 - Firmware
- Policy List

Executive Summary

- Total Attacks Detected
- Top Application Category
- Top Web Category
- Top Web Domain
- Top Host by Bandwidth
- Host with Highest Session Count

Security and Threat Prevention

- High Risk Applications
- Application Vulnerability Exploits
- Malware, botnets and Spyware/Adware
- At-Risk Devices and Hosts

User Productivity

- Application Usage
 - Top Application Categories
 - Top Social Media Applications
 - Top Video/Audio Streaming Applications
 - Top Peer to Peer Applications
 - Top Gaming Applications
- Web Usage
 - Top Web Categories
 - Top Web Applications
 - Top Web Domains

Policy Modes

You can operate your FortiGate or individual VDOMs in **Next Generation Firewall (NGFW) Policy Mode**.

You can enable NGFW policy mode by going to **System > Settings**, setting the **Inspection mode** to **Flow-based** and setting the NGFW mode to **Policy-based**. When selecting **NGFW policy-based** mode you also select the SSL/SSH Inspection mode that is applied to all policies

Flow-based inspection with profile-based **NGFW mode** is the default in FortiOS 5.6.

Inspection Mode: Flow-based (selected), Proxy

NGFW Mode: Profile-based, Policy-based (selected)

SSL/SSH Inspection: SSL, deep-inspection (selected)

Or use the following CLI command:

```
config system settings
  set inspection-mode flow
  set policy-mode {standard | ngfw}
end
```

NGFW policy mode and NAT

If your FortiGate is operating in NAT mode, rather than enabling source NAT in individual NGFW policies you go to **Policy & Objects > Central SNAT** and add source NAT policies that apply to all matching traffic. In many cases you may only need one SNAT policy for each interface pair. For example, if you allow users on the internal network (connected to port1) to browse the Internet (connected to port2) you can add a port1 to port2 Central SNAT policy similar to the following:

New Central SNAT Policy

Incoming Interface	port1	+	×
Outgoing Interface	port2	+	×
Source address	all	+	×
Destination address	all	+	×

☒ NAT

IP Pool Configuration: Use Outgoing Interface Address (selected), Use Dynamic IP Pool

Protocol: ANY (selected), TCP, UDP, SCTP, Specify, 0

Application control in NGFW policy mode

You configure **Application Control** simply by adding individual applications to security policies. You can set the action to accept or deny to allow or block the applications.

Name 	Block YouTube	
Incoming Interface	 port1	▼
Outgoing Interface	 port2	▼
Source	 all	✕
	+	
Destination	 all	✕
	+	
Schedule	 always	▼
Service	 ALL	✕
	+	
Application	 YouTube ✕  YouTube_Channel.Access ✕  YouTube_HD.Streaming ✕  YouTube_Video.Access ✕  YouTube_Video.Embedded ✕ <div style="text-align: center;">+</div>	
URL Category	+	
Action	 ACCEPT  DENY  LEARN	

Web Filtering in NGFW mode

You configure **Web Filtering** by adding URL categories to security policies. You can set the action to accept or deny to allow or block the applications.

Name 	Block Streaming Websites	
Incoming Interface	 port1	▼
Outgoing Interface	 port2	▼
Source	 all	✕
	+	
Destination	 all	✕
	+	
Schedule	 always	▼
Service	 ALL	✕
	+	
Application	+	
URL Category	Streaming Media and Download	✕
	+	
Action	 ACCEPT  DENY  LEARN	

Other NGFW policy mode options

You can also combine both application control and web filtering in the same NGFW policy mode policy. Also if the policy accepts applications or URL categories you can also apply Antivirus, DNS Filtering, and IPS profiles in NGFW mode policies as well a logging and policy learning mode.

Security profiles

Where security policies provide the instructions to the FortiGate unit for controlling what traffic is allowed through the device, the Security profiles provide the screening that filters the content coming and going on the network. Security profiles enable you to instruct the FortiGate unit about what to look for in the traffic that you don't want, or want to monitor, as it passes through the device.

A security profile is a group of options and filters that you can apply to one or more firewall policies. Security profiles can be used by more than one security policy. You can configure sets of security profiles for the traffic types handled by a set of security policies that require identical protection levels and types, rather than repeatedly configuring those same security profile settings for each individual security policy.

For example, while traffic between trusted and untrusted networks might need strict antivirus protection, traffic between trusted internal addresses might need moderate antivirus protection. To provide the different levels of protection, you might configure two separate profiles: one for traffic between trusted networks, and one for traffic between trusted and untrusted networks.

Security profiles are available for various unwanted traffic and network threats. Each are configured separately and can be used in different groupings as needed. You configure security profiles in the Security Profiles menu and applied when creating a security policy by selecting the security profile type.

There is a separate handbook for the topic of the Security Profiles, but because the Security Profiles are applied through the Firewall policies it makes sense to have at least a basic idea of what the security profile do and how they integrate into the FortiGate's firewall policies. The following is a listing and a brief description of what the security profiles offer by way of functionality and how they can be configured into the firewall policies.

- HTTP
- SMTP
- POP3
- IMAP
- FTP
- NNTP
- MAPI
- DNS
- IM

AntiVirus

Antivirus is used as a catch all term to describe the technology for protection against the transmission of malicious computer code sometimes referred to as malware. As anyone who has listened to the media has heard that the Internet can be a dangerous place filled with malware of various flavors. Currently, the malware that is most common in the Internet, in descending order, is Trojan horses, viruses, worms, adware, back door exploits, spyware and other variations. In recent years, not only has the volume of malicious software become greater than would have been believed when it first appeared but the level of sophistication has risen as well.

The Antivirus Filter works by inspecting the traffic that is about to be transmitted through the FortiGate. To increase the efficiency of effort it only inspects the traffic being transmitted via the protocols that it has been configured to check. Before the data moves across the FortiGate firewall from one interface to another it is checked for attributes or signatures that have been known to be associated with malware. If malware is detected, it is removed.

Web Filtering

Malicious code is not the only thing to be wary of on the Internet. There is also the actual content. While the content will not damage or steal information from your computer there is still a number of reasons that would require protection from it.

In a setting where there are children or other sensitive people using the access provided by a connected computer there is a need to make sure that images or information that is not appropriate is not inadvertently displayed to them. Even if there is supervision, in the time it takes to recognize something that is inappropriate and then properly react can expose those we wish to protect. It is more efficient to make sure that the content cannot reach the screen in the first place.

In an organizational setting, there is still the expectation that organization will do what it can to prevent inappropriate content from getting onto the computer screens and thus provoking an Human Resources incident. There is also the potential loss of productivity that can take place if people have unfiltered access to the Internet. Some organizations prefer to limit the amount of distractions available to tempt their workers away from their duties.

The Web filter works primarily by looking at the destination location request for a HTTP(S) request made by the sending computer. If the URL is on a list that you have configured to list unwanted sites, the connection will be disallowed. If the site is part of a category of sites that you have configured to deny connections to the session will also be denied. You can also configure the content filter to check for specific key strings of data on the actual web site and if any of those strings of data appear the connection will not be allowed.

The configuration for each of these protocols is handled separately.

DNS filtering is similar to Web Filtering from the viewpoint of the user. The difference is under the hood. When using regular Web Filtering, the traffic can go through some processing steps before it gets to the point where the web filter determines whether or not the traffic should be accepted or denied. Because the filtering takes place at the DNS level, some sites can be denied before a lot of the additional processing takes place. This can save resource usage on the FortiGate and help performance.

Application Control

Application Control is designed to allow you to determine what applications are operating on your network and to also filter the use of these applications as required. Application control is also for outgoing traffic to prevent the use of applications that are against an organization's policy from crossing the network gateway to other networks. An example of this would be the use of proxy servers to circumvent the restrictions put in place using the Web Filtering.

Intrusion Protection (IPS)

Intrusion Prevention System is almost self explanatory. In the same way that there is malware out on the Internet that the network needs to be protected from there are also people out there that take a more targeted approach to malicious cyber activity. No operating system is perfect and new vulnerabilities are being discovered all of the time. An intrusion prevention system is designed to look for activity or behavior that is consistent with attacks against your network. When attack like behavior is detected it can either be dropped or just monitored depending on the approach that you would like to take.

As new vulnerabilities are discovered they can be added to the IPS database so that the protection is current.

Anti-Spam

Spam or unsolicited bulk email is said to account for approximately 90% of the email traffic on the Internet. Sorting through it is both time consuming and frustrating. By putting an email filter on policies that handle email traffic, the amount of spam that users have to deal with can be greatly reduced.

Data Leak Prevention (DLP)

Data Leak Prevention is used to prevent sensitive information from leaving your network. When people think of security in the cyber-world one of the most common images is that of a hacker penetrating your network and making off with your sensitive information, but the other way that you can lose sensitive data is if someone already on the inside of your network sends it out. This does not have to be an act of industrial espionage. It can just be a case of not knowing the policies of the organization or a lack of knowledge of security or laws concerning privacy.

For instance, a company may have a policy that they will not reveal anyone's Social Security number, but an employee emails a number of documents to another company that included a lengthy document that has a Social Security number buried deep within it. There is not malicious intent but if the information got out there could be repercussions.

If an organization has any information in a digital format that it cannot afford for financial or legal reasons, to leave its network, it makes sense to have Data Leak Prevention in place as an additional layer of protection.

VoIP

Voice over IP is essentially the protocols for transmitting voice or other multimedia communications over Internet Protocol networks such as the Internet. The Security Profiles VoIP options apply the SIP Application Level Gateway (ALG) to support SIP through the FortiGate unit. The SIP ALG can also be used to protect networks from SIP-based attacks.

ICAP

Internet Content Adaptation Protocol (ICAP) off loads HTTP traffic to another location for specialized processing. The purpose of this module when triggered is to send the incoming HTTP traffic over to a remote server to be processed thus taking some of the strain off of the resources of the FortiGate unit. The reasons for the specialized process could be anything from more sophisticated Antivirus to manipulation of the HTTP headers and URLs.

Just like other components of the FortiGate, there is the option for different Proxy Option profiles so that you can be very granular in your control of the workings of the FortiGate. In the case of the Proxy Option profiles the thing that you will want to focus on is the matching up of the correct profile to a firewall policy that is using the appropriate protocols. If you are creating a Proxy Option profile that is designed for policies that control SMTP traffic into your network you only want to configure the settings that apply to SMTP. You do not need or want to configure the HTTP components.

The Web Application Firewall performs a similar role as devices such as Fortinet's FortiWeb, though in a more limited fashion. Its function is to protect internal web servers from malicious activity specific to those types of servers. This includes things like SQL injection, Cross site Scripting and trojans. It uses signatures and other straight forward methods to protect the web servers, but it is a case of turning the feature on or off and the actions are limited to **Allow**, **Monitor** or **Block**. To get protection that is more sophisticated, granular and intelligent, as well as having many more features, it is necessary to get a device like the FortiWeb that can devote more resources to the process. However, if your needs are simple, choosing to use the WAF feature built into the FortiGate should provide valuable protection.

The comfort client feature mitigates this potential issue by feeding a trickle of data while waiting for the scan to complete so as to let the user know that processing is taking place and that there hasn't been a failure in the transmission. This slow transfer rate continues until the antivirus scan is complete. Once the file has been successfully scanned without any indication of viruses the transfer will proceed at full speed.

Without prior approval the email should not be forwarded.

Please be environmentally friendly and don't print out emails

Security Profile Groups

It may seem counter intuitive to have a topic on Security Profile Groups in the Firewall Chapter/Handbook when there is already a chapter/handbook on Security Profiles, but there are reasons.

- Security Profile Groups are used exclusively in the configuration of a firewall policy, which is described in the Firewall Chapter/Handbook.
- The CLI commands for creating and using Security Profile Groups are in the firewall configuration context of the command line structure of settings.

The purpose of Security Profile Groups is just the same as other groups such as Address, Service, and VIP groups. They are used to save time and effort in the administration of the FortiGate when there are a lot of policies with a similar pattern of Security Profile use. In a fairly basic network setup with a handful of policies it doesn't seem like it would be worth the effort to set up groups of security profiles but if you have a large complex configuration with hundreds of policies where many of them use the same security profiles it can definitely save some effort and help prevent missing adding an important profile from a policy. As an added benefit, when it comes time to add or change the profiles for the policies that use the Security Profile Groups, the changes only have to be made to the group, not each policy.

The most difficult part about using Security Profile Groups is making them visible in the GUI.

Making Security Profile Groups visible in the GUI

By default, the Security Profile Groups are not visible in the GUI. Neither the ability to assign one to a policy nor the ability to configure the members of a group are available by default. You will not find the option to enable Security Profile Groups under **System > Feature Visibility** either. Instead, they only become visible in the GUI once one has been created and assigned to a policy. This must be done the first time through the CLI using the following syntax:

```
config system settings
    set gui-dynamic-profile-display enable
end
```

Step 1 - Create a Security Profile Group:

Enter the command:

```
config firewall profile-group
```

Use the edit command to give a name to and create a new Security Profile Group

```
(profile-group) # edit test-group
```

Configure the members of the group by setting the name of the desired profile in the field for the related profile/sensor/list. The options are:

av-profile	Name of an existing Antivirus profile.
webfilter-profile	Name of an existing Web filter profile.
dnsfilter-profile	Name of an existing DNS filter profile.
spamfilter-profile	Name of an existing Spam filter profile.
dlp-sensor	Name of an existing DLP sensor.
ips-sensor	Name of an existing IPS sensor.
application-list	Name of an existing Application list.
voip-profile	Name of an existing VoIP profile.
icap-profile	Name of an existing ICAP profile.

waf-profile	Name of an existing Web application firewall profile.
profile-protocol-options	Name of an existing Protocol options profile.
ssl-ssh-profile	Name of an existing SSL SSH profile.

Example:

```
set av-profile default
set profile-protocol-options default
end
```

Always set the `profile-protocol-options` setting before attempting to save the profile group. If this is not set, you will get the error:

```
node_check_object fail! for profile-protocol-options
Attribute 'profile-protocol-options' MUST be set.
Command fail. Return code -56
```

Step 2 - Add a Security Profile to a policy

Now that there is group to add to a policy we can configure a policy to allow the use of a Security Policy group. This is also done in the CLI.

In the following example only the command necessary to enable the use and pick of a Security Policy group have been listed.

```
config firewall policy
edit 0
set utm-status enable
set profile-type group
set profile-group test-group
```

Step 3 - The appearance in the GUI of the Security Profile Group configuration features

- Under **Security Profiles** there is a menu item called **Profile Groups** that can be used to create new and edit existing profile groups.
- In the **Edit Policy** window for **IPv4** and **IPv6** policies there is a **Use Security Profile Group** field to enable or disable the use of the groups.
 - In the window, policy groups can be created or edited by clicking on the appropriate icons next to or in the drop down menu
- In the policy listing window there is a Security Profiles column.
 - Right or left clicking on the icon for the group brings up editing options either via a slide out window or a drop down menu, respectively.

Proxy Option Components

Any time a security profile that requires the use of a proxy is enabled the Proxy Options field will be displayed. Certain inspections defined in security profiles require that the traffic be held in proxy while the inspection is carried out and so the Proxy Options are there to define the parameters of how the traffic will be processed and to what level the traffic will be processed. In the same way that there can be multiple security profiles of a single type there can also be a number of unique Proxy Option profiles so that as the requirements for a policy differ from one policy to the next you can also configure a different Proxy Option profile for each individual policy or you can use one profile repeatedly.

The Proxy Options refer to the handling of the following protocols:

- HTTP
- SMTP
- POP3
- IMAP
- FTP
- NNTP
- MAPI
- DNS
- IM

The configuration for each of these protocols is handled separately.

It should also be noted that these configurations apply to only the Security Profiles Proxy-based processes and not the Flow-based processes.

The use of different proxy profiles and profile options

Just like other components of the FortiGate, there is the option for different Proxy Option profiles so that you can be very granular in your control of the workings of the FortiGate. In the case of the Proxy Option profiles the thing that you will want to focus on is the matching up of the correct profile to a firewall policy that is using the appropriate protocols. If you are creating a Proxy Option profile that is designed for policies that control SMTP traffic into your network you only want to configure the settings that apply to SMTP. You do not need or want to configure the HTTP components.

Oversized File Log

This setting is for those that would like to log the occurrence of oversized files being processed. It does not change how they are processed it only enables the FortiGate unit to log that they were either blocked or allowed through. A common practice is to allow larger files through without antivirus processing. This allows you to get an idea of how often this happens and decide on whether or not to alter the settings relating to the treatment of oversized files.

The setting of the threshold for what is considered to be an oversized file is located in the Oversized File / Email Threshold that is found in some of the protocol options for the Proxy Options.

Protocol Port Mapping

While each of the protocols listed has a default TCP port that is commonly used, the level of granularity of control on the FortiGate firewall allows that the port used by the protocols can be individually modified in each separate Profile. It can also be set to inspect any port with flowing traffic for that particular protocol. The headers of the

packets will indicate which protocol generated the packet. To optimize the resources of the unit the mapping and inspection of protocols can be enabled or disabled depending on your requirements.

Comfort Clients

When proxy-based antivirus scanning is enabled, the FortiGate unit buffers files as they are downloaded. Once the entire file is captured, the FortiGate unit begins scanning the file. During the buffering and scanning procedure, the user must wait. After the scan is completed, if no infection is found, the file is sent to the next step in the process flow. If the file is a large one this part of the process can take some time. In some cases enough time that some users may get impatient and cancel the download.

The comfort client feature mitigates this potential issue by feeding a trickle of data while waiting for the scan to complete so as to let the user know that processing is taking place and that there hasn't been a failure in the transmission. This slow transfer rate continues until the antivirus scan is complete. Once the file has been successfully scanned without any indication of viruses the transfer will proceed at full speed.

If there is evidence of an infection the FortiGate unit caches the URL and drops the connection. The client does not receive any notification of what happened because the download to the client had already started. Instead, the download stops and the user is left with a partially downloaded file. If the user tries to download the same file again within a short period of time, the cached URL is matched and the download is blocked. The client receives the Infection cache message replacement message as a notification that the download has been blocked. The number of URLs in the cache is limited by the size of the cache.

Client comforting is available for HTTP and FTP traffic. If your FortiGate unit supports SSL content scanning and inspection, you can also configure client comforting for HTTPS and FTPS traffic.

Buffering the entire file allows the FortiGate unit to eliminate the danger of missing an infection due to fragmentation because the file is reassembled before examination. Client comforting can send unscanned and therefore potentially infected content to the client. You should only enable client comforting if you are prepared to accept this risk. Keeping the client comforting interval high and the amount low will reduce the amount of potentially infected data that is downloaded.

Oversized File/Email Threshold

This is another feature that is related to antivirus scanning. The FortiGate unit has a finite amount of resources that can be used to buffer and scan a file. If a large file such as an ISO image or video file was to be downloaded this could not only overwhelm the memory of the FortiGate, especially if there were other large files being downloaded at the same time, but could exceed it as well. For this reason, how to treat large files needs to be addressed.

A threshold is assigned to determine what should be considered an oversized file or email. This can be set at any size from 1 MB to 50 MB. Any file or email over this threshold will not be processed by the Antivirus Security Profiles. Once a file is determined to be oversized it must be then determined whether to allow it or to block it.

These settings are not a technical decision but a policy one that will depend on your comfort level with letting files into your network. As there often is, there is a compromise between convenience or ease of use and security. If you want to go for a high peace of mind level you can configure the firewall to block oversized files and thus no files would be coming into the network that have not been scanned. If you are looking for optimizing the memory of the FortiGate unit and making sure that everybody is getting the files they want, you can lower the threshold and allow files that are over the threshold.

It should be noted that in terms of probability that malware is more likely to be found in smaller files than in larger files. A number of administrators take this into account when they lower the default threshold so as to lessen the impact on memory if they see the FortiGate unit going into conserve mode on a regular basis.

Chunked Bypass

The HTTP section allows the enabling of “Chunked Bypass”. This refers to the mechanism in version 1.1 of HTTP that allows a web server to start sending chunks of dynamically generated output in response to a request before actually knowing the actual size of the content. Where dynamically generated content is concerned this means that there is a faster initial response to HTTP requests. From a security stand point it means that the content will not be held in the proxy as an entire file before proceeding.

Allow Fragmented Messages

The specifications of RFC 2046 allow for the breaking up of emails and sending the fragments in parallel to be rebuilt and read at the other end by the mail server. It was originally designed to increase the performance over slower connections where larger email messages were involved. It will depend on your mail configuration if this is even possible for your network but outside of Microsoft Outlook and Outlook Express, not many email clients are set up to break up messages like this. The drawback of allowing this feature is that if malware is broken up between multiple fragments of the message the risk is run that it will not be detected by some antivirus configurations because the code may not all be present at the same time to identify.

Append Email Signature

The Append Email Signature is used when an organization would like to ensure that over and above our in this case underneath the existing personal signatures of the sender, all of the emails going out of their network have the appropriate “boilerplate”, for lack of a better term. These appended emails do not replace existing signatures. They are as the feature states, appended to the email.

Examples could include things like:

- Without prior approval the email should not be forwarded.
- Please be environmentally friendly and don't print out emails
- For questions regarding the purchasing of our products please call...

It can be anything that the organization would like as long as it is in text format. The use of this feature usually works best in an environment where there is some standardization of what goes into the personal signatures of the senders so that there is no duplication or contradiction of information in the signatures.

SSL/SSH Inspection

While the profile configuration for **SSL/SSH Inspection** is found in the **Security Profiles** section it is enabled in the firewall policy by enabling any of the security profiles. Choosing which of the **SSL/SSH Inspection** profiles is all that can really be done in the policy.

The reason for having this inspection as part of the policy is the wide spread use of encryption by both legitimate and malicious actors. The legitimate users of the Internet use encryption to hide their information from snooping bad guy but the bad guys use encryption to hide their malicious content from being scanned for viruses and other malicious code by security devices.

By using the correct SSL certificates, the FortiGate can open up encrypted traffic and inspect it for malicious content that would otherwise make it past the other profiles because they couldn't read the encrypted traffic.

There are two basic types of inspection:

- Certificate inspection, which only looks at the certificate that encrypted the packets to make sure that it is a recognized and valid certificate.
- Full inspection, or deep inspection, that looks at all of the content of the packet. While more thorough, it also takes up more resources to perform.

HTTP Strict Transport Security (HSTS) Protocol

HSTS is a protocol used by Google and other web browsers to prevent man-in-the-middle attacks.

When performing deep inspection, the FortiGate intercepts the https traffic and would send its own self-signed CA certificate to the browser. If the browser is configured to use HSTS connections, it would refuse the FortiGate CA certificate since it is not on the trusted list for Google servers.

To keep the CA certificate from being refused, the HSTS settings should be cleared from the browser. Instructions for this vary between browsers.

To gain a deeper understanding read the **SSL/SSH Inspection** section in the **Security Profile** chapter.

Mirroring SSL inspected traffic

It is possible to "mirror" or send a copy of traffic decrypted by SSL inspection to one or more FortiGate interfaces so that the traffic can be collected by a raw packet capture tool for archiving or analysis. This feature is available if the inspection mode is set to flow-based.

Decryption, storage, inspection, and use decrypted content is subject to local privacy rules. Use of these features could enable malicious users with administrative access to your FortiGate to harvest sensitive information submitted using an encrypted channel.

In this example, the setting enables the policy to send all traffic decrypted by the policy to the FortiGate port1 and port2 interfaces.

```
config firewall policy
  edit 0
    set ssl-mirror enable
    set ssl-mirror-intf port1 port2
  end
```

RPC over HTTP

How protocol options profiles and SSL inspection profiles handle RPC (Remote Procedure Calls) over HTTP traffic can be configured separately from normal HTTP traffic. The configuration is done in the CLI.

Configuration in Protocol Options

```
config firewall profile-protocol-options
  edit 0
    set rpc-over-http [disable|enable]
  end
```

Configuration in SSL/SSH inspection

```
config firewall ssl-ssh-profile
edit deep inspection
set rpc-over-http [disable|enable]
end
```

IPv6

Internet Protocol version 6 (IPv6) will succeed IPv4 as the standard networking protocol of the Internet. IPv6 provides a number of advances over IPv4 but the primary reason for its replacing IPv4 is its limitation in addresses. IPv4 uses 32 bit addresses which means there is a theoretical limit of 2 to the power of 32. The IPv6 address scheme is based on a 128 bit address or a theoretical limit of 2 to the power of 128.

Possible Addresses:

- IPv4 = 4,294,967,296 (over 4 billion)
- IPv6 = 340,282,366,920,938,463,374,607,431,768,211,456 (over 340 undecillion - We had to look that term up. We didn't know what a number followed by 36 digits was either)

Assuming a world population of approximately 8 billion people, IPv6 would allow for each individual to have approximately 42,535,295,865,117,200,000,000,000,000 devices with an IP address. That's 42 quintillion devices.

There is little likelihood that you will ever need to worry about these numbers as any kind of serious limitation in addressing but they do give an idea of the scope of the difference in the available addressing.

Aside from the difference of possible addresses there is also the different formatting of the addresses that will need to be addressed.

A computer would view an IPv4 address as a 32 bit string of binary digits made up of 1s and 0s, broken up into 4 octets of 8 digits separated by a period “.”

Example:

```
10101100.00010000.11111110.00000001
```

To make number more user friendly for humans we translate this into decimal, again 4 octets separated by a period “.” which works out to:

```
172.16.254.1
```

A computer would view an IPv6 address as a 128 bit string of binary digits made up of 1s and 0s, broken up into 8 octets of 16 digits separated by a colon “:”

```
1000000000000001:0000110110111000:101011000001000:1111111000000001:0000000000000000
0:0000000000000000:0000000000000000:0000000000000000
```

To make number a little more user friendly for humans we translate this into hexadecimal, again 8 octets separated by a colon “:” which works out to:

```
8001:0DB8:AC10:FE01:0000:0000:0000:0000:
```

Because any four-digit group of zeros within an IPv6 address may be reduced to a single zero or altogether omitted, this address can be shortened further to:

```
8001:0DB8:AC10:FE01:0:0:0:0
```

or

8001:0DB8:AC10:FE01::

Some of the other benefits of IPv6 include:

- More efficient routing
- Reduced management requirement
- Stateless auto-reconfiguration of hosts
- Improved methods to change Internet Service Providers
- Better mobility support
- Multi-homing
- Security
- Scoped address: link-local, site-local and global address space

IPv6 in FortiOS

From an administrative point of view IPv6 works almost the same as IPv4 in FortiOS. The primary differences are the use of IPv6 format for addresses and fewer address types for IPv6. There is also no need for NAT if the FortiGate firewall is the interface between IPv6 networks. If the subnets attached to the FortiGate firewall are IPv6 and IPv4 NAT can be configured between the 2 different formats. This will involve either configuring a dual stack routing or IPv4 tunneling configuration. The reason for this is simple. NAT was developed primarily for the purpose of extending the number of usable IPv4 addresses. IPv6's addressing allows for enough available addresses so the NAT is no longer necessary.

When configuring IPv6 in FortiOS, you can create a dual stack route or IPv4-IPv6 tunnel. A dual stack routing configuration implements dual IP layers, supporting both IPv4 and IPv6, in both hosts and routers. An IPv4-IPv6 tunnel is essentially similar, creating a tunnel that encapsulates IPv6 packets within IPv4 headers that carry these IPv6 packets over IPv4 tunnels. The FortiGate unit can also be easily integrated into an IPv6 network. Connecting the FortiGate unit to an IPv6 network is exactly the same as connecting it to an IPv4 network, the only difference is that you are using IPv6 addresses.

By default the IPv6 settings are not displayed in the Web-based Manager. It is just a matter of enabling the display of these feature to use them through the web interface. To enable them just go to **System > Feature Select** and select **IPv6**. Once enabled, you will be able to use IPv6 addresses as well as the IPv4 addressing for the following FortiGate firewall features:

- Static routing
- Policy Routing
- Packet and network sniffing
- Dynamic routing (RIPv6, BGP4+, and OSPFv3)
- IPsec VPN
- DNS
- DHCP
- SSL VPN
- Network interface addressing
- Security Profiles protection
- Routing access lists and prefix lists
- NAT and Transparent mode
- NAT 64 and NAT 66
- IPv6 tunnel over IPv4 and IPv4 tunnel over IPv6

- Logging and reporting
- Security policies
- SNMP
- Authentication
- Virtual IPs and groups
- IPv6 over SCTP
- IPv6-specific troubleshooting, such as ping6

Dual Stack routing configuration

Dual stack routing implements dual IP layers in hosts and routers, supporting both IPv6 and IPv4. A dual stack architecture supports both IPv4 and IPv6 traffic and routes the appropriate traffic as required to any device on the network. Administrators can update network components and applications to IPv6 on their own schedule, and even maintain some IPv4 support indefinitely if that is necessary. Devices that are on this type of network, and connect to the Internet, can query Internet DNS servers for both IPv4 and IPv6 addresses. If the Internet site supports IPv6, the device can easily connect using the IPv6 address. If the Internet site does not support IPv6, then the device can connect using the IPv4 addresses. In the FortiOS dual stack architecture it is not just the basic addressing functions that operate in both versions of IP. The other features of the appliance such as Security Profiles and routing can also use both IP stacks.

If an organization with a mixed network uses an Internet service provider that does not support IPv6, they can use an IPv6 tunnel broker to connect to IPv6 addresses that are on the Internet. FortiOS supports IPv6 tunneling over IPv4 networks to tunnel brokers. The tunnel broker extracts the IPv6 packets from the tunnel and routes them to their destinations.

IPv6 Tunneling

IPv6 Tunneling is the act of tunneling IPv6 packets from an IPv6 network through an IPv4 network to another IPv6 network. This is different than Network Address Translation (NAT) because once the packet reaches its final destination the true originating address of the sender will still be readable. The IPv6 packets are encapsulated within packets with IPv4 headers, which carry their IPv6 payload through the IPv4 network. This type of configuration is more appropriate for those who have completely transitional over to IPv6, but need an Internet connection, which is still mostly IPv4 addresses.

The key to IPv6 tunneling is the ability of the 2 devices, whether they are a host or a network device, to be dual stack compatible. They have to be able to work with both IPv4 and IPv6 at the same time. In the process the entry node of the tunnel portion of the path will create an encapsulating IPv4 header and transmit the encapsulated packet. The exit node at the end of the tunnel receives the encapsulated packet. The IPv4 header is removed. The IPv6 header is updated and the IPv6 packet is processed.

There are two types of tunnels in IPv6:

Automatic tunnels	Automatic tunnels are configured by using IPv4 address information embedded in an IPv6 address – the IPv6 address of the destination host includes information about which IPv4 address the packet should be tunneled to.
Configured tunnels	Configured tunnels must be configured manually. These tunnels are used when using IPv6 addresses that do not have any embedded IPv4 information. The IPv6 and IPv4 addresses of the endpoints of the tunnel must be specified.

Tunnel Configurations

There are a few ways in which the tunneling can be performed depending on which segment of the path between the end points of the session the encapsulation takes place.

Network Device to Network Device	Dual stack capable devices connected by an IPv4 infrastructure can tunnel IPv6 packets between themselves. In this case, the tunnel spans one segment of the path taken by the IPv6 packets.
Host to Network Device	Dual stack capable hosts can tunnel IPv6 packets to an intermediary IPv6 or IPv4 network device that is reachable through an IPv4 infrastructure. This type of tunnel spans the first segment of the path taken by the IPv6 packets.
Host to Host	Dual stack capable hosts that are interconnected by an IPv4 infrastructure can tunnel IPv6 packets between themselves. In this case, the tunnel spans the entire path taken by the IPv6 packets.
Network Device to Host	Dual stack capable network devices can tunnel IPv6 packets to their final destination IPv6 or IPv4 host. This tunnel spans only the last segment of the path taken by the IPv6 packets.

Regardless of whether the tunnel starts at a host or a network device, the node that does the encapsulation needs to maintain soft state information, such as the maximum transmission unit (MTU), about each tunnel in order to process the IPv6 packets.

Tunneling IPv6 through IPsec VPN

A variation on the tunneling IPv6 through IPv4 is using an IPsec VPN tunnel between two FortiGate devices. FortiOS supports IPv6 over IPsec. In this sort of scenario, 2 networks using IPv6 behind FortiGate units are separated by the Internet, which uses IPv4. An IPsec VPN tunnel is created between the 2 FortiGate units and a tunnel is created over the IPv4 based Internet but the traffic in the tunnel is IPv6. This has the additional advantage of making the traffic secure as well.

NAT

NAT or Network Address Translation is the process that enables a single device such as a router or firewall to act as an agent between the Internet or Public Network and a local or private network. This “agent”, in real time, translates the source IP address of a device on one network interface, usually the Internal, to a different IP address as it leaves another interface, usually the interface connected to the ISP and the Internet. This enables a single public address to represent a significantly larger number of private addresses.

The Origins of NAT

In order to understand NAT it helps to know why it was created. At one time, every computer that was part of a network had to have its own addresses so that the other computers could talk to it. There were a few protocols in use at the time, some of which were only for use on a single network, but of those that were routable, the one that had become the standard for the Internet was IP (Internet Protocol) version 4.

When IP version 4 addressing was created nobody had any idea how many addresses would be needed. The total address range was based on the concept of 2 to the 32nd power, which works out to be 4 294 967 296 potential addresses. Once you eliminate some of those for reserved addresses, broadcast addresses, network addresses,

multicasting, etc., you end up with a workable scope of about 3.2 million addressees. This was thought to be more than enough at the time. The designers were not expecting the explosion of personal computing, the World Wide Web or smart phones. As of the beginning of 2012, some estimate the number of computers in the world in the neighborhood of 1 billion, and most of those computer users are going to want to be on the Internet or Search the World Wide Web. In short, we ran out of addresses.

This problem of an address shortage was realized before we actually ran out, and in the mid 1990s 2 technical papers called RFCs numbered 1631 (<http://www.ietf.org/rfc/rfc1631.txt>) and 1918 (<http://tools.ietf.org/html/rfc1918>), proposed components of a method that would be used as a solution until a new addressing methodology could be implemented across the Internet infrastructure. For more information on this you can look up IP version 6.

RFC 1631 described a process that would allow networking devices to translate a single public address to multiple private IP addresses and RFC 1918 laid out the use of the private addresses. The addresses that were on the Internet (Public IP addresses) could not be duplicated for them to work as unique addresses, but behind a firewall, which most large institutions had, they could use their own Private IP addresses for internal use and the internal computers could share the external or Public IP address.

To give an idea on a small scale how this works, image that a company has a need for 200 computer addresses. Before Private IP addresses and NAT the company would have purchased a full Class C address range which would have been 254 usable IP addresses; wasting about 50 addresses. Now with NAT, that company only needs 1 IP address for its 200 computers and this leaves the rest of the IP addresses in that range available for other companies to do the same thing.

NAT gives better value than it would first appear because it is not 253 companies that can use 254 addresses but each of those 254 companies could set up their networking infrastructures to use up to thousands of Private IP addresses, more if they don't all have to talk to the Internet at the same time. This process enabled the Internet to keep growing even though we technically have many more computers networked than we have addresses.

Dynamic NAT

Dynamic NAT maps the private IP addresses to the first available Public Address from a pool of possible Addresses. In the FortiGate firewall this can be done by using IP Pools.

Overloading

This is a form of Dynamic NAT that maps multiple private IP address to a single Public IP address but differentiates them by using a different port assignment. This is probably the most widely used version of NAT. This is also referred to as PAT (Port Address Translation) or Masquerading.

An example would be if you had a single IP address assigned to you by your ISP but had 50 or 60 computers on your local network.

Say the internal address of the interface connected to the ISP was 256.16.32.65 (again an impossible address) with 256.16.32.64 being the remote gateway. If you are using this form of NAT any time one of your computers accesses the Internet it will be seen from the Internet as 256.16.32.65. If you wish to test this go to 2 different computers and verify that they each have a different private IP address then go to a site that tells you your IP address such as www.ipchicken.com. You will see that the site gives the same result of 256.16.32.65, if it existed, as the public address for both computers.

As mentioned before this is sometimes called Port Address Translation because network device uses TCP ports to determine which internal IP address is associated with each session through the network device. For example, if you have a network with internal addresses ranging from 192.168.1.1 to 192.168.1.255 and you have 5 computers all trying to connect to a web site which is normally listening on port 80 all of them will appear to the

remote web site to have the IP address of 256.16.32.65 but they will each have a different sending TCP port, with the port numbers being somewhere between 1 and 65 535, although the port numbers between 1 to 1024 are usually reserved or already in use. So it could be something like the following:

192.168.1.10	256.16.32.65:	port 486
192.168.1.23	256.16.32.65:	port 2409
192.168.1.56	256.16.32.65:	port 53763
192.168.1.109	256.16.32.65:	port 5548
192.168.1.201	256.16.32.65:	port 4396

And the remote web server would send the responding traffic back based on those port numbers so the network device would be able to sort through the incoming traffic and pass it on to the correct computer.

Overlapping

Because everybody is using the relative same small selection of Private IP addresses it is inevitable that there will be two networks that share the same network range that will need to talk with each other. This happens most often over Virtual Private Networks or when one organization ends up merging with another. This is a case where a private IP address may be translated into a different private IP address so there are no issues with conflict of addresses or confusion in terms of routing.

An example of this would be when you have a Main office that is using an IP range of 172.16.0.1 to 172.20.255.255 connecting through a VPN to a recently acquired branch office that is already running with an IP range of 172.17.1.1 to 172.17.255.255. Both of these ranges are perfectly valid but because the Branch office range is included in the Main Office range any time the system from the Main office try to connect to an address in the Branch Office the routing the system will not send the packet to the default gateway because according to the routing table the address is in its own subnet.

The plan here would be to NAT in both directions so that traffic from neither side of the firewall would be in conflict and they would be able to route the traffic. Everything coming from the Branch Office could be assigned an address in the 192.168.1.1 to 192.168.1.255 range and everything from the Main office going to the Branch Office could be assigned to an address in the 192.168.10.1 to 192.168.10.255 range.

Static NAT

In Static NAT one internal IP address is always mapped to the same public IP address.

In FortiGate firewall configurations this is most commonly done with the use of Virtual IP addressing.

An example would be if you had a small range of IP addresses assigned to you by your ISP and you wished to use one of those IP address exclusively for a particular server such as an email server.

Say the internal address of the Email server was 192.168.12.25 and the Public IP address from your assigned addresses range from 256.16.32.65 to 256.16.32.127. Many readers will notice that because one of the numbers is above 255 that this is not a real Public IP address. The Address that you have assigned to the interface connected to your ISP is 256.16.32.66, with 256.16.32.65 being the remote gateway. You wish to use the address of 256.16.32.70 exclusively for your email server.

When using a Virtual IP address you set the external IP address of 256.16.32.70 to map to 192.168.12.25. This means that any traffic being sent to the public address of 256.16.32.70 will be directed to the internal computer at the address of 192.168.12.25

When using a Virtual IP address, this will have the added function that when ever traffic goes from 192.168.12.25 to the Internet it will appear to the recipient of that traffic at the other end as coming from 256.16.32.70.

You should note that if you use Virtual IP addressing with the Port Forwarding enabled you do not get this reciprocal effect and must use IP pools to make sure that the outbound traffic uses the specified IP address.

Benefits of NAT

More IP addresses Available while Conserving Public IP Addresses

As explained earlier, this was the original intent of the technology and does not need to be gone into further.

Financial Savings

Because an organization does not have to purchase IP addresses for every computer in use there is a significant cost savings due to using the process of Network Address Translation.

Security Enhancements

One of the side benefits of the process of NAT is an improvement in security. Individual computers are harder to target from the outside and if port forwarding is being used computers on the inside of a firewall are less likely to have unmonitored open ports accessible from the Internet.

Ease of Compartmentalization of Your Network

With a large available pool of IP addresses to use internally a network administrator can arrange things to be compartmentalized in a rational and easily remembered fashion and networks can be broken apart easily to isolate for reasons of network performance and security.

Example

You have a large organization that for security reasons has certain departments that do not share network resources.

You can have the main section of the organization set up as follows;

Network Devices	192.168.1.1 to 192.168.1.25
Internal Servers	192.168.1.26 to 192.168.1.50
Printers	192.168.1.51 to 192.168.1.75
Administration Personnel	192.168.1.76 to 192.168.1.100
Sales People	192.168.1.101 to 192.168.1.200
Marketing	192.168.1.201 to 192.168.1.250

You could then have the following groups broken off into separate subnets:

Accounting	192.168.100.1 to 192.168.100.255
-------------------	----------------------------------

Research and Development	172.16.1.1 to 172.16.255.255
Executive Management	192.168.50.1 to 192.168.50.255
Web sites and Email Servers	10.0.50.1 to 10.0.50.255

These addresses do not have to be assigned right away but can be used as planned ranges.

NAT in Transparent Mode

Similar to operating in NAT mode, when operating a FortiGate unit in Transparent mode you can add security policies and:

- Enable NAT to translate the source addresses of packets as they pass through the FortiGate unit.
- Add virtual IPs to translate destination addresses of packets as they pass through the FortiGate unit.
- Add IP pools as required for source address translation

A FortiGate unit operating in Transparent mode normally has only one IP address - the management IP. To support NAT in Transparent mode, you can add a second management IP. These two management IPs must be on different subnets. When you add two management IP addresses, all FortiGate unit network interfaces will respond to connections to both of these IP addresses.

Use the following steps to configure NAT in Transparent mode:

1. Add two management IPs
2. Add an IP pool to the WAN1 interface
3. Add an Internal to WAN1 security policy

You can add the security policy from the web-based manager and then use the CLI to enable NAT and add the IP pool.

The usual practice of NATing in transparent mode makes use of two management IP addresses that are on different subnets, but this is not an essential requirement in every case.

If there is a router between the client systems and the FortiGate unit you can use the router's capabilities of tracking sessions to assign NATed addresses from an IP pool to the clients even if the assigned address don't belong to a subnet on your network.

Example

Client computer has an IP address of 1.1.1.33 on the subnet 1.1.1.0/24.

Router "A" sits between the client computer and the FortiGate (in Transparent mode) with the IP address of 1.1.1.1 on the client's side of the router and the IP address of 192.168.1.211 on the FortiGate's side of the router.

Use NAT to assign addresses from an address pool of 9.9.9.1 to 9.9.9.99 to traffic coming from gateway of 192.168.1.211.

To enable the return traffic to get to the original computer, set up a static route than assigns any traffic with a destination of 9.9.9.0/24 to go through the 192.168.1.211 gateway. As long as the session for the outgoing traffic

has been maintained, communication between the client computer and the external system on the other side of the FortiGate will work.

.

Central NAT Table

The central NAT table enables you to define, and control with more granularity, the address translation performed by the FortiGate unit. With the NAT table, you can define the rules which dictate the source address or address group and which IP pool the destination address uses.

While similar in functionality to IP pools, where a single address is translated to an alternate address from a range of IP addresses, with IP pools there is no control over the translated port. When using the IP pool for source NAT, you can define a fixed port to guarantee the source port number is unchanged. If no fix port is defined, the port translation is randomly chosen by the FortiGate unit. With the central NAT table, you have full control over both the IP address and port translation.

The FortiGate unit reads the NAT rules in a top-down methodology, until it hits a matching rule for the incoming address. This enables you to create multiple NAT policies that dictate which IP pool is used based on the source address. The NAT policies can be rearranged within the policy list as well. NAT policies are applied to network traffic after a security policy.

NAT 64 and NAT46

NAT64 and NAT46 are the terms used to refer to the mechanism that allows IPv6 addressed hosts to communicate with IPv4 addressed hosts and vice-versa. Without such a mechanism an IPv6 node on a network such as a corporate LAN would not be able to communicate with a web site that was still in a IPv4 only environment and IPv4 environments would not be able to connect to IPv6 networks.

One of these setups involves having at least 2 interfaces, 1 on an IPv4 network and 1 on an IPv6 network. The NAT64 server synthesizes AAAA records, used by IPv6 from A records used by IPv4. This way client-server and peer to peer communications will be able to work between an IPv6 only client and an IPv4 server without making changes to either of the end nodes in the communication transaction. The IPv6 network attached to the FortiGate unit should be a 32 bit segment, (for instance 64:ff9b::/96, see RFC 6052 and RFC 6146). IPv4 address will be embedded into the communications from the IPv6 client.

Because the IPv6 range of addresses is so much larger than the IPv4 range, a one to one mapping is not feasible. Therefore the NAT64 function is required to maintain any IPv6 to IPv4 mappings that it synthesizes. This can be done either statically by the administrator or automatically by the service as the packets from the IPv6 network go through the device. The first method would be a stateless translation and the second would be a stateful translation. NAT64 is designed for communication initiated from IPv6 hosts to IPv4 addresses. It is address mapping like this that allows the reverse to occur between established connections. The stateless or manual method is an appropriate solution when the NAT64 translation is taking place in front of legacy IPv4 servers to allow those specific servers to be accessed by remote IPv6-only clients. The stateful or automatic solution is best used closer to the client side when you have to allow some specific IPv6 clients to talk to any of the IPv4-only servers on the Internet.

There are currently issues with NAT64 not being able to make everything accessible. Examples would be SIP, Skype, MSN, Goggle talk, and sites with IPv4 literals. IPv4 literals being IPv4 addresses that are imbedded into content rather than a FQDN.

Policies that employ NAT64 or NAT46 can be configured from the web-based manager as long as the feature is enabled using the Features setting found at **System > Config > Features**.

- To create a NAT64 policy go to **Policy & Objects > NAT64 Policy** and select **Create New**.
- To create a NAT46 policy go to **Policy > NAT46 Policy** and select **Create New**.

The difference between these NAT policies and regular policies is that there is no option to use the security profiles and sensors.

NAT64 CLAT traffic is now supported by the FortiGate. CLAT traffic comes from devices that use the SIIT translator that plays a part in affecting IPv6 - IPv4 NAT translation.

NAT64 CLAT

NAT64 CLAT traffic is supported by FortiOS. CLAT traffic comes from devices that use the SIIT translator that plays a part in affecting IPv6 - IPv4 NAT translation.

NAT 66

NAT 66 is Network Address Translation between 2 IPv6 network. The basic idea behind NAT 66 is no different than the regular NAT between IPv4 networks that we are all used to. The difference are in the mechanics of how it is performed, mainly because of the complexity and size of the addresses that are being dealt with.

In an IPv4 world, the reason for the use of NAT was usually one or a combination of the following 3 reasons:

- Improved security - actual addresses behind NAT are virtually hidden
- Amplification of addresses - hundreds of computers can use as little as a single public IP address
- Internal address stability - there is control of internal addressing. The addresses can stay the same even if Internet Service Providers change.

In these days of security awareness the protective properties of NAT are not something that are not normally depended on by themselves to defend a network and with the vastly enlarged IPv6 address scope there is no longer a need to amplify the available addresses. However, the desire to have internal address control still exists. The most common reason for using NAT66 is likely to be the maintaining of the existing address scheme of the internal network despite changes outside of it. Imagine that you have an internal network of 2000 IP addresses and one day the company changes its ISP and thus the addresses assigned to it. Even if most of the addressing is handled by DHCP, changing the address scheme is going to have an impact on operations.

Addressing stability can be achieved by:

- Keeping the same provider - this would depend on the reason for the change. If the cost of this provider has become too expensive this is unlikely. If the ISP is out of business it becomes impossible.
- Transfer the addresses from the old provider to the new one - There is little motivation for an ISP to do you a favor for not doing business with them.
- Get your own autonomous system number - this can be too expensive for smaller organizations.
- NAT - this is the only one on the list that is in the control of IT.

There are differences between NAT66 and IPv4 NAT. Because there is no shortage of addresses most organizations will be given a /48 network that can be translated into another /48 network. This allows for a one to one translation, no need for port forwarding. This is a good thing because port forwarding is more complicated in IPv6. In fact, NAT66 will actually just be the rewriting of the prefix on the address.

Example

If your current IPv6 address is

```
2001:db8:cafe::/48
```

you could change it to

```
2001:db8:fea7::/48
```

There is an exception to the one to one translation. NAT66 cannot translate internal networks that contain 0xffff in bits 49 through 63 - this is due to the way checksums are calculated in TCP/IP: they use the one's-complement representation of numbers which assigns the value zero to both 0x0000 and 0xffff.

How FortiOS differentiates sessions when NATing

The basics of NAT are fairly simple. Many private addresses get translated into a smaller number of public addresses, often just one. The trick is how the FortiGate keeps track of the return traffic because the web server, or what ever device that was out on the Internet is going to be sending traffic back not to the private address behind the FortiGate but to the IP address of the interface on the public side of the FortiGate.

The way this is done is by making each session unique. Most of the attributes that are available in the network packets cannot be changed without changing where the packet will go but because the source port has to be changed anyway in case two computer on the network used the same source port this is a useful way of making each listing of network attributes a unique combination. As a packet goes through the NAT process FortiOS assigns different source ports for each of the internally initiated sessions and keeping track of which port was used for each device in a database until the session has ended. It then becomes a matter of how the port number is selected.

In a very simple example of an environment using NAT, we will use a fictitious university with a rather large student population. So large in fact that they use a subnet of 10.0.0.0/8 as their subnet for workstation IP addresses. All of these private IP addresses are NATed out a single IP address. To keep the number of numeric values in this example from getting to a confusing level, we'll just use "u.u.u.1" to refer to the public IP address of the University and the IP address of the web server on the Internet will be "w.w.w.1".

Student A (IP address 10.1.1.56) sends an HTML request to a web server on the Internet with the IP address w.w.w.1. The applicable networking information in the packet breaks down as follows:

Attribute	Original Packet	Packet after NATing
Source IP address or src-ip	10.1.1.56	u.u.u.1
Destination IP address or dst-ip:	w.w.w.1	w.w.w.1
Source port or src-port:	10000	46372
Destination port or dst-port	80	80

The source IP address is now that of the public facing interface of the FortiGate and source port number is an unused TCP port number on the FortiGate chosen by the FortiGate. Of these variable the only one the that FortiGate can really change and still have the packet reach the correct destination, in both directions, is the source port number.

There are a few methods of assigning the port number. First we'll look at the methods that are or have been used in the industry but aren't used by Fortinet.

Global pool

This method of differentiation focuses on the attribute of the source port number. In this approach a single pool of potential port numbers is set aside for the purposes of NAT. As a pool number is assigned, it is removed from the pool so that two sessions from different computers can not using the same port number. Once the session is over and no longer in use by the computer, the port number is put back into the pool where it can be assigned again.

Example global pool:

	Hexidecimal	Decimal
Start or range	0x7000	28672
End end of range	0xF000	61440
Possible ports in range	215	32768

This is a simple approach to implement and is good if the number of connections in unlike to reach the pool size. It would be okay for home use, but our example is for a university using `10.1.1.0/8` as a subnet. That means 16,777,214 possible IP addresses; more than this method can handle.

Fortinet does not use this method.

Global per protocol

This method uses the attributes source port number and type of protocol to differentiate between sessions. This approach is a variation of the first one. An additional piece of information is referred to in the packet that describes the protocol. For instance UDP or TCP. This could effectively double the number of potential addresses to NAT.

Example:

Here are two possible packets that would be considered different by the FortiGate so that any responses from the web server would make it back to their correct original sender.

From Student A

Attribute	Original Packet	Packet after NATing
Source IP address or src-ip	10.1.1.56	u.u.u.1
Destination IP address or dst-ip:	w.w.w.1	w.w.w.1
Protocol	tcp	tcp
Source port or src-port:	10000	46372
Destination port or dst-port	80	80

From Student B

Attribute	Original Packet	Packet after NATing
Source IP address or src-ip	10.5.1.233	u.u.u.1
Destination IP address or dst-ip:	w.w.w.1	w.w.w.1
Protocol	udp	udp
Source port or src-port:	26785	46372
Destination port or dst-port	80	80

Even though the source port is the same, because the protocol is different they are considered to be from different sessions and different computers.

The drawback is that it would depend on the protocols being used be evenly distributed between TCP and UDP. Even if this was the case the number would only double; reaching an upper limit of 65,536 possible connections. That number is still far short of the possible more than 16 million for an IP subnet with an eight bit subnet mask like the one in our example.

Fortinet does not use this method.

Per NAT IP Pool

This approach adds on to the previous one by adding another variable. In this case that variable is the IP addresses on the public side of the FortiGate. By having a pool of IP addresses to assign as the source IP address when NATing, the same number that was potentially available for the Global per protocol method can be multiplied by the number of external IP addresses in the pool. If you can assign a second IP address to the pool, you can double the potential number of sessions.

Example:

In this example it will be assumed that the FortiGate has 2 IP addresses that it can use. This could happen either by using two ISPs, or by having a pool of IP addresses assigned to a single interface. For simplicity will refer to these IP public IP addresses as u.u.u.1 and u.u.u.2.

Here are two possible packets that would be considered different by the FortiGate so that any responses from the web server would make it back to their correct original sender.

From Student A

Attribute	Original Packet	Packet after NATing
Source IP address or src-ip	10.1.1.56	u.u.u.1
Destination IP address or dst-ip:	w.w.w.1	w.w.w.1
Protocol	tcp	tcp

Attribute	Original Packet	Packet after NATing
Source port or src-port:	10000	46372
Destination port or dst-port	80	80

From Student B

Attribute	Original Packet	Packet after NATing
Source IP address or src-ip	10.5.1.233	u.u.u.2
Destination IP address or dst-ip:	w.w.w.1	w.w.w.1
Protocol	tcp	tcp
Source port or src-port:	26785	46372
Destination port or dst-port	80	80

In this example we even made the protocol the same. After the NATing process all of the variables are the same except the source address. This is still going to make it back to the original sender.

The drawback is that if you have only one IP address for the purposes of NATing this method does not gain you anything over the last method. Or if you do have multiple IP addresses to use it will still take quite a few to reach the 16 million possible that the subnet is capable of handling.

Fortinet does not use this method.

Per NAT IP, destination IP, port, and protocol

This is the approach that FortiOS uses.

It uses all of the differentiation point of the previous methods, NAT IP, port number and protocol, but the additional information point of the destination IP is also used. So now the network information points in the packet that the FortiGate keeps in its database to differentiate between sessions is:

- Public IP address of the FortiGate assigned by NATing
- Protocol of the traffic
- Source port assigned by the FortiGate
- Destination IP address of the packet

The last one is an especially good way to differentiate because as a theoretical number, the upper limit on that is the numbers of Public IP addresses on the whole of the Internet. Chances are that while a large number of session from inside the University will be going to a small group of sites such as Google, Youtube, Facebook and some others it is unlikely that they will all be going to them at the same time.

Example:

In this example it will be assumed that the FortiGate has only one IP address. Two possible packets will be described. The only difference in the attributes recorded will be the destination of the HTML request. These packets are still considered to be from different sessions and any responses will make it back to the correct computer.

From Student A

Attribute	Original Packet	Packet after NATing
Source IP address or src-ip	10.1.1.56	u.u.u.1
Destination IP address or dst-ip:	w.w.w.1	w.w.w.1
Protocol	tcp	tcp
Source port or src-port:	10000	46372
Destination port or dst-port	80	80

From Student B

Attribute	Original Packet	Packet after NATing
Source IP address or src-ip	10.5.1.233	u.u.u.1
Destination IP address or dst-ip:	w.w.w.2	w.w.w.2
Protocol	tcp	tcp
Source port or src-port:	26785	46372
Destination port or dst-port	80	80

The reason that these attributes are used to determine differentiation between traffic is based on how the indexes for the sessions are recorded in the database. When a TCP connection is made through a FortiGate unit, a session is created and two indexes are created for the session. The FortiGate unit uses these indexes to guide matching traffic to the session.

This following could be the session record for the TCP connection in the first example.

Attribute	Outgoing Traffic	Returning Traffic
Source IP address	10.78.33.97 (internal address)	w.w.w.1
Destination address	w.w.w.1	u.u.u.1

Attribute	Outgoing Traffic	Returning Traffic
Protocol	tcp	tcp
Source port	10000 (from original computer) 46372 (assigned by NAT)	80
Destination port	80	46372 (FortiGate assigned port)

Using the FortiGate's approach for session differentiation, FortiOS only has to ensure that the assigned port, along with the other four attributes is a unique combination to identify the session. So for example, if Student A simultaneously makes a HTTP(port 80) connection and a HTTPS(port 443) connection the same web server this would create another session and the index in the reply direction would be:

Attribute	Outgoing Traffic	Returning Traffic
Source IP address	10.78.33.97 (internal address)	w.w.w.1
Destination address	w.w.w.1	u.u.u.1
Protocol	tcp	tcp
Source port	10000 (from original computer) 46372 (assigned by NAT)	443
Destination port	443	46372 (FortiGate assigned port)

These two sessions are different and acceptable because of the different source port numbers on the returning traffic or the destination port depending on the direction of the traffic.

Calculations for possible session numbers

The result of using these four attributes instead of just the one that was originally used is a large increase in the number of possible unique combinations. For those who love math, the maximum number of simultaneous connections that can be supported is:

$$N \times R \times P \times D \times Dp$$

where:

- **N** is the number of NAT IP addresses
- **R** is the port range,
- **P** is the number of protocols,
- **D** is the number of unique destination IP addresses
- **Dp** the number of unique destination ports.

As a rough example let's do some basic calculations

- N - In our existing example we have already stated that there is only one public IP address that is being used by NAT. Realistically, for a university this number would likely be larger, but we're keeping it simple.

N = 1

R - The port range for our example has already been describe and we will keep it the same.

R = 32768

P - While there are a few protocols that are involved in Internet traffic we will limit this calculation just to TCP traffic.

P = 1

D - As mentioned before the number of unique destination addresses is growing larger every day, so figuring out the upper limit of that number would be difficult to say the least. Instead we will make the assumption that most of the university students, do to their shared interest and similar demographic will concentrate most of their web browsing to the same sites; sites such as YouTube, Facebook, Google, Twitter, Instagram, Wikipedia etc. This is not even taking into account the fact that many of these popular sites use load balancing and multiple IP addresses. As an arbitrary number let's use the number 25.

D = 25

Dp - To keep things simple it is tempting to limit the destination port to port 80, the one that many associate with web browsing, but this would not be realistic. the use of HTTPS, port 443 is on the rise. There is also email, DNS, FTP, NTP and a number of other background services that we use without thinking too closely about. Let's keep it small and say ten of them.

Dp = 10

The math on this very conservative calculation is:

$1 \times 32768 \times 1 \times 25 \times 10 = 8,192,000$ possible NAT sessions

When you take into account that the chances of everybody being online at the same time, going only to one of those 25 sites and not millions of others, and using only TCP not UDP or any of the other protocols, it starts to look like this method may provide enough potential unique sessions even for a subnet as large as the one described.

IP Pools

IP Pools are a mechanism that allow sessions leaving the FortiGate Firewall to use NAT. An IP pool defines a single IP address or a range of IP addresses to be used as the source address for the duration of the session. These assigned addresses will be used instead of the IP address assigned to that FortiGate interface.

When using IP pools for NATing, there is a limitation that must be taken into account. In order for communication to be successful in both directions, it is normal for the source address in the packet header assigned by the NAT process to be an address that is associated with the interface that the traffic is going through. For example, if traffic is going out an interface with the IP address 172.16.100.1, packets would be NATed so that the source IP address would be 172.16.100.1. This way the returning traffic will be directed to the same interface on the same FortiGate that the traffic left from. Even if the packets are assigned a source address that is associated with another interface on the same FortiGate this can cause issues with asymmetrical routing. It is possible to configure the NATed source IP address to be different than the IP address of the interface but you have to make sure that the routing rules of the surrounding network devices take this unorthodox approach into consideration.

There are 4 types of IP Pools that can be configured on the FortiGate firewall:

- One-to-One - in this case the only internal address used by the external address is the internal address that it is mapped to.
- Overload - this is the default setting. Internal addresses other than the one designated in the policy can use this address for the purposes of NAT.
- Fixed Port Range - rather than a single address to be used, there is a range of addresses that can be used as the NAT address. These addresses are randomly assigned as the connections are made.
- Port Block Allocation - this setting is used to allocate a block of port numbers for IP pool users. Two variables will also have to be set. The block size can be set from 64 to 4096 and as the name implies describes the number of ports in one block of port numbers. The number of blocks per user determines how many of these blocks will be assigned. This number can range from 1 to 128.

Be careful when calculating the values of the variables. The maximum number of ports that are available on an address is 65,536. If you chose the maximum value for both variables you will get a number far in excess of the available port numbers.

$$4096 \times 128 = 524,288$$

One of the more common examples is when you have an email server behind your FortiGate firewall and the range of IP addresses assigned to you by your ISP is more than one. If an organization is assigned multiple IP addresses it is normally considered a best practice to assign a specific address other than the one used for the Firewall to the mail server. However, when normal NAT is used the address assigned to the firewall is also assigned to any outbound sessions. Anti-spam services match the source IP address of mail traffic that they receive to the MX record on DNS servers as an indicator for spam. If there is a mismatch the mail may not get through so there is a need to make sure that the NATed address assigned matches the MX record.

You can also use the Central NAT table as a way to configure IP pools.

Source IP address and IP pool address matching when using a range

When the source addresses are translated to an IP pool that is a range of addresses, one of the following three cases may occur:

Scenario 1:

The number of source addresses equals that of IP pool addresses

In this case, the FortiGate unit always matches the IP addressed one to one.

If you enable fixed port in such a case, the FortiGate unit preserves the original source port. This may cause conflicts if more than one security policy uses the same IP pool, or the same IP addresses are used in more than one IP pool.

Scenario 2:

The number of source addresses is more than that of IP pool addresses

In this case, the FortiGate unit translates IP addresses using a wrap-around mechanism. If you enable fixed port in such a case, the FortiGate unit preserves the original source port. But conflicts may occur since users may have different sessions using the same TCP 5 tuples.

Scenario 3:

The number of source addresses is fewer than that of IP pool addresses

In this case, some of the IP pool addresses are used and the rest of them are not be used.

ARP Replies

If a FortiGate firewall interface IP address overlaps with one or more IP pool address ranges, the interface responds to ARP requests for all of the IP addresses in the overlapping IP pools. For example, consider a FortiGate unit with the following IP addresses for the port1 and port2 interfaces:

- port1 IP address: 1.1.1.1/255.255.255.0 (range is 1.1.1.0-1.1.1.255)
- port2 IP address: 2.2.2.2/255.255.255.0 (range is 2.2.2.0-2.2.2.255)

And the following IP pools:

- IP_pool_1: 1.1.1.10-1.1.1.20
- IP_pool_2: 2.2.2.10-2.2.2.20
- IP_pool_3: 2.2.2.30-2.2.2.40

The port1 interface overlap IP range with IP_pool_1 is:

$(1.1.1.0-1.1.1.255) \text{ and } (1.1.1.10-1.1.1.20) = 1.1.1.10-1.1.1.20$

The port2 interface overlap IP range with IP_pool_2 is:

$(2.2.2.0-2.2.2.255) \text{ \& } (2.2.2.10-2.2.2.20) = 2.2.2.10-2.2.2.20$

The port2 interface overlap IP range with IP_pool_3 is:

$(2.2.2.0-2.2.2.255) \text{ \& } (2.2.2.30-2.2.2.40) = 2.2.2.30-2.2.2.40$

And the result is:

- The port1 interface answers ARP requests for 1.1.1.10-1.1.1.20
- The port2 interface answers ARP requests for 2.2.2.10-2.2.2.20 and for 2.2.2.30-2.2.2.40

Select Enable NAT in a security policy and then select Dynamic IP Pool. Select an IP pool to translate the source address of packets leaving the FortiGate unit to an address randomly selected from the IP pool. Whether or not the external address of an IP Pool will respond to an ARP request can be disabled. You might want to disable the ability to responded to ARP requests so that these address cannot be used as a way into your network or show up on a port scan.

IP pools and zones

Because IP pools are associated with individual interfaces IP pools cannot be set up for a zone. IP pools are connected to individual interfaces.

Fixed Port

Some network configurations do not operate correctly if a NAT policy translates the source port of packets used by the connection. NAT translates source ports to keep track of connections for a particular service.

However, enabling the use of a fixed port means that only one connection can be supported through the firewall for this service. To be able to support multiple connections, add an IP pool, and then select Dynamic IP pool in the policy. The firewall randomly selects an IP address from the IP pool and assigns it to each connection. In this case, the number of connections that the firewall can support is limited by the number of IP addresses in the IP pool.

Match-VIP

The match-vip feature allows the FortiGate unit to log virtual IP traffic that gets implicitly dropped. This feature eliminates the need to create two policies for virtual IPs; one that allows the virtual IP, and the other to get proper log entry for DROP rules.

For example, you have a virtual IP security policy and enabled the match-vip feature; the virtual IP traffic that is not matched by the policy is now caught.

The match-vip feature is available only in the CLI. By default, the feature is disabled.

Services and TCP ports

There are a number of different services and protocols in use on the Internet. The most commonly known is HTTP which is used by web servers to transmit requests and responses for unencrypted web pages. These services are set up to listen for requests on a numbered port. These services and protocols can use any port from 1 to 65,535. To keep things simple for everyone a large number of the more commonly used services started using a standardized list of ports. For instance, though it is not required, by default, most web servers listen for HTTP requests on port 80 and by default, web browsers will send HTTP traffic to port 80. If you wish to use another port such as 8080 you would put “:8080” at the end of the URL to indicate that you want the browser to use 8080 instead of the default port.

Example

Default URL for HTTP traffic when the web server is listening on the standard HTTP port:

`http://fortinet.com`

URL to the same address when the web server is listening for HTTP traffic on port 8080

`http://fortinet.com:8080`

Services represent typical traffic types and application packets that pass through the FortiGate unit. Firewall services define one or more protocols and port numbers associated with each service. Security policies use service definitions to match session types. You can organize related services into service groups to simplify your security policy list.

Many well-known traffic types have been predefined on the FortiGate unit. If there is a service that does not appear on the list you can create a service or edit an existing one. You need to know the ports, IP addresses or protocols of that particular service or application uses, to create a service.

Best Practices

While you can edit a predefined service it is best to leave those ones alone and create a new service and name it something similar such as the same service name with a descriptive identifier appended.

Based on the previous example, instead of the name “HTTP” you could name the service “HTTP8080” or use the application that is using that port, “HTTP-Application”.

Protocol Types

One of the fundamental aspects of a service is the type of protocol that use used to define it. When a service is defined one of the following categories of protocol needs to be determined:

- TCP/UDP/SCTP
- ICMP
- ICMPv6
- IP

Depending on which of these protocol categories is choose another set of specifications will can also be defined.

Protocol Type	Related specifications
TCP/UDP/SCTP	This is the most commonly used service protocol category. Once this category has been selected the other available options to choose are an address, either IP or FQDN, and the protocol and port number. The protocol will be TCP, UDP or SCTP.
ICMP or ICMP6	When ICMP or ICMP6 is chosen the available options are the ICMP Type and its code.
IP	When IP is the chosen protocol type the addition option is the Protocol Number.

TCP/UDP/SCTP

TCP

Transmission Control Protocol (TCP) is one of the core or fundamental protocols of the Internet. It is part of the Transport Layer of the OSI Model. It is designed to provide reliable delivery of data from a program on one device on the network or Internet to another program on another device on the network or Internet. TCP achieves its reliability because it is a connection based protocol. TCP is stream-oriented. It transports streams of data reliably and in order.

TCP establishes a prior connection link between the hosts before sending data. This is often referred to as the handshake. Once the link is established the protocol uses checks to verify that the data transmitted. If an error check fails the data is retransmitted. This makes sure that the data is getting to the destination error free and in the correct order so that it can be put back together into a form that is identical to the way they were sent.

TCP is configured more for reliability than for speed and because of this TCP will likely be slower than a connectionless protocol such as UDP. This is why TCP is generally not used for real time applications such as voice communication or online gaming.

Some of the applications that use TCP are:

- World Wide Web (HTTP and HTTPS)
- Email (SMTP, POP3, IMAP4)
- Remote administration (RDP)
- File transfer (FTP)

UDP

User Datagram Protocol (UDP) like TCP is one of the core protocols of the Internet and part of the Transport Layer of the OSI Model. UDP is designed more for speed than reliability and is generally used for different applications than TCP. UDP sends messages, referred to as datagrams across the network or Internet to other hosts without establishing a prior communication link. In other words, there is no handshake.

UDP is an unreliable service as the datagrams can arrive out of order, duplicated or go missing without any mechanism to verify them. UDP works on the assumption that any error checking is done by the application or is not necessary for the function of the application. This way it avoids the overhead that is required to verify the integrity of the data.

This lack of overhead improves the speed of the data transfer and is why UDP is often used by applications that are time sensitive in nature. UDP's stateless nature is also great for applications that answer a large number of small queries from a large number of clients.

Common uses for UDP are:

- Domain Name Resolution (DNS)
- Time (NTP)
- Streaming media (RTSP, RTP and RTCP)
- Telephone of the Internet (VoIP)
- File Transfer (TFTP)
- Logging (SNMP)
- Online games (GTP and OGP)

SCTP

Stream Control Transmission Protocol (SCTP) is part of the Transport Layer of the OSI Model just like TCP and UDP and provides some of the features of both of those protocols. It is message or datagram orientated like UDP but it also ensures reliable sequential transport of data with congestion control like TCP.

SCTP provides the following services:

- Acknowledged error-free non-duplicated transfer of user data
- Data fragmentation to conform to discovered path MTU size
- Sequenced delivery of user messages within multiple streams, with an option for order-of-arrival delivery of individual user messages
- Optional bundling of multiple user messages into a single SCTP packet
- Network-level fault tolerance through supporting of multi-homing at either or both ends of an association
- Congestion avoidance behavior and resistance to flooding and masquerade attacks

SCTP uses multi-streaming to transport its messages which means that there can be several independent streams of messages traveling in parallel between the points of the transmission. The data is sent out in larger chunks of data than is used by TCP just like UDP but the messages include a sequence number within each message in the same way that TCP does so that the data can be reassembled at the other end of the transmission in the correct sequence without the data having to arrive in the correct sequence.

SCTP is effective as the transport protocol for applications that require monitoring and session-loss detection. For such applications, the SCTP path and session failure detection mechanisms actively monitor the connectivity of the session. SCTP differs from TCP in having multi-homing capabilities at either or both ends and several streams within a connection, typically referred to as an association. A TCP stream represents a sequence of bytes; an SCTP stream represents a sequence of messages.

Some common applications of SCTP include supporting transmission of the following protocols over IP networks:

- SCTP is important in 3G and 4G/LTE networks (for example, HomeNodeB = FemtoCells)
- SS7 over IP (for example, for 3G mobile networks)
- SCTP is also defined and used for SIP over SCTP and H.248 over SCTP
- Transport of Public Switched Telephone Network (PSTN) signaling messages over IP networks.

SCTP is a much newer protocol. It was defined by the IETF Signaling Transport (SIGTRAN) working group in 2000. It was introduced by RFC 3286 and more fully define by RFC 4960.

The FortiGate firewall can apply security policies to SCTP sessions in the same way as TCP and UDP sessions. You can create security policies that accept or deny SCTP traffic by setting the service to "ALL". FortiOS does not include pre-defined SCTP services. To configure security policies for traffic with specific SCTP source or destination ports you must create custom firewall services for SCTP.

FortiGate units route SCTP traffic in the same way as TCP and UDP traffic. You can configure policy routes specifically for routing SCTP traffic by setting the protocol number to 132. SCTP policy routes can route SCTP traffic according to the destination port of the traffic if you add a port range to the policy route.

You can configure a FortiGate unit to perform stateful inspection of different types of SCTP traffic by creating custom SCTP services and defining the port numbers or port ranges used by those services. FortiGate units support SCTP over IPv4. The FortiGate unit performs the following checks on SCTP packets:

- Source and Destination Port and Verification Tag.
- Chunk Type, Chunk Flags and Chunk Length
- Verify that association exists
- Sequence of Chunk Types (INIT, INIT ACK, etc)
- Timer checking
- Four way handshake checking
- Heartbeat mechanism
- Protection against INIT/ACK flood DoS attacks, and long-INIT flooding
- Protection against association hijacking

FortiOS also supports SCTP sessions over IPsec VPN tunnels, as well as full traffic and event logging for SCTP sessions.

Protocol Port Values

The source and destination ports for TCP/UDP/SCTP services are important to get correct. If they are reversed the service will not work. The destination port(s) are the ones that refer to the ports that the computer will be listening on. These are the port numbers that most people are familiar with when they associate a port number to

a protocol. In most cases the source port will be one that is randomly assigned by the computer that is not being already used by another service.

Most people associate HTTP with port 80. This means that a web-server will be listening on port 80 for any http requests being sent to the computer. The computer that is sending the request can use any port that is not already assigned to another service or communication session. There are 65,535 ports that it can randomly assign, but because the ports from 1 to 1024 are normally used for listening for incoming communications it is usually not in that range. It is unless there is a specific instance when you know that a communication will be coming from a predefined source port it is best practice to set the source port range from 1 to 65,535.

ICMP

The Internet Control Message Protocol (ICMP) is a protocol layered onto the Internet Protocol Suite to provide error reporting flow control and first-hop gateway redirection. It is normally used by the operating systems of networked computers to send connectivity status query, response and error messages. It is assigned protocol number 1. There is a separate version of the protocol for both IPv4 and for IPv6. It is not designed to be absolutely reliable like TCP.

ICMP is not typically used for transporting data or for end-user network applications with the exception of some diagnostic utilities such as ping and traceroute.

ICMP messages are sent in several situations, for example:

- when a datagram cannot reach its destination,
- time exceeded messages
- redirect messages
- when the gateway does not have the buffering capacity to forward a datagram
- when the gateway can direct the host to send traffic on a shorter route.

Some of the specific ICMP message types are:

- ICMP_ECHO
- ICMP_TIMESTAMP
- ICMP_INFO_REQUEST
- ICMP_ADDRESS

For ICMP error messages, only those reporting an error for an existing session can pass through the firewall. The security policy will allow traffic to be routed, forwarded or denied. If allowed, the ICMP packets will start a new session. Only ICMP error messages of a corresponding security policy is available will be sent back to the source. Otherwise, the packet is dropped. That is, only ICMP packets for a corresponding security policy can traverse the FortiGate unit.

ICMP Types and Codes

ICMP has a number of messages that are identified by the "Type" field. Some of these types have assigned "Code" fields as well. The table below shows the different types of ICMP Types with their associated codes if there are any.

ICMP Types and Codes

Type Number	Type Name	Optional Code(s)
0	Echo Reply	
1	Unassigned	
2	Unassigned	
3	Destination Unreachable	0 Net Unreachable
		1 Host Unreachable
		2 Protocol Unreachable
		3 Port Unreachable
		4 Fragmentation Needed and Don't Fragment was Set
		5 Source Route Failed
		6 Destination Network Unknown
		7 Destination Host Unknown
		8 Source Host Isolated
		9 Communication with Destination Network is Administratively Prohibited
		10 Communication with Destination Host is Administratively Prohibited
		11 Destination Network Unreachable for Type of Service
		12 Destination Host Unreachable for Type of Service
		13 Communication Administratively Prohibited
		14 Host Precedence Violation
		15 Precedence cutoff in effect
4	Source Quench	

Type Number	Type Name	Optional Code(s)
5	Redirect	0 Redirect Datagram for the Network (or subnet)
		1 Redirect Datagram for the Host
		2 Redirect Datagram for the Type of Service and Network
		3 Redirect Datagram for the Type of Service and Host
6	Alternate Host Address	
7	Unassigned	
8	Echo	
9	Router Advertisement	
10	Router Selection	
11	Time Exceeded	0 Time to Live exceeded in Transit
		1 Fragment Reassembly Time Exceeded
12	Parameter Problem	0 Pointer indicates the error
		1 Missing a Required Option
		2 Bad Length
13	Timestamp	
14	Timestamp Reply	
15	Information Request	
16	Information Reply	
17	Address Mask Request	
18	Address Mask Reply	
19	Reserved (for Security)	

Type Number	Type Name	Optional Code(s)
20 - 29	Reserved (for Robustness Experiment)	
30	Traceroute	
31	Datagram Conversion Error	
32	Mobile Host Redirect	
33	IPv6 Where-Are-You	
34	IPv6 I-Am-Here	
35	Mobile Registration	
36	Mobile Registration Reply	
37	Domain Name Request	
38	Domain Name Reply	
39	SKIP	
40	Photuris	
41 - 255	Reserved	

log-invalid-packet

The `log-invalid-packet` CLI setting is one that is intended to log invalid ICMP packets. The exact definition being:

If the FortiGate unit receives an ICMP error packet that contains an embedded `IP(A, B) | TCP(C, D)` header, then if FortiOS can locate the `A:C -> B:D` session it checks to make sure that the sequence number in the TCP header is within the range recorded in the session. If the sequence number is not in range then the ICMP packet is dropped.

When this field is enabled, the FortiGate also log messages that are not ICMP error packets.

Types of logs covered by `log-invalid-packet`

- Invalid ICMP
 - If ICMP error message verification (see "check-reset-range") is enabled
- Invalid DNS packets
 - DNS packets that contain requests for non-existing domains
- `iprope` check failed
- reverse path check fail
- denied and broadcast traffic
- no session matched

Some other examples of messages that are not errors that will be logged, based on [RFC792](#):

Type 3 messages correspond to "Destination Unreachable Message"

- Type 3, Code 1 = host unreachable
- Type 3, Code 3 = port unreachable

Type 11 messages correspond to "Time Exceeded Message"

- Type 11, Code 0 = time to live exceeded in transit

ICMPv6

Internet Control Message Protocol version 6 (ICMPv6) is the new implementation of the Internet Control Message Protocol (ICMP) that is part of Internet Protocol version 6 (IPv6). The ICMPv6 protocol is defined in [RFC 4443](#).

ICMPv6 is a multipurpose protocol. It performs such things as:

- error reporting in packet processing
- diagnostic functions
- Neighbor Discovery process
- IPv6 multicast membership reporting

It also designed as a framework to use extensions for use with future implementations and changes.

Examples of extensions that have already been written for ICMPv6:

- Neighbor Discovery Protocol (NDP) - a node discovery protocol in IPv6 which replaces and enhances functions of ARP.
- Secure Neighbor Discovery Protocol (SEND) - an extension of NDP with extra security.
- Multicast Router Discovery (MRD) - allows discovery of multicast routers.

ICMPv6 messages use IPv6 packets for transportation and can include IPv6 extension headers. ICMPv6 includes some of the functionality that in IPv4 was distributed among protocols such as ICMPv4, ARP (Address Resolution Protocol), and IGMP (Internet Group Membership Protocol version 3).

ICMPv6 has simplified the communication process by eliminating obsolete messages.

ICMPv6 messages are subdivided into two classes: error messages and information messages.

Error Messages are divided into four categories:

1. Destination Unreachable
2. Time Exceeded

3. Packet Too Big
4. Parameter Problems

Information messages are divided into three groups:

1. Diagnostic messages
2. Neighbor Discovery messages
3. Messages for the management of multicast groups.

ICMPv6 Types and Codes

ICMPv6 has a number of messages that are identified by the “Type” field. Some of these types have assigned “Code” fields as well. The table below shows the different types of ICMP Types with their associated codes if there are any.

Type codes 0 – 127 are error messages and type codes 128 – 255 are for information messages.

ICMPv6 Types and Codes

Type Number	Type Name	Code
0	Reserved	0 - no route to destination
		1 - communication with destination administratively prohibited
		2 - beyond scope of source address
		3 - address unreachable
		4 - port unreachable
		5 - source address failed ingress/egress policy
		6 - reject route to destination
		7 - Error in Source Routing Header
1	Destination Unreachable	
2	Packet Too Big	
3	Time Exceeded	0 - hop limit exceeded in transit
		1 - fragment reassembly time exceeded
4	Parameter Problem	0 - erroneous header field encountered
		1 - unrecognized Next Header type encountered
		2 - unrecognized IPv6 option encountered

Type Number	Type Name	Code
100	Private Experimentation	
101	Private Experimentation

200	Private experimentation	
201	Private experimentation	
255	Reserved for expansion of ICMPv6 informational messages	

IP

Internet Protocol (IP) is the primary part of the Network Layer of the OSI Model that is responsible for routing traffic across network boundaries. It is the protocol that is responsible for addressing. IPv4 is probable the version that most people are familiar with and it has been around since 1974. IPv6 is its current successor and due to a shortage of available IPv4 addresses compared to the explosive increase in the number of devices that use IP addresses, IPv6 is rapidly increasing in use.

When IP is chosen as the protocol type the available option to further specify the protocol is the protocol number. This is used to narrow down which protocol within the Internet Protocol Suite and provide a more granular control.

Protocol Number

IP is responsible for more than the address that it is most commonly associated with and there are a number of associated protocols that make up the Network Layer. While there are not 256 of them, the field that identifies them is a numeric value between 0 and 256.

In the Internet Protocol version 4 (IPv4) [RFC791] there is a field called "Protocol" to identify the next level protocol. This is an 8 bit field. In Internet Protocol version 6 (IPv6) [RFC2460], this field is called the "Next Header" field.

Protocol Numbers

#	Protocol	Protocol's Full Name
0	HOPOPT	IPv6 Hop-by-Hop Option
1	ICMP	Internet Control Message Protocol
2	IGMP	Internet Group Management
3	GGP	Gateway-to-Gateway
4	IPv4	IPv4 encapsulation Protocol
5	ST	Stream
6	TCP	Transmission Control Protocol
7	CBT	CBT

VPN Policies

At one point, if you wanted to have secure digital communications between 2 points a private network would be created. This network would only allow the people that were intended to get the communications on it. This is very straightforward if the 2 points are in the same room or even in the same building. It can all be done physically. If you are supposed to be on the secure network

VPNs are an answer to one of today's biggest concerns, how to make digital communications secure between to points that must communicate over the Internet which anybody can have access to.

There are two types of VPNs supported by FortiOS, SSL and IPsec. They are differentiated by the security protocol suites that are used to secure the traffic. These are both described in more detail in the VPN section, but the IPsec VPN can be configured as an **Action** with a firewall policy.

IPsec Policies

IPsec policies allow IPsec VPN traffic access to the internal network from a remote location. These policies include authentication information that authenticates users and user group or groups. These policies specify the following:

- the FortiGate firewall interface that provides the physical connection to the remote VPN gateway, usually an interface connected to the Internet
- the FortiGate firewall interface that connects to the private network
- IP addresses associated with data that has to be encrypted and decrypted
- optional: a schedule that restricts when the VPN can operate, and services (or types of data) that can be sent.

For a route-based (interface mode) VPN, you do not configure an IPsec security policy. Instead, you configure two regular ACCEPT security policies, one for each direction of communication, with the IPsec virtual interface as the source or destination interface, as appropriate.

DSRI

The Disable Server Response Inspection (DSRI) options is available for configuration in the CLI. This is used to assist performance when only URL filtering is being used. This allows the system to ignore the HTTP server responses. The setting is configured to be disabled by default.

CLI syntax for changing the status of the DSRI setting

In IPv4 or IPv6 firewall policies

```
config firewall policy|policy6
edit 0
```

```
set dsri enable|disable
end
```

In IPv4 or IPv6 interface policies

```
config firewall interface-policy|interface-policy6
edit 0
set dsri enable|disable
end
```

When using the sniffer

```
config firewall sniffer
edit 0
set dsri enable|disable
end
```

Interface Policies

Interface policies are implemented before the “security” policies and are only flow based. They are configured in the CLI.

This feature allows you to attach a set of IPS policies with the interface instead of the forwarding path, so packets can be delivered to IPS before entering firewall. This feature is used for following IPS deployments:

- One-Arm: by defining interface policies with IPS and DoS anomaly checks and enabling sniff-mode on the interface, the interface can be used for one-arm IDS;
- IPv6 IPS: IPS inspection can be enabled through interface IPv6 policy. Only IPS signature scan is supported in FortiOS 4.0. IPv6 DoS protection is not supported;
- Scan traffics that destined to FortiGate;
- Scan and log traffics that are silently dropped or flooded by Firewall or Multicast traffic.

IPS sensors can be assigned to an interface policy. Both incoming and outgoing packets are inspected by IPS sensor (signature).

Here is an example of an interface policy,

show full-configuration

```
config firewall interface-policy
edit 1
set status enable
set comments 'test interface policy #1'
set logtraffic utm
set interface "port9"
set srcaddr "all"
set dstaddr "all"
set service "ALL"
set application-list-status disable
set ips-sensor-status disable
set dsri disable
set av-profile-status enable
set av-profile "default"
set webfilter-profile-status disable
set spamfilter-profile-status disable
set dlp-sensor-status disable
set scan-botnet-connections disable
```

```
next
end
```

DoS Protection

Denial of Service (DoS) policies are primarily used to apply DoS anomaly checks to network traffic based on the FortiGate interface it is entering as well as the source and destination addresses. DoS checks are a traffic anomaly detection feature to identify network traffic that does not fit known or common traffic patterns and behavior. A common example of anomalous traffic is the denial of service attack. A denial of service occurs when an attacking system starts an abnormally large number of sessions with a target system. The large number of sessions slows down or disables the target system, so that legitimate users can no longer use it.

DoS policies are similar to firewall policies except that instead of defining the way traffic is allowed to flow, they keep track of certain traffic patterns and attributes and will stop traffic displaying those attributes. Further, DoS policies affect only incoming traffic on a single interface. You can further limit a DoS policy by source address, destination address, and service.

DoS configurations have been changed a couple of times in the past. In FortiOS 4.0, DoS protection is moved to the interface policy, so when it is enabled, it is the first thing checked when a packet enters FortiGate. Because of this early detection, DoS policies are a very efficient defense that uses few resources. Denial of service attacks, for example, are detected and its packets dropped before requiring security policy look-ups, antivirus scans, and other protective but resource-intensive operations.

A DoS policy examines network traffic arriving at an interface for anomalous patterns usually indicating an attack. This does not mean that all anomalies experience by the firewall are the result of an intentional attack.

Because an improperly configured DoS anomaly check can interfere with network traffic, no DoS checks are preconfigured on a factory default FortiGate unit. You must create your own before they will take effect. Thresholds for newly created sensors are preset with recommended values that you can adjust to meet the needs of your network.

To create a Denial of Service policy determine if it needs to be an IPv4 or IPv6 policy, then go to:

Policy & Objects > IPv4 DoS Policy for IPv4.

Policy & Objects > IPv6 DoS Policy for IPv6.

The **Enable SSH Deep Scan** feature is enabled by default when creating a new SSL/SSH Inspection profile. There are situations where this feature can cause issues so be sure that you would like it enabled before applying it.

Settings used in configuring DoS

Incoming Interface

The interface to which this security policy applies. It will be the that the traffic is coming into the firewall on.

Source Address

This will be the address that the traffic is coming from and must be a address listed in the Address section of the Firewall Objects. This can include the predefined “all” address which covers any address coming in on any interface. Multiple addresses or address groups can be chosen

Destination Address

This will be the address that the traffic is addressed to. In this case it must be an address that is associated with the firewall itself. For instance it could be one of the interface address of the firewall, a secondary IP address or the interface address assigned to a Virtual IP address. Just like with the Source Address this address must be already configured before being used in the DoS policy. Multiple addresses, virtual IPs or virtual IP groups can be chosen.

Service

While the Service field allows for the use of the ALL service some administrators prefer to optimize the resources of the firewall and only check on the services that will be answered on an interface. Multiple services or service groups can be chosen.

Anomalies

The anomalies can not be configured by the user. They are predefined sensors set up for specific patterns of anomalous traffic

The anomalies that have been predefined for use in the DoS Policies are:

Anomaly Name	Description	Recommended Threshold
tcp_syn_flood	If the SYN packet rate of new TCP connections, including retransmission, to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second.
tcp_port_scan	If the SYN packet rate of new TCP connections, including retransmission, from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second.
tcp_src_session	If the number of concurrent TCP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
tcp_dst_session	If the number of concurrent TCP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
udp_flood	If the UDP traffic to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second.
udp_scan	If the number of UDP sessions originating from one source IP address exceeds the configured threshold value, the action is executed.	2000 packets per second.
udp_src_session	If the number of concurrent UDP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.

Anomaly Name	Description	Recommended Threshold
udp_dst_session	If the number of concurrent UDP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
icmp_flood	If the number of ICMP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	250 packets per second.
icmp_sweep	If the number of ICMP packets originating from one source IP address exceeds the configured threshold value, the action is executed.	100 packets per second.
icmp_src_session	If the number of concurrent ICMP connections from one source IP address exceeds the configured threshold value, the action is executed.	300 concurrent sessions
icmp_dst_session	If the number of concurrent ICMP connections to one destination IP address exceeds the configured threshold value, the action is executed.	3000 concurrent sessions
ip_src_session	If the number of concurrent IP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
ip_dst_session	If the number of concurrent IP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
sctp_flood	If the number of SCTP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second
sctp_scan	If the number of SCTP sessions originating from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second
sctp_src_session	If the number of concurrent SCTP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions
sctp_dst_session	If the number of concurrent SCTP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions

Status

The status field is enabled to enable the sensor for the associated anomaly. In terms of actions performed there is no difference between disabling a sensor and having the action as "Pass" but by disabling sensors that are not being used for blocking or logging you can save some resources of the firewall that can be better used elsewhere.

Logging

Regardless of whether the traffic is blocked or passed through the anomalous traffic will be logged.

Pass

Allows the anomalous traffic to pass through unimpeded.

Block

For Thresholds based on the number of concurrent sessions blocking the anomaly will not allow more than the number of concurrent sessions set as the threshold.

For rate based thresholds where the threshold is measured in packets per second, the Action setting “Block” prevents the overwhelming of the firewall by anomalous traffic in one of 2 ways. Setting which of those 2 ways will be issued is determined in the CLI.

- continuous - blocks packets once an anomaly is detected. This overrides individual anomaly settings.
- periodical - allows matching anomalous traffic up to the rate set by the threshold.

If the period for a particular anomaly is 60 seconds, such as those where the threshold is measured in concurrent sessions, after the 60 second timer has expired, the number of allowed packets that match the anomaly criteria is reset to zero. This means that if you allow 10 sessions through before blocking, after the 60 seconds is up, another 10 will be allowed. The attrition of sessions from expiration should keep the allowed sessions from reaching the maximum.

To set the type of block action for the rate based anomaly sensors:

```
config ips global
    set anomaly-mode continuous
    set anomaly-mode periodical
end
```

Threshold

The threshold can be either in terms of concurrent session or in packets per second depending on which sensor is being referred to.

Quarantine

The quarantine feature is found in the CLI. This setting is used to block any further traffic from a source address that is now considered to be a malicious actor or a source of traffic dangerous to the network. Not only is no more traffic accepted for the duration of the quarantine through the DoS policy but the source IP address of the traffic is added to the banned source ip list. This list is kept in the kernel and used by

- Antivirus
- Data Leak Prevention (DLP)
- Denial of Service (DoS)
- Intrusion Prevention System (IPS)

Any policies that use any of these features will block traffic from the attacker's IP address.

Syntax

```
config firewall {DoS-policy|DoS-policy6}
    edit <policyid>
        set quarantine {none|attacker}
        set quarantine-exipiry {string}
```

```

    set quarantine-log {enable|disable}
end

```

Option	Description
quarantine	Quarantine method. <ul style="list-style-type: none"> <code>none</code> - Quarantine is disabled. <code>attacker</code> - Block all traffic sent from the attacker's IP address. The quarantined IP address is also added to the banned ip list. The destination address is not affected.
quarantine-expiry	Duration of quarantine The format is ###d##h##m, ranging from 1 minute to 364 days, 23 hours, and 59 minutes starting from now. The default is 0d0h5m. Requires quarantine set to attacker.
quarantine-log	Enables or disables the logging of quarantine events.

One-Arm IDS

Interface-based policy only defines what and how IPS functions are applied to the packets transmitted by the interface. It works no matter if the port is used in a forwarding path or used as an One-Arm device.

To enable One-Arm IDS, the user should first enable sniff-mode on the interface,

```

config system interface
    edit port2
        set ips-sniffer-mode enable
    next
end

```

Once sniff-mode is turned on, both incoming and outgoing packets will be dropped after IPS inspections. The port can be connected to a hub or a switch's SPAN port. Any packet picked up by the interface will still follow the interface policy so different IPS and DoS anomaly checks can be applied.

IPv6 IPS

IPv6 IPS signature scan can be enabled by interface policy. The user can create an normal IPS sensor and assign it to the IPv6 interface policy.

```

config firewall interface-policy6
    edit 1
        set interface "port1"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set service6 "ALL"
        set ips-sensor-status enable
        set ips-sensor "all_default"
    next
end

```

Traffic Destined to the FortiGate unit

IPS enabled in firewall policies can only inspect the traffic pass through FortiGate unit, not the traffic destined to FortiGate unit. Enabling IPS in interface-policy allows IPS to pick up any packet on the interface so it is able to inspect attacks targeting FGT.

Dropped, Flooded, Broadcast, Multicast and L2 packets

In many evaluation or certification tests, FortiGate firewall is often required to log any packets dropped by the firewall. In most of cases, these packets are of invalid headers so firewall just drops them silently. It is natural to forward all these packets to IPS first so FortiGate firewall is able to generate logs for invalid packets.

Flooded, broadcast and multicast traffics do not reach any of services in the forwarding path. They can be inspected by the interface policy as long as they match the addresses defined. Potentially, L2 packets can also be sent to IPS for inspection through interface-policy, but it is not enabled in FortiOS 4.0.

GUI and CLI

Now in FortiGate, there are two places that IPS can be enabled, in a firewall policy and in an interface policy. In the firewall policy implementation, IPS sensor can be configured in both CLI and GUI. When adding an IPS sensor to an interface policy it must be done through the CLI. There is no GUI input window for the “Interface Policy”. There is however, a DoS Policy section in the GUI.

Local-In Policies

On the FortiGate unit, there are a number of protocols and traffic that is specific to the internal workings of FortiOS. For many of these traffic sources, you can identify a specific port/IP address for this self-originating traffic. The following traffic can be configured to a specific port/IP address:

- SNMP
- Syslog
- alert email
- FortiManager connection IP
- FortiGuard services
- FortiAnalyzer logging
- NTP
- DNS
- Authorization requests such as RADIUS
- FSSO

Security policies control the flow of traffic through the FortiGate unit. The FortiGate unit also includes the option of controlling internal traffic, that is, management traffic.

Each interface includes an allow access configuration to allow management access for specific protocols. Local policies are set up automatically to allow all users all access. Local-in policies takes this a step further, to enable or restrict the user with that access. This also extends beyond the allow access selection.

Local-in policies are configured in the CLI with the commands:

```
config firewall local-in-policy
  edit <policy_number>
    set intf <source_interface>
    set srcaddr <source_address>
```

```

    set dstaddr <destination_address>
    set action {accept | deny}
    set service <service name>
    set schedule <schedule_name>
end

```

For example, you can configure a local-in policy so that only administrators can access the FortiGate unit on weekends from a specific management computer at 192.168.21.12, represented by the address object `mgmt-comp1`, using SSH on port 3 (192.168.21.77 represented by the address object `FG-port3`) using the Weekend schedule which defines the time the of access.

```

config firewall local-in-policy
edit <1>
    set intf port3
    set srcaddr mgmt-comp1
    set dstaddr FG-port3
    set action accept
    set service SSH
    set schedule Weekend
end

```

You can also disable a policy should there be a requirement to turn off a policy for troubleshooting or other purpose. To disable a policy enter the commands:

```

config firewall local-in-policy
edit <policy_number>
    set status disable
end

```

Use the same commands with a status of enable to use the policy again.

It is also an option to dedicate the interface as HA management interface by using the setting:

```
set ha-mgmt-intf-only enable
```

Local-in policies are also supported for IPv6 by entering the command:

```
config firewall local-in-policy6.
```

While there is a section under **Policy & Objects** for viewing the existing **Local In Policy** configuration, policies cannot be created or edited here in the GUI. The Local In polices can only be created or edited in the CLI.

Security Policy 0

Any security policy that is automatically added by the FortiGate unit has a policy ID number of zero (0). The most common reasons the FortiGate unit creates this policy is:

- The IPsec policy for FortiAnalyzer (and FortiManager version 3.0) is automatically added when an IPsec connection to the FortiAnalyzer unit or FortiManager is enabled.
- The policy to allow FortiGuard servers to be automatically added has a policy ID number of zero.
- The (default) drop rule that is the last rule in the policy and that is automatically added has a policy ID number of zero.
- When a network zone is defined within a VDOM, the intra-zone traffic set to allow or block is managed by policy 0 if it is not processed by a configured security policy.

This policy can appear in logs but will never appear in the security policy list, and therefore, can never be repositioned in the list.

When viewing the FortiGate firewall logs, you may find a log field entry indicating `policyid=0`. The following log message example indicates the log field `policyid=0` in bold.

```
2008-10-06 00:13:49 log_id=0022013001 type=traffic subtype=violation pri=warning
vd=root SN=179089 duration=0 user=N/A group=N/A rule=0 policyid=0 proto=17
service=137/udp app_type=N/A status=deny src=10.181.77.73 srcname=10.181.77.73
dst=10.128.1.161 dstname=10.128.1.161 src_int=N/A dst_int="Internal" sent=0 rcvd=0
src_port=137 dst_port=137 vpn=N/A tran_ip=0.0.0.0 tran_port=0
```

Deny Policies

Deny security policies deny traffic that is coming into the network. The FortiGate unit automatically blocks traffic that is associated with a deny security policy.

Deny security policies are usually configured when you need to restrict specific traffic, for example, SSH traffic. Deny security policies can also help when you want to block a service, such as DNS, but allow a specific DNS server.

Accept Policies

Accept security policies accept traffic that is coming into the network. These policies allow traffic through the FortiGate unit, where the packets are scanned, translated if NAT is enabled, and then sent out to its destination.

Accept security policies are the most common security policies that are created in FortiOS. These security policies are basic policies, such as allowing Internet access, as well as complex policies, such as IPsec VPN.

Fixed Port

Some network configurations do not operate correctly if a NAT policy translates the source port of packets used by the connection. NAT translates source ports to keep track of connections for a particular service.

From the CLI you can enable `fixedport` when configuring a security policy for NAT policies to prevent source port translation.

```
config firewall policy
  edit <policy-id>
    ...
    set fixedport enable
    ...
  end
```

However, enabling `fixedport` means that only one connection can be supported through the firewall for this service. To be able to support multiple connections, add an IP pool, and then select Dynamic IP pool in the policy. The firewall randomly selects an IP address from the IP pool and assigns it to each connection. In this case, the number of connections that the firewall can support is limited by the number of IP addresses in the pool.

Endpoint Security

Endpoint security enforces the use of the FortiClient End Point Security (FortiClient and FortiClient Lite) application on your network. It can also allow or deny endpoints access to the network based on the application installed on them.

By applying endpoint security to a security policy, you can enforce this type of security on your network. FortiClient enforcement can check that the endpoint is running the most recent version of the FortiClient application, that the antivirus signatures are up-to-date, and that the firewall is enabled. An endpoint is usually often a single PC with a single IP address being used to access network services through a FortiGate unit.

With endpoint security enabled on a policy, traffic that attempts to pass through, the FortiGate unit runs compliance checks on the originating host on the source interface. Non-compliant endpoints are blocked. If someone is browsing the web, the endpoints are redirected to a web portal which explains the non-compliance and provides a link to download the FortiClient application installer. The web portal is already installed on the FortiGate unit, as a replacement message, which you can modify if required.

Endpoint Security requires that all hosts using the security policy have the FortiClient Endpoint Security agent installed. Currently, FortiClient Endpoint Security is available for Microsoft Windows 2000 and later only.

For more information about endpoint security, see the Security Profiles chapter in the FortiOS Handbook.

Traffic Logging

When you enable logging on a security policy, the FortiGate unit records the scanning process activity that occurs, as well as whether the FortiGate unit allowed or denied the traffic according to the rules stated in the security policy. This information can provide insight into whether a security policy is working properly, as well as if there needs to be any modifications to the security policy, such as adding traffic shaping for better traffic performance.

Depending on what the FortiGate unit has in the way of resources, there may be advantages in optimizing the amount of logging taking places. This is why in each policy you are given 3 options for the logging:

- **Disable Log Allowed Traffic** - Does not record any log messages about traffic accepted by this policy.

If you enable Log Allowed Traffic, the following two options are available:

- **Security Events** - This records only log messages relating to security events caused by traffic accepted by this policy.
- **All Sessions** - This records all log messages relating to all of the traffic accepted by this policy.

Depending on the model, if the Log all Sessions option is selected there may be 2 additional options. These options are normally available in the GUI on the higher end models such as the FortiGate 600C or larger.

- **Generate Logs when Session Starts**
- **Capture Packets**

You can also use the CLI to enter the following command to write a log message when a session starts:

```
config firewall policy
  edit <policy-index>
    set logtraffic-start
  end
```

Traffic is logged in the traffic log file and provides detailed information that you may not think you need, but do. For example, the traffic log can have information about an application used (web: HTTP.Image), and whether or not the packet was SNAT or DNAT translated. The following is an example of a traffic log message.

```
2011-04-13
05:23:47
log_id=4
type=traffic
subtype=other
pri=notice
```

```
vd=root
status="start"
src="10.41.101.20"
srcname="10.41.101.20"
src_port=58115
dst="172.20.120.100"
dstname="172.20.120.100"
dst_country="N/A"
dst_port=137
tran_ip="N/A"
tran_port=0
tran_sip="10.31.101.41"
tran_sport=58115
service="137/udp"
proto=17
app_type="N/A"
duration=0
rule=1
policyid=1
sent=0
rcvd=0
shaper_drop_sent=0
shaper_drop_rcvd=0
perip_drop=0
src_int="internal"
dst_int="wan1"
SN=97404 app="N/A"
app_cat="N/A"
carrier_ep="N/A"
```

If you want to know more about logging, see the Logging and Reporting chapter in the FortiOS Handbook. If you want to know more about traffic log messages, see the FortiGate Log Message Reference.

Network defense

This section describes in general terms the means by which attackers can attempt to compromise your network using attacks at the network level rather than through application vulnerabilities, and steps you can take to protect it. The goal of an attack can be as complex as gaining access to your network and the privileged information it contains, or as simple as preventing customers from accessing your web server.

Because of popular media, many people are aware of viruses and other malware as a threat against their computers and data, but some of the most costly malicious attack in history have been against networks. A 2016 study found that a single DDoS attack could cost a company over \$1.6 million. Depending on the size and type of company the areas of expense can be:

- Changes in credit and insurance ratings
- Overtime payment to employees
- Hiring new employees to increase IT staff
- PR expenses to restore a company's reputation
- Upgrading infrastructure and software
- Customer compensation

The following topics are included in this section:

- [Monitoring](#)
- [Blocking external probes](#)
- [Defending against DoS attacks](#)

Monitoring

Monitoring, in the form of logging, alert email, and SNMP, does not directly protect your network. But monitoring allows you to review the progress of an attack, whether afterwards or while in progress. How the attack unfolds may reveal weaknesses in your preparations. The packet archive and sniffer policy logs can reveal more details about the attack. Depending on the detail in your logs, you may be able to determine the attacker's location and identity.

While log information is valuable, you must balance the log information with the resources required to collect and store it.

Blocking external probes

Protection against attacks is important, but attackers often use vulnerabilities and network tools to gather information about your network to plan an attack. It is often easier to prevent an attacker from learning important details about your network than to defend against an attack designed to exploit your particular network.

Attacks are often tailored to the hardware or operating system of the target, so reconnaissance is often the first step. The IP addresses of the hosts, the open ports, and the operating systems the hosts are running is invaluable information to an attacker. Probing your network can be as simple as an attacker performing an address sweep or port scan to a more involved operation like sending TCP packets with invalid combinations of flags to see how your firewall reacts.

Address sweeps

An address sweep is a basic network scanning technique to determine which addresses in an address range have active hosts. A typical address sweep involves sending an ICMP ECHO request (a ping) to each address in an address range to attempt to get a response. A response signifies that there is a host at this address that responded to the ping. It then becomes a target for more detailed and potentially invasive attacks.

Address sweeps do not always reveal all the hosts in an address range because some systems may be configured to ignore ECHO requests and not respond, and some firewalls and gateways may be configured to prevent ECHO requests from being transmitted to the destination network. Despite this shortcoming, Address sweeps are still used because they are simple to perform with software tools that automate the process.

Use the `icmp_sweep` anomaly in a DoS policy to protect against address sweeps.

There are a number of IPS signatures to detect the use of ICMP probes that can gather information about your network. These signatures include `AddressMask`, `Traceroute`, `ICMP.Invalid.Packet.Size`, and `ICMP.Oversized.Packet`. Include ICMP protocol signatures in your IPS sensors to protect against these probes/attacks.

Port scans

Potential attackers may run a port scan on one or more of your hosts. This involves trying to establish a communication session to each port on a host. If the connection is successful, a service may be available that the attacker can exploit.

Use the DoS anomaly check for `tcp_port_scan` to limit the number of sessions (complete and incomplete) from a single source IP address to the configured threshold. If the number of sessions exceed the threshold, the configured action is taken.

Use the DoS anomaly check for `udp_scan` to limit UDP sessions in the same way.

Probes using IP traffic options

Every TCP packet has space reserved for eight flags or control bits. They are used for communicating various control messages. Although space in the packet is reserved for all eight, there are various combinations of flags that should never happen in normal network operation. For example, the SYN flag, used to initiate a session, and the FIN flag, used to end a session, should never be set in the same packet.

Attackers may create packets with these invalid combinations to test how a host will react. Various operating systems and hardware react in different ways, giving a potential attackers clues about the components of your network.

The IPS signature `TCP.Bad.Flags` detects these invalid combinations. The default action is pass though you can override the default and set it to **Block** in your IPS sensor.

Configure packet replay and TCP sequence checking

The anti-replay CLI command allows you to set the level of checking for packet replay and TCP sequence checking (or TCP Sequence (SEQ) number checking). All TCP packets contain a Sequence Number (SEQ) and an Acknowledgement Number (ACK). The TCP protocol uses these numbers for error free end-to-end communications. TCP sequence checking can also be used to validate individual packets.

FortiGate units use TCP sequence checking to make sure that a packet is part of a TCP session. By default, if a packet is received with sequence numbers that fall out of the expected range, the FortiGate unit drops the packet. This is normally a desired behavior, since it means that the packet is invalid. But in some cases you may

want to configure different levels of anti-replay checking if some of your network equipment uses non-RFC methods when sending packets.

Configure the anti-replay CLI command:

```
config system global
    set anti-replay {disable | loose | strict}
end
```

You can set anti-replay protection to the following settings:

- **disable** — No anti-replay protection.
- **loose** — Perform packet sequence checking and ICMP anti-replay checking with the following criteria:
 - The SYN, FIN, and RST bit can not appear in the same packet.
 - The FortiGate unit does not allow more than one ICMP error packet through before it receives a normal TCP or UDP packet.
 - If the FortiGate unit receives an RST packet, and check-reset-range is set to strict, the FortiGate unit checks to determine if its sequence number in the RST is within the un-ACKed data and drops the packet if the sequence number is incorrect.
- **strict** — Performs all of the loose checking but for each new session also checks to determine if the TCP sequence number in a SYN packet has been calculated correctly and started from the correct value for each new session. Strict anti-replay checking can also help prevent SYN flooding.

If any packet fails a check it is dropped.

Configure ICMP error message verification

Enable ICMP error message verification to ensure an attacker can not send an invalid ICMP error message.

```
config system global
    check-reset-range {disable | strict}
end
```

- **disable** — the FortiGate unit does not validate ICMP error messages.
- **strict** — enable ICMP error message checking.

If the FortiGate unit receives an ICMP error packet that contains an embedded IP(A,B) | TCP(C,D) header, then if FortiOS can locate the A:C->B:D session it checks to make sure that the sequence number in the TCP header is within the range recorded in the session. If the sequence number is not in range then the ICMP packet is dropped. Strict checking also affects how the anti-replay option checks packets.

Protocol header checking

Select the level of checking performed on protocol headers.

```
config system global
    check-protocol-header {loose | strict}
end
```

- **loose** — the FortiGate unit performs basic header checking to verify that a packet is part of a session and should be processed. Basic header checking includes verifying that the layer-4 protocol header length, the IP header length, the IP version, the IP checksum, IP options are correct, etc.
- **strict** — the FortiGate unit does the same checking as above plus it verifies that ESP packets have the correct sequence number, SPI, and data length.

If the packet fails header checking it is dropped by the FortiGate unit.

Evasion techniques

Attackers employ a wide range of tactics to try to disguise their techniques. If an attacker disguises a known attack in such a way that it is not recognized, the attack will evade your security and possibly succeed. FortiGate security recognizes a wide variety of evasion techniques and normalizes data traffic before inspecting it.

Packet fragmentation

Information sent across local networks and the Internet is encapsulated in packets. There is a maximum allowable size for packets and this maximum size varies depending on network configuration and equipment limitations. If a packet arrives at a switch or gateway and it is too large, the data it carries is divided among two or more smaller packets before being forwarded. This is called fragmentation.

When fragmented packets arrive at their destination, they are reassembled and read. If the fragments do not arrive together, they must be held until all of the fragments arrive. Reassembly of a packet requires all of the fragments.

The FortiGate unit automatically reassembles fragmented packets before processing them because fragmented packets can evade security measures. This reassembly of packets affects TCP, UDP and IP packets. There can be some variation though in what process does the reassembling. The IPS engine, nTurbo and the kernel all can do defragmentation.

For example, you have configured the FortiGate unit to block access to the example.org web site. Any checks for example.com will fail if a fragmented packet arrives and one fragment contains `http://www.exa` while the other contains `mple.com/`. Viruses and malware can be fragmented and avoid detection in the same way. The FortiGate unit will reassemble fragmented packets before examining network data to ensure that inadvertent or deliberate packet fragmentation does not hide threats in network traffic.

Non-standard ports

Most traffic is sent on a standard port based on the traffic type. The FortiGate unit recognizes most traffic by packet content rather than the TCP/UDP port and uses the proper IPS signatures to examine it. Protocols recognized regardless of port include DHCP, DNP3, FTP, HTTP, IMAP, MS RPC, NNTP, POP3, RSTP, SIP, SMTP, and SSL, as well as the supported IM/P2P application protocols.

In this way, the FortiGate unit will recognize HTTP traffic being sent on port 25 as HTTP rather than SMTP, for example. Because the protocol is correctly identified, the FortiGate unit will examine the traffic for any enabled HTTP signatures.

Negotiation codes

Telnet and FTP servers and clients support the use of negotiation information to allow the server to report what features it supports. This information has been used to exploit vulnerable servers. To avoid this problem, the FortiGate unit removes negotiation codes before IPS inspection.

HTTP URL obfuscation

Attackers encode HTML links using various formats to evade detection and bypass security measures. For example, the URL `www.example.com/cgi.bin` could be encoded in a number of ways to avoid detection but still work properly, and be interpreted the same, in a web browser.

The FortiGate prevents the obfuscation by converting the URL to ASCII before inspection.

HTTP URL obfuscation types

Encoding type	Example
No encoding	http://www.example.com/cgi.bin/
Decimal encoding	http://www.example.com/c#103;#105;#46;#98;#105;#110;#47;
URL encoding	http://www.example.com/%43%47%49%2E%42%49%4E%2F
ANSI encoding	http://www.example.com/%u0063%u0067%u0069%u002E%u0062%u0069%u006E/
Directory traversal	http://www.example.com/cgi.bin/test/..

HTTP header obfuscation

The headers of HTTP requests or responses can be modified to make the discovery of patterns and attacks more difficult. To prevent this, the FortiGate unit will:

- remove junk header lines
- reassemble an HTTP header that's been folded onto multiple lines
- move request parameters to HTTP POST body from the URL

The message is scanned for any enabled HTTP IPS signatures once these problems are corrected.

HTTP body obfuscation

The body content of HTTP traffic can be hidden in an attempt to circumvent security scanning. HTTP content can be GZipped or deflated to prevent security inspection. The FortiGate unit will uncompress the traffic before inspecting it.

Another way to hide the contents of HTTP traffic is to send the HTTP body in small pieces, splitting signature matches across two separate pieces of the HTTP body. The FortiGate unit reassembles these 'chunked bodies' before inspection.

Microsoft RPC evasion

Because of its complexity, the Microsoft Remote Procedure Call protocol suite is subject to a number of known evasion techniques, including:

- SMB-level fragmentation
- DCERPC-level fragmentation
- DCERPC multi-part fragmentation
- DCERPC UDP fragmentation
- Multiple DCERPC fragments in one packet

The FortiGate unit reassembles the fragments into their original form before inspection.

Defending against DoS attacks

A denial of service is the result of an attacker sending an abnormally large amount of network traffic to a target system. Having to deal with the traffic flood slows down or disables the target system so that legitimate users can not use it for the duration of the attack.

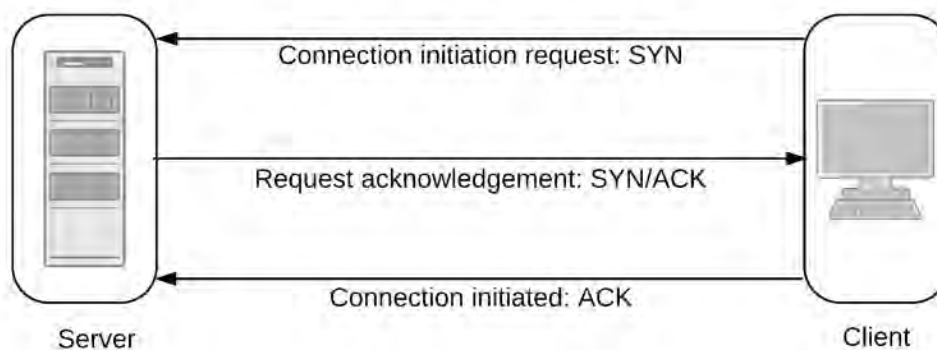

Any network traffic the target system receives has to be examined, and then accepted or rejected. TCP, UDP, and ICMP traffic is most commonly used, but a particular type of TCP traffic is the most effective. TCP packets with the SYN flag are the most efficient DoS attack tool because of how communication sessions are started between systems.

The “three-way handshake”

Communication sessions between systems start with establishing a TCP/IP connection. This is a simple three step process, sometimes called a “three-way handshake,” initiated by the client attempting to open the connection.

1. The client sends a TCP packet with the SYN flag set. With the SYN packet, the client informs the server of its intention to establish a connection.
2. If the server is able to accept the connection to the client, it sends a packet with the SYN and the ACK flags set. This simultaneously acknowledges the SYN packet the server has received, and informs the client that the server intends to establish a connection.
3. To acknowledge receipt of the packet and establish the connection, the client sends an ACK packet.

Establishing a TCP/IP connection

The three-way handshake is a simple way for the server and client to each agree to establish a connection and acknowledge the other party expressing its intent. Unfortunately, the three-way handshake can be used to interfere with communication rather than facilitate it.

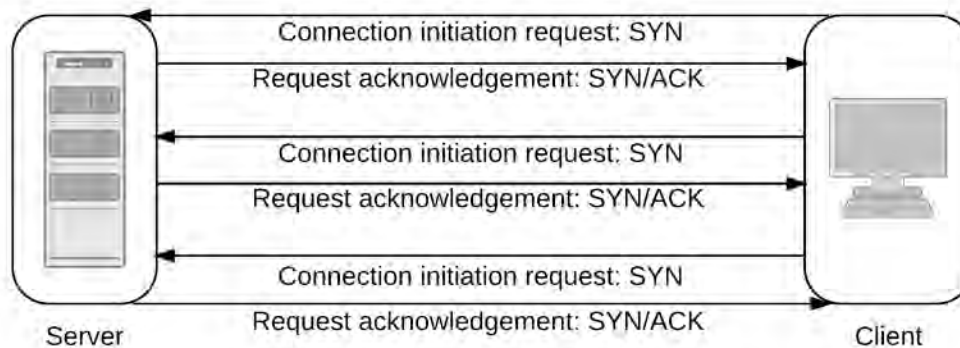

SYN flood

When a client sends a SYN packet to a server, the server creates an entry in its session table to keep track of the connection. The server then sends a SYN+ACK packet expecting an ACK reply and the establishment of a connection.

An attacker intending to disrupt a server with a denial of service (DoS) attack can send a flood of SYN packets and not respond to the SYN+ACK packets the server sends in response. Networks can be slow and packets can get

lost so the server will continue to send SYN+ACK packets until it gives up, and removes the failed session from the session table. If an attacker sends enough SYN packets to the server, the session table will fill completely, and further connection attempts will be denied until the incomplete sessions time out. Until this happens, the server is unavailable to service legitimate connection requests.

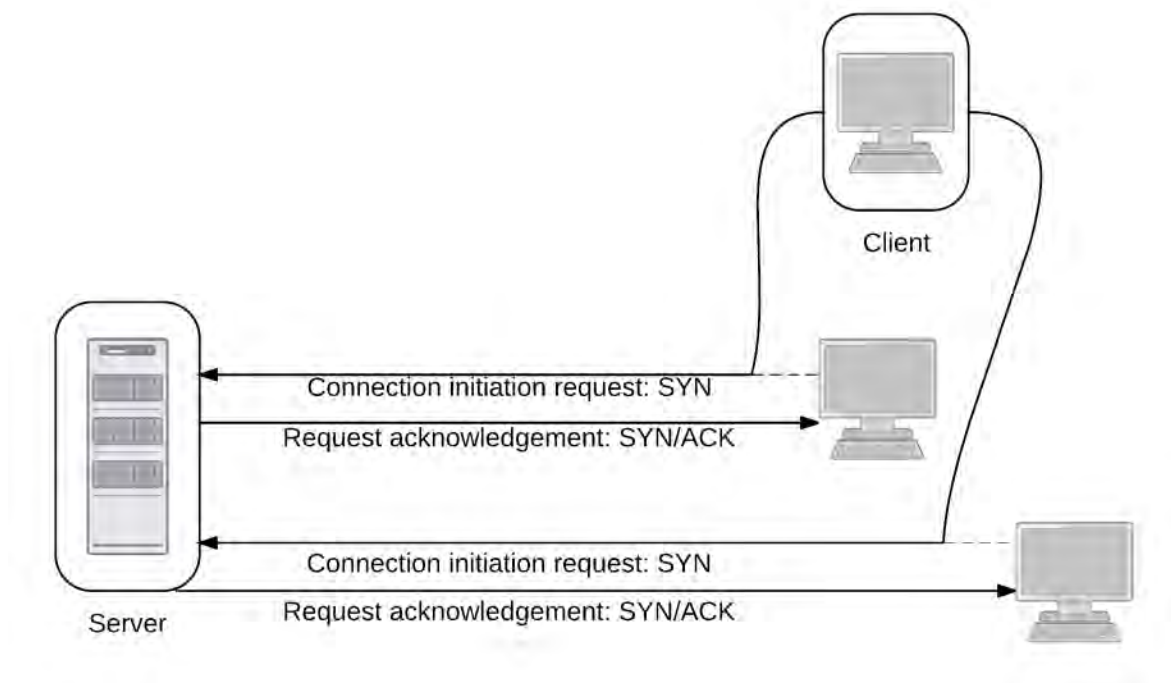

A single client launches a SYN flood attack

SYN floods are seldom launched from a single address so limiting the number of connection attempts from a single IP address is not usually effective.

SYN spoofing

With a flood of SYN packets coming from a single attacker, you can limit the number of connection attempts from the source IP address or block the attacker entirely. To prevent this simple defense from working, or to disguise the source of the attack, the attacker may spoof the source address and use a number of IP addresses to give the appearance of a distributed denial of service (DDoS) attack. When the server receives the spoofed SYN packets, the SYN+ACK replies will go to the spoofed source IP addresses which will either be invalid, or the system receiving the reply will not know what to do with it.

A client launches a SYN spoof attack**DDoS SYN flood**

The most severe form of SYN attack is the distributed SYN flood, one variety of distributed denial of service attack (DDoS). Like the SYN flood, the target receives a flood of SYN packets and the ACK+SYN replies are never answered. The attack is distributed across multiple sources sending SYN packets in a coordinated attack.

Multiple attackers launch a distributed SYN flood

The distributed SYN flood is more difficult to defend against because multiple clients are capable of creating a larger volume of SYN packets than a single client. Even if the server can cope, the volume of traffic may

overwhelm a point in the network upstream of the targeted server. The only defense against this is more bandwidth to prevent any choke-points.

Configuring the SYN threshold to prevent SYN floods

The preferred primary defense against any type of SYN flood is the DoS anomaly check for `tcp_syn_flood` threshold. The threshold value sets an upper limit on the number of new incomplete TCP connections allowed per second. If the number of incomplete connections exceeds the threshold value, and the action is set to **Pass**, the FortiGate unit will allow the SYN packets that exceed the threshold. If the action is set to **Block**, the FortiGate unit will block the SYN packets that exceed the threshold, but it will allow SYN packets from clients that send another SYN packet.

The tools attackers use to generate network traffic will not send a second SYN packet when a SYN+ACK response is not received from the server. These tools will not “retry.” Legitimate clients will retry when no response is received, and these retries are allowed even if they exceed the threshold with the action set to **Block**.

SYN proxy

FortiGate units with network acceleration hardware, whether built-in or installed in the form of an add-on module, offer a third action for the `tcp_syn_flood` threshold. Instead of **Block** and **Pass**, you can choose to **Proxy** the incomplete connections that exceed the threshold value.

When the `tcp_syn_flood` threshold action is set to **f**, incomplete TCP connections are allowed as normal as long as the configured threshold is not exceeded. If the threshold is exceeded, the FortiGate unit will intercept incoming SYN packets from clients and respond with a SYN+ACK packet. If the FortiGate unit receives an ACK response as expected, it will “replay” this exchange to the server to establish a communication session between the client and the server, and allow the communication to proceed.

Other flood types

UDP and ICMP packets can also be used for DoS attacks, though they are less common. TCP SYN packets are so effective because the target receives them and maintains a session table entry for each until they time out. Attacks using UDP or ICMP packets do not require the same level of attention from a target, rendering them less effective. The target will usually drop the offending packets immediately, closing the session.

Use the `udp_flood` and `icmp_flood` thresholds to defend against these DoS attacks.

DoS policies

DDoS attacks vary in nature and intensity. Attacks aimed at saturating the available bandwidth upstream of your service can only be countered by adding more bandwidth. DoS policies can help protect against DDoS attacks that aim to overwhelm your server resources.

DoS policy recommendations

- Use and configure DoS policies to appropriate levels based on your network traffic and topology. This will help drop traffic if an abnormal amount is received.
- It is important to set a good threshold. The threshold defines the maximum number of sessions/packets per second of normal traffic. If the threshold is exceeded, the action is triggered. Threshold defaults are general recommendations, although your network may require very different values.
- One way to find the correct values for your environment is to set the action to **Pass** and enable logging. Observe the logs and adjust the threshold values until you can determine the value at which normal traffic begins to generate attack reports. Set the threshold above this value with the margin you want. Note that the smaller the margin, the

more protected your system will be from DoS attacks, but your system will also be more likely to generate false alarms.

Inside FortiOS: Denial of Service (DoS) Protection

FortiOS DoS protection maintains network integrity and performance by identifying and blocking harmful IPv4 and IPv6-based denial of service (DoS) attacks.

About DoS and DDoS attacks

A denial of service (DoS) occurs when an attacker overwhelms server resources by flooding a target system with anomalous data packets, rendering it unable to service genuine users. A distributed denial of service (DDoS) occurs when an attacker uses a master computer to control a network of compromised systems, otherwise known as a 'botnet', which collectively inundates the target system with excessive anomalous data packets.

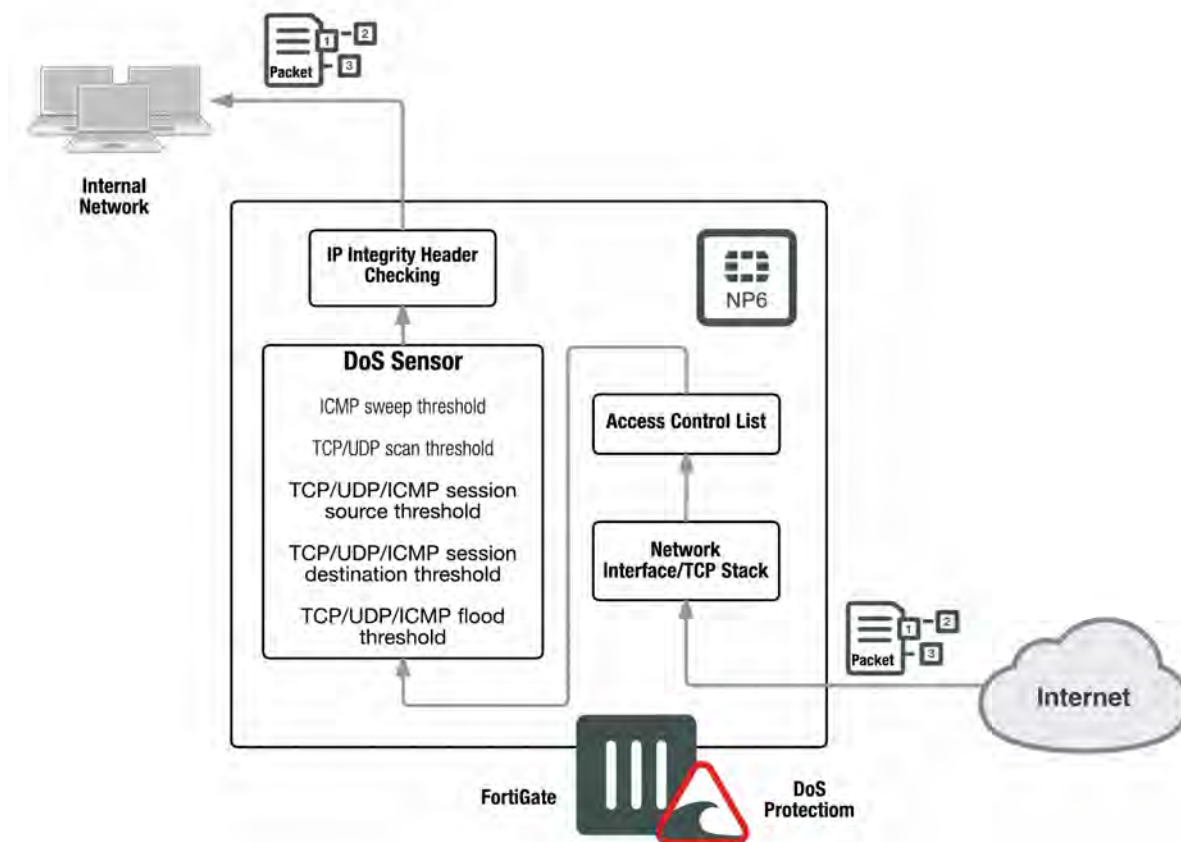

FortiOS DoS and DDoS protection

FortiOS DoS protection identifies potentially harmful traffic that could be part of a DoS or a DDoS attack by looking for specific traffic anomalies. Traffic anomalies that become DoS attacks include: TCP SYN floods, UDP floods, ICMP floods, TCP port scans, TCP session attacks, UDP session attacks, ICMP session attacks, and ICMP sweep attacks. Only traffic identified as part of a DoS attack is blocked; connections from legitimate users are processed normally.

FortiOS applies DoS protection very early in its traffic processing sequence to minimize the effect of a DoS attack on FortiOS system performance. DoS protection is the first step for packets after they are received by a FortiGate interface. Potential DoS attacks are detected and blocked before the packets are sent to other FortiOS systems.

FortiOS also includes an access control list feature that is implemented next. This accelerated ACL technology uses NP6 processors to block traffic (including DoS attacks) by source and destination address and service again before the packets are sent to the FortiGate CPU.

FortiOS DoS protection can operate in a standard configuration or operate out of band in sniffer mode, also known as one-arm mode, similar to intrusion detection systems. When operating in sniffer mode the FortiGate unit detects attacks and logs them without blocking them.

FortiOS DoS policies determine the course of action to take when anomalous traffic reaches a configured packet rate threshold. You can block an attacker, block an interface, block an attacker and interface, or allow traffic to pass through for monitoring purposes. This allows you to maintain network security by gathering information about attacks, monitor potentially offending traffic, or block offenders for the most protection.

FortiGates with NP6 processors also support synproxy DoS protection. An NP6-accelerated TCP SYN proxy offloads the three-way TCP handshake TCP SYN anomaly checking DoS protection to NP6 processors.

FortiOS DDoS Prevention

In addition to using DoS protection for protection against DoS attacks, FortiOS includes a number of features that prevent the spread of Botnet and C&C activity. Mobile Malware or Botnet and C&C protection keeps Botnet and C&C code from entering a protected network and compromising protected systems. As a result, systems on the protected network cannot become Botnet clients.

In addition, FortiOS can monitor and block outgoing Botnet connection attempts. Monitoring allows you to find and remove Botnet clients from your network and blocking prevents infected systems from communicating with Botnet sites.

Configuration options

Choose the standard configuration for maximum protection or configure sniffer mode to gather information.

Standard configuration

DoS protection is commonly configured on a FortiGate unit that connects a private or DMZ network to the Internet or on a FortiWiFi unit that connects a wireless LAN to an internal network and to the Internet. All Internet traffic or wireless LAN traffic passes through DoS protection in the FortiGate unit or the FortiWiFi unit.

Out of band configuration (sniffer mode)

A FortiGate unit in sniffer mode operates out of band as a one-armed Intrusion Detection System by detecting and reporting attacks. It does not process network traffic nor does it take action against threats. The FortiGate interface operating in sniffer mode is connected to a Test Access Point (TAP) or a Switch Port Analyzer (SPAN) port that processes all of the traffic to be analyzed. The TAP or SPAN sends a copy of the switch traffic to the out of band FortiGate for analysis.

FortiOS records log messages and sends alerts to system administrators when a DoS attack is detected. IDS scanning does not affect network performance or network traffic if the IDS fails or goes offline.

DoS policies

DoS policies provide effective and early DoS detection while remaining light on system resources. They are configured to monitor and to stop traffic with abnormal patterns or attributes. The DoS policy recognizes traffic as a threat when the traffic reaches a user-configured packet rate threshold. The policy then determines the appropriate action. In addition to choosing whether or not to log each type of anomaly, you can choose to pass or block threats.

DoS policy anomaly protection is applied to all incoming traffic to a single FortiGate interface, but you can narrow policies by specifying service, source address, and destination address. The FortiGate unit processes DoS policies in their own respective order first, followed by all other firewall policies.

Hardware acceleration

Hardware acceleration enhances protection and increases the efficiency of your network. FortiOS integrated Content Processors (CPs), Network Processors (NPs), and Security Processors (SPs) accelerate specialized security processing. DoS SYN proxy protection is built in to NP6 processors and many Fortinet Security Processors, like the CE4, XE2, and FE8, to guard against TCP SYN floods. TCP packets with the SYN flag are the most efficient DoS attack tool because of how communication sessions are initiated between systems. NP6 and SP processors can offload TCP SYN flood attack detection and blocking. The SP module increases a FortiGate unit's capacity to protect against TCP SYN flood attacks while minimizing the effect of attacks on the FortiGate unit's overall performance and the network performance. The result is improved capacity and overall system performance.

The FortiGuard Center

The FortiGuard Center shows information on all the most recent FortiGuard news, including information concerning zero-day research and hot intrusion detections. Research papers are also available that concern a variety of current security issues.

To view recent developments, go to <http://www.fortiguard.com/static/intrusionprevention.html>.

Firewall Policies

The firewall policies of the FortiGate are one of the most important aspects of the appliance. There are a lot of building blocks and configurations involved in setting up a firewall and it within the policies that a lot of these components come together to form a cohesive unit to perform the firewall's main function, analyzing network traffic and responding appropriately to the results of that analysis.

There are a few different kinds of policies and in most cases these are further divided into IPv4 and IPv6 versions:

- [IPv4 Policy](#) - used for managing traffic going through the appliance using IPv4 protocols
- [IPv6 Policy](#) - used for managing traffic going through the appliance using IPv6 protocols
- [NAT64 Policy](#) - used for managing traffic going through the appliance that converts from IPv6 on the incoming interface to IPv4 on the outgoing interface
- [NAT46 Policy](#) - used for managing traffic going through the appliance that converts from IPv4 on the incoming interface to IPv6 on the outgoing interface
- [Multicast Policy](#) - used to manage traffic sent to multiple destinations
- [IPv4 Access Control List](#) - used to filter out packets based on specific IPV4 parameters.
- [IPv6 Access Control List](#) - used to filter out packets based on specific IPV6 parameters.
- [IPv4 DoS Policy](#) - used to prevent malicious or flawed packets on an IPv4 interface from denying access to users.
- [IPv6 DoS Policy](#) - used to prevent malicious or flawed packets on an IPv6 interface from denying access to users.

Because the policy determines whether or not NAT will be used, it is also import to look at how to configure:

- [Central SNAT](#) - used for granular controlling when NATing is in use.

Viewing Firewall Policies

To find a Policy window, follow one of these path in the GUI:

- **Policy & Objects> IPv4 Policy**
- **Policy & Objects> IPv6 Policy**
- **Policy & Objects> NAT64 Policy**
- **Policy & Objects> NAT46 Policy**
- **Policy & Objects> Proxy Policy**
- **Policy & Objects> Multicast Policy**

You may notice other policy options on the left window pane such as:

- **Policy & Objects> IPv4 DoS Policy**
- **Policy & Objects> IPv6 DoS Policy**
- **Policy & Objects> Local InPolicy**

These are different enough that they have their own descriptions in the sections that relate to them.

Menu Items

There are some variations, but there are some common elements share by all of them. There is a menu bar across the top. The menu bar will have the following items going from left to right:

- **Create New** button
- **Edit** button
- **Delete** button
- **Search** field
- **Interface Pair View**- Displays the policies in the order that they are checked for matching traffic, grouped by the pairs of Incoming and Outgoing interfaces. For instance, all of the policies referencing traffic from WAN1 to DMZ will be in one section. The policies referencing traffic from DMZ to WAN1 will be in another section. The sections are collapsible so that you only need to look at the sections with policies you are interested in.
- **By Sequence**- Displays the policies in the order that they are checked for matching traffic without any grouping.

Menu items not shared by all policies

- **Policy Lookup** - (IPv4, IPv6)
- **NAT64 Forwarding** - (NAT64)

The Table of Policies

Columns

The tables that make up the Policy window are based on rows which represent individual policies and the columns that represent the various parameters or status within the policy. The columns are customizable by which columns are included and what order they are in.

The table can be laid out a number ways to suit the viewer. There is a column for most of the important pieces of information that you might be interested in seeing, but a lot of them are hidden by default. If you had a large enough screen, you might be able to show all of the columns, but even then it might look a bit busy and cramped together. Figure out which pieces of information are most important to you and hide the rest.

To configure which columns are visible and which are hidden, right click on the header row of the table. This will present a drop down menu. The drop down will be divided into sections. At the top will be the **Selected Columns** which are currently visible, and the next section will be **Available Columns** which show which columns are available to add to the table.

To move a column from the **Available** list to the **Selected** list just click on it. To move a column from the **Selected** list to the **Available** list, it also just takes a click of the mouse. To make the changes show up on the table, go to the bottom of the drop down menu and select **Apply**. Any additions to the table will show up on the right side.

One of the more useful ones that can be added is the ID column. The reason for adding this one is that within the configuration file and CLI, the policies are referenced by their ID number. Some policy settings are only available for configuration in the CLI. If you are looking in the CLI you will see that the only designation for a policy is its number and if you wish to edit the policy or change its order in the sequence you will be asked to move it before or after another policy by referencing its number.

How “Any” policy can remove the Interface Pair View

The FortiGate unit will automatically change the view on the policy list page to **By Sequence** whenever there is a policy containing “any” as the Source or Destination interface. If the **Interface Pair View** is grayed out it is likely that one or more of the policies has used the “any” interface.

By using the “any” interface, the policy should go into multiple sections because it could effectively be any of a number of interface pairings. As mentioned, policies are sectioned by using the interface pairings (for example,

port1 -> port2) and each section has its own specific policy order. The order in which a policy is checked for matching criteria to a packet's information is based solely on the position of the policy within its section or within the entire list of policies as a whole but if the policy is in multiple sections at the same time there is no mechanism for placing the policy in a proper order within all of those sections at the same time because it is a manual process and there is no parameter to compare the precedence of one section or policy over the other. Thus a conflict is created. In order to resolve the conflict the FortiGate firewall removes that aspect of the sections so that there is no need to compare and find precedence between the sections and it therefore has only the Global View to work with.

Policy Names

Each policy has a name field. Every policy name must be unique for the current VDOM regardless of policy type. Previous to FortiOS 5.4, this field was optional.

On upgrading from an earlier version of FortiOS to 5.4, policy names are not assigned to old policies, but when configuring new policies, a unique name must be assigned to the policy.

Configuring the Name field

GUI

In the GUI, the field for the policy name is the first field on the editing page.

CLI

In the CLI, the syntax for assigning the policy name is:

```
config firewall [policy|policy6]
  edit 0
    set name <policy name>
  end
```

Disabling Policy name requirement

While by default the requirement of having a unique name for each policy is the default, it can be enabled or disabled. Oddly enough, if disabling the requirement is a one time thing, doing it in the CLI is more straightforward.

This setting is VDOM based so if you are running multiple VDOMs, you will have to enter the correct VDOM before entering the CLI commands or turning the feature on or off in the GUI.

GUI

To edit the requirement in the GUI, the ability to do so must be enabled in the CLI. The syntax is:

```
config system settings
  set gui-allow-unnamed-policy [enable|disable]
end
```

Once it has been enabled, the requirement for named policies can be relaxed by going to **System > Feature Visibility**. Allow **Unnamed Policies** can be found under **Additional Features**. Here you can toggle the requirement on and off.

CLI

To change the requirement in the CLI, use the following syntax:

```
config system settings
    set gui-advance policy [enable|disable]
end
```

IPv4 Policy

To configure a IPv4 policy in the GUI

1. Go to **Policy & Objects > IPv4 Policy**

The right side window will display a table of the existing IPv4 Policies.

- To edit an existing policy, double click on the policy you wish to edit
- To create a new policy, select the **Create New** icon in the top left side of the right window.

2. Make sure the policy has a name in the **Name** field

By default, a policy is required to have a name, but it is possible to toggle this requirement on or off in the CLI, or in the GUI if you have first enabled the GUI option in the CLI.

- #### 3. Set the **Incoming Interface** parameter by selecting the field with the "+" next to the field label. Selecting the field will slide out a window from the right where you can select from the available interfaces. You can select one or more specific interfaces or you can select the **any** option. Choosing the any option will remove any other interfaces. For more information on interfaces, check the Concepts section called [Interfaces and Zones](#).
