The load balancing method defines how sessions are load balanced to real servers. A number of load balancing methods are available as listed below.

All load balancing methods will not send traffic to real servers that are down or not responding. However, the FortiGate unit can only determine if a real server is not responding by using a health check monitor. You should always add at least one health check monitor to a virtual server or to individual real servers, or load balancing methods may attempt to distribute sessions to real servers that are not functioning.

### Static

The traffic load is statically spread evenly across all real servers. However, sessions are not assigned according to how busy individual real servers are. This load balancing method provides some persistence because all sessions from the same source address always go to the same real server. However, the distribution is stateless, so if a real server is added or removed (or goes up or down) the distribution is changed and persistence could be lost.

### Round Robin

Directs new requests to the next real server, and treats all real servers as equals regardless of response time or number of connections. Dead real servers or non responsive real servers are avoided.

### Weighted

Real servers with a higher weight value receive a larger percentage of connections. Set the real server weight when adding a real server.

### Least Session

Directs requests to the real server that has the least number of current connections. This method works best in environments where the real servers or other equipment you are load balancing all have similar capabilities. This load balancing method uses the FortiGate session table to track the number of sessions being processed by each real server. The FortiGate unit cannot detect the number of sessions actually being processed by a real server.

### Least RTT

Directs sessions to the real server with the least round trip time. The round trip time is determined by a Ping health check monitor and is defaulted to 0 if no Ping health check monitors are added to the virtual server.

## First Alive

Always directs sessions to the first alive real server. This load balancing schedule provides real server failover protection by sending all sessions to the first alive real server and if that real server fails, sending all sessions to the next alive real server. Sessions are not distributed to all real servers so all sessions are processed by the “first” real server only.

First refers to the order of the real servers in the virtual server configuration. For example, if you add real servers A, B and C in that order, then all sessions always go to A as long as it is alive. If A goes down then sessions go to B and if B goes down sessions go to C. If A comes back up sessions go back to A. Real servers are ordered in the virtual server configuration in the order in which you add them, with the most recently added real server last. If you want to change the order you must delete and re-add real servers in the required order.

## HTTP Host

Load balances HTTP host connections across multiple real servers using the host's HTTP header to guide the connection to the correct real server.

## Session persistence

Use persistence to make sure that a user is connected to the same real server every time they make an HTTP, HTTPS, or SSL request that is part of the same user session. For example, if you are load balancing HTTP and HTTPS sessions to a collection of eCommerce web servers, when a user is making a purchase they will be starting multiple sessions as they navigate the eCommerce site. In most cases all of the sessions started by this user during on eCommerce session should be processed by the same real server. Typically, the HTTP protocol keeps track of these related sessions using cookies. HTTP cookie persistence makes sure that all sessions that are part of the same user session are processed by the same real server

When you configure persistence, the FortiGate unit load balances a new session to a real server according to the load balance method. If the session has an HTTP cookie or an SSL session ID, the FortiGate unit sends all subsequent sessions with the same HTTP cookie or SSL session ID to the same real server. For more information about HTTP and HTTPS persistence, see [“HTTP and HTTPS persistence”](#).

## Real servers

Add real servers to a load balancing virtual server to provide the information the virtual server requires to be able to send sessions to the server. A real server configuration includes the IP address of the real server and port number that the real server receives sessions on. The FortiGate unit sends sessions to the real server's IP address using the destination port number in the real server configuration.

When configuring a real server you can also specify the weight (used if the load balance method is set to weighted) and you can limit the maximum number of open connections between the FortiGate unit and the real server. If the maximum number of connections is reached for the real server, the FortiGate unit will automatically switch all further connection requests other real servers until the connection number drops below the specified limit. Setting Maximum Connections to 0 means that the FortiGate unit does not limit the number of connections to the real server.

## Real server active, standby, and disabled modes

By default the real server mode setting is active indicating that the real server is available to receive connections. If the real server is removed from the network (for example, for routine maintenance or because of a hardware or

software failure) you can change the mode to standby or disabled. In disabled mode the FortiGate unit no longer sends sessions to the real server.

If a real server is in standby mode the FortiGate also does not send sessions to it unless other real servers added to the same virtual server become unavailable. For example:

- A virtual server that includes two real servers one in active mode and one in standby mode. If the real server in active mode fails, the real server in standby mode is changed to active mode and all sessions are sent to this real server.
- A virtual server includes three real servers, two in active mode and one in standby mode, if one of the real servers in active mode fails, the real server in standby mode is changed to active mode and sessions are load balanced between it and still operating real server. If both real servers in active mode fail, all sessions are sent to the real server in standby mode.

### Adding real servers from the GUI

To add a real server from the GUI go to **Policy & Objects > Virtual Servers**, edit a virtual server and under **Real Servers** select **Create New** to add a real server to this virtual server.

#### IP Address

Enter the IP address of the real server.

#### Port

Enter the port number on the destination network to which the external port number is mapped.

#### Weight

Enter the weight value of the real server. The higher the weight value, the higher the percentage of connections the server will handle. A range of 1-255 can be used. This option is available only if the associated virtual server's load balance method is **Weighted**.

#### Max Connections

Enter the limit on the number of active connections directed to a real server. A range of 1-99999 can be used. If the maximum number of connections is reached for the real server, the FortiGate unit will automatically switch all further connection requests to another server until the connection number drops below the specified limit.

Setting **Maximum Connections** to **0** means that the FortiGate unit does not limit the number of connections to the real server.

#### HTTP Host

Enter the HTTP header for load balancing across multiple real servers. This feature is used for load balancing HTTP host connections across multiple real servers using the host's HTTP header to guide the connection to the correct real server, providing better load balancing for those specific connections.

#### Mode

Select a mode for the real server. The real server can be active, on standby, or disabled.

## Adding real servers from the CLI

To add a real server from the CLI you configure a virtual server and add real servers to it. For example, to add three real servers to a virtual server that load balances UDP sessions on port 8190 using weighted load balancing. For each real server the port is not changed. The default real server port is 0 resulting in the traffic being sent the real server with destination port 8190. Each real sever is given a different weight. Servers with higher weights have a max-connections limit to prevent too many sessions from being sent to them.

```
config firewall vip
 edit Vserver-UDP-1
 set type server-load-balance
 set server-type udp
 set ldb-method weighted
 set extip 172.20.120.30
 set extintf wan1
 set extport 8190
 set monitor ping-mon-1
 config realservers
 edit 1
 set ip 10.31.101.30
 set weight 100
 set max-connections 10000
 next
 edit 2
 set ip 10.31.101.40
 set weight 100
 set max-connections 10000
 next
 edit 3
 set ip 10.31.101.50
 set weight 10
 end
 end
end
```

## Health check monitoring

From the FortiGate GUI you can go to **Policy & Objects > Health Check** and configure health check monitoring so that the FortiGate unit can verify that real servers are able respond to network connection attempts. If a real server responds to connection attempts the load balancer continues to send sessions to it. If a real server stops responding to connection attempts the load balancer assumes that the server is down and does not send sessions to it. The health check monitor configuration determines how the load balancer tests the real servers. You can use a single health check monitor for multiple load balancing configurations.

You can configure TCP, HTTP and Ping health check monitors. Usually you would want the health check monitor to use the same protocol for checking the health of the server as the traffic being load balanced to it. For example, for an HTTP load balancing configuration you would normally use an HTTP health check monitor.

For the TCP and HTTP health check monitors you can specify the destination port to use to connect to the real servers. If you set the port to 0, the health check monitor uses the port defined in the real server. This allows you to use the same health check monitor for multiple real servers using different ports. You can also configure the interval, timeout and retry. A health check occurs every number of seconds indicated by the interval. If a reply is not received within the timeout period the health check is repeated every second. If no response is received after the number of configured retries, the virtual server is considered unresponsive, and load balancing does not send

traffic to that real server. The health check monitor will continue to contact the real server and if successful, the load balancer can resume sending sessions to the recovered real server.

The default health check configuration has an interval of 10 seconds, a timeout of 2 seconds and a retry of 3. This means that the health check monitor checks the health of a real server every 10 seconds. If a reply is not received within 2 seconds the health check monitor re-checks the server every second for 3 retries. If no response is received for 2 seconds after the final retry the server is considered unresponsive. This entire process takes a total of 7 seconds to consider a virtual server as unresponsive (2 second timeout + (3 re-checks x 1 second) + 2 second timeout = 7 seconds). Since this health check process is repeated every 10 seconds, a server can be down for a maximum of  $10 + 7 = 17$  seconds before the health check monitor considers it down.

For HTTP health check monitors, you can add URL that the FortiGate unit connects to when sending a get request to check the health of a HTTP server. The URL should match an actual URL for the real HTTP servers. The URL is optional.

The URL would not usually include an IP address or domain name. Instead it should start with a "/" and be followed by the address of an actual web page on the real server. For example, if the IP address of the real server is 10.31.101.30, the URL "/test\_page.htm" causes the FortiGate unit to send an HTTP get request to "http://10.31.101.30/test\_page.htm".

For HTTP health check monitors, you can also add a matched content phrase that a real HTTP server should include in response to the get request sent by the FortiGate unit using the content of the URL option. If the URL returns a web page, the matched content should exactly match some of the text on the web page. You can use the URL and Matched Content options to verify that an HTTP server is actually operating correctly by responding to get requests with expected web pages. Matched content is only required if you add a URL.

For example, you can set matched content to "server test page" if the real HTTP server page defined by the URL option contains the phrase "server test page". When the FortiGate unit receives the web page in response to the URL get request, the system searches the content of the web page for the matched content phrase.

## Name

Enter the name of the health check monitor configuration.

## Type

Select the protocol used to perform the health check.

- TCP
- HTTP
- PING

## Port

Enter the port number used to perform the health check. If you set the **Port** to 0, the health check monitor uses the port defined in the real server. This way you can use a single health check monitor for different real servers.

This option does not appear if the **Type** is **PING**.

## Interval

Enter the number of seconds between each server health check.

## URL

For HTTP health check monitors, add a URL that the FortiGate unit uses when sending a get request to check the health of a HTTP server. The URL should match an actual URL for the real HTTP servers. The URL is optional.

The URL would not usually include an IP address or domain name. Instead it should start with a “/” and be followed by the address of an actual web page on the real server. For example, if the IP address of the real server is 10.10.10.1, the **URL** “/test\_page.htm” causes the FortiGate unit to send an HTTP get request to “http://10.10.10.1/test\_page.htm”.

This option appears only if **Type** is **HTTP**.

## Matched Content

For HTTP health check monitors, add a phrase that a real HTTP server should include in response to the get request sent by the FortiGate unit using the content of the **URL** option. If the **URL** returns a web page, the **Matched Content** should exactly match some of the text on the web page. You can use the **URL** and **Matched Content** options to verify that an HTTP server is actually operating correctly by responding to get requests with expected web pages. Matched content is only required if you add a URL.

For example, you can set **Matched Content** to “server test page” if the real HTTP server page defined by the URL option contains the phrase “server test page”. When the FortiGate unit receives the web page in response to the URL get request, the system searches the content of the web page for the **Matched Content** phrase.

This option appears only if **Type** is **HTTP**.

## Max Redirects

For an HTTP health check monitor, specify the maximum number of redirects that the health check monitor will follow when testing the health of the real HTTP server. This feature allows you to do health checking of the HTTP server is accessed through one or more redirects.

## Timeout

Enter the number of seconds which must pass after the server health check to indicate a failed health check.

## Retry

Enter the number of times, if any, a failed health check will be retried before the server is determined to be inaccessible.

## Load balancing limitations

The following limitations apply when adding virtual IPs, load balancing virtual servers, and load balancing real servers. Load balancing virtual servers are actually server load balancing virtual IPs. You can add server load balance virtual IPs from the CLI.

- Virtual IP **External IP Address/Range** entries or ranges cannot overlap with each other or with load balancing virtual server **Virtual Server IP** entries.
- A virtual IP **Mapped IP Address/Range** cannot be 0.0.0.0 or 255.255.255.255.
- A real server **IP** cannot be 0.0.0.0 or 255.255.255.255.
- If a static NAT virtual IP **External IP Address/Range** is 0.0.0.0, the **Mapped IP Address/Range** must be a single IP address.

- If a load balance virtual IP **External IP Address/Range** is 0.0.0.0, the **Mapped IP Address/Range** can be an address range.
- When port forwarding, the count of mapped port numbers and external port numbers must be the same. The GUI does this automatically but the CLI does not.
- Virtual IP and virtual server names must be different from firewall address or address group names.

## Monitoring load balancing

From the GUI you can go to **Monitor > Load Balance Monitor** to monitor the status of configured virtual servers and real servers and start or stop the real servers. You can also use the `get test ipldb` command from the CLI to display similar information.

For each real server the monitor displays health status (up or down), active sessions, round trip time (RTT) and the amount of bytes of data processed. From the monitor page you can also stop sending new sessions to any real server. When you select to stop sending sessions the FortiGate unit performs a graceful stop by continuing to send data for sessions that were established or persistent before you selected stop. However, no new sessions are started.

### Virtual Server

The IP addresses of the existing virtual servers.

### Real Server

The IP addresses of the existing real servers.

### Health Status

Displays the health status according to the health check results for each real server. A green arrow means the server is up. A red arrow means the server is down.

### Mode

The mode of the health check monitor. Can be active, standby, or disabled.

### Monitor Events

Display each real server's up and down times.

### Active Sessions

Display each real server's active sessions.

### RTT (ms)

Displays the Round Trip Time (RTT) of each real server. By default, the RTT is "<1". This value will change only when ping monitoring is enabled on a real server.

### Bytes Processed

Displays the traffic processed by each real server.

## Graceful Stop/Start

Select to start or stop real servers. When stopping a server, the FortiGate unit will not accept new sessions but will wait for the active sessions to finish.

## Load balancing diagnose commands

You can also use the following diagnose commands to view status information for load balancing virtual servers and real servers:

```
diagnose firewall vip realserver {down | flush | healthcheck | list | up}
diagnose firewall vip virtual-server {filter | log | real-server | session | stats}
```

For example, the following command lists and displays status information for all real servers:

```
diagnose firewall vip virtual-server real-server

vd root/0 vs vs/2 addr 10.31.101.30:80 status 1/1
conn: max 0 active 0 attempts 0 success 0 drop 0 fail 0

vd root/0 vs vs/2 addr 10.31.101.20:80 status 1/1
conn: max 0 active 0 attempts 0 success 0 drop 0 fail 0
```

Many of the diagnostic commands involve retrieving information about one or more virtual servers. To control which servers are queried you can define a filter:

```
diagnose firewall vip virtual-server filter <filter_str>
```

Where <filter\_str> can be:

- **clear** erase the current filter
- **dst** the destination address range to filter by
- **dst-port** the destination port range to filter by
- **list** display the current filter
- **name** the vip name to filter by
- **negate** negate the specified filter parameter
- **src** the source address range to filter by
- **src-port** the source port range to filter by
- **vd** index of virtual domain. -1 matches all

The default filter is empty so no filtering is done.

## Logging Diagnostics

The logging diagnostics provide information about two separate features:

```
diagnose firewall vip virtual-server log {console | filter}
```

Where

- **console {disable | enable}** enables or disables displaying the event log messages generated by virtual server traffic on the console to simplify debugging.
- **filter** sets a filter for the virtual server debug log
- The filter option controls what entries the virtual server daemon will log to the console if `diagnose debug application vs` level is non-zero. The filtering can be done on source, destination, virtual-server name, virtual domain, and so on:

```
diagnose firewall vip virtual-server log filter <filter_str>
```

Where <filter\_str> can be

- `clear` erase the current filter
- `dst` the destination address range to filter by
- `dst-port` the destination port range to filter by
- `list` display the current filter
- `name` the virtual-server name to filter by
- `negate` negate the specified filter parameter
- `src` the source address range to filter by
- `src-port` the source port range to filter by
- `vd` index of virtual domain. -1 matches all

The default filter is empty so no filtering is done.

## Real server diagnostics

Enter the following command to list all the real servers:

```
diag firewall vip virtual-server real-server list
```

In the following example there is only one virtual server called `slb` and it has two real-servers:

```
diag firewall vip virtual-server server
vd root/0 vs slb/2 addr 172.16.67.191:80 status 1/1
conn: max 10 active 0 attempts 0 success 0 drop 0 fail 0
http: available 0 total 0

vd root/0 vs slb/2 addr 172.16.67.192:80 status 1/1
conn: max 10 active 1 attempts 4 success 4 drop 0 fail 0
http: available 1 total 1
```

The `status` indicates the administrative and operational status of the real-server.

- `max` indicates that the real-server will only allow 10 concurrent connections.
- `active` is the number of current connections to the server attempts is the total number of connections attempted success is the total number of connections that were successful.
- `drop` is the total number of connections that were dropped because the active count hit max.
- `fail` is the total number of connections that failed to complete due to some internal problem (for example, lack of memory).

If the virtual server has HTTP multiplexing enabled then the HTTP section indicates how many established connections to the real-server are available to service a HTTP request and also the total number of connections.

## HTTP and HTTPS load balancing, multiplexing, and persistence

In a firewall load balancing virtual server configuration, you can select HTTP to load balance only HTTP sessions. The virtual server will load balance HTTP sessions received at the virtual server interface with destination IP address that matches the configured virtual server IP and destination port number that matches the configured virtual server port. The default virtual server port for HTTP load balancing is 80, but you can change this to any port number. Similarly for HTTPS load balancing, set the virtual server type to HTTPS and then select the interface, virtual server IP, and virtual server port that matches the HTTPS traffic to be load balanced. Usually HTTPS traffic uses port 443.

You can also configure load balancing to offload SSL processing for HTTPS and SSL traffic. See [SSL/TLS load balancing on page 2987](#).

## HTTP and HTTPS multiplexing

For both HTTP and HTTPS load balancing you can multiplex HTTP requests and responses over a single TCP connection. HTTP multiplexing is a performance saving feature of HTTP/1.1 compliant web servers that provides the ability to pipeline many unrelated HTTP or HTTPS requests on the same connection. This allows a single HTTPD process on the server to interleave and serve multiple requests. The result is fewer idle sessions on the web server so server resources are used more efficiently. HTTP multiplexing can take multiple separate inbound sessions and multiplex them over the same internal session. This may reduce the load on the backend server and increase the overall performance.

HTTP multiplexing may improve performance in some cases. For example, if users web browsers are only compatible with HTTP 1.0. HTTP multiplexing can also improve performance between a web server and the FortiGate unit if the FortiGate unit is performing SSL acceleration. However, in most cases HTTP multiplexing should only be used if enabling it leads to a measurable improvement in performance.

To enable HTTP multiplexing from the GUI, select multiplex HTTP requests/responses over a single TCP connection. To enable HTTP multiplexing from the CLI enable the `http-multiplex` option.

### Preserving the client IP address

Select preserve client IP from the GUI or enable the `http-ip-header` option from the CLI to preserve the IP address of the client in the `X-Forwarded-For` HTTP header. This can be useful in an HTTP multiplexing configuration if you want to be able to see the original client IP address in log messages on the destination web server. If this option is not selected, the `X-Forwarded-For` HTTP header contains the IP address of the FortiGate unit.

### Preserving the client IP address in a different HTTP header

If you select preserve client IP from the GUI or enable the `http-ip-header` option from the CLI you can also preserve the client IP in a different HTTP header. This can be useful if you want to use a custom header name instead of `X-Forwarded-For`.

You can add the custom header name from the CLI. When `http-ip-header` is enabled you can add a custom header name to the `http-ip-header-name` option. If you don't add a name the `X-Forwarded-For` header is used.

## HTTP and HTTPS persistence

Configure load balancing persistence for HTTP or HTTPS to make sure that a user is connected to the same server every time they make a request that is part of the same session. HTTP cookie persistence uses injected cookies to enable persistence.

When you configure persistence, the FortiGate unit load balances a new session to a real server according to the **Load Balance Method**. If the session has an HTTP cookie or an SSL session ID, the FortiGate unit sends all subsequent sessions with the same HTTP cookie or SSL session ID to the same real server.

The following example shows how to enable cookie persistence and set the cookie domain to `.example.org`.

```
config firewall vip
 edit HTTP_Load_Balance
 set type server-load-balance
 set server-type http
 set extport 8080
 set extintf port2
```

```

set extip 192.168.20.20
set persistence http-cookie
set http-cookie-domain .example.org
config realservers
edit 1
 set ip 10.10.10.1
 set port 80
next
edit 2
 set ip 10.10.10.2
 set port 80
next
edit 3
 set ip 10.10.10.3
 set port 80
end

```

## How HTTP cookie persistence options work

The following options are available for the `config firewall vip` command when `type` is set to `server-load-balance`, `server-type` is set to `http` or `https` and `persistence` is set to `http-cookie`:

```

http-cookie-domain-from-host
http-cookie-domain
http-cookie-path
http-cookie-generation
http-cookie-age
http-cookie-share
https-cookie-share

```

When HTTP cookie persistence is enabled the FortiGate unit inserts a header of the following form into each HTTP response unless the corresponding HTTP request already contains a `FGTServer` cookie:

```
Set-Cookie: FGTServer=E7D01637C4B08E89A6714213A9D85D9C7E4D8158; Version=1; Max-Age=3600
```

The value of the `FGTServer` cookie encodes the server that traffic should be directed to. The value is encoded so as to not leak information about the internal network.

Enable `http-cookie-domain-from-host` to extract the cookie domain from the `host:` header in the HTTP request. For example, to restrict the cookie to `.server.com`, enter:

The generated cookies could have the following form if the **Host:** header contains **exhost.com**:

```
Set-Cookie: FGTServer=E7D01637C4B08E89A6714213A9D85D9C7E4D8158; Version=1;
Domain=.exhost.com; Max-Age=3600
```

For more information, see [“HTTP host-based load balancing”](#).

Use `http-cookie-domain` to restrict the domain that the cookie should apply to. For example, to restrict the cookie to `.server.com`, enter:

```
set http-cookie-domain .server.com
```

Now all generated cookies will have the following form:

```
Set-Cookie: FGTServer=E7D01637C4B08E89A6714213A9D85D9C7E4D8158; Version=1;
Domain=.server.com; Max-Age=3600
```

Use `http-cookie-path` to limit the cookies to a particular path. For example, to limit cookies to the path `/sales`, enter:

```
set http-cookie-path /sales
```

Now all generated cookies will have the following form:

```
Set-Cookie: FGTSerVer=E7D01637C4B08E89A6714213A9D85D9C7E4D8158; Version=1;
Domain=.server.com; Path=/sales; Max-Age=3600
```

Use `http-cookie-age` to change how long the browser caches the cookie. You can enter an age in minutes or set the age to 0 to make the browser keep the cookie indefinitely:

```
set http-cookie-age 0
```

Now all generated cookies will have the following form:

```
Set-Cookie: FGTSerVer=E7D01637C4B08E89A6714213A9D85D9C7E4D8158; Version=1;
Domain=.server.com; Path=/sales
```

Use `http-cookie-generation` to invalidate all cookies that have already been generated. The exact value of the generation is not important, only that it is different from any generation that has already been used for cookies in this domain. The simplest approach is to increment the generation by one each time invalidation is required. Since the default is 0, enter the following to invalidate all existing cookies:

```
set http-cookie-generation 1
```

Use `http-cookie-share {disable | same-ip}` to control the sharing of cookies across virtual servers in the same virtual domain. The default setting `same-ip` means that any `FGTSerVer` cookie generated by one virtual server can be used by another virtual server in the same virtual domain. For example, if you have an application that starts on HTTP and then changes to HTTPS and you want to make sure that the same server is used for the HTTP and HTTPS traffic then you can create two virtual servers, one for port 80 (for HTTP) and one for port 443 (for HTTPS). As long as you add the same real servers to both of these virtual servers (and as long as both virtual servers have the same number of real servers with the same IP addresses), then cookies generated by accessing the HTTP server are reused when the application changes to the HTTPS server.

If for any reason you do not want this sharing to occur then select `disable` to make sure that a cookie generated for a virtual server cannot be used by other virtual servers.

Use `https-cookie-secure` to enable or disable using secure cookies. Secure cookies are disabled by default because secure cookies can interfere with cookie sharing across HTTP and HTTPS virtual servers. If enabled, then the `Secure` tag is added to the cookie inserted by the FortiGate unit:

```
Set-Cookie: FGTSerVer=E7D01637C4B08E89A6714213A9D85D9C7E4D8158; Version=1; Max-Age=3600;
Secure
```

## HTTP host-based load balancing

When configuring HTTP or HTTPS load balancing you can select HTTP host load balancing to load balance HTTP host connections across multiple real servers using the host's HTTP header to guide the connection to the correct real server. HTTP 1.1 includes the concept of a virtual server which allows a HTTP or HTTPS server with a single external IP address to serve requests for multiple DNS domains by using the mandatory `Host:` header in a HTTP request to indicate which DNS domain the request is destined for.

FortiOS can load-balance HTTP and HTTPS connections among multiple real servers using the `Host:` header to guide the connection to the correct real server. The host load balancing method allows a real server to specify a `http-host` attribute which is the domain name of the traffic for that real server. Each real server can only specify a single domain name. The same domain name can appear in more than one real server but only the first one that is up will be used, any others are purely for redundancy. If the `Host:` header contains a domain that does not match any `http-host` entry then the connection will be dropped. A real server with no `http-host` can be matched by any `Host:` domain.

For example, consider a FortiGate unit that is load-balancing traffic to three real servers. Traffic for `www.example1.com` should go to `192.168.2.1`, traffic for `www.example2.com` should go to `192.168.2.2` and traffic to any other domain should go to `192.168.2.3`. To enable this configuration you would add a virtual server and set the load balance method to HTTP host. Then you would add three real servers and set the HTTP host of

the real server with IP address 192.168.2.1 to www.example1.com, the HTTP host of the real server with IP address 192.168.2.2 to www.example2.com and you would not specify an HTTP host for the third real server.

The configuration of a virtual IP to achieve this result would be:

```
config firewall vip
 edit "http-host-ldb"
 set type server-load-balance
 set extip 172.16.67.195
 set extintf "lan"
 set server-type http
 set ldb-method http-host
 set extport 80
 config realservers
 edit 1
 set http-host "www.example1.com"
 set ip 192.168.2.1
 set port 80
 next
 edit 2
 set http-host "www.example2.com"
 set ip 192.168.2.2
 set port 80
 next
 edit 3
 set ip 192.168.2.3
 set port 80
 next
 end
 end
end
```

## Host load balancing and HTTP cookie persistence

In an HTTP host-based load balancing configuration with HTTP cookie persistence enabled you can optionally configure cookie persistence to use the domain set in the host header as the cookie domain. You can do this by enabling the `http-cookie-domain-from-host` option, for example:

```
config firewall vip
 edit "http-host-ldb"
 set type server-load-balance
 set extip 172.16.67.195
 set extintf "lan"
 set server-type http
 set ldb-method http-host
 set extport 80
 set persistence http-cookie
 set http-cookie-domain-from-host enable
 config realservers
 edit 1
 set http-host "www.example1.com"
 set ip 192.168.2.1
 set port 80
 next
 edit 2
 set http-host "www.example2.com"
 set ip 192.168.2.2
 set port 80
 next
 end
 end
end
```

```
edit 3
 set ip 192.168.2.3
 set port 80
next
end
```

## SSL/TLS load balancing

In a firewall load balancing virtual server configuration, you can select SSL to load balance only SSL and TLS sessions. The virtual server will load balance SSL and TLS sessions received at the virtual server interface with destination IP address that matches the configured virtual server IP and destination port number that matches the configured virtual server port. Change this port to match the destination port of the sessions to be load balanced.

For SSL load balancing you can also set persistence to SSL session ID. Persistence is achieved by the FortiGate unit sending all sessions with the same SSL session ID to the same real server. When you configure persistence, the FortiGate unit load balances a new session to a real server according to the **Load Balance Method**. If the session has an SSL session ID, the FortiGate unit sends all subsequent sessions with the same SSL session ID to the same real server.

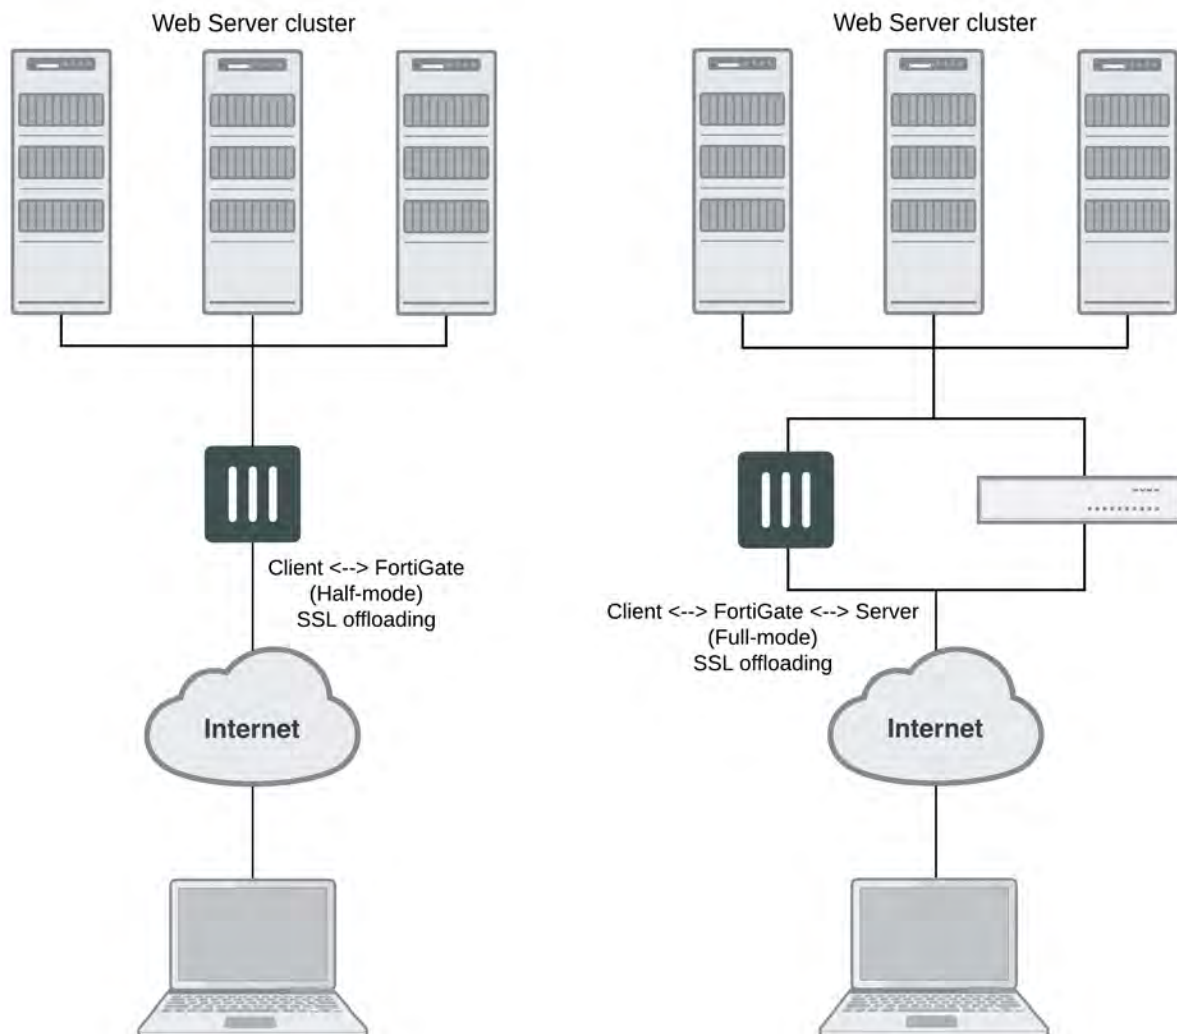

## SSL/TLS offloading

Use SSL offloading to accelerate clients' SSL or HTTPS connections to real servers by using the FortiGate unit to perform SSL/TLS operations (offloading them from the real servers using the FortiGate unit's SSL acceleration hardware). FortiGate units can offload most versions of SSL/TLS, including SSL 3.0, TLS 1.0 and TLS 1.2. SSL/TLS offloading is available on FortiGate units that support SSL acceleration.

To configure SSL offloading from the GUI go to **Policy & Objects > Virtual Servers**. Add a virtual server and set the type to HTTPS or SSL and select the SSL offloading type (**Client <-> FortiGate** or **Client <-> FortiGate <-> Server**).

Select **Client <-> FortiGate** to apply hardware accelerated SSL/TLS processing only to the part of the connection between the client and the FortiGate unit. This mode is called half mode SSL offloading. The segment between the FortiGate unit and the server will use clear text communications. This results in best performance, but cannot be used in failover configurations where the failover path does not have an SSL accelerator.

Select **Client <-> FortiGate <-> Server** to apply hardware accelerated SSL processing to both parts of the connection: the segment between client and the FortiGate unit, and the segment between the FortiGate unit and the server. This mode is called full mode SSL offloading. The segment between the FortiGate unit and the server will use encrypted communications, but the handshakes will be abbreviated. This is not as efficient as half mode SSL offloading, but still improves performance. As well full-mode SSL offloading can be used in failover configurations where the failover path does not have an SSL accelerator. If the server is already configured to use SSL, this also enables SSL acceleration without requiring changes to the server's configuration.

**SSL Offloading modes (Half Mode and Full Mode)**

Configuring SSL offloading also requires selecting a certificate to use for the SSL offloading sessions. SSL offloading supports key sizes up to 4096. FortiGate models with CP9 processors support 3072 and 4096 DH bit sizes in hardware. All FortiGate models up to and including those with CP8 processors only support offloading DH bit sizes up to 2048 so any sizes larger than that are done in software and thus are relatively resource intensive.

The following CLI command shows an example half mode HTTPS SSL offloading configuration. In the example the `ssl-mode` option sets the SSL offload mode to `half` (which is the default mode).

```
config firewall vip
 edit Vserver-ssl-offload
 set type server-load-balance
 set server-type https
 set ldb-method round-robin
 set extip 172.20.120.30
 set extintf wan1
 set extport 443
```

```
set persistence ssl-session-id
set ssl-mode half
set ssl-certificate my-cert
set monitor tcp-mon-1
config realservers
edit 1
 set ip 10.31.101.30
 set port 443
next
edit 2
 set ip 10.31.101.40
 set port 443
end
end
```

## Separate virtual-server client and server TLS version and cipher configuration

In previous versions of FortiOS you can configure minimum and maximum SSL/TLS versions that a virtual server will accept. Those versions primarily applied to the client to FortiGate connection; but, they are also applied to the FortiGate to server connection. In some cases you may want the to use different versions of SSL or TLS on the client to FortiGate connection than on the FortiGate to server connection. For example, you may want to use the FortiGate to protect a legacy SSL 3.0 or TLS 1.0 server while making sure that client to FortiGate connections must always use the higher level of protection offered by TLS 1.1 or greater.

Similarly in previous versions of FortiOS you could control the cypher suites that can be used by the FortiGate to negotiate with the client and with the server. But you could only configure the same configuration for both client and server connections. Also, in some cases you might want to protect a server that only has weak ciphers (for example, DES or RC4) while making sure that all connections between the FortiGate and the client use a strong cipher for better protection.

The following new options are available when configuring server load balancing for HTTPS sessions configured with the following command:

```
config firewall vip
edit server-name
 set type server-load-balance
 set server-type https
 set ssl-mode full
...
```

## Setting the SSL/TLS versions to use for server and client connections

The `ssl-server-min-version`, `ssl-server-max-version`, `ssl-min-version` and `ssl-max-version` configuration options allow the minimum and maximum SSL/TLS versions for the client to FortiGate connection to be independent of the FortiGate to server configuration. By default these options are both set to `client` and the configured `ssl-min-version` and `ssl-max-version` settings are applied to both the client and the server connection.

You can change the `ssl-server-min-version` and `ssl-server-max-version` to apply different options to the server connection. The `ssl-min-version` and `ssl-max-version` settings are still applied to the client connection. If you set the `ssl-server-min-version` and `ssl-server-max-version` to an explicit version then both must be set to an explicit version.

The `ssl-server-min-version` and `ssl-server-max-version` options allow you to specify the minimum and maximum SSL/TLS versions the FortiGate will offer to the server (in the record header of the ClientHello) when performing full mode SSL offloading and thus the minimum and maximum SSL/TLS versions the FortiGate accepts from the server (in a ServerHello). If the server responds with a version in its ServerHello that is lower than `ssl-server-min-version` or higher than the `ssl-server-max-version` then the FortiGate terminates the connection.

Command syntax is:

```
config firewall vip
 edit server-name
 set type server-load-balance
 set server-type https
 set ssl-mode full
 set ssl-min-version {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2}
 set ssl-max-version {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2}
 set ssl-server-min-version {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2 | client}
 set ssl-server-max-version {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2 | client}
```

## Setting the SSL/TLS cipher choices for server and client connections

The `ssl-algorithm` and `ssl-server-algorithm` configuration options allow the cipher choice for the FortiGate to server connection to be independent of the client to FortiGate connection. By default, `ssl-server-algorithm` is set to `client` and the configured `ssl-algorithm` setting is applied to both the client and the server connection.

You can change the `ssl-server-algorithm` to apply different options to the server connection. The `ssl-algorithm` setting is still applied to the client connection.

The following `ssl-server-algorithm` options are available:

- `high`, offer AES or 3DES cypher suites in the ServerHello
- `medium`, use AES, 3DES, or RC4 cypher suites in the ServerHello
- `low`, use AES, 3DES, RC4, or DES cypher suites in the ServerHello
- `custom`, specify custom cypher suites using the `config ssl-server-cipher-suites` and offer these custom cypher suites in the ServerHello.
- `client`, offer the cypher suites in the ServerHello that are offered in the ClientHello.

Command syntax is:

```
config firewall vip
 edit server-name
 set type server-load-balance
 set server-type https
 set ssl-mode full
 set ssl-algorithm {high | medium | low | custom}
 set ssl-server-algorithm {high | medium | low | custom | client}
```

If you set `ssl-server-algorithm` to `custom`, the syntax is:

```
config firewall vip
 edit server-name
 set type server-load-balance
 set server-type https
 set ssl-mode full
 set ssl-server-algorithm custom
 config ssl-server-cipher-suites
```

```

edit 10
 set cipher <cipher-suite>
 set versions {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2}
next
edit 20
 set cipher <cipher-suite>
 set versions {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2}
end

```

## Protection from TLS protocol downgrade attacks

The `ssl-client-fallback` option, when enabled (the default configuration), performs downgrade attack prevention (RFC 7507).

Command syntax is:

```

config firewall vip
edit server-name
 set type server-load-balance
 set server-type https
 set ssl-client-fallback {disable | enable}

```

## Setting 3072- and 4096-bit Diffie-Hellman values

The `ssl-dh-bits` option allows you to specify the number of bits of the prime number used in the Diffie-Hellman exchange for RSA encryption of the SSL connection. Larger prime numbers are associated with greater cryptographic strength. You can set DH values from 768 to 4096 bits.

Command syntax is:

```

config firewall vip
edit server-name
 set type server-load-balance
 set server-type https
 set ssl-dh-bits {768 | 1024 | 1536 | 2048 | 3072 | 4096}

```

Setting the DH bits to 2048 only provides the equivalent of a symmetric cipher in the range of 112 - 128 bits. This means that if AES 256 is used then the weakest point is the DH of 2048 and a value of at least 3072 should be used if the goal is to have 256 bits of security.

FortiGate models with CP9 processors support 3072 and 4096 DH bit sizes in hardware. All FortiGate models up to and including those with CP8 processors only support offloading DH bit sizes up to 2048 so any sizes larger than that are done in software and thus are relatively resource intensive.

## Additional SSL load balancing and SSL offloading options

The following SSL load balancing and SSL offloading options are only available from the CLI:

```
ssl-client-session-state-max <sessionstates_int>
```

Enter the maximum number of SSL session states to keep for the segment of the SSL connection between the client and the FortiGate unit.

```
ssl-client-session-state-timeout <timeout_int>
```

Enter the number of minutes to keep the SSL session states for the segment of the SSL connection between the client and the FortiGate unit.

```
ssl-client-session-state-type {both | client | disable | time}
```

Select which method the FortiGate unit should use when deciding to expire SSL sessions for the segment of the SSL connection between the client and the FortiGate unit.

- **both:** Select to expire SSL session states when either `ssl-client-session-state-max` or `ssl-client-session-state-timeout` is exceeded, regardless of which occurs first.
- **count:** Select to expire SSL session states when `ssl-client-session-state-max` is exceeded.
- **disable:** Select to keep no SSL session states.
- **time:** Select to expire SSL session states when `ssl-client-session-state-timeout` is exceeded.

```
ssl-http-location-conversion {enable | disable}
```

Select to replace `http` with `https` in the reply's `Location` HTTP header field. For example, in the reply, `Location: http://example.com/` would be converted to `Location: https://example.com/`

```
ssl-http-match-host {enable | disable}
```

Select to apply `Location` conversion to the reply's HTTP header only if the host name portion of `Location` matches the request's `Host` field, or, if the `Host` field does not exist, the host name portion of the request's URI. If disabled, conversion occurs regardless of whether the host names in the request and the reply match.

For example, if host matching is enabled, and a request contains `Host: example.com` and the reply contains `Location: http://example.cc/`, the `Location` field does not match the host of the original request and the reply's `Location` field remains unchanged. If the reply contains `Location: http://example.com/`, however, then the FortiGate unit detects the matching host name and converts the reply field to `Location: https://example.com/`.

This option appears only if `ssl-http-location-conversion` is `enable`.

```
ssl-send-empty-frags {enable | disable}
```

Select to precede the record with empty fragments to protect from attacks on CBC IV. You might disable this option if SSL acceleration will be used with an old or buggy SSL implementation which cannot properly handle empty fragments.

```
ssl-server-session-state-max <sessionstates_int>
```

Enter the maximum number of SSL session states to keep for the segment of the SSL connection between the server and the FortiGate unit.

```
ssl-server-session-state-timeout <timeout_int>
```

Enter the number of minutes to keep the SSL session states for the segment of the SSL connection between the server and the FortiGate unit. This option appears only if `ssl-mode` is `full`.

```
ssl-server-session-state-type {both | count | disable | time}
```

Select which method the FortiGate unit should use when deciding to expire SSL sessions for the segment of the SSL connection between the server and the FortiGate unit. This option appears only if `ssl-mode` is `full`.

- **both:** Select to expire SSL session states when either `ssl-server-session-state-max` or `ssl-server-session-state-timeout` is exceeded, regardless of which occurs first.
- **count:** Select to expire SSL session states when `ssl-server-session-state-max` is exceeded.
- **disable:** Select to keep no SSL session states.
- **time:** Select to expire SSL session states when `ssl-server-session-state-timeout` is exceeded.

## SSL offloading support for Internet Explorer 6

In some cases the Internet Explorer 6 web browser may be able to access real servers. To resolve this issue, disable the `ssl-send-empty-frags` option:

```
config firewall vip
 edit vip_name
```

```

 set type server-load-balance
 set server-type https
 set ssl-send-empty-frags disable
end

```

You can disable this option if SSL acceleration will be used with an old or buggy SSL implementation that cannot properly handle empty fragments.

## Selecting the cipher suites available for SSL load balancing

You can use the following command to view the complete list of cipher suites available for SSL offloading:

```

config firewall vip
edit <vip-name>
 set type server-load-balance
 set server-type https
 set ssl-algorithm custom
 config ssl-cipher-suites
 edit 0
 set cipher ?

```

In most configurations the matching cipher suite is automatically selected but you can limit the set of cipher suites that are available for a given SSL offloading configuration. For example, use the following command to limit an SSL load balancing configuration to use the three cipher suites that support ChaCha20 and Poly1305:

```

config firewall vip
edit <vip-name>
 set type server-load-balance
 set server-type https
 set ssl-algorithm custom
 config ssl-cipher-suites
 edit 1
 set cipher TLS-ECDHE-RSA-WITH-CHACHA20-POLY1305-SHA256
 next
 edit 2
 set cipher TLS-ECDHE-ECDSA-WITH-CHACHA20-POLY1305-SHA256
 next
 edit 3
 set cipher TLS-DHE-RSA-WITH-CHACHA20-POLY1305-SHA256
 end
 end
end

```

## Disabling SSL/TLS re-negotiation

The vulnerability [CVE-2009-3555](#) affects all SSL/TLS servers that support re-negotiation. FortiOS when configured for SSL/TLS offloading is operating as a SSL/TLS server. The IETF is working on a TLS protocol change that will fix the problem identified by CVE-2009-3555 while still supporting re-negotiation. Until that protocol change is available, you can use the `ssl-client-renegotiation` option to disable support for SSL/TLS re-negotiation. The default value of this option is `allow`, which allows an SSL client to renegotiate. You can change the setting to `deny` to abort any attempts by an SSL client to renegotiate. If you select `deny` as soon as a `ClientHello` message indicating a re-negotiation is received from the client FortiOS terminates the TCP connection.

Since SSL offloading does not support requesting client certificates the only circumstance in which a re-negotiation is required is when more than 2<sup>32</sup> bytes of data are exchanged over a single handshake. If you are

sure that this volume of traffic will not occur then you can disable re-negotiation and avoid any possibility of the attack described in CVE-2009-3555.

The re-negotiation behavior can be tested using OpenSSL. The OpenSSL `s_client` application has the feature that the user can request that it do renegotiation by typing "R". For example, the following shows a successful re-negotiation against a FortiGate unit configured with a VIP for 192.168.2.100:443:

```
$ openssl s_client -connect 192.168.2.100:443
CONNECTED(00000003)

## IP, TCP, and UDP load balancing

You can load balance all IP, TCP or UDP sessions accepted by the security policy that includes a load balancing virtual server with the type set to IP, TCP, or UDP. Traffic with destination IP and port that matches the virtual server IP and port is load balanced. For these protocol-level load balancing virtual servers you can select a load balance method and add real servers and health checking. However, you can't configure persistence, HTTP multiplexing and SSL offloading.

## Example HTTP load balancing to three real web servers

In this example, a virtual web server with IP address 192.168.37.4 on the Internet, is mapped to three real web servers connected to the FortiGate unit dmz1 interface. The real servers have IP addresses 10.10.123.42, 10.10.123.43, and 10.10.123.44. The virtual server uses the **First Alive** load balancing method. The configuration also includes an HTTP health check monitor that includes a URL used by the FortiGate unit for get requests to monitor the health of the real servers.

Connections to the virtual web server at IP address 192.168.37.4 from the Internet are translated and load balanced to the real servers by the FortiGate unit. First alive load balancing directs all sessions to the first real server. The computers on the Internet are unaware of this translation and load balancing and see a single virtual server at IP address 192.168.37.4 rather than the three real servers behind the FortiGate unit.

### Virtual server configuration example

### GUI configuration

Use the following procedures to configure this load balancing setup from the GUI.

#### To add an HTTP health check monitor

In this example, the HTTP health check monitor includes the **URL** “/index.html” and the **Matched Phrase** “Fortinet products”.

1. Go to **Policy & Objects > Health Check**.
2. Select **Create New**.
3. Add an HTTP health check monitor that sends get requests to `http://<real_server_IP_address>/index.html` and searches the returned web page for the phrase “Fortinet products”.

|                        |                   |
|------------------------|-------------------|
| <b>Name</b>            | HTTP_health_chk_1 |
| <b>Type</b>            | HTTP              |
| <b>Port</b>            | 80                |
| <b>URL</b>             | /index.html       |
| <b>Matched Content</b> | Fortinet products |

|                 |            |
|-----------------|------------|
| <b>Interval</b> | 10 seconds |
| <b>Timeout</b>  | 2 seconds  |
| <b>Retry</b>    | 3          |

4. Select **OK**.

#### To add the HTTP virtual server and the real servers

1. Go to **Policy & Objects > Virtual Servers**.
2. Select **Create New**.
3. Add an HTTP virtual server that allows users on the Internet to connect to the real servers on the internal network. In this example, the FortiGate wan1 interface is connected to the Internet.

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Virtual Server IP</b>   | 192.168.37.4<br><br>The public IP address of the web server.<br><br>The virtual server IP address is usually a static IP address obtained from your ISP for your web server. This address must be a unique IP address that is not used by another host and cannot be the same as the IP address of the external interface the virtual IP will be using. However, the external IP address must be routed to the selected interface. The virtual IP address and the external IP address can be on different subnets. When you add the virtual IP, the external interface responds to ARP requests for the external IP address. |

| <b>IP Address</b>      | 10.10.10.42                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Port</b>            | 80                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Max Connections</b> | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                        | Setting <b>Max Connections</b> to 0 means the FortiGate unit does not limit the number of connections to the real server. Since the virtual server uses <b>First Alive</b> load balancing you may want to limit the number of connections to each real server to limit the traffic received by each server. In this example, the <b>Max Connections</b> is initially set to 0 but can be adjusted later if the real servers are getting too much traffic. |
| <b>Mode</b>            | Active                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Configuration for the second real server.

|                        |             |
|------------------------|-------------|
| <b>IP Address</b>      | 10.10.10.43 |
| <b>Port</b>            | 80          |
| <b>Max Connections</b> | 0           |
| <b>Mode</b>            | Active      |

Configuration for the third real server.

|                        |             |
|------------------------|-------------|
| <b>IP Address</b>      | 10.10.10.44 |
| <b>Port</b>            | 80          |
| <b>Max Connections</b> | 0           |
| <b>Mode</b>            | Active      |

### To add the virtual server to a security policy

Add a wan1 to dmz1 security policy that uses the virtual server so that when users on the Internet attempt to connect to the web server's IP address, packets pass through the FortiGate unit from the wan1 interface to the dmz1 interface. The virtual IP translates the destination address of these packets from the virtual server IP address to the real server IP addresses.

1. Go to **Policy & Objects > IPv4 Policy**.
2. Select **Create New**.
3. Configure the security policy:

|                           |                            |
|---------------------------|----------------------------|
| <b>Name</b>               | Add a name for the policy. |
| <b>Incoming Interface</b> | wan1                       |

|                            |                                                                          |
|----------------------------|--------------------------------------------------------------------------|
| <b>Outgoing Interface</b>  | dmz1                                                                     |
| <b>Source</b>              | all (or a more specific address)                                         |
| <b>Destination</b>         | Load_Bal_VS1                                                             |
| <b>Schedule</b>            | always                                                                   |
| <b>Service</b>             | HTTP                                                                     |
| <b>Action</b>              | ACCEPT                                                                   |
| <b>NAT</b>                 | Select this option and select <b>Use Destination Interface Address</b> . |
| <b>Log Allowed Traffic</b> | Select to log virtual server traffic                                     |

4. Select other security policy options as required.
5. Select **OK**.

## CLI configuration

Use the following procedure to configure this load balancing setup from the CLI.

### To configure HTTP load balancing

1. Use the following command to add an HTTP health check monitor that sends get requests to `http://<real_server_IP_address>/index.html` and searches the returned web page for the phrase "Fortinet products".

```
config firewall ldb-monitor
edit HTTP_health_chk_1
set type http
set port 80
set http-get /index.html
set http-match "Fortinet products"
set interval 10
set timeout 2
set retry 3
end
```

2. Use the following command to add an HTTP virtual server that allows users on the Internet to connect to the real servers on the internal network. In this example, the FortiGate wan1 interface is connected to the Internet.

```
config firewall vip
edit Load-Bal_VS1
set type server-load-balance
set server-type http
set ldb-method first-alive
set http-multiplex enable
set http-ip-header enable
set extip 192.168.37.4
set extintf wan1
set extport 80
set persistence http-cookie
set monitor HTTP_health_chk_1
config realservers
edit 1
set ip 10.10.10.42
set port 80
```

```
 next
 edit 2
 set ip 10.10.10.43
 set port 80
 next
 edit 3
 set ip 10.10.10.44
 set port 80
 end
 end
end
```

3. Use the following command to add a security policy that includes the load balance virtual server as the destination address.

```
config firewall policy
 edit 0
 set name <policy-name>
 set srcintf wan1
 set srcaddr all
 set dstintf dmz1
 set dstaddr Load-Bal_VS1
 set action accept
 set schedule always
 set service ALL
 set nat enable
 end
```

Configure other security policy settings as required.

## Example Basic IP load balancing configuration

This example shows how to add a server load balancing virtual IP that load balances all traffic among 3 real servers. In the example the Internet is connected to `port2` and the virtual IP address of the virtual server is 192.168.20.20. The load balancing method is `weighted`. The IP addresses of the real servers are 10.10.10.1, 10.10.10.2, and 10.10.10.3. The weights for the real servers are 1, 2, and 3. The default weight is 1 and does not have to be changed for the first real server.

```
config firewall vip
 edit All_Load_Balance
 set type server-load-balance
 set server-type ip
 set extintf port2
 set extip 192.168.20.20
 set ldb-method weighted
 config realservers
 edit 1
 set ip 10.10.10.1
 next
 edit 2
 set ip 10.10.10.2
 set weight 2
 next
 edit 3
 set ip 10.10.10.3
 set weight 3
 end
 end
```

end

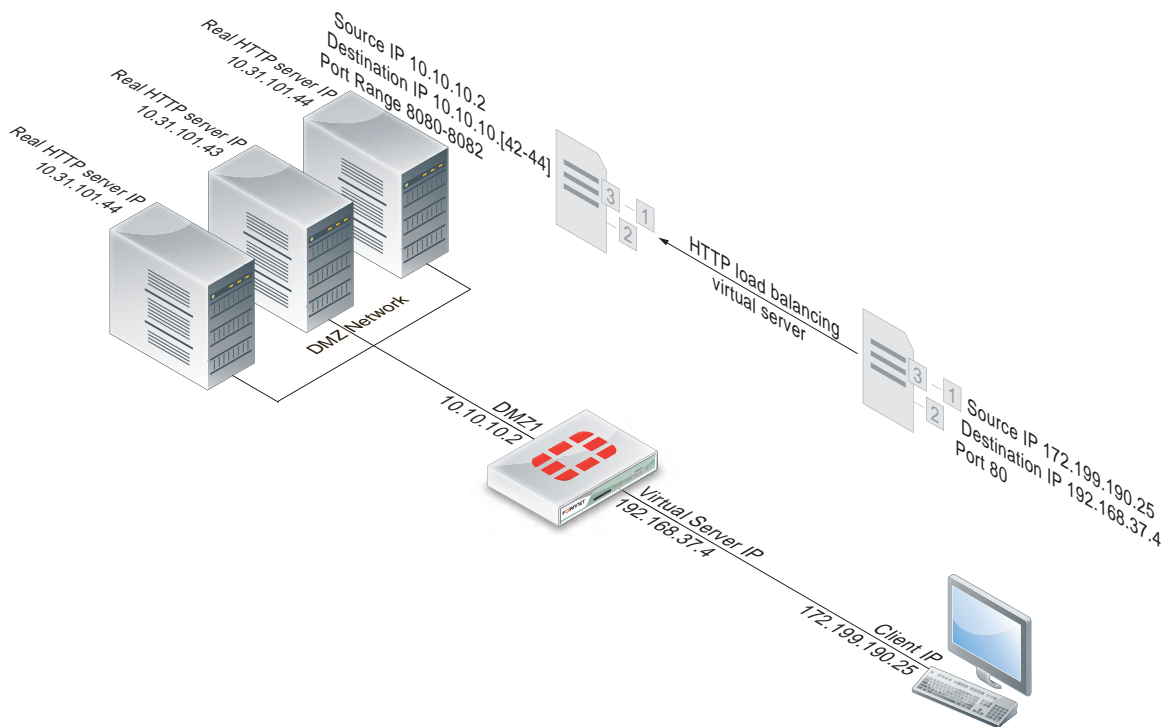

## Example Adding a server load balance port forwarding virtual IP

In this example, a virtual web server with IP address 192.168.37.4 on the Internet, is mapped to three real web servers connected to the FortiGate unit dmz1 interface. The real servers have IP addresses 10.10.123.42, 10.10.123.43, and 10.10.123.44. The virtual server uses the **First Alive** load balancing method.

Each real server accepts HTTP connections on a different port number. The first real server accepts connections on port 8080, the second on port 8081, and the third on 8082. The configuration also includes an HTTP health check monitor that includes a URL used by the FortiGate unit for get requests to monitor the health of the real servers.

Connections to the virtual web server at IP address 192.168.37.4 from the Internet are translated and load balanced to the real servers by the FortiGate unit. First alive load balancing directs all sessions to the first real server. The computers on the Internet are unaware of this translation and load balancing and see a single virtual server at IP address 192.168.37.4 rather than the three real servers behind the FortiGate unit.

### Server load balance virtual IP port forwarding

To complete this configuration, all of the steps would be the same as in [Example Adding a server load balance port forwarding virtual IP on page 3003](#) except for configuring the real servers.

### To add the real servers to the virtual server

Use the following steps to add three real servers to the virtual server Load\_Bal\_VS1. These real servers cause the FortiGate unit to forward HTTP packets to the three real servers on ports 8080, 8081, and 8082.

1. Go to **Policy & Objects > Virtual Servers** and edit the **Load\_Bal\_VS1** virtual server.
2. Select **Create New**.
3. Add the following three real servers. Each real server must include the IP address of a real server on the internal network and have a different port number.

Configuration for the first real server.

|                        |             |
|------------------------|-------------|
| <b>IP Address</b>      | 10.10.10.42 |
| <b>Port</b>            | 8080        |
| <b>Max Connections</b> | 0           |
| <b>Mode</b>            | Active      |

Configuration for the second real server.

|                        |             |
|------------------------|-------------|
| <b>IP</b>              | 10.10.10.43 |
| <b>Port</b>            | 8081        |
| <b>Max Connections</b> | 0           |
| <b>Mode</b>            | Active      |

Configuration for the third real server.

|                        |             |
|------------------------|-------------|
| <b>IP</b>              | 10.10.10.44 |
| <b>Port</b>            | 8082        |
| <b>Max Connections</b> | 0           |
| <b>Mode</b>            | Active      |

## Example Weighted load balancing configuration

This example shows how to using firewall load balancing to load balances all traffic among 3 real servers. In the example the Internet is connected to `port2` and the virtual IP address of the virtual server is 192.168.20.20. The load balancing method is `weighted`. The IP addresses of the real servers are 10.10.10.1, 10.10.10.2, and 10.10.10.3. The weights for the real servers are 1, 2, and 3.

This configuration does not include a health check monitor.

## GUI configuration

Use the following procedures to configure this load balancing setup from the FortiGate GUI.

**To add the HTTP virtual server**

1. Go to **Policy & Objects > Virtual Servers**.
2. Select **Create New**.
3. Add an IP virtual server that allows users on the Internet to connect to the real servers on the internal network. In this example, the FortiGate port2 interface is connected to the Internet.

|                            |                 |
|----------------------------|-----------------|
| <b>Name</b>                | HTTP_weghted_LB |
| <b>Type</b>                | IP              |
| <b>Interface</b>           | port2           |
| <b>Virtual Server IP</b>   | 192.168.20.20   |
| <b>Load Balance Method</b> | Weighted        |

All other virtual server settings are not required or cannot be changed.

4. Under **Real Servers** select **Create New**.
5. Add three real servers. Because the **Load Balancing Method** is **Weighted**, each real server includes a weight. Servers with a higher weight receive a more sessions.

Configuration for the first real server.

|                        |                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>IP Address</b>      | 10.10.10.1                                                                                                                |
| <b>Weight</b>          | 1                                                                                                                         |
| <b>Max Connections</b> | 0                                                                                                                         |
|                        | Setting <b>Max Connections</b> to 0 means the FortiGate unit does not limit the number of connections to the real server. |
| <b>Mode</b>            | Active                                                                                                                    |

Configuration for the second real server.

|                        |            |
|------------------------|------------|
| <b>IP Address</b>      | 10.10.10.2 |
| <b>Weight</b>          | 2          |
| <b>Max Connections</b> | 0          |
| <b>Mode</b>            | Active     |

Configuration for the third real server.

|                        |            |
|------------------------|------------|
| <b>IP Address</b>      | 10.10.10.3 |
| <b>Weight</b>          | 3          |
| <b>Max Connections</b> | 0          |
| <b>Mode</b>            | Active     |

### To add the virtual server to a security policy

Add a port2 to port1 security policy that uses the virtual server so that when users on the Internet attempt to connect to the web server's IP address, packets pass through the FortiGate unit from the wan1 interface to the dmz1 interface. The virtual IP translates the destination address of these packets from the virtual server IP address to the real server IP addresses.

1. Go to **Policy & Objects > IPv4 Policy**.
2. Select **Create New**.
3. Configure the security policy:

|                           |                                                                          |
|---------------------------|--------------------------------------------------------------------------|
| <b>Name</b>               | Policy name                                                              |
| <b>Incoming Interface</b> | port2                                                                    |
| <b>Outgoing Interface</b> | port1                                                                    |
| <b>Source</b>             | all (or a more specific address)                                         |
| <b>Destination</b>        | HTTP_weghted_LB                                                          |
| <b>Schedule</b>           | always                                                                   |
| <b>Service</b>            | ALL                                                                      |
| <b>Action</b>             | ACCEPT                                                                   |
| <b>NAT</b>                | Select this option and select <b>Use Destination Interface Address</b> . |

4. Select other security policy options as required.
5. Select **OK**.

## CLI configuration

Load balancing is configured from the CLI using the `config firewall vip` command and by setting `type` to `server-load-balance`. The default weight is 1 and does not have to be changed for the first real server.

Use the following command to add the virtual server and the three weighted real servers.

```
config firewall vip
 edit HTTP_weghted_LB
 set type server-load-balance
 set server-type ip
 set extintf port2
 set extip 192.168.20.20
 set ldb-method weighted
 config realservers
 edit 1
 set ip 10.10.10.1
 next
 edit 2
 set ip 10.10.10.2
 set weight 2
 next
 edit 3
 set ip 10.10.10.3
```

```

 set weight 3
 end
end

```

## Example HTTP and HTTPS persistence configuration

This example shows how to add a virtual server named **HTTP\_Load\_Balance** that load balances HTTP traffic using port 80 and a second virtual server named **HTTPS\_Load\_Balance** that load balances HTTPS traffic using port 443. The Internet is connected to port2 and the virtual IP address of the virtual server is 192.168.20.20. Both server load balancing virtual IPs load balance sessions to the same three real servers with IP addresses 10.10.10.2, 10.10.10.2, and 10.10.10.3. The real servers provide HTTP and HTTPS services.

For both virtual servers, persistence is set to **HTTP Cookie** to enable HTTP cookie persistence.

### To add the HTTP and HTTPS virtual servers

1. Go to **Policy & Objects > Virtual Servers**.
2. Add the HTTP virtual server that includes HTTP Cookie persistence.

|                            |                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------|
| <b>Name</b>                | HTTP_Load_Balance                                                                       |
| <b>Type</b>                | HTTP                                                                                    |
| <b>Interface</b>           | port2                                                                                   |
| <b>Virtual Server IP</b>   | 192.168.20.20                                                                           |
| <b>Virtual Server Port</b> | 80                                                                                      |
|                            | In this example the virtual server uses port 8080 for HTTP sessions instead of port 80. |
| <b>Load Balance Method</b> | Static                                                                                  |
| <b>Persistence</b>         | HTTP cookie                                                                             |

3. Under **Real Servers** select **Create New**.
4. Add three real servers.

Configuration for the first real server.

|                        |            |
|------------------------|------------|
| <b>IP Address</b>      | 10.10.10.1 |
| <b>Port</b>            | 80         |
| <b>Max Connections</b> | 0          |
| <b>Mode</b>            | Active     |

Configuration for the second real server.

|                            |            |
|----------------------------|------------|
| <b>IP Address</b>          | 10.10.10.2 |
| <b>Port</b>                | 80         |
| <b>Maximum Connections</b> | 0          |
| <b>Mode</b>                | Active     |

Configuration for the third real server.

|                        |            |
|------------------------|------------|
| <b>IP Address</b>      | 10.10.10.3 |
| <b>Port</b>            | 80         |
| <b>Max Connections</b> | 0          |
| <b>Mode</b>            | Active     |

5. Select **OK**.
6. Select **Create New** to add the HTTPS virtual server that also includes HTTP Cookie persistence.

|                            |                    |
|----------------------------|--------------------|
| <b>Name</b>                | HTTPS_Load_Balance |
| <b>Type</b>                | HTTPS              |
| <b>Interface</b>           | port2              |
| <b>Virtual Server IP</b>   | 192.168.20.20      |
| <b>Virtual Server Port</b> | 443                |
| <b>Load Balance Method</b> | Static             |
| <b>Persistence</b>         | HTTP cookie        |

7. Under **Real Servers** select **Create New**
8. Add three real servers.

Configuration for the first real server.

|                        |            |
|------------------------|------------|
| <b>IP Address</b>      | 10.10.10.1 |
| <b>Port</b>            | 443        |
| <b>Max Connections</b> | 0          |
| <b>Mode</b>            | Active     |

Configuration for the second real server.

|                   |            |
|-------------------|------------|
| <b>IP Address</b> | 10.10.10.2 |
| <b>Port</b>       | 443        |

|                        |        |
|------------------------|--------|
| <b>Max Connections</b> | 0      |
| <b>Mode</b>            | Active |

Configuration for the third real server.

|                        |            |
|------------------------|------------|
| <b>IP Address</b>      | 10.10.10.3 |
| <b>Port</b>            | 443        |
| <b>Max Connections</b> | 0          |
| <b>Mode</b>            | Active     |

### To add the virtual servers to security policies

Add a port2 to port1 security policy that uses the virtual server so that when users on the Internet attempt to connect to the web server's IP address, packets pass through the FortiGate unit from the wan1 interface to the dmz1 interface. The virtual IP translates the destination address of these packets from the virtual server IP address to the real server IP addresses.

1. Go to **Policy & Objects > IPv4 Policy**.
2. Select **Create New**.
3. Configure the HTTP security policy:

|                           |                                                                          |
|---------------------------|--------------------------------------------------------------------------|
| <b>Name</b>               | Policy name.                                                             |
| <b>Incoming Interface</b> | port2                                                                    |
| <b>Outgoing Interface</b> | port1                                                                    |
| <b>Source</b>             | all                                                                      |
| <b>Destination</b>        | HTTP_Load_Balance                                                        |
| <b>Schedule</b>           | always                                                                   |
| <b>Service</b>            | HTTP                                                                     |
| <b>Action</b>             | ACCEPT                                                                   |
| <b>NAT</b>                | Select this option and select <b>Use Destination Interface Address</b> . |

4. Select other security policy options as required.
5. Select **OK**.
6. Select **Create New**.
7. Configure the HTTP security policy:

|                           |              |
|---------------------------|--------------|
| <b>Name</b>               | Policy name. |
| <b>Incoming Interface</b> | port2        |
| <b>Outgoing Interface</b> | port1        |

|                    |                                                                          |
|--------------------|--------------------------------------------------------------------------|
| <b>Source</b>      | all                                                                      |
| <b>Destination</b> | HTTPS_Load_Balance                                                       |
| <b>Schedule</b>    | always                                                                   |
| <b>Service</b>     | HTTPS                                                                    |
| <b>Action</b>      | ACCEPT                                                                   |
| <b>NAT</b>         | Select this option and select <b>Use Destination Interface Address</b> . |

8. Select other security policy options as required.

9. Select **OK**.

## CLI configuration: adding persistence for a specific domain

Load balancing is configured from the CLI using the `config firewall vip` command and by setting `type` to `server-load-balance`.

For the CLI configuration, both virtual servers include setting `http-cookie-domain` to `.example.org` because HTTP cookie persistence is just required for the `example.org` domain.

First, the configuration for the HTTP virtual IP:

```
config firewall vip
 edit HTTP_Load_Balance
 set type server-load-balance
 set server-type http
 set extport 8080
 set extintf port2
 set extip 192.168.20.20
 set persistence http-cookie
 set http-cookie-domain .example.org
 config realservers
 edit 1
 set ip 10.10.10.1
 next
 edit 2
 set ip 10.10.10.2
 next
 edit 3
 set ip 10.10.10.3
 end
 end
```

Second, the configuration for the HTTPS virtual IP. In this configuration you don't have to set `extport` to 443 because `extport` is automatically set to 443 when `server-type` is set to `https`.

```
config firewall vip
 edit HTTPS_Load_Balance
 set type server-load-balance
 set server-type https
 set extport 443
 set extintf port2
 set extip 192.168.20.20
 set persistence http-cookie
 set http-cookie-domain .example.org
```

```
config realservers
 edit 1
 set ip 10.10.10.1
 next
 edit 2
 set ip 10.10.10.2
 next
 edit 3
 set ip 10.10.10.3
 end
end
```

# Chapter 27 - SSL VPN

## SSL VPN

This document provides a general introduction to SSL VPN technology, explains the features available with SSL VPN and gives guidelines to decide what features you need to use, and how the FortiGate unit is configured to implement the features.

The following chapters are included in this document:

[Overview](#) provides useful general information about VPN and SSL, how the FortiGate unit implements them, and gives guidance on how to choose between SSL and IPsec.

[Basic configuration](#) explains how to configure the FortiGate unit and the web portal. Along with these configuration details, this chapter also explains how to grant unique access permissions, how to configure the SSL encryption key algorithm, and describes the SSL VPN OS Patch Check feature that allows a client with a specific OS patch to access SSL VPN services.

[The SSL VPN client](#) provides an overview of the FortiClient software required for tunnel mode, where to obtain the software, how to install it, and the configuration information required for remote users to connect to the internal network.

[The SSL VPN web portal](#) provides an overview of the SSL VPN web portal, with explanations of how to use and configure the web portal features.

[Setup examples](#) explores several configuration scenarios with step-by-step instructions. While the information provided is enough to set up the described SSL VPN configurations, these scenarios are not the only possible SSL VPN setups.

[Troubleshooting](#) provides some general maintenance and troubleshooting procedures for SSL VPNs.

## What's new in FortiOS 5.6

This chapter describes new SSL VPN features added to FortiOS 5.6.

### FortiOS 5.6.4

These features first appeared in FortiOS 5.6.4.

- "Tunnel Mode Client Options logic" on page 3032
- "HTTP header information" on page 3081

### FortiOS 5.6.3

These features first appeared in FortiOS 5.6.3.

#### Virtual desktop option no longer supported (442044)

The SSL VPN web portal no longer supports the virtual desktop and its option has been removed from the interface.

#### Option to disable FortiClient download in web portal (439736)

You can use the following commands to enable or disable allowing SSL VPN users to download FortiClient from the SSL VPN web portal. If `forticlient-download` is enabled, you can select the download method (`direct` or over the `ssl_vpn`). You can also optionally specify a custom URL for downloading the Windows and Mac OS versions of FortiClient.

#### Syntax

```
config vpn ssl web portal
 edit <portal name>
 set forticlient-download {enable | disable}
 set forticlient-download-method {direct | ssl-vpn}
 set customize-forticlient-download-url {enable | disable}
 set windows-forticlient-download-url <url>
 set macos-forticlient-download-url <url>
 end
```

#### Upgraded OpenSSL to 1.1.x (412033) (...)

OpenSSL has been upgraded to 1.1 to provide more cryptographic algorithms. All 3rd-party libraries that depend on OpenSSL have also been updated. OpenLDAP has been upgraded to 2.4.45 to be compatible with OpenSSL 1.1. Furthermore, the `ssl_v3` attribute has been removed from `vpn.ssl.settings` and `global.admin-https-ssl-version`.

### FortiOS 5.6.1

These features first appeared in FortiOS 5.6.1.

## Added a button to send Ctrl-Alt-Delete to the remote host for VNC and RDP desktop connections (401807)

Previously, users were unable to send **Ctrl-Alt-Delete** to the host machine in an SSL VPN remote desktop connection.

FortiOS 5.6.1 adds a new button that allows users to send **Ctrl-Alt-Delete** in remote desktop tools (also fixes 412456, preserving the SSL VPN realm after session timeout prompts a logout).

## Improved SSL VPN Realms page (0392184)

Implemented minor functional changes to the dialog on the **SSL VPN > Realms** page:

- URL preview uses info message similar to that seen on the SSL VPN settings dialog.
- Virtual-Host input is now visible when set in the CLI.
- Added help tooltip describing what the virtual-host property does.

## Customizable FortiClient Download URL in SSL VPN Web Portal (437883)

A new attribute, `customize-forticlient-download-url`, is added to `vpn.ssl.web.portal`.

The added attribute indicates whether to support a customizable download URI for FortiClient. This attribute is disabled by default. If enabled, two other attributes, `windows-forticlient-download-url` and `macos-forticlient-download-url`, will appear through which the user can customize the download URL for FortiClient.

### Syntax

```
config vpn ssl web portal
 edit <portal>
 set customize-forticlient-download-url {enable | disable}
 set windows-forticlient-download-url <custom URL for Windows>
 set macos-forticlient-download-url <custom URL for Mac OS>
 next
end
```

## SSL VPN SSO Support for HTML5 RDP (417248)

This feature adds support for SSO from the SSL VPN portal to an RDP bookmark. If SSO is used, then the credentials used to login to SSL VPN will be automatically used when connecting to a remote RDP server.

### Syntax

```
conf vpn ssl web user-bookmark
 edit <name>
 config bookmarks
 edit <name>
 set apptype rdp
 set host "x.x.x.x"
 set port <value>
 set sso [disable | auto]
 next
 end
 next
end
```

## FortiOS 5.6.0

These features first appeared in FortiOS 5.6.0.

### Remote desktop configuration changes (410648)

If NLA security is chosen when creating an RDP bookmark, a username and password must be provided. However there may be instances where the user might want to use a blank password, despite being highly unrecommended. If a username is provided but the password is empty, the CLI will display a warning. See example CLI below, where the warning appears as a caution before finishing the command:

```
config vpn ssl web user-group-bookmark
edit <group-name>
config bookmarks
edit <bookmark-name>
set apptype rdp
set host 172.16.200.121
set security nla
set port 3389
set logon-user <username>
next
end
```

**Warning: password is empty. It might fail user authentication and remote desktop connection would be failed.**

```
end
```

If no username (logon-user) is specified, the following warning message will appear:

```
Please enter user name for RDP security method NLA. object set operator error, -2010
discard the setting Command fail. Return code -2010
```

### SSL VPN supports WAN link load balancing interface (396236)

This new feature allows you to set `virtual-wan-link` as the destination interface in a firewall policy (when SSL VPN is the source interface) for WAN link load balancing in the GUI and in the CLI. This lets you log into a FortiGate via SSL VPN for traffic inspection and then have outbound traffic load balanced by WAN link load balancing.

#### Syntax

```
config firewall policy
edit <example>
set dstintf virtual-wan-link
end
```

### SSL VPN login timeout to support high latency (394583)

With long network latency, the FortiGate can timeout the client before it can finish negotiation processes, such as DNS lookup and time to enter a token. Two new CLI commands under `config vpn ssl settings` have been added that allow the login timeout to be configured, replacing the previous hard timeout value. The second command can be used to set the SSL VPN maximum DTLS hello timeout.

#### Syntax

```
config vpn ssl settings
edit <example>
```

```
set login-timeout [10-180] Default is 30 seconds.
set dtls-hello-timeout [10-60] Default is 10 seconds.
end
```

## SSL VPN supports Windows 10 OS check (387276)

A new CLI field has been added to the `os-check-list` under `config vpn ssl web portal` to allow OS checking for Windows 10.

### Syntax

```
config vpn ssl web portal
edit <example>
set os-check enable
config os-check-list windows-10
set action {deny | allow | check-up-to-date}
end
end
```

## SSL VPN DNS suffix per portal and number of portals (383754)

A new CLI command under `config vpn ssl web portal` to implement a DNS suffix per SSL VPN portal. Each suffix setting for each specific portal will override the `dns-suffix` setting under `config vpn ssl` settings.

This feature also raises bookmark limits and the number of portals that can be supported, depending on what FortiGate series model is used:

- 650 portals on 1000D series
- 1300 portals on 2000E series
- 2600 portals on 3000D series

The previous limit for 1000D series models, for example, was 256 portals.

### Syntax

```
config vpn ssl web portal
edit <example>
set dns-suffix <string>
end
```

## New SSL VPN timeout settings (379870)

New SSL VPN timeout settings have been introduced to counter 'Slowloris' and 'R-U-Dead-Yet' vulnerabilities that allow remote attackers to cause a denial of service via partial HTTP requests.

The FortiGate solution is to add two attributes (`http-request-header-timeout` and `http-request-body-timeout`).

### Syntax

```
config vpn ssl settings
set http-request-header-timeout [1-60] (seconds)
set http-request-body-timeout [1-60] (seconds)
end
```

## Personal bookmark improvements (377500)

You can now move and clone personal bookmarks in the GUI and CLI.

### Syntax

```
config vpn ssl web user-bookmark
 edit 'name'
 config bookmarks
 move bookmark1 after/before
 clone bookmark1 to
 next
 end
```

## New controls for SSL VPN client login limits (376983)

Removed the limitation of SSL VPN user login failure time, by linking SSL VPN user setting with `config user settings` and provided a new option to remove SSL VPN login attempts limitation. New CLI allows the administrator to configure the number of times wrong credentials are allowed before SSL VPN server blocks an IP address, and also how long the block would last.

### Syntax

```
config vpn ssl settings
 set login-attempt-limit [0-10] Default is 2.
 set login-block-time [0-86400] Default is 60 seconds.
end
```

## Unrated category removed from ssl-exempt (356428)

The "Unrated" category has been removed from the SSL Exempt/Web Category list.

## Clipboard support for SSL VPN remote desktop connections (307465)

A remote desktop clipboard viewer pane has been added which allows user to copy, interact with and overwrite remote desktop clipboard contents.

## Overview

As organizations have grown and become more complex, secure remote access to network resources has become critical for day-to-day operations. In addition, businesses are expected to provide clients with efficient, convenient services including knowledge bases and customer portals. Employees traveling across the country or around the world require timely and comprehensive access to network resources. As a result of the growing need for providing remote/mobile clients with easy, cost-effective and secure access to a multitude of resources, the concept of a Virtual Private Network (VPN) was developed.

SSL VPNs establish connectivity using SSL, which functions at Levels 4 - 5 (Transport and Session layers). Information is encapsulated at Levels 6 - 7 (Presentation and Application layers), and SSL VPNs communicate at the highest levels in the OSI model. SSL is not strictly a Virtual Private Network (VPN) technology that allows clients to connect to remote networks in a secure way. A VPN is a secure logical network created from physically separate networks. VPNs use encryption and other security methods to ensure that only authorized users can access the network. VPNs also ensure that the data transmitted between computers cannot be intercepted by unauthorized users. When data is encoded and transmitted over the Internet, the data is said to be sent through a "VPN tunnel". A VPN tunnel is a non-application oriented tunnel that allows the users and networks to exchange a wide range of traffic regardless of application or protocol.

The advantages of a VPN over an actual physical private network are two-fold. Rather than utilizing expensive leased lines or other infrastructure, you use the relatively inexpensive, high-bandwidth Internet. Perhaps more important though is the universal availability of the Internet. In most areas, access to the Internet is readily obtainable without any special arrangements or long wait times.

SSL (Secure Sockets Layer) as HTTPS is supported by most web browsers for exchanging sensitive information securely between a web server and a client. SSL establishes an encrypted link, ensuring that all data passed between the web server and the browser remains private and secure. SSL protection is initiated automatically when a user (client) connects to a web server that is SSL-enabled. Once the successful connection is established, the browser encrypts all the information before it leaves the computer. When the information reaches its destination, it is decrypted using a secret (private) key. Any data sent back is first encrypted, and is decrypted when it reaches the client.

FortiOS supports the SSL and TLS versions defined below:

### SSL and TLS version support table

| Version | RFC                      |
|---------|--------------------------|
| SSL 2.0 | <a href="#">RFC 6176</a> |
| SSL 3.0 | <a href="#">RFC 6101</a> |
| TLS 1.0 | <a href="#">RFC 2246</a> |
| TLS 1.1 | <a href="#">RFC 4346</a> |
| TLS 1.2 | <a href="#">RFC 5246</a> |

## SSL VPN modes of operation

When a remote client connects to the FortiGate unit, the FortiGate unit authenticates the user based on username, password, and authentication domain. A successful login determines the access rights of remote users according to user group. The user group settings specify whether the connection will operate in web-only mode or tunnel mode.

### Web-only mode

Web-only mode provides remote users with a fast and efficient way to access server applications from any thin client computer equipped with a web browser. Web-only mode offers true clientless network access using any web browser that has built-in SSL encryption and the Sun Java Runtime Environment (note that there is no minimum Java/JRE version requirement—any version of Java/JRE currently supported by the supplier of the Java/JRE for the operating system should work).

Support for SSL VPN web-only mode is built into FortiOS. The feature comprises of an SSL daemon running on the FortiGate unit, and a web portal, which provides users with access to network services and resources including HTTP/HTTPS, Telnet, FTP, SMB/CIFS, VNC, RDP, and SSH.

In web-only mode, the FortiGate unit acts as a secure HTML5 HTTPS gateway and authenticates remote users as members of a user group. After successful authentication, the FortiGate unit redirects the web browser to the web portal home page and the user can access the server applications behind the FortiGate unit.

When a user starts a connection to a server from the web portal, FortiOS starts the appropriate client application to communicate with the server. All connections to server applications are new connections from the FortiGate to the server. Communication between the FortiGate and the user continues to be over HTML5 HTTPS, so all user communication with the sever is secured by FortiOS. This includes all supported server protocols (HTTP/HTTPS, Telnet, FTP, SMB/CIFS, VNC, RDP, and SSH).

When the FortiGate unit provides services in web-only mode, a secure connection between the remote client and the FortiGate unit is established through the SSL VPN security in the FortiGate unit and the SSL security in the web browser.

FortiGate SSL VPN web portals have a 1- or 2-column page layout and portal functionality is provided through small applets called widgets. Widget windows can be moved or minimized. The controls within each widget depend on its function. There are predefined web portals and the administrator can create additional portals.

Configuring the FortiGate unit involves selecting the appropriate web portal configuration in the user group settings. These configuration settings determine which server applications can be accessed. SSL encryption is used to ensure traffic confidentiality.

See the FortiOS release notes for information about the operating systems and web browsers supported by SSL VPN web-only mode.

### Tunnel mode

In Tunnel mode, remote clients connect to a FortiGate unit that acts as a secure HTTP/HTTPS gateway and authenticates remote users as members of a user group.

The SSL VPN client encrypts all traffic from the remote client computer and sends it to the FortiGate unit through an SSL VPN tunnel over the HTTPS link between the user and the FortiGate unit. Another option is split tunneling, which ensures that only the traffic for the private network is sent to the SSL VPN gateway. Internet traffic is sent through the usual unencrypted route. This conserves bandwidth and alleviates bottlenecks.

When the user initiates a VPN connection with the FortiGate unit through the SSL VPN client, the FortiGate unit establishes a tunnel with the client and assigns the client a virtual IP address from a range of reserved addresses. The client uses the assigned IP address as its source address for the duration of the connection. After the tunnel has been established, the user can access the network behind the FortiGate unit.

## Port forwarding mode

While tunnel mode provides a Layer 3 tunnel that users can run any application over, the user needs to install the tunnel client, and have the required administrative rights to do so. In some situations, this may not be desirable, yet the simple web mode does not provide enough flexibility for application support (for example, if you wish to use an email client that communicates with a POP3 server). The port forward mode, or proxy mode, provides this middle ground between web mode and tunnel mode.

SSL VPN port forwarding listens on local ports on the user's computer. When it receives data from a client application, the port forward module encrypts and sends the data to the FortiGate unit, which then forwards the traffic to the application server.

The port forward module is implemented with a Java applet, which is downloaded and runs on the user's computer. The applet provides the up-to-date status information such as addressing and bytes sent and received.

On the user end, the user logs into the FortiGate SSL VPN portal, and selects a port forward bookmark configured for a specific application. The bookmark defines the server address and port as well as which port to listen to on the user's computer.

The user must configure the application on the PC to point to the local proxy instead of the application server. For information on this configuration change, see the application documentation.

This mode only supports client/server applications that are using a static TCP port. It will not support client/server applications using dynamic ports or traffic over UDP.

## Application support

With Citrix application servers, the server downloads an ICA configuration file to the user's PC. The client application uses this information to connect to the Citrix server. The FortiGate unit will read this file and append a SOCKS entry to set the SOCKS proxy to 'localhost'. The Citrix client will then be able to connect to the SSL VPN port forward module to provide the connection. When configuring the port forwarding module, a selection is available for Citrix servers.

For Windows Remote Desktop Connections, when selecting the RDP option, the tunnel will launch the RDP client and connect to the local loopback address after the port forward module has been initiated.

Note that the RDP/VNC web portals are **not** supported for the following platforms:

| Platform         | Model                                                                                |
|------------------|--------------------------------------------------------------------------------------|
| FortiGate        | 80D, 92D, 200D, 200D-POE, 240D, 240D-POE, 600C, 800C, 1000C, 3240C, 3600C, and 5001C |
| FortiGate-Rugged | 90D                                                                                  |
| FortiWiFi        | 92D                                                                                  |

## Antivirus and firewall host compatibility

The following tables list the antivirus and firewall client software packages that are supported in FortiOS.

### Supported Windows XP antivirus and firewall software

| Product supported                 | Antivirus | Firewall |
|-----------------------------------|-----------|----------|
| Symantec Endpoint Protection V11  | •         | •        |
| Kaspersky Antivirus 2009          | •         |          |
| McAfee Security Center v8.1       | •         | •        |
| Trend Micro Internet Security Pro | •         | •        |
| F-Secure Internet Security 2009   | •         | •        |

### Supported Windows 7 32-bit and 64-bit antivirus and firewall software

| Product supported                                        | Antivirus | Firewall |
|----------------------------------------------------------|-----------|----------|
| CA Internet Security 2011                                | •         | •        |
| AVG Internet Security 2011                               |           |          |
| F-Secure Internet Security 2011                          | •         | •        |
| Kaspersky Internet Security 2011                         | •         | •        |
| McAfee Internet Security 2011                            | •         | •        |
| Norton 360™ Version 4.0                                  | •         | •        |
| Norton™ Internet Security 2011                           | •         | •        |
| Panda Internet Security 2011                             | •         | •        |
| Sophos Security Suite                                    | •         | •        |
| Trend Micro Titanium Internet Security                   | •         | •        |
| ZoneAlarm Security Suite                                 | •         | •        |
| Symantec Endpoint Protection Small Business Edition 12.0 | •         | •        |

## SSL VPN conserve mode

FortiGate units perform all security profile processing in physical RAM. Since each model has a limited amount of memory, Kernel conserve mode is activated when the remaining free memory is nearly exhausted or the AV proxy

has reached the maximum number of sessions it can service.

SSL VPN also has its own conserve mode. The FortiGate enters the SSL VPN conserve mode before the Kernel conserve mode in an attempt to prevent the Kernel conserve mode from triggering. During the SSL VPN conserve mode, no new SSL connections are allowed. It starts when free memory is <25% of the total memory (when the memory on the FortiGate is less than 512Mb) or <10% of the total memory (when the FortiGate has more than 512Mb built in).

### To determine if the FortiGate has entered SSL VPN conserve mode - CLI

Run the following command in the CLI Console:

```
diagnose vpn ssl statistics
```

Result (showing conserve mode state in red):

```
SSLVPN statistics:

Memory unit: 1
System total memory: 2118737920
System free memory: 218537984
SSLVPN memory margin: 314572800
SSLVPN state: conserve

Max number of users: 2
Max number of tunnels: 0
Max number of connections: 13

Current number of users: 1
Current number of tunnels: 0
Current number of connections: 1
```

## Traveling and security

Because SSL VPN provides a means for “on-the-go” users to dial in to the network while away from the office, you need to ensure that wherever and however they choose to dial in is secure, and not potentially compromising the corporate network.

### Host check

To reinforce security, you can enable a host integrity checker to scan the remote client. The integrity checker probes the remote client computer to verify that it is safe before access is granted. Security attributes recorded on the client computer (for example, in the Windows registry, in specific files, or held in memory due to running processes) are examined and uploaded to the FortiGate unit. For more information, see [Host check on page 3045](#).

Host Check is applicable for both SSL VPN Web Mode and SSL VPN Tunnel mode.

## SSL VPN and IPv6

FortiOS supports SSL VPN with IPv6 addressing, and is available for all the java applets (Telnet, VNC, RDP, and so on). IPv6 configurations for security policies and addressing include:

- Policy matching for IPv6 addresses
- Support for DNS resolving in SSL VPN
- Support IPv6 for ping
- FTP applications
- SMB

In essentially any of the following instructions, replace **IPv4** with **IPv6** to achieve the same desired results, but for IPv6 addresses and configurations.

## Basic configuration

Configuring SSL VPN involves a number of configurations within FortiOS that you need to complete to make it all come together. This chapter describes the components required, and how and where to configure them to set up the FortiGate unit as an SSL VPN server. The configurations and steps are high level, to show you the procedures needed, and where to locate the options in FortiOS. For real-world examples, see [Setup examples on page 3068](#).

There are three or four key steps to configuring an SSL VPN tunnel. The first three in the points below are mandatory, while the others are optional. This chapter outlines these key steps as well as additional configurations for tighter security and monitoring.

The key steps are:

- Create user accounts and user groups for the remote clients.  
([User accounts and groups on page 3024](#))
- Create a web portal to define user access to network resources.  
([Configuring SSL VPN web portals on page 3028](#))
- Configure the security policies.  
([Configuring security policies on page 3037](#))
- For tunnel-mode operation, add routing to ensure that client tunnel-mode packets reach the SSL VPN interface.  
([Routing in tunnel mode on page 3044](#))
- Setup logging of SSL VPN activities.  
([SSL VPN logs on page 3051](#))

This section contains the following information:

### User accounts and groups

The first step for an SSL VPN tunnel is to add the users and user groups that will access the tunnel. You may already have users defined for other authentication-based security policies.

The user group is associated with the web portal that the user sees after logging in. You can use one policy for multiple groups, or multiple policies to handle differences between the groups such as access to different services, or different schedules.

#### To create a user account:

- In the web-based manager, go to **User & Device > User Definition**, and select **Create New**.
- In the CLI, use the commands in `config user local`.

All users accessing the SSL tunnel must be in a firewall user group. User names can be up to 64 characters long.

#### To create user groups:

- In the web-based manager, go to **User & Device > User Groups** and select **Create New**.
- In the CLI, use the commands in `config user group`.

Guest group and SSO group have been removed from `config user group` and `config vpn ssl web user-group-bookmark`.

## Authentication

Remote users must be authenticated before they can request services and/or access network resources through the web portal. The authentication process can use a password defined on the FortiGate unit or optionally use established external authentication mechanisms such as RADIUS or LDAP.

To authenticate users, you can use a plain text password on the local FortiGate unit, forward authentication requests to an external RADIUS, LDAP or TACACS+ server, or utilize PKI certificates.

FortiOS supports LDAP password renewal notification and updates through SSL VPN. Configuration is enabled using the CLI commands:

```
config user ldap
 edit <username>
 set server <domain>
 set password-expiry-warning enable
 set password-renewal enable
 next
end
```

## MAC host check

When a remote client attempts to log in to the portal, you can have the FortiGate unit check against the client's MAC address to ensure that only a specific computer or device is connecting to the tunnel. This can ensure better security should a password be compromised.

MAC addresses can be tied to specific portals and can be either the entire MAC address or a subset of the address. MAC host checking is configured in the CLI using the following commands:

```
conf vpn ssl web portal
 edit portal
 set mac-addr-check enable
 set mac-addr-action allow
 config mac-addr-check-rule
 edit "rule1"
 set mac-addr-list 01:01:01:01:01:01 08:00:27:d4:06:5d
 set mac-addr-mask 48
 end
 end
 end
```

## IP addresses for users

After the FortiGate unit authenticates a request for a tunnel-mode connection, the FortiGate unit assigns the SSL VPN client an IP address for the session. The address is assigned from an IP Pool, which is a firewall address defining an IP address range.

Take care to prevent overlapping IP addresses. Do not assign to clients any IP addresses that are already in use on the private network. As a precaution, consider assigning IP addresses from a network that is not commonly used (for example, 10.254.254.0/24).

#### To set tunnel-mode client IP address range - web-based manager:

1. Go to **Policy & Objects > Addresses** and select **Create New**.
2. Enter an **Name**, for example, `SSL_VPN_tunnel_range`.
3. Select a **Type of IP Range**.
4. In the **Subnet/IP Range** field, enter the starting and ending IP addresses that you want to assign to SSL VPN clients, for example `10.254.254.[80-100]`.
5. In **Interface**, select **Any**.
6. Select **OK**.

#### To set tunnel-mode client IP address range - CLI:

If your SSL VPN tunnel range is for example 10.254.254.80 - 10.254.254.100, you could enter

```
config firewall address
 edit SSL_tunnel_users
 set type iprange
 set end-ip 10.254.254.100
 set start-ip 10.254.254.80
 end
```

### Authentication of remote users

When remote users connect to the SSL VPN tunnel, they must perform authentication before being able to use the internal network resources. This can be as simple as assigning users with their own passwords, connecting to an LDAP server or using more secure options. FortiOS provides a number of options for authentication as well as security option for those connected users.

The web portal can include bookmarks to connect to internal network resources. A web (HTTP/HTTPS) bookmark can include login credentials so that the FortiGate unit automatically logs the user into the website. This means that the user logs into the SSL VPN and then does not have to enter any more credentials to visit preconfigured web sites.

Both the administrator and the end user can configure bookmarks, including SSO bookmarks. To add bookmarks as a web portal user, see [Using the Bookmarks widget on page 3061](#).

### Setting the client authentication timeout

The client authentication timeout controls how long an authenticated user will remain connected. When this time expires, the system forces the remote client to authenticate again. As with the idle timeout, a shorter period of time is more secure. The default value is 28800 seconds (8 hours). You can only modify this timeout value in the CLI.

For example, to change the authentication timeout to 18 000 seconds, enter the following commands in the CLI:

```
config vpn ssl settings
 set auth-timeout 18000
end
```

You can also set the idle timeout for the client, to define how long the user does not access the remote resources before they are logged out.

### Additional timeout settings

SSL VPN timeout settings are also available to counter 'Slowloris' and 'R-U-Dead-Yet' vulnerabilities that allow remote attackers to cause a denial of service via partial HTTP requests.

The FortiGate solution involves two attributes (`http-request-header-timeout` and `http-request-body-timeout`).

### CLI syntax

```
config vpn ssl settings
 set http-request-header-timeout [1-60] (seconds)
 set http-request-body-timeout [1-60] (seconds)
end
```

### Allow one-time login per user

You can set the SSL VPN tunnel such that each user can only log into the tunnel one time concurrently per user per login. That is, once logged into the portal, they cannot go to another system and log in with the same credentials again.

#### To allow one-time login per user - web-based manager:

Go to **VPN > SSL-VPN Portals**, select a portal, and enable **Limit Users to One SSL-VPN Connection at a Time**. It is disabled by default.

#### To allow one-time login per user - CLI:

```
config vpn ssl web portal
 edit <portal_name>
 set limit-user-logins enable
 end
```

### Strong authentication with security certificates

The FortiGate unit supports strong (two-factor) authentication through X.509 security certificates (version 1 or 3). The FortiGate unit can require clients to authenticate using a certificate, and the client can require the FortiGate unit to authenticate using a certificate.

You can select the **Require Client Certificate** option so that clients must authenticate using certificates. The client browser must have a local certificate installed, and the FortiGate unit must have the corresponding CA certificate installed.

When the remote client initiates a connection, the FortiGate unit prompts the client browser for its client-side certificate as part of the authentication process.

#### To require client authentication by security certificates - web-based manager:

1. Go to **VPN > SSL-VPN Settings**.
2. Select **Require Client Certificate**.
3. Select **Apply**.

### To require client authentication by security certificates - CLI:

```
config vpn ssl settings
 set reqclientcert enable
end
```

If your SSL VPN clients require strong authentication, the FortiGate unit must offer a CA certificate that the client browser has installed.

In the FortiGate unit SSL VPN settings, you can select which certificate the FortiGate offers to authenticate itself. By default, the FortiGate unit offers its factory installed (Fortinet\_CA\_SSLProxy) certificate from Fortinet to remote clients when they connect. If you leave the default setting, a warning appears that recommends you purchase a certificate for your domain and upload it for use.

### To enable FortiGate unit authentication by certificate - web-based manager:

1. Go to **VPN > SSL-VPN Settings**.
2. From the **Server Certificate** list, select the certificate that the FortiGate unit uses to identify itself to SSL VPN clients.
3. Select **Apply**.

### To enable FortiGate unit authentication by certificate - CLI:

For example, to use the `example_cert` certificate

```
config vpn ssl settings
 set servercert example_cert
end
```

FortiOS will check the server certificate to verify that the certificate is valid. Only valid server certificates should be used.

---

## NSA Suite B cryptography support

FortiOS supports the use of ECDSA Local Certificates for SSL VPN Suite B. The National Security Agency (NSA) developed Suite B algorithms in 2005 to serve as a cryptographic base for both classified and unclassified information at an interoperable level.

FortiOS allows you to import, generate, and use ECDSA certificates defined by the Suite B cryptography set. To generate ECDSA certificates, use the following command in the CLI:

```
exec vpn certificate local generate ec <certificate-name_str> <elliptic-curve-name>
 <subject_str> [<optional_information>]
```

## Configuring SSL VPN web portals

The SSL VPN portal enables remote users to access internal network resources through a secure channel using a web browser. FortiGate administrators can configure login privileges for system users as well as the network resources that are available to the users.

FortiOS supports LDAP password renewal notification and updates through SSL VPN. Configuration is enabled using the CLI commands:

```
config user ldap
 edit <username>
 set server <domain>
 set password-expiry-warning enable
 set password-renewal enable
 next
end
```

This step in the configuration of the SSL VPN tunnel sets up the infrastructure; the addressing, encryption, and certificates needed to make the initial connection to the FortiGate unit. This step is also where you configure what the remote user sees with a successful connection. The portal view defines the resources available to the remote users and the functionality they have on the network.

## SSL connection configuration

To configure the basic SSL VPN settings for encryption and login options, go to **VPN > SSL-VPN Settings**.

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Listen on Interface(s)</b>              | Define the interface which the FortiGate will use to listen for SSL VPN tunnel requests. This is generally your external interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Listen on Port</b>                      | Enter the port number for HTTPS access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Redirect port 80 to this login port</b> | <p>Enable to redirect the admin HTTP port to the admin HTTPS port.</p> <p>There are two likely scenarios for this:</p> <ul style="list-style-type: none"> <li>• SSL VPN is not in use, in which case the admin GUI runs on port 443 or 10443, and port 80 is redirected.</li> <li>• SSL VPN runs on port 443, in which case port 80 is redirected to 443 and the admin port runs on 10443.</li> </ul> <p>If the administrator chooses to run SSL VPN on port 80, the redirect option is invalid.</p> <p>This can also be configured in the CLI as shown below (note that HTTPS-redirect is disabled by default):</p> <p><b>Syntax:</b></p> <pre>config vpn ssl settings   set https-redirect [enable   disable] end</pre> |
| <b>Restrict Access</b>                     | Restrict accessibility to either <b>Allow access from any host</b> or to <b>Limit access to specific hosts</b> as desired. If selecting the latter, you must specify the hosts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Idle Logout</b>                 | Type the period of time (in seconds) that the connection can remain inactive before the user must log in again. The range is from 10 to 28800 seconds. Setting the value to 0 will disable the idle connection timeout. This setting applies to the SSL VPN session. The interface does not time out when web application sessions or tunnels are up.                                                                                                                                                                              |
| <b>Server Certificate</b>          | Select the signed server certificate to use for authentication. If you leave the default setting (Fortinet_CA_SSLProxy), the FortiGate unit offers its built-in certificate from Fortinet to remote clients when they connect. A warning appears that recommends you purchase a certificate for your domain and upload it for use.                                                                                                                                                                                                 |
| <b>Require Client Certificate</b>  | Select to use group certificates for authenticating remote clients. When the remote client initiates a connection, the FortiGate unit prompts the client for its client-side certificate as part of the authentication process.                                                                                                                                                                                                                                                                                                    |
| <b>Address Range</b>               | Select <b>Automatically assign addresses</b> or <b>Specify custom IP ranges</b> . The latter will allow you to select the range or subnet firewall addresses that represent IP address ranges reserved for tunnel-mode SSL VPN clients.                                                                                                                                                                                                                                                                                            |
| <b>DNS Server</b>                  | <p>If you select <b>Specify</b>, you may enter up to two DNS servers (IPv4 or IPv6) to be provided for the use of clients.</p> <p><b>Note:</b> It is possible to implement a unique DNS suffix per SSL VPN portal using the CLI. Each suffix setting for each specific portal will override the <code>dns-suffix</code> setting under <code>config vpn ssl settings</code>. This is a CLI-only option, using the following syntax:</p> <pre>config vpn ssl web portal edit &lt;example&gt; set dns-suffix &lt;string&gt; end</pre> |
| <b>Specify WINS Servers</b>        | Enable to access options for entering up to two WINS servers (IPv4 or IPv6) to be provided for the use of clients.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Allow Endpoint Registration</b> | Select so that FortiClient registers with the FortiGate unit when connecting. If you configured a registration key by going to <b>System &gt; Config &gt; Advanced</b> , the remote user is prompted to enter the key. This only occurs on the first connection to the FortiGate unit.                                                                                                                                                                                                                                             |

## Portal configuration

The portal configuration determines what the remote user sees when they log in to the portal. Both the system administrator and the user have the ability to customize the SSL VPN portal.

To view the portals settings page, go to **VPN > SSL-VPN Portals**.

There are three pre-defined default portal configurations available:

- *full-access*
- *tunnel-access*

- *web-access*

Each portal type includes similar configuration options. Select between the different portals by double-clicking one of the default portals in the list. You can also create a custom portal by selecting the **Create New** option at the top.

| Portal Setting                                         | Description                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>                                            | The name for the portal.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Limit Users to One SSL-VPN Connection at a Time</b> | You can set the SSL VPN tunnel such that each user can only log into the tunnel one time concurrently per user per login. That is, once logged into the portal, they cannot go to another system and log in with the same credentials again. This option is disabled by default.                                                                                                       |
| <b>Tunnel Mode</b>                                     | These settings determine how tunnel mode clients are assigned IPv4 addresses.                                                                                                                                                                                                                                                                                                          |
| <b>Enable Split Tunneling</b>                          | <p>Select so that the VPN carries only the traffic for the networks behind the FortiGate unit. The user's other traffic follows its normal route.</p> <p>If you enable split tunneling, you are required to set the <b>Routing Address</b>, which is the address that your corporate network is using. Traffic intended for the Routing Address will not be split from the tunnel.</p> |
| <b>Source IP Pools</b>                                 | Select an IP Pool for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.                                                                                                                                                                                                                            |

| Portal Setting                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tunnel Mode Client Options</b> | <p>These options affect how the FortiClient application behaves when connected to the FortiGate VPN tunnel. When enabled, a check box for the corresponding option appears on the VPN login screen in FortiClient, and is not enabled by default.</p> <ul style="list-style-type: none"> <li>• <b>Allow client to save password</b> - When enabled, if the user selects this option, their password is stored on the user's computer and will automatically populate each time they connect to the VPN.</li> <li>• <b>Allow client to connect automatically</b> - When enabled, if the user selects this option, when the FortiClient application is launched, for example after a reboot or system startup, FortiClient will automatically attempt to connect to the VPN tunnel.</li> <li>• <b>Allow client to keep connections alive</b> - When enabled, if the user selects this option, the FortiClient should try to reconnect once it detects the VPN connection is down unexpectedly (not manually disconnected by user).</li> </ul> |
| <b>Enable Web Mode</b>            | Select to enable web mode access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Portal Message</b>             | This is a text header that appears on the top of the web portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Theme</b>                      | Select a color styling specifically for the web portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Show Session Information</b>   | The <b>Show Session Information</b> widget displays the login name of the user, the amount of time the user has been logged in and the inbound and outbound traffic statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Show Connection Launcher</b>   | Displays the <b>Connection Launcher</b> widget in the web portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Show Login History</b>         | Select to include user login history on the web portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>User Bookmarks</b>             | Enable to allow users to add their own bookmarks in the web portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Predefined Bookmarks</b>       | Select to include bookmarks on the web portal. Bookmarks are used as links to internal network resources. When a bookmark is selected from a bookmark list, a pop-up window appears with the web page. Telnet, VNC, and RDP require a browser plugin. FTP and Samba replace the bookmarks page with an HTML file-browser.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Tunnel Mode Client Options logic

The FortiGate will check the logic of Tunnel mode VPN client options.

If `auto-connect` or `keep-alive` is enabled, the following warning message will be shown: *'save-password should be enabled if either auto-connect or keep-alive is enabled.'*

At the end of editing the portal, if either `auto-connect` or `keep-alive` is enabled and `save-password` is not enabled, the following message will be shown, and adding or editing the portal is not permitted: *'save-password should be enabled as either auto-connect or keep-alive is enabled.'*

### Options to allow firewall address to be used in routing table for SSL VPN

If destination **Named Address** is set in **Network > Static Routes** and **Address Range** is set to **Automatically assign addresses** in **VPN > SSL-VPN Settings**, SSL VPN should refresh the routing table automatically.

If your network configuration does not contain a default SSL VPN portal, you might receive the error message “Input value is invalid” when you attempt to access **VPN > SSL-VPN Portals**.

#### To enable a default portal - CLI:

```
config vpn ssl settings
 set default-portal <full-access | tunnel-access |
 web-access>
end
```

### Adding bookmarks

A web bookmark can include login credentials to automatically log the SSL VPN user into the website. When the administrator configures bookmarks, the website credentials must be the same as the user's SSL VPN credentials. Users configuring their own bookmarks can specify alternative credentials for the website.

#### To add a bookmark - web-based manager:

1. On the **VPN > SSL-VPN Portals** page, ensure **Enable User Bookmarks** is enabled.
2. Select **Create New** and enter the following information:

|                       |                                                                                                                                                                                                                                                            |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Category</b>       | Select a category, or group, to include the bookmark. If this is the first bookmark added, you will be prompted to add a category. Otherwise, select <b>Create</b> from the drop-down list.                                                                |
| <b>Name</b>           | Enter a name for the bookmark.                                                                                                                                                                                                                             |
| <b>Type</b>           | Select the type of link from the drop-down list. Telnet, VNC, and RDP require a browser plugin. FTP and Samba replace the bookmarks page with an HTML file-browser.                                                                                        |
| <b>URL</b>            | Enter the IP address source.                                                                                                                                                                                                                               |
| <b>Description</b>    | Enter a brief description of the link.                                                                                                                                                                                                                     |
| <b>Single Sign-On</b> | <p>Enable if you wish to use Single Sign-On (SSO) for any links that require authentication.</p> <p>When including a link using SSO, be sure to use the entire URL. For example, <code>http://10.10.1.0/login</code>, rather than just the IP address.</p> |

3. Select **OK**.

For more configuration options, see [Configuring SSL VPN web portals on page 3028](#).

## Personal bookmarks

The administrator has the ability to view bookmarks the remote client has added to their SSL VPN login in the bookmarks widget. This enables the administrator to monitor and, if needed, remove unwanted bookmarks that do not meet with corporate policy.

To view and maintain remote client bookmarks, go to **VPN > SSL-VPN Personal Bookmarks**.

For more information about available bookmark applications, see [Applications available in the web portal on page 3060](#)

### To enable personal bookmarks:

1. Go to **System > Feature Visibility**.
2. Enable **SSL-VPN Personal Bookmark Management**.
3. Select **Apply**.

## Moving and cloning bookmarks

The administrator also has the ability to move and clone personal bookmarks in the GUI and CLI.

### CLI syntax

```
config vpn ssl web user-bookmark
 edit 'name'
 config bookmarks
 move bookmark1 after/before
 clone bookmark1 to
 next
 end
```

## Supporting browsers without plugins (Citrix/Port forward) - CLI only

### CLI syntax

```
config vpn ssl web user-bookmark
 edit <name>
 config bookmarks
 edit "citrix-address"
 set apptype citrix
 set description "my citrix server"
 set url "https://my.citrix.server.com"
 set sso enable
 next
 end
 next
end
```

## Group-based SSL VPN bookmarks

The administrator can add bookmarks for groups of users. SSL VPN will only output the matched group-name entry to the client. This can only be done via the CLI.

**To add group-based SSL VPN bookmarks - CLI:**

```

config vpn ssl web portal
 edit "portal-name"
 set user-group-bookmark enable*/disable
 next
end
config vpn ssl web user-group-bookmark
 edit "group-name"
 config bookmark
 edit "bookmark1"

 next
 end
 next
end

```

**Remote desktop bookmark creation with no password**

If NLA security is chosen when creating an RDP bookmark, a username and password must be provided. However there may be instances where the user might want to use a blank password, despite being highly unrecommended. If a username is provided but the password is empty, the CLI will display a warning. See example CLI below, where the warning appears as a caution before finishing the command:

```

config vpn ssl web user-group-bookmark
 edit <group-name>
 config bookmarks
 edit <bookmark-name>
 set apptype rdp
 set host 172.16.200.121
 set security nla
 set port 3389
 set logon-user <username>
 next
 end
 end

```

**Warning: password is empty. It might fail user authentication and remote desktop connection would be failed.**

```
end
```

If no username (logon-user) is specified, the following warning message will appear:

```

Please enter user name for RDP security method NLA. object set operator error, -2010
discard the setting Command fail. Return code -2010

```

**SSO support for HTML5 RDP**

This feature adds support for SSO from the SSL VPN portal to an RDP bookmark. If SSO is used, then the credentials used to login to SSL VPN will be automatically used when connecting to a remote RDP server.

This option is only available in CLI.

**To configure SSO support for HTML5 RDP - CLI:**

```

conf vpn ssl web user-bookmark
 edit <name>
 config bookmarks
 edit <name>
 set apptype rdp
 set host "x.x.x.x"
 next
 end
 end

```

```

 set port <value>
 set sso [disable | auto]
 next
end
next
end

```

## SSL VPN Realms

You can go to **VPN > SSL-VPN Realms** and create custom login pages for your SSL VPN users. You can use this feature to customize the SSL VPN login page for your users and also to create multiple SSL VPN logins for different user groups.

In order to create a custom login page using the web-based manager, this feature must be enabled using **Feature Select**.

Before you begin, copy the default login page text to a separate text file for safe-keeping. Afterward, if needed, you can restore the text to the original version.

### To configure SSL VPN Realms - web-based manager:

1. Configure a custom SSL VPN login by going to **VPN > SSL-VPN Realms** and selecting **Create New**. Users access different portals depending on the URL they enter.
2. The first option in the custom login page is to enter the path of the custom URL.  
This path is appended to the address of the FortiGate unit interface to which SSL VPN users connect. The actual path for the custom login page appears beside the URL path field.
3. You can also limit the number of users that can access the custom login at any given time.
4. You can use HTML code to customize the appearance of the login page.
5. After adding the custom login, you must associate it with the users that will access the custom login. Do this by going to **VPN > SSL-VPN Settings** and adding a rule to the **Authentication/Portal Mapping** section.
6. Under **Authentication/Portal Mapping**, click **Create New** and select the user group(s) and the associated Realm.

### To configure SSL VPN Realms - CLI:

```

config vpn ssl web realm
 edit <url-path>
 set login-page <content_str>
 set max-concurrent-user <int>
 set virtual-host <hostname_str>
 end

```

Where the following variables are set:

| Variable        | Description                                                                       | Default     |
|-----------------|-----------------------------------------------------------------------------------|-------------|
| edit <url-path> | Enter the URL path to access the SSL-VPN login page.<br>Do not include "http://". | No default. |

| Variable                                       | Description                                                                              | Default     |
|------------------------------------------------|------------------------------------------------------------------------------------------|-------------|
| <code>login-page &lt;content_str&gt;</code>    | Enter replacement HTML for SSL-VPN login page.                                           | No default. |
| <code>max-concurrent-user &lt;int&gt;</code>   | Enter the maximum number of concurrent users allowed. Range 0-65 535. 0 means unlimited. | 0           |
| <code>virtual-host &lt;hostname_str&gt;</code> | Enter the virtual host name for this realm. Optional. Maximum length 255 characters.     | No default. |

## Customizable FortiClient download URL

The attribute `customize-forticlient-download-url` (disabled by default) can be enabled to allow users to customize the download URL for FortiClient. This option is only available in CLI.

If enabled, two other attributes, `windows-forticlient-download-url` and `macos-forticlient-download-url`, will appear.

### To configure a customizable FortiClient download URL- CLI:

```
config vpn ssl web portal
 edit <portal>
 set customize-forticlient-download-url {enable | disable}
 set windows-forticlient-download-url <custom URL for Windows>
 set macos-forticlient-download-url <custom URL for Mac OS>
 next
end
```

## Disabling FortiClient download in the web portal

Use the following syntax to disable FortiClient download in the web portal.

```
config vpn ssl web portal
 edit <portal name>
 set forticlient-download disable
 next
end
```

## Configuring security policies

You will need at least one SSL VPN security policy. This is an identity-based policy that authenticates users and enables them to access the SSL VPN web portal. The SSL VPN user groups named in the policy determine who can authenticate and which web portal they will use. From the web portal, users can access protected resources or download the SSL VPN tunnel client application.

This section contains the procedures needed to configure security policies for web-only mode operation and tunnel-mode operation. These procedures assume that you have already completed the procedures outlined in [Configuring security policies on page 3037](#).

If you will provide tunnel mode access, you will need a second security policy—an ACCEPT tunnel mode policy to permit traffic to flow between the SSL VPN tunnel and the protected networks.

## Firewall addresses

Before you can create security policies, you need to define the firewall addresses you will use in those policies. For both web-only and tunnel mode operation, you need to create firewall addresses for all of the destination networks and servers to which the SSL VPN client will be able to connect.

For tunnel mode, you will already have defined firewall addresses for the IP address ranges that the FortiGate unit will assign to SSL VPN clients.

The source address for your SSL VPN security policies will be the predefined “all” address. Both the address and the netmask are 0.0.0.0. The “all” address is used because VPN clients will be connecting from various addresses, not just one or two known networks. For improved security, if clients will be connecting from one or two known locations you should configure firewall addresses for those locations, instead of using the “all” address.

To create a firewall address, in the web-based manager, go to **Policy & Objects > Objects > Addresses**, and select **Create New**.

## Create an SSL VPN security policy

At minimum, you need one SSL VPN security policy to authenticate users and provide access to the protected networks. You will need additional security policies only if you have multiple web portals that provide access to different resources. You can use one policy for multiple groups, or multiple policies to handle differences between the groups such as access to different services, or different schedules.

The SSL VPN security policy specifies:

- The incoming interface that corresponds to the ssl.root interface.
- The SSL VPN user groups that can use the security policy.
- The times (schedule) and types of services that users can access.
- The UTM features and logging that are applied to the connection.

Do not use ALL as the destination address. If you do, you will see the “Destination address of Split Tunneling policy is invalid” error when you enable Split Tunneling.

### To create an SSL-VPN security policy - web-based manager:

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information:

|                           |                                                                                                                                                                                                                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Incoming Interface</b> | Select the virtual SSL VPN interface, such as <b>ssl.root</b> .                                                                                                                                                                                                                               |
| <b>Outgoing Interface</b> | Select the FortiGate network interface that connects to the protected network.                                                                                                                                                                                                                |
| <b>Source</b>             | Select to allow access only to holders of a (shared) group certificate. The holders of the group certificate must be members of an SSL VPN user group, and the name of that user group must be present in the Allowed field. See <a href="#">Configuring security policies on page 3037</a> . |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Destination Address</b> | <p>Select the firewall address you created that represents the networks and servers to which the SSL VPN clients will connect.</p> <p>If you want to associate multiple firewall addresses or address groups with the <b>Destination Interface/Zone</b>, from <b>Destination Address</b>, select the plus symbol. In the dialog box, move the firewall addresses or address groups from the <b>Available Addresses</b> section to the <b>Members</b> section, then select <b>OK</b>.</p> |
| <b>Schedule</b>            | Select <b>always</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Service</b>             | Select services in the left list and use the right arrow button to move them to the right list. Select the ALL service to allow the user group access to all services.                                                                                                                                                                                                                                                                                                                   |
| <b>Action</b>              | Select <b>Accept</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Your identity-based policies are listed in the security policy table. The FortiGate unit searches the table from the top down to find a policy to match the client's user group. Using the move icon in each row, you can change the order of the policies in the table to ensure the best policy will be matched first. You can also use the icons to edit or delete policies. Furthermore, you can drag and drop policies in the policy list to rearrange their order.

### To create an SSL VPN security policy - CLI:

Create the SSL VPN security policy by entering the following CLI commands.

```
config firewall policy
 edit <id>
 set srcintf ssl.root(sslvpn tunnel interface)
 set dstintf port2
 set srcaddr all
 set dstaddr OfficeLAN
 set nat enable
 end
```

### Create a tunnel mode security policy

If your SSL VPN will provide tunnel mode operation, you need to create a security policy to enable traffic to pass between the SSL VPN virtual interface and the protected networks. This is in addition to the SSL VPN security policy that you created in the preceding section.

The SSL VPN virtual interface is the FortiGate unit end of the SSL tunnel that connects to the remote client. It is named `ssl.<vdom_name>`. In the root VDOM, for example, it is named `ssl.root`. If VDOMs are not enabled on your FortiGate unit, the SSL VPN virtual interface is also named `ssl.root`.

### To configure the tunnel mode security policy - web-based manager:

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information and select **OK**.

|                           |                                                                 |
|---------------------------|-----------------------------------------------------------------|
| <b>Incoming Interface</b> | Select the virtual SSL VPN interface, such as <b>ssl.root</b> . |
|---------------------------|-----------------------------------------------------------------|

|                            |                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Outgoing Interface</b>  | Select the FortiGate network interface that connects to the protected network.                                                                                                                                                                                                                |
| <b>Source Address</b>      | Select the firewall address you created that represents the IP address range assigned to SSL VPN clients, such as SSL_VPN_tunnel_users.                                                                                                                                                       |
| <b>Source User(s)</b>      | Select to allow access only to holders of a (shared) group certificate. The holders of the group certificate must be members of an SSL VPN user group, and the name of that user group must be present in the Allowed field. See <a href="#">Configuring security policies on page 3037</a> . |
| <b>Destination Address</b> | Select the firewall address that represents the networks and servers to which the SSL VPN clients will connect.<br><br>To select multiple firewall addresses or address groups, select the plus sign next to the drop-down list.                                                              |
| <b>Schedule</b>            | Select <b>always</b> .                                                                                                                                                                                                                                                                        |
| <b>Service</b>             | Select services in the left list and use the right arrow button to move them to the right list. Select the ALL service to allow the user group access to all services.                                                                                                                        |
| <b>Action</b>              | Select <b>Accept</b> .                                                                                                                                                                                                                                                                        |
| <b>Enable NAT</b>          | Select <b>Enable NAT. (Optional)</b>                                                                                                                                                                                                                                                          |

#### To configure the tunnel mode security policy - CLI:

```
config firewall policy
 edit <id>
 set srcintf ssl.root(sslvpn tunnel interface)
 set dstintf <dst_interface_name>
 set srcaddr <tunnel_ip_address>
 set dstaddr <protected_network_address_name>
 set schedule always
 set service ALL
 set nat enable
 end
```

This policy enables the SSL VPN client to initiate communication with hosts on the protected network. If you want to enable hosts on the protected network to initiate communication with the SSL VPN client, you should create another Accept policy like the preceding one but with the source and destination settings reversed.

You must also add a static route for tunnel mode operation.

#### Routing for tunnel mode

If your SSL VPN operates in tunnel mode, you must add a static route so that replies from the protected network can reach the remote SSL VPN client.

#### To add the tunnel mode route - web-based manager:

1. Go to **Network > Static Routes** and select **Create New**.

For low-end FortiGate units, go to **System > Network > Routing** and select **Create New**.

2. Enter the **Destination IP/Mask** of the tunnel IP address that you assigned to the users of the web portal.
3. Select the SSL VPN virtual interface for the **Device**.
4. Select **OK**.

#### To add the tunnel mode route - CLI:

If you assigned 10.11.254.0/24 as the tunnel IP range, you would enter:

```
config router static
 edit <id>
 set device ssl.root
 set dst 10.11.254.0/24
 end
```

### Split tunnel Internet browsing policy

With split tunneling disabled, all of the SSL VPN client's requests are sent through the SSL VPN tunnel. But the tunnel mode security policy provides access only to the protected networks behind the FortiGate unit. Clients will receive no response if they attempt to access Internet resources. You can enable clients to connect to the Internet through the FortiGate unit using a split tunnel Internet browsing policy.

#### To add an Internet browsing policy:

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information and select **OK**.

|                            |                                                                                                           |
|----------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Incoming Interface</b>  | Select the virtual SSL VPN interface ( <b>ssl.root</b> , for example).                                    |
| <b>Outgoing Interface</b>  | Select the FortiGate network interface that connects to the Internet.                                     |
| <b>Source</b>              | Select the firewall address you created that represents the IP address range assigned to SSL VPN clients. |
| <b>Destination Address</b> | Select <b>All</b> .                                                                                       |
| <b>Action</b>              | Select <b>Accept</b> .                                                                                    |
| <b>Enable NAT</b>          | Select <b>Enable</b> .                                                                                    |

#### To configure the Internet browsing security policy - CLI:

To enable browsing the Internet through port1, you would enter:

```
config firewall policy
 edit 0
 set srcintf ssl.root
 set dstintf port1
 set srcaddr SSL_tunne_users
 set dstaddr all
 set schedule always
 set service ALL
 set nat enable
 end
```

## Enabling a connection to an IPsec VPN

You might want to provide your SSL VPN clients access to another network, such as a branch office, that is connected by an IPsec VPN. To do this, you need only to add the appropriate security policy.

### Route-based connection

**To configure interconnection with a route-based IPsec VPN - web-based manager:**

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information and select **OK**.

|                            |                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------|
| <b>Incoming Interface</b>  | Select the virtual SSL VPN interface ( <b>ssl.root</b> , for example).                        |
| <b>Outgoing Interface</b>  | Select the virtual IPsec interface for your IPsec VPN.                                        |
| <b>Source</b>              | Select the firewall address that represents the IP address range assigned to SSL VPN clients. |
| <b>Destination Address</b> | Select the address of the IPsec VPN remote protected subnet.                                  |
| <b>Action</b>              | Select <b>ACCEPT</b> .                                                                        |
| <b>Enable NAT</b>          | Enable.                                                                                       |

**To configure interconnection with a route-based IPsec VPN - CLI:**

If, for example, you want to enable SSL VPN users to connect to the private network (address name OfficeAnet) through the toOfficeA IPsec VPN, you would enter:

```
config firewall policy
 edit 0
 set srcintf ssl.root
 set dstintf toOfficeA
 set srcaddr SSL_tunnel_users
 set dstaddr OfficeAnet
 set action accept
 set nat enable
 set schedule always
 set service ALL
 end
```

### Policy-based connection

**To configure interconnection with a policy-based IPsec VPN - web-based manager:**

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information and select **OK**.

|                           |                                                                        |
|---------------------------|------------------------------------------------------------------------|
| <b>Incoming Interface</b> | Select the virtual SSL VPN interface ( <b>ssl.root</b> , for example). |
| <b>Outgoing Interface</b> | Select the FortiGate network interface that connects to the Internet.  |

|                            |                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------|
| <b>Source</b>              | Select the firewall address that represents the IP address range assigned to SSL VPN clients. |
| <b>Destination Address</b> | Select the address of the IPsec VPN remote protected subnet.                                  |

### 3. Configure inbound NAT from the CLI:

```
config firewall policy
 edit 0
 set natinbound enable
 end
```

### To configure interconnection with a policy-based IPsec VPN - CLI:

If, for example, you want to enable SSL VPN users to connect to the private network (address name OfficeAnet) through the OfficeA IPsec VPN, you would enter:

```
config firewall policy
 edit 0
 set srcintf ssl.root
 set dstintf port1
 set srcaddr SSL_tunnel_users
 set dstaddr OfficeAnet
 set action ipsec
 set schedule always
 set service ALL
 set inbound enable
 set outbound enable
 set natinbound enable
 set vpntunnel OfficeA
 end
```

In this example, port1 is connected to the Internet.

## Configuring encryption key algorithms

The FortiGate unit supports a range of cryptographic cipher suites to match the capabilities of various web browsers. The web browser and the FortiGate unit negotiate a cipher suite before any information (for example, a user name and password) is transmitted over the SSL link. You can only configure encryption key algorithms for SSL VPN in the CLI.

### To configure encryption key algorithms - CLI:

Use the following CLI command,

```
config vpn ssl settings
 set algorithm <cipher_suite>
end
```

where one of the following variables replaces *<cipher\_suite>*:

| Variable | Description                                           |
|----------|-------------------------------------------------------|
| low      | Use any cipher suite; AES, 3DES, RC4, DES, or ChaCha. |

| Variable | Description                                                       |
|----------|-------------------------------------------------------------------|
| medium   | Use a 128-bit or greater cipher suite; AES, 3DES, RC4, or ChaCha. |
| high     | Use a cipher suite greater than 128 bits; AES or ChaCha.          |

Note that the `algorithm <cipher_suite>` syntax is only available when the `sslvpn-enable` attribute is set to **enable**.

## Controlling the use of specific cipher suites

Administrators can ban the use of specific cipher suites in the CLI for SSL VPN, so PCI-DSS (Payment Card Industry Data Security Standard) certification can be met.

### To ban the use of specific cipher suites for SSL VPN - CLI:

```
config vpn ssl settings
 set banned-cipher [RSA | DH | DHE | ECDH | ECDHE | DSS | ECDSA | AES | AESGCM |
 CAMELLIA | 3DES | SHA1 | SHA256 | SHA384 | STATIC]
```

## Additional configuration options

Beyond the basics of setting up the SSL VPN, you can configure a number of other options that can help to ensure your internal network is secure and can limit the possibility of attacks and viruses entering the network from an outside source.

## Routing in tunnel mode

If you are creating a SSL VPN connection in tunnel mode, you need to add a static route so that replies from the protected network can reach the remote SSL VPN client.

### To add the tunnel mode route - web-based manager:

1. Go to **Network > Static Routes** and select **Create New**.
2. Enter the **Destination IP/Mask** of the tunnel IP address that you assigned to the users of the web portal.
3. Select the SSL VPN virtual interface for the **Device**.
4. Select **OK**.

### To add the tunnel mode route - CLI:

If you assigned 10.11.254.0/24 as the tunnel IP range, you would enter:

```
config router static
 edit <id>
 set device ssl.root
 set dst 10.11.254.0/24
 end
```

## Changing the port number for web portal connections

You can specify a different TCP port number for users to access the web portal login page through the HTTPS link. By default, the port number is 443 and users can access the web portal login page using the following default

URL:

```
https://<FortiGate_IP_address>:443/remote/login
```

where <FortiGate\_IP\_address> is the IP address of the FortiGate interface that accepts connections from remote users.

### To change the SSL VPN port - web-based manager:

1. If **Current VDOM** appears at the bottom left of the screen, select **Global** from the list of VDOMs.
2. Go to **VPN > SSL-VPN Settings**.
3. Type an unused port number in the **Listen on Port** field and select **Apply**.

### To change the SSL VPN port - CLI:

This is a global setting. For example, to set the SSL VPN port to 10443, enter the following:

```
config vpn ssl settings
 set port 10443
end
```

### HTTP to HTTPS redirect support

The admin HTTP port can be redirected to the admin HTTPS port. This is enabled in **VPN > SSL-VPN Settings** using the option **Redirect port 80 to this login port**.

There are two likely scenarios for this:

- SSL VPN is not in use, in which case the admin GUI runs on port 443 or 10443, and port 80 is redirected.
- SSL VPN runs on port 443, in which case port 80 is redirected to 443 and the admin port runs on 10443.

If the administrator chooses to run SSL VPN on port 80, the redirect option is invalid.

This can also be configured in the CLI as described below:

### To redirect HTTP to HTTPS port - CLI:

```
config vpn ssl settings
 set https-redirect [enable | disable] (default: disabled)
end
```

### SSL offloading

To configure SSL offloading, which allows or denies client renegotiation, you must use the CLI. This helps to resolve the issues that affect all SSL and TLS servers that support renegotiation, identified by the Common Vulnerabilities and Exposures system in CVE-2009-3555. The SSL offloading renegotiation feature is considered a workaround until the IETF permanently resolves the issue.

The CLI command is `ssl-client-renegotiation` and is found under the `config firewall vip` syntax.

### Host check

When you enable AV, FW, or AV-FW host checking in the web portal Security Control settings, each client is checked for security software that is recognized by the Windows Security Center. As an alternative, you can

create a custom host check that looks for security software selected from the Host Check list. For more information, see [Additional configuration options on page 3044](#).

The Host Check list includes default entries for many security software products.

Host integrity checking is only possible with client computers running Microsoft Windows platforms.

---

### To configure host checking - CLI:

To configure the full-access portal to check for AV and firewall software on client Windows computers, you would enter the following:

```
config vpn ssl web portal
 edit full-access
 set host-check av-fw
 end
```

To configure the full-access portal to perform a custom host check for FortiClient Host Security AV and firewall software, you would enter the following:

```
config vpn ssl web portal
 edit full-access
 set host-check custom
 set host-check-policy FortiClient-AV FortiClient-FW
 end
```

### Replacing the host check error message

You can add your own host security check error message using either the web-based manager or the CLI. The default message reads: "Your PC does not meet the host checking requirements set by the firewall. Please check that your OS version or antivirus and firewall applications are installed and running properly or you have the right network interface."

#### To replace the host check error message - web-based manager:

1. Navigate to **System > Replacement Messages** and select **Extended View** in the upper right corner.
2. Scroll down to **SSL VPN** and select **Hostcheck Error Message**.
3. Edit the text in the right-hand column below and select **Save**.  
If you are unhappy with the new message, you can restore the message to its default by selecting **Restore Default** instead of **Save**.

#### To replace the host check error message - CLI:

Configure the host check error message using the following command.

```
config system replacemsg sslvpn hostcheck-error
```

### Creating a custom host check list

You can add your own software requirements to the host check list using the CLI. Host integrity checking is only possible with client computers running Microsoft Windows platforms. Enter the following commands:

```
config vpn ssl web host-check-software
 edit <software_name>
```

```

 set guid <guid_value>
 set type <av | fw>
 set version <version_number>
 end
end

```

If known, enter the Globally Unique Identifier (GUID) for the host check application. Windows uses GUIDs to identify applications in the Windows Registry. The GUID can be found in the Windows registry in the HKEY\_CLASSES\_ROOT section.

To obtain the exact versioning, in Windows, right-click on the .EXE file of the application and select **Properties**, then select the **Version** tab.

### Example Tunnel Mode Host Check - Registry Key Check

- Check to see if a required registry key is present:

```

config vpn ssl web host-check-software
 edit <computer_name>
 config check-item-list
 edit 1
 set target "HKEY_LOCAL_MACHINE\\SYSTEM\\CurrentControlSet\\Control\\ComputerName\\ActiveComputerName:ComputerName=WINXP32SP3B62"
 set type registry <<<-----
 next
 end
 next
end

```

### Example Tunnel Mode Host Check - Application Running Check

- Check to see if a required application is installed and/or running:

```

config vpn ssl web host-check-software
 edit "calc"
 config check-item-list
 edit 1
 set target "calc.exe"
 set type process <<<-----
 next
 end
 next
end

```

### Example Tunnel Mode Host Check - File Check

- Check to see if a specific file exists at a specific location:

```

config vpn ssl web host-check-software
 edit "putty"
 config check-item-list
 edit 1
 set target "C:\\software\\putty.txt"
 set md5s <ENC>
 next
 end
 next
end

```

## Configuring virtual desktop

Available for 32-bit Windows XP, Windows Vista, and Windows 7 client PCs, the virtual desktop feature completely isolates the SSL VPN session from the client computer's desktop environment. All data is encrypted, including cached user credentials, browser history, cookies, temporary files, and user files created during the session. When the SSL VPN session ends normally, the files are deleted. If the session ends due to a malfunction, files might remain, but they are encrypted so that the information is protected.

When the user starts an SSL VPN session that has virtual desktop enabled, the virtual desktop replaces the user's normal desktop. When the virtual desktop exits, the user's normal desktop is restored.

Virtual desktop requires the Fortinet cache cleaner plugin. If the plugin is not present, it automatically downloads to the client computer.

### To enable virtual desktop :

To enable virtual desktop on the full-access portal and apply the application control list 'List1', for example, you would enter:

```
config vpn ssl web portal
 edit full-access
 set virtual-desktop enable
 set virtual-desktop-app-list List1
 end
```

## Configuring virtual desktop application control

You can control which applications users can run on their virtual desktop. To do this, you create an Application Control List of either allowed or blocked applications. When you configure the web portal, you select the list to use.

Configure the application control list in the CLI.

### To create an Application Control List - CLI:

If you want to add 'BannedApp' to 'List1', a list of blocked applications, you would enter:

```
config vpn ssl web virtual-desktop-app-list
 edit "List1"
 set action block
 config apps
 edit "BannedApp"
 set md5s "06321103A343B04DF9283B80D1E00F6B"
 end
 end
 end
```

## Configuring client OS Check

The SSLVPN client OS Check feature can determine if clients are running the Windows 2000, Windows XP, Windows Vista, Windows 7, or Windows 10 operating system. You can configure the OS Check to do any of the following:

- Allow the client access.
- Allow the client access only if the operating system has been updated to a specified patch (service pack) version.
- Deny the client access.

The OS Check has no effect on clients running other operating systems.

The Windows patch check enables you to define the minimum Windows version and patch level allowed when connecting to the SSL VPN portal. When the user attempts to connect to the web portal, FortiOS performs a query on the version of Windows the user has installed. If it does not match the minimum requirement, the connection is denied. The Windows patch check is configured in the CLI.

To specify the acceptable patch level, you set the `latest-patch-level` and the `tolerance`. The lowest acceptable patch level is `latest-patch-level` minus `tolerance`. In this case, `latest-patch-level` is 3 and `tolerance` is 1, so 2 is the lowest acceptable patch level.

### To configure OS Check:

OS Check is configurable only in the CLI.

```
config vpn ssl web portal
 edit <portal_name>
 set os-check enable
 config os-check-list [windows-2000 | windows-xp | windows-vista | windows-7 |
 windows-10]
 set action [allow | check-up-to-date | deny]
 set latest-patch-level [disable | 0 - 255]
 set tolerance <tolerance_num>
 end
 end
```

### Host check for Windows firewall

The Windows built-in firewall does not have a GUID in `root\securitycenter` or `root\securitycenter2`, but you can use a registry value to detect the firewall status.

If Windows firewall is on, the following registry value will be set to 1:

- **KeyName:** `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\StandardProfile`
- **ValueName:** `EnableFirewall`

In FortiOS, use the `registry-value-check` feature to define the Windows Firewall software by entering the following in the CLI:

```
config vpn ssl web host-check-software
 edit "Microsoft-Windows-Firewall"
 config check-item-list
 edit 1
 set target
 "HKLM\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\StandardProfile:EnableFirewall==1"
 set type registry
 next
 edit 2
 set target
 "HKLM\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\PublicProfile:EnableFirewall==1"
 set type registry
 next
 edit 3
 set target
 "HKLM\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\DomainProfile:EnableFirewall==1"
 set type registry
 end
 end
```

```
 next
 end
 set type fw
next
set host-check custom
set host-check-policy Microsoft-Windows-Firewall
```

## Adding WINS and DNS services for clients

You can specify the WINS or DNS servers that are made available to SSL-VPN clients.

DNS servers provide the IP addresses that browsers need to access web sites. For Internet sites, you can specify the DNS server that your FortiGate unit uses. If SSL VPN users will access intranet sites using URLs, you need to provide them access to the intranet's DNS server. You specify a primary and a secondary DNS server.

A WINS server provides IP addresses for named servers in a Windows domain. If SSL VPN users will access a Windows network, you need to provide them access to the domain WINS server. You specify a primary and a secondary WINS server.

### To specify WINS and DNS services for clients - web-based manager:

1. Go to **VPN > SSL-VPN Settings**.
2. Next to **DNS Server** select **Specify**.
3. Enter the IP addresses of DNS servers in the **DNS Server** fields as needed. Fields are available for both IPv4 and IPv6 addresses.
4. Select **Specify WINS Servers**, and enter the IP addresses of WINS servers in the **WINS Server** fields as needed. Fields are available for both IPv4 and IPv6 addresses.
5. Select **Apply**.

### To specify WINS and DNS services for clients - CLI:

```
config vpn ssl settings
 set dns-server1 <address_ipv4>
 set dns-server2 <address_ipv4>
 set wins-server1 <address_ipv4>
 set wins-server2 <address_ipv4>
end
```

## Idle timeout

The idle timeout setting controls how long the connection can remain idle before the system forces the remote user to log in again. For security, keep the default value of 5000 seconds or less. Set the timeout value to 0 to disable idle timeouts.

### To set the idle timeout - web-based manager:

1. Go to **VPN > SSL-VPN Settings** and enable **Idle Logout**.
2. In the **Inactive For** field, enter the timeout value.  
The valid range is from 10 to 28800 seconds.
3. Select **Apply**.

**To set the idle timeout - CLI:**

```
config vpn ssl settings
 set idle-timeout <seconds_int>
end
```

**Login timeout**

With long network latency, the FortiGate can timeout the client before it can finish negotiation processes, such as DNS lookup and time to enter a token. Two CLI commands under `config vpn ssl settings` allow the login timeout to be configured, replacing the previous hard timeout value. The second command can be used to set the SSL VPN maximum DTLS hello timeout.

**CLI syntax**

```
config vpn ssl settings
 edit <example>
 set login-timeout [10-180] Default is 30 seconds.
 set dtls-hello-timeout [10-60] Default is 10 seconds.
 end
```

**Login failure limit**

The following CLI allows the administrator to configure the number of times wrong credentials are allowed before the SSL VPN server blocks an IP address, and also how long the block would last.

**CLI syntax**

```
config vpn ssl settings
 set login-attempt-limit [0-10] Default is 2.
 set login-block-time [0-86400] Default is 60 seconds.
end
```

**SSL VPN logs**

Logging is available for SSL VPN traffic so you can monitor users connected to the FortiGate unit and their activity.

**To enable logging of SSL VPN events - web-based manager:**

1. Go to **Log & Report > Log Settings**.
2. Enable **Event Logging**, and select **VPN activity event**.
3. Select **Apply**.

To view the SSL VPN log data, in the web-based manager, go to **Log & Report** and select either the **Event Log** or **Traffic Log**.

In event log entries, look for the sub-types “sslvpn-session” and “sslvpn-user”.

For information about how to interpret log messages, see the [FortiGate Log Message Reference](#).

**Monitoring active SSL VPN sessions**

You can go to **User & Device > Monitor** to view a list of active SSL VPN sessions. The list displays the user name of the remote user, the IP address of the remote client, and the time the connection was made. You can also see which services are being provided, and delete an active web session from the FortiGate unit.

**To monitor SSL VPNs - web-based manager:**

To view the list of active SSL VPN sessions, go to **Monitor > SSL-VPN Monitor**.

When a tunnel-mode user is connected, the **Description** field displays the IP address that the FortiGate unit assigned to the remote host.

If required, you can end a session/connection by selecting its checkbox and then clicking the **Delete** icon.

**Importing and using a CA-signed SSL certificate**

Use the following set of instructions to import a CA-signed SSL certificate and configure an SSL VPN using that certificate.

**Import the signed certificate into your FortiGate device**

1. Unzip the file downloaded from the CA.  
There should be two .CRT files: a CA certificate with bundle in the file name, and a local certificate.
2. Log in to your FortiGate unit and browse to **System > Certificates**.
3. Select **Create New > Local Certificate** to import the local certificate.  
The status of the certificate will change from PENDING to OK.
4. Import the CA certificate by selecting **Import > CA Certificate**.  
It will be listed in the CA Certificates section of the certificates list. You can now configure SSL VPN using the signed certificate.

**Configure your FortiGate device to use the signed certificate**

1. Log in to your FortiGate unit and browse to **VPN > SSL-VPN Settings**.
2. In the **Connection Settings** section, locate the **Server Certificate** field.
3. Select the new certificate from the drop-down menu.
4. Select **Apply** to configure SSL VPN to use the new certificate.

**Implement post-authentication CSRF protection in SSL VPN web mode**

This attribute can enable/disable verification of a referrer in the HTTP request header in order to prevent a Cross-Site Request Forgery attack.

**CLI Syntax**

```
config vpn ssl settings
 set check-referer [enable|disable]
end
```

**DTLS support**

The Datagram Transport Layer Security (DTLS) protocol is supported for SSL VPN connections. DTLS allows datagram-based applications to communicate in a way that prevents eavesdropping, tampering, or message forgery. It can also be used to improve upload/download throughput. It is similar to the Transport Layer Security (TLS) protocol.

DTLS support can be enabled in the CLI as described below.

## CLI Syntax

```
config vpn ssl settings
 set dtls-tunnel [enable | disable] (default: enabled)
end
```

### Allow firewall address to be used in routing table for SSL VPN

If destination **Named Address** is set in **Network > Static Routes** and **Address Range is set to Automatically assign addresses** is enabled in **VPN > SSL-VPN Settings**, SSL VPN should refresh the routing table automatically.

To view the routes in the routing table, go to **Monitor > Routing Monitor**.

### WAN link load balancing

You can set `virtual-wan-link` as the destination interface in a firewall policy (when SSL VPN is the source interface) for WAN link load balancing. This allows logging into a FortiGate via SSL VPN for traffic inspection and then have outbound traffic load balanced by WAN link load balancing.

## CLI syntax

```
config firewall policy
 edit <example>
 set dstintf virtual-wan-link
 end
```

## The SSL VPN client

The remote client connects to the SSL VPN tunnel in various ways, depending on the VPN configuration.

- Tunnel mode establishes a connection to the remote protected network that any application can use. If the client computer runs Microsoft Windows, they can download the tunnel mode client from the web portal. If the client computer runs Linux or Mac OS X, the user needs to download the tunnel mode client application from the Fortinet Support web site. See the Release Notes for your FortiOS firmware for the specific operating system versions that are supported.
- The virtual desktop application creates a virtual desktop on a user's PC and monitors the data read/write activity of the web browser running inside the virtual desktop. When the application starts, it presents a 'virtual desktop' to the user. The user starts the web browser from within the virtual desktop and connects to the SSL VPN web portal. The browser file/directory operation is redirected to a new location, and the data is encrypted before it is written to the local disk. When the virtual desktop application exits normally, all the data written to the disk is removed. If the session terminates abnormally (power loss, system failure, etc.), the data left behind is encrypted and unusable to the user. The next time you start the virtual desktop, the encrypted data is removed.

The SSL VPN standalone client installer for Windows is no longer supported in FortiOS 5.4. Users should use the FortiClient installer with the "VPN Only" option instead.

---

## FortiClient

Remote users can use the FortiClient software to initiate an SSL VPN tunnel to connect to the internal network. FortiClient uses local port TCP 1024 to initiate an SSL encrypted connection to the FortiGate unit, on port TCP 443. When connecting using FortiClient, the FortiGate unit authenticates the FortiClient SSL VPN request based on the user group options. The FortiGate unit establishes a tunnel with the client and assigns a virtual IP address to the client PC. Once the tunnel has been established, the user can access the network behind the FortiGate unit.

FortiClient software is available for download at [www.forticlient.com](http://www.forticlient.com) and is available for Windows, Mac OS X, Apple iOS, and Android.

## Tunnel mode client configuration

The FortiClient SSL VPN tunnel client requires basic configuration by the remote user to connect to the SSL VPN tunnel. When distributing the FortiClient software, provide the following information for the remote user to enter once the client software has been started. Once entered, they can select **Connect** to begin an SSL VPN session.

|                        |                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Connection Name</b> | If you have pre-configured the connection settings, select the connection from the list and then select <b>Connect</b> . Otherwise, enter the settings in the fields below. |
| <b>Remote Gateway</b>  | Enter the IP address or FQDN of the FortiGate unit that hosts the SSL VPN.                                                                                                  |

|                           |                                                                                                                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Username</b>           | Enter your username.                                                                                                                                                                                                          |
| <b>Client Certificate</b> | <p>Use this field if the SSL VPN requires a certificate for authentication.</p> <p>Select the required certificate from the drop-down list. The certificate must be installed in the Internet Explorer certificate store.</p> |

## The SSL VPN web portal

This chapter explains how to use and configure the web portal features. This chapter is written for end users as well as administrators.

The following topics are included:

### Connecting to the FortiGate unit

You can connect to the FortiGate unit using a web browser. The URL of the FortiGate interface may vary from one installation to the next. If required, ask your FortiGate administrator for the URL of the FortiGate unit, and obtain a user name and password. You can connect to the web portal using an Android phone, iPhone, or iPad. The FortiGate unit will display the content of the portal to fit the device's screen.

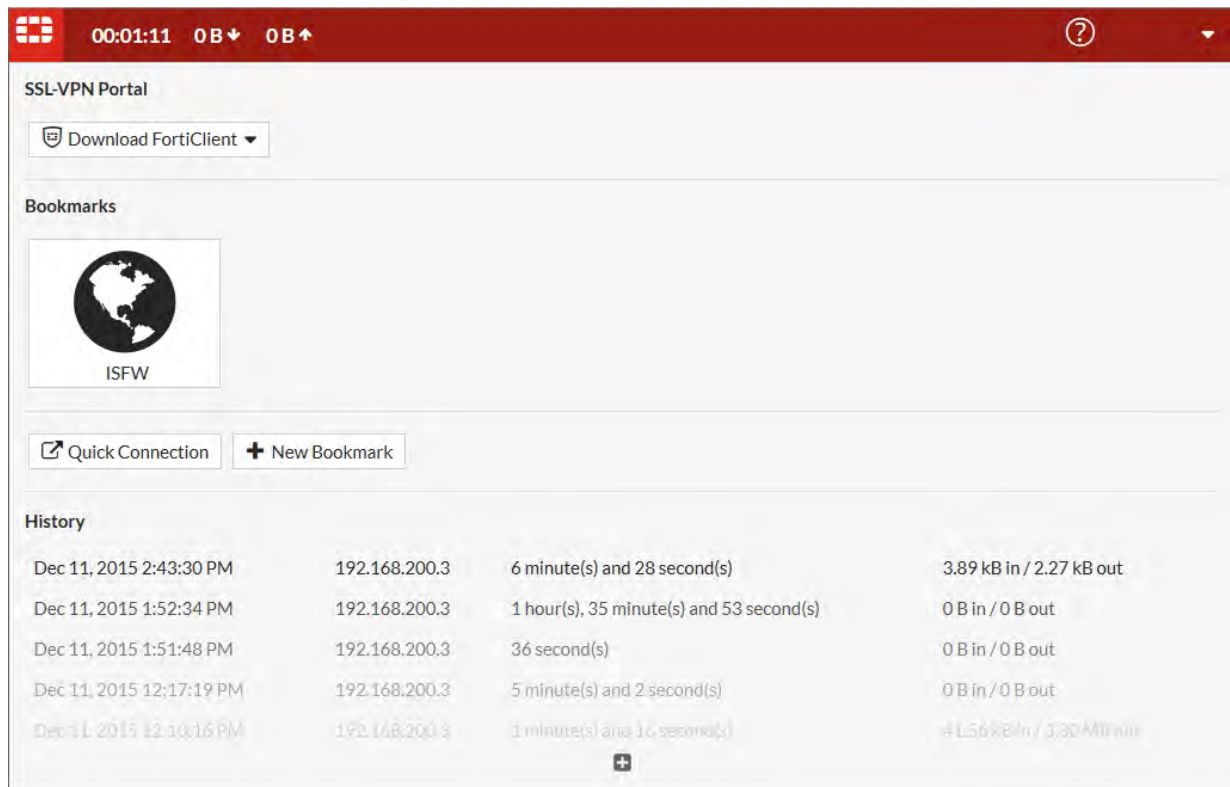

In addition, if you will be using a personal or group security (X.509) certificate to connect to the FortiGate unit, your web browser may prompt you for the name of the certificate. Your FortiGate administrator can tell you which certificate to select.

#### To log into the secure FortiGate HTTP gateway

1. Using the web browser on your computer, browse to the URL of the FortiGate unit (for example, `https://<FortiGate_IP_address>:443/remote/login`). The FortiGate unit may offer you a self-signed security certificate. If you are prompted to proceed, select **Yes**.  
A second message may be displayed to inform you that the FortiGate certificate distinguished name differs from the original request. This message is displayed because the FortiGate unit is attempting to redirect your web browser connection. You can ignore the message.
2. When you are prompted for your user name and password:
  - In the **Name** field, type your user name.
  - In the **Password** field, type your password.
3. Select **Login**.  
The FortiGate unit will redirect your web browser to the FortiGate SSL VPN web portal home page automatically.

### Web portal overview

After logging in to the web portal, the remote user is presented with a web portal page similar to the following:

Various widgets provide the web portal's features:

- **Session Information** displays the elapsed time since login and the volume of HTTP and HTTPS traffic, both inbound and outbound.
- **Quick Connection** enables you to connect to network resources without using or creating a bookmark.
- **Download Forticlient** provides access to the FortiClient tunnel application for various operating systems.
- **Bookmarks** provides links to network resources. You can use the administrator-defined bookmarks and you can add your own bookmarks.

While using the web portal, you can select the **Help** button to get information to assist you in using the portal features. This information displays in a separate browser window.

When you have finished using the web portal, select the **Logout** button in the top right corner of the portal window.

After making any changes to the web portal configuration, be sure to select **Apply**.

## Portal configuration

The SSL VPN web portal enables users to access network resources through a secure channel using a web browser. Fortinet administrators can configure log in privileges for system users and which network resources are available to the users.

The portal configuration determines what the user sees when they log in to the portal. Both the system administrator and the user have the ability to customize the SSL VPN portal.

There are three pre-defined default web portal configurations available:

- **full-access**: Includes all widgets available to the user - **Session Information**, **Tunnel Mode** options, **Connection Launcher**, **Remote Desktop**, and **Predefined Bookmarks**.
- **tunnel-access**: Includes **Session Information** and **Tunnel Mode** options.
- **web-access**: Includes **Session Information** and **Predefined Bookmarks** widgets.

You can also create your own web portal to meet your corporate requirements.

| Portal page       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Create New</b> | Creates a new web portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Edit</b>       | Select a portal from the list to enable the Edit option, and modify the portal configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Delete</b>     | Removes a portal configuration.<br><br>To remove multiple portals from the list, select the check box beside the portal names, then select <b>Delete</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Name</b>       | The name of the web portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Portal settings

A web portal defines SSL VPN user access to network resources. The portal configuration determines what SSL VPN users see when they log in to the unit. Both the Fortinet administrator and the SSL VPN user have the ability to customize the web portal settings. Portal settings are configured in **VPN > SSL-VPN Portals**.

The following settings are available, allow you to configure general and security console options for your web portal.

| Portal Setting                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Name</b>                                            | The name for the portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Limit Users to One SSL-VPN Connection at a Time</b> | You can set the SSL VPN tunnel such that each user can only log into the tunnel one time concurrently per user per login. That is, once logged into the portal, they cannot go to another system and log in with the same credentials again. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Tunnel Mode</b>                                     | These settings determine how tunnel mode clients are assigned IPv4 addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Enable Split Tunneling</b>                          | <p>Select so that the VPN carries only the traffic for the networks behind the FortiGate unit. The user's other traffic follows its normal route.</p> <p>If you enable split tunneling, you are required to set the <b>Routing Address</b>, which is the address that your corporate network is using. Traffic intended for the Routing Address will not be split from the tunnel.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Source IP Pools</b>                                 | Select an IP Pool for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Tunnel Mode Client Options</b>                      | <p>These options affect how the FortiClient application behaves when connected to the FortiGate VPN tunnel. When enabled, a check box for the corresponding option appears on the VPN login screen in FortiClient, and is not enabled by default.</p> <ul style="list-style-type: none"> <li>• <b>Allow client to save password</b> - When enabled, if the user selects this option, their password is stored on the user's computer and will automatically populate each time they connect to the VPN.</li> <li>• <b>Allow client to connect automatically</b> - When enabled, if the user selects this option, when the FortiClient application is launched, for example after a reboot or system startup, FortiClient will automatically attempt to connect to the VPN tunnel.</li> <li>• <b>Allow client to keep connections alive</b> - When enabled, if the user selects this option, the FortiClient should try to reconnect once it detects the VPN connection is down unexpectedly (not manually disconnected by user).</li> </ul> |
| <b>Enable Web Mode</b>                                 | Select to enable web mode access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Portal Message</b>                                  | This is a text header that appears on the top of the web portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Portal Setting                  | Description                                                                                                                                                                                                                                                                                                               |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Theme</b>                    | Select a color styling specifically for the web portal.                                                                                                                                                                                                                                                                   |
| <b>Show Session Information</b> | The <b>Show Session Information</b> widget displays the login name of the user, the amount of time the user has been logged in and the inbound and outbound traffic statistics.                                                                                                                                           |
| <b>Show Connection Launcher</b> | Displays the <b>Connection Launcher</b> widget in the web portal.                                                                                                                                                                                                                                                         |
| <b>Show Login History</b>       | Select to include user login history on the web portal.                                                                                                                                                                                                                                                                   |
| <b>User Bookmarks</b>           | Enable to allow users to add their own bookmarks in the web portal.                                                                                                                                                                                                                                                       |
| <b>Predefined Bookmarks</b>     | Select to include bookmarks on the web portal. Bookmarks are used as links to internal network resources. When a bookmark is selected from a bookmark list, a pop-up window appears with the web page. Telnet, VNC, and RDP require a browser plugin. FTP and Samba replace the bookmarks page with an HTML file-browser. |

### Predefined Bookmarks

Bookmarks are used as links to specific resources on the network. When a bookmark is selected from a bookmark list, a pop-up window appears with the requested web page. Telnet, RDP, and VNC pop up a window that requires a browser plug-in. FTP and Samba replace the bookmarks page with an HTML file-browser.

Note that the RDP/VNC web portals are **not** supported for the following platforms:

| Platform                | Model                                                                                |
|-------------------------|--------------------------------------------------------------------------------------|
| <b>FortiGate</b>        | 80D, 92D, 200D, 200D-POE, 240D, 240D-POE, 600C, 800C, 1000C, 3240C, 3600C, and 5001C |
| <b>FortiGate-Rugged</b> | 90D                                                                                  |
| <b>FortiWiFi</b>        | 92D                                                                                  |

A web bookmark can include login credentials to automatically log the SSL VPN user into the web site. When the administrator configures bookmarks, the web site credentials must be the same as the user's SSL VPN credentials. Users configuring their own bookmarks can specify alternative credentials for the web site.

### Applications available in the web portal

Depending on the web portal configuration and user group settings, one or more of the following server applications are available to you through **Predefined Bookmarks**, as well as the **Quick Connection** widget:

- Citrix makes use of SOCKS so that the Citrix client can connect to the SSL VPN port forward module to provide the connection.
- FTP (File Transfer Protocol) enables you to transfer files between your computer and a remote host.

- HTTP/HTTPS accesses web pages.
- Port Forward provides the middle ground between web mode and tunnel mode. When the SSL VPN receives data from a client application, the data is encrypted and sent to the FortiGate unit, which then forwards the traffic to the application server.
- RDP (Remote Desktop Protocol), similar to VNC, enables you to remotely control a computer running Microsoft Terminal Services.
- SMB/CIFS implements the Server Message Block (SMB) protocol to support file sharing between your computer and a remote server host.
- SSH (Secure Shell) enables you to exchange data between two computers using a secure channel.
- TELNET (Teletype Network emulation) enables you to use your computer as a virtual text-only terminal to log in to a remote host.
- VNC (Virtual Network Computing) enables you to remotely control another computer, for example, accessing your work computer from your home computer.

Some server applications may prompt you for a user name and password. You must have a user account created by the server administrator so that you can log in.

Windows file sharing through SMB/CIFS is supported through shared directories.

## Group-based SSL VPN bookmarks

The administrator can add bookmarks for groups of users. SSL VPN will only output the matched group-name entry to the client. This can only be done via the CLI.

### To add group-based SSL VPN bookmarks - CLI:

```
config vpn ssl web portal
 edit "portal-name"
 set user-group-bookmark enable*/disable
 next
end
config vpn ssl web user-group-bookmark
 edit "group-name"
 config bookmark
 edit "bookmark1"

 next
 end
 next
end
```

## Using the Bookmarks widget

The Bookmarks widget shows both administrator-configured and user-configured bookmarks. Administrator bookmarks cannot be altered but you can add, edit or delete user bookmarks.

The FortiGate unit forwards client requests to servers on the Internet or internal network. To use the web-portal applications, you add the URL, IP address, or name of the server application to the My Bookmarks list. For more information, see [Adding bookmarks on page 3062](#).

If you want to access a web server or telnet server without first adding a bookmark to the My Bookmarks list, use the Connection Tool instead. For more information, see [Using the Bookmarks widget on page 3061](#).

## Adding bookmarks

You can add frequently used connections as bookmarks. Afterward, select any hyperlink from the Bookmarks list to initiate a session.

### To add a bookmark

1. In the web portal, select **New Bookmark**.
2. Enter the following information:

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>              | Enter the name to display in the Bookmarks list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Type</b>              | Select the abbreviated name of the server application or network service from the drop-down list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Location</b>          | Enter the IP address or FQDN of the server application or network service.<br><br>For RDP connections, you can append some parameters to control screen size and keyboard layout. See <a href="#">Using the Bookmarks widget on page 3061</a> .                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>       | Optionally enter a short description. The description displays when you pause the mouse pointer over the hyperlink.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>SSO</b>               | Single Sign On (SSO) is available for HTTP/HTTPS bookmarks only.<br><br><b>Disabled</b> — This is not an SSO bookmark.<br><br><b>Automatic</b> — Use your SSL VPN credentials or an alternate set. See the <b>SSO Credentials</b> field.<br><br><b>Static</b> — Supply credentials and other required information (such as an account number) to a web site that uses an HTML form for authentication. You provide a list of the form field names and the values to enter into them. This method does not work for sites that use HTTP authentication, in which the browser opens a pop-up dialog box requesting credentials. |
| <b>SSO fields</b>        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>SSO Credentials</b>   | <b>SSL VPN Login</b> — Use your SSL VPN login credentials.<br><br><b>Alternative</b> — Enter <b>Username</b> and <b>Password</b> below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Username</b>          | Alternative username. Available if <b>SSO Credentials</b> is <b>Alternative</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Password</b>          | Alternative password. Available if <b>SSO Credentials</b> is <b>Alternative</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Static SSO fields</b> | These fields are available if <b>SSO</b> is <b>Static</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                   |                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Name</b> | Enter the field name, as it appears in the HTML form.                                                                                 |
| <b>Value</b>      | Enter the field value.<br><br>To use the values from <b>SSO Credentials</b> , enter %passwd% for password or %username% for username. |
| <b>Add</b>        | Add another <b>Field Name / Value</b> pair.                                                                                           |

3. Select **OK** and then select **Done**.

### Group-based SSL VPN bookmarks

This CLI-only feature allows administrators to add bookmarks for groups of users. SSL VPN will only output the matched group-name entry to the client.

#### Syntax:

```
config vpn ssl web portal
 edit "portal-name"
 set user-group-bookmark enable*/disable
 next
end
conf vpn ssl web user-group-bookmark
 edit "group-name"
 conf bookmark
 edit "bookmark1"

 next
 end
next
end
```

### Group-based SSL VPN bookmarks

This CLI-only feature allows administrators to add bookmarks for groups of users. SSL VPN will only output the matched group-name entry to the client.

#### Syntax:

```
config vpn ssl web portal
 edit <portal-name>
 set user-group-bookmark [enable | disable]
 next
end
config vpn ssl web user-group-bookmark
 edit <group-name>
 config bookmark
 edit <bookmark1>

 next
 end
next
end
```

## Using the Quick Connection Tool

The **Quick Connection Tool** widget enables a user to connect to a resource when it isn't a predefined bookmark.

You can connect to any type of server without adding a bookmark to the **Bookmarks** list. The fields in the **Quick Connection Tool** enable you to specify the type of server and the URL or IP address of the host computer.

See the following procedures:

- To connect to a web server on page 3064
- To ping a host or server behind the FortiGate unit on page 3064
- To start a Telnet session on page 3065
- To start an FTP session on page 3065
- To start an SMB/CIFS session on page 3065
- To start an SSH session on page 3066
- To start an RDP session on page 3066
- To start a VNC session on page 3066

Except for ping, these services require that you have an account on the server to which you connect.

---

When you use **Quick Connection Tool**, the FortiGate unit may offer you its self-signed security certificate. Select **Yes** to proceed. A second message may be displayed to inform you of a host name mismatch. This message is displayed because the FortiGate unit is attempting to redirect your web browser connection. Select **Yes** to proceed.

---

### To connect to a web server

1. In **Type**, select **HTTP/HTTPS**.
2. In the **Host** field, type the URL of the web server.  
For example: `http://www.mywebexample.com` or `https://172.20.120.101`
3. Select **Launch**.
4. To end the session, close the browser window.

### To ping a host or server behind the FortiGate unit

1. In **Type**, select **Ping**.
2. In the **Host** field, enter the IP address of the host or server that you want to reach.  
For example: `10.11.101.22`
3. Select **Launch**.  
A message stating whether the IP address can be reached or not is displayed.

**To start a Telnet session**

1. In **Type**, select **Telnet**.
2. In the **Host** field, type the IP address of the telnet host.  
For example: 10.11.101.12
3. Select **Launch**.  
A Telnet window opens.
4. Select **Connect**.
5. A telnet session starts and you are prompted to log in to the remote host.  
After you log in, you may enter any series of valid telnet commands at the system prompt.
6. To end the session, select **Disconnect** (or type `exit`) and then close the TELNET connection window.

**To start an FTP session**

1. In **Type**, select **FTP**.
2. In the **Host** field, type the IP address of the FTP server.  
For example: 10.11.101.12
3. Select **Launch**.  
A login window opens.
4. Enter your user name and password and then select **Login**.  
You must have a user account on the remote host to log in.
5. Manipulate the files in any of the following ways:
  - To download a file, select the file link in the **Name** column.
  - To access a subdirectory (**Type** is **Folder**), select the link in the **Name** column.
  - To create a subdirectory in the current directory, select **New directory**.
  - To delete a file or subdirectory from the current directory, select its **Delete** icon.
  - To rename a file in the current directory, select its **Rename** icon.
  - To upload a file to the current directory from your client computer, select **Upload**.
  - When the current directory is a subdirectory, you can select **Up** to access the parent directory.
6. To end the FTP session, select **Logout**.

**To start an SMB/CIFS session**

1. In **Type**, select **SMB/CIFS**.
2. In the **Host** field, type the IP address of the SMB or CIFS server.  
For example: 10.11.101.12
3. Select **Launch**.
4. Enter your user name and password and then select **Login**.  
You must have a user account on the remote host to log in.
5. Manipulate the files in any of the following ways:
  - To download a file, select the file link in the **Name** column.
  - To access a subdirectory (**Type** is **Folder**), select the file link in the **Name** column.
  - To create a subdirectory in the current directory, select **New Directory**.
  - To delete a file or subdirectory from the current directory, select its **Delete** icon.
  - To rename a file, select its **Rename** icon.

- To upload a file from your client computer to the current directory, select **Upload**.
  - When the current directory is a subdirectory, you can select **Up** to access the parent directory.
6. To end the SMB/CIFS session, select **Logout** and then close the SMB/CIFS window.

### To start an SSH session

1. In **Type**, select **SSH**.
2. In the **Host** field, type the IP address of the SSH host.  
For example: 10.11.101.12
3. Select **Launch**.  
A login window opens.
4. Select **Connect**.  
A SSH session starts and you are prompted to log in to the remote host. You must have a user account to log in. After you log in, you may enter any series of valid commands at the system prompt.
5. To end the session, select **Disconnect** (or type `exit`) and then close the SSH connection window.

### To start an RDP session

1. In **Type**, select **RDP**.
2. In the **Host** field, type the IP address of the RDP host.  
For example: 10.11.101.12
3. To log in to the remote host, type your user name and password. You must have a user account on the remote host to log in. Note that the user name should be entered in User Principal Name (UPN) format.
4. Select **Launch**.  
A login window opens.
5. Select **Login**.  
If you need to send Ctrl-Alt-Delete in your session, use Ctrl-Alt-End.
6. To end the RDP session, Log out of Windows or select **Cancel** from the Logon window.

Some Windows servers require a specific Security to be set for RDP sessions, such as Network Level Authentication (NLA) or Transport Layer Security (TLS), not the standard RDP encryption security. For example, Windows 10 requires the use of TLS.

---

### To start a VNC session

1. In **Type**, select **VNC**.
2. In the **Host** field, type the IP address of the VNC host.  
For example: 10.11.101.12
3. Select **Launch**.  
A login window opens.
4. Type your user name and password when prompted to log in to the remote host.  
You must have a user account on the remote host to log in.
5. Select **OK**.  
If you need to send Ctrl-Alt-Delete in your session, press F8, then select **Send Ctrl-Alt-Delete** from the pop-up menu.
6. To end the VNC session, close the VNC window.

Note that the RDP/VNC web portals are **not** supported for the following platforms:

| Platform                | Model                                                                                |
|-------------------------|--------------------------------------------------------------------------------------|
| <b>FortiGate</b>        | 80D, 92D, 200D, 200D-POE, 240D, 240D-POE, 600C, 800C, 1000C, 3240C, 3600C, and 5001C |
| <b>FortiGate-Rugged</b> | 90D                                                                                  |
| <b>FortiWiFi</b>        | 92D                                                                                  |

## Using FortiClient

Remote users can use FortiClient Endpoint Security to initiate an SSL VPN tunnel to connect to the internal network. FortiClient uses local port TCP 1024 to initiate an SSL encrypted connection to the FortiGate unit, on port TCP 10443. When connecting using FortiClient, the FortiGate unit authenticates the FortiClient SSL VPN request based on the user group options. the FortiGate unit establishes a tunnel with the client and assigns a virtual IP address to the client PC. Once the tunnel has been established, the user can access the network behind the FortiGate unit.

For information on configuring the FortiGate unit for SSL VPN connectivity, see [Basic configuration on page 3024](#). For details on configuring FortiClient for SSL VPN connections, see the FortiClient documentation.

## Setup examples

The examples in this chapter demonstrate the basic configurations needed for common connections to the SSL VPN tunnel and portals, applying the steps outlined in [Basic configuration on page 3024](#).

The following examples are included:

### Secure Internet browsing

This example sets up an SSL VPN tunnel that provides remote users the ability to access the Internet while traveling, and ensures that they are not subject to malware and other dangers, by using the corporate firewall to filter all of their Internet traffic. Essentially, the remote user will connect to the corporate FortiGate unit to surf the Internet.

Using SSL VPN and FortiClient SSL VPN software, you create a means to use the corporate FortiGate to browse the Internet safely.

### Creating an SSL VPN IP pool and SSL VPN web portal

1. Go to **VPN > SSL-VPN Portals** and select *tunnel-access*.
2. Disable **Split Tunneling**.
3. For **Source IP Pools** select **SSLVPN\_TUNNEL\_ADDR1**.
4. Select **OK**.

### Creating the SSL VPN user and user group

1. Create the SSL VPN user and add the user to a user group configured for SSL VPN use.
2. Go to **User & Device > User Definition** and select **Create New** to add the user:

|                  |          |
|------------------|----------|
| <b>User Name</b> | twhite   |
| <b>Password</b>  | password |

3. Select **OK**.
4. Go to **User & Device > User Groups** and select **Create New** to add *twhite* to a group called **SSL VPN**:

|             |          |
|-------------|----------|
| <b>Name</b> | SSL VPN  |
| <b>Type</b> | Firewall |

5. Move **white** to the **Members** list.
6. Select **OK**.

### Creating a static route for the remote SSL VPN user

Create a static route to direct traffic destined for tunnel users to the SSL VPN tunnel.

1. Go to **Network > Static Routes** and select **Create New** to add the static route.

|                            |                            |
|----------------------------|----------------------------|
| <b>Destination IP/Mask</b> | 10.212.134.0/255.255.255.0 |
| <b>Device</b>              | ssl.root                   |

The **Destination IP/Mask** matches the network address of the remote SSL VPN user.

2. Select **OK**.

### Creating security policies

Create an SSL VPN security policy with SSL VPN user authentication to allow SSL VPN traffic to enter the FortiGate unit.

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Add an SSL VPN security policy as below, and click **OK**.

|                           |          |
|---------------------------|----------|
| <b>Incoming Interface</b> | ssl.root |
| <b>Outgoing Interface</b> | internal |
| <b>Source Address</b>     | all      |
| <b>Source User Group</b>  | SSL VPN  |
| <b>Destination</b>        | all      |

3. Select **OK**.

### Configuring authentication rules

1. Go to **VPN > SSL-VPN Settings** and select **Create New** under **Authentication/Portal Mapping**.
2. Add an authentication rule for the remote user:

|                     |               |
|---------------------|---------------|
| <b>Users/Groups</b> | Tunnel        |
| <b>Portal</b>       | tunnel-access |

3. Select **OK** and **Apply**.

## Results

Using the FortiClient SSLVPN application, access the VPN using the address `https://172.20.120.136:443/` and log in as `twhite`. Once connected, you can browse the Internet.

From the FortiGate web-based manager, go to **Monitor > SSL-VPN Monitor** to view the list of users connected using SSL VPN. The **Subsession** entry indicates the split tunnel which redirects to the Internet.

## Split Tunnel

In this configuration, remote users are able to securely access the head office internal network through the head office firewall, yet browse the Internet without going through the head office FortiGate. Split tunneling is enabled by default for SSL VPN on FortiGate units.

The solution below describes how to configure FortiGate SSL VPN split tunneling using the FortiClient SSL VPN software, available from the [Fortinet Support site](#).

*Without* split tunneling, all communication from remote SSL VPN users to the head office internal network and to the Internet uses an SSL VPN tunnel between the user's PC and the head office FortiGate unit. Connections to the Internet are routed back out the head office FortiGate unit to the Internet. Replies come back into the head office FortiGate unit before being routed back through the SSL VPN tunnel to the remote user.

In short, enabling split tunneling protects the head office from potentially harmful access and external threats that may occur as a result of the end user's indiscretion while browsing the Internet. By contrast, disabling split tunneling protects the end user by forcing all their Internet traffic to pass through the FortiGate firewall.

## Creating a firewall address for the head office server

1. Go to **Policy & Objects > Addresses** and select **Create New** and add the head office server address:

| Category          | Address            |
|-------------------|--------------------|
| Name              | Head office server |
| Type              | Subnet             |
| Subnet / IP Range | 192.168.1.12       |
| Interface         | Internal           |

2. Select **OK**.

## Creating an SSL VPN IP pool and SSL VPN web portal

1. Go to **VPN > SSL-VPN Portals** and select **tunnel-access**.
2. Enter the following:

|                    |                               |
|--------------------|-------------------------------|
| Name               | Connect to head office server |
| Enable Tunnel Mode | Enable                        |

|                               |                     |
|-------------------------------|---------------------|
| <b>Enable Split Tunneling</b> | Enable              |
| <b>Routing Address</b>        | Internal            |
| <b>Source IP Pools</b>        | SSLVPN_TUNNEL_ADDR1 |

3. Select **OK**.

### Creating the SSL VPN user and user group

Create the SSL VPN user and add the user to a user group.

1. Go to **User & Device > User Definition**, select **Create New** and add the user:

|                  |          |
|------------------|----------|
| <b>User Name</b> | twhite   |
| <b>Password</b>  | password |

2. Select **OK**.
3. Go to **User & Device > User Groups** and select **Create New** to add the new user to the SSL VPN user group:

|             |          |
|-------------|----------|
| <b>Name</b> | Tunnel   |
| <b>Type</b> | Firewall |

4. Move **twhite** to the **Members** list.
5. Select **OK**.

### Creating a static route for the remote SSL VPN user

Create a static route to direct traffic destined for tunnel users to the SSL VPN tunnel.

1. Go to **Network > Static Routes** and select **Create New**

|                            |                            |
|----------------------------|----------------------------|
| <b>Destination IP/Mask</b> | 10.212.134.0/255.255.255.0 |
| <b>Device</b>              | ssl.root                   |

2. Select **OK**.

### Creating security policies

Create an SSL VPN security policy with SSL VPN user authentication to allow SSL VPN traffic to enter the FortiGate unit. Create a normal security policy from ssl.root to wan1 to allow SSL VPN traffic to connect to the Internet.

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Complete the following:

|                           |          |
|---------------------------|----------|
| <b>Incoming Interface</b> | ssl.root |
|---------------------------|----------|

|                            |                    |
|----------------------------|--------------------|
| <b>Source Address</b>      | all                |
| <b>Source User(s)</b>      | Tunnel             |
| <b>Outgoing Interface</b>  | internal           |
| <b>Destination Address</b> | Head office server |

3. Select **OK**.
4. Add a security policy that allows remote SSL VPN users to connect to the Internet.
5. Select **Create New**.
6. Complete the following and select **OK**:

|                            |          |
|----------------------------|----------|
| <b>Incoming Interface</b>  | ssl.root |
| <b>Source Address</b>      | all      |
| <b>Source User(s)</b>      | Tunnel   |
| <b>Outgoing Interface</b>  | wan1     |
| <b>Destination Address</b> | all      |
| <b>Schedule</b>            | always   |
| <b>Service</b>             | ALL      |
| <b>Action</b>              | ACCEPT   |

### Configuring authentication rules

1. Go to **VPN > SSL-VPN Settings** and select **Create New** under **Authentication/Portal Mapping**.
2. Add an authentication rule for the remote user:

|                     |               |
|---------------------|---------------|
| <b>Users/Groups</b> | Tunnel        |
| <b>Portal</b>       | tunnel-access |

3. Select **OK** and **Apply**.

### Results

Using the FortiClient SSL VPN application on the remote PC, connect to the VPN using the address `https://172.20.120.136:443/` and log in with the `twhite` user account. Once connected, you can connect to the head office server or browse to web sites on the Internet.

From the web-based manager, go to **Monitor > SSL-VPN Monitor** to view the list of users connected using SSL VPN. The **Subsession** entry indicates the split tunnel which redirects SSL VPN sessions to the Internet.

## Multiple user groups with different access permissions

You might need to provide access to several user groups with different access permissions. Consider the following example topology in which users on the Internet have controlled access to servers and workstations on private networks behind a FortiGate unit.

In this example configuration, there are two users:

- User1 can access the servers on Subnet\_1.
- User2 can access the workstation PCs on Subnet\_2.

You could easily add more users to either user group to provide them access to the user group's assigned web portal.

### General configuration steps

1. Create firewall addresses for:
  - The destination networks.
  - Two non-overlapping tunnel IP address ranges that the FortiGate unit will assign to tunnel clients in the two user groups.
2. Create two web portals.
3. Create two user accounts, User1 and User2.
4. Create two user groups. For each group, add a user as a member and select a web portal. In this example, User1 will belong to Group1, which will be assigned to Portal1 (similar configuration for User2).
5. Create security policies:
  - Two SSL VPN security policies, one to each destination.
  - Two tunnel-mode policies to allow each group of users to reach its permitted destination network.
6. Create the static route to direct packets for the users to the tunnel.

### Creating the firewall addresses

Security policies do not accept direct entry of IP addresses and address ranges. You must define firewall addresses in advance.

### Creating the destination addresses

SSL VPN users in this example can access either Subnet\_1 or Subnet\_2.

#### To define destination addresses - web-based manager:

1. Go to **Policy & Objects > Addresses**.
2. Select **Create New**, enter the following information, and select **OK**:

|                        |                |
|------------------------|----------------|
| <b>Name</b>            | Subnet_1       |
| <b>Type</b>            | Subnet         |
| <b>Subnet/IP Range</b> | 10.11.101.0/24 |
| <b>Interface</b>       | port2          |

3. Select **Create New**, enter the following information, and select **OK**:

|                        |                |
|------------------------|----------------|
| <b>Name</b>            | Subnet_2       |
| <b>Type</b>            | Subnet         |
| <b>Subnet/IP Range</b> | 10.11.201.0/24 |
| <b>Interface</b>       | port3          |

### Creating the tunnel client range addresses

To accommodate the two groups of users, split an otherwise unused subnet into two ranges. The tunnel client addresses must not conflict with each other or with other addresses.

#### To define tunnel client addresses - web-based manager:

1. Go to **Policy & Objects > Addresses**.
2. Select **Create New**, enter the following information, and select **OK**:

|                        |                          |
|------------------------|--------------------------|
| <b>Name</b>            | Tunnel_group1            |
| <b>Type</b>            | IP Range                 |
| <b>Subnet/IP Range</b> | 10.11.254.1-10.11.254.50 |
| <b>Interface</b>       | Any                      |

3. Select **Create New**, enter the following information, and select **OK**.

|                        |                            |
|------------------------|----------------------------|
| <b>Name</b>            | Tunnel_group2              |
| <b>Type</b>            | IP Range                   |
| <b>Subnet/IP Range</b> | 10.11.254.51-10.11.254.100 |
| <b>Interface</b>       | Any                        |

### Creating the web portals

To accommodate two different sets of access permissions, you need to create two web portals, portal1 and portal2, for example. Later, you will create two SSL VPN user groups, one to assign to portal1 and the other to assign to portal2.

#### To create the portal1 web portal:

1. Go to **VPN > SSL-VPN Portals** and select **Create New**.
2. Enter `portal1` in the **Name** field.
3. In **Source IP Pools**, select **Tunnel\_group1**.
4. Select **OK**.

**To create the portal2 web portal:**

1. Go to **VPN > SSL-VPN Portals** and select **Create New**.
2. Enter `portal2` in the **Name** field and select **OK**.
3. In **IP Pools**, select **Tunnel\_group2**
4. Select **OK**.

Later, you can configure these portals with bookmarks and enable connection tool capabilities for the convenience of your users.

**Creating the user accounts and user groups**

After enabling SSL VPN and creating the web portals that you need, you need to create the user accounts and then the user groups that require SSL VPN access.

Go to **User & Device > User Definition** and create user1 and user2 with password authentication. After you create the users, create the SSL VPN user groups.

**To create the user groups - web-based manager:**

1. Go to **User & Device > User Groups**.
2. Select **Create New** and enter the following information:

|             |          |
|-------------|----------|
| <b>Name</b> | Group1   |
| <b>Type</b> | Firewall |

3. From the **Available** list, select **User1** and move it to the **Members** list by selecting the right arrow button.
4. Select **OK**.
5. Repeat steps 2 through 4 to create Group2, assigned to Portal2, with User2 as its only member.

**Creating the security policies**

You need to define security policies to permit your SSL VPN clients, web-mode or tunnel-mode, to connect to the protected networks behind the FortiGate unit. Before you create the security policies, you must define the source and destination addresses to include in the policy. See [Creating the firewall addresses on page 3073](#).

Two types of security policy are required:

- An SSL VPN policy enables clients to authenticate and permits a web-mode connection to the destination network. In this example, there are two destination networks, so there will be two SSL VPN policies. The authentication ensures that only authorized users can access the destination network.
- A tunnel-mode policy is a regular ACCEPT security policy that enables traffic to flow between the SSL VPN tunnel interface and the protected network. Tunnel-mode policies are required if you want to provide tunnel-mode connections for your clients. In this example, there are two destination networks, so there will be two tunnel-mode policies.

**To create the SSL VPN security policies - web-based manager:**

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information and click **OK**:

|                            |                                    |
|----------------------------|------------------------------------|
| <b>Incoming Interface</b>  | ssl.root (sslvpn tunnel interface) |
| <b>Source Address</b>      | All                                |
| <b>Source User(s)</b>      | Group1                             |
| <b>Outgoing Interface</b>  | port2                              |
| <b>Destination Address</b> | Subnet_1                           |
| <b>Service</b>             | All                                |

3. Select **Create New**.
4. Enter the following information:

|                            |                                    |
|----------------------------|------------------------------------|
| <b>Incoming Interface</b>  | ssl.root (sslvpn tunnel interface) |
| <b>Source Address</b>      | All                                |
| <b>Source User(s)</b>      | Group2                             |
| <b>Outgoing Interface</b>  | port3                              |
| <b>Destination Address</b> | Subnet_2                           |
| <b>Service</b>             | All                                |

5. Click **OK**.

### Configuring authentication rules

1. Go to **VPN > SSL-VPN Settings** and select **Create New** under **Authentication/Portal Mapping**.
2. Add an authentication rule for the first remote group:

|                     |         |
|---------------------|---------|
| <b>Users/Groups</b> | Group1  |
| <b>Portal</b>       | Portal1 |

3. Select **OK** and **Apply**.
4. Select **Create New** and add an authentication rule for the second remote group:

|                     |         |
|---------------------|---------|
| <b>Users/Groups</b> | Group2  |
| <b>Portal</b>       | Portal2 |

5. Select **OK** and **Apply**.

### To create the tunnel-mode security policies - web-based manager:

1. Go to **Policy & Objects > IPv4 Policy** and select **Create New**.
2. Enter the following information, and select **OK**:

|                            |                                    |
|----------------------------|------------------------------------|
| <b>Incoming Interface</b>  | ssl.root (sslvpn tunnel interface) |
| <b>Source Address</b>      | Tunnel_group1                      |
| <b>Source User(s)</b>      | Group1                             |
| <b>Outgoing Interface</b>  | port2                              |
| <b>Destination Address</b> | Subnet_1                           |
| <b>Service</b>             | All                                |
| <b>Action</b>              | ACCEPT                             |
| <b>Enable NAT</b>          | Enable                             |

3. Select **Create New**.
4. Enter the following information, and select **OK**:

|                            |                                    |
|----------------------------|------------------------------------|
| <b>Incoming Interface</b>  | ssl.root (sslvpn tunnel interface) |
| <b>Source Address</b>      | Tunnel_group2                      |
| <b>Source User(s)</b>      | Group2                             |
| <b>Outgoing Interface</b>  | port3                              |
| <b>Destination Address</b> | Subnet_2                           |
| <b>Service</b>             | All                                |
| <b>Action</b>              | ACCEPT                             |
| <b>Enable NAT</b>          | Enable                             |

### Create the static route to tunnel mode clients

Reply packets destined for tunnel mode clients must pass through the SSL VPN tunnel. You need to define a static route to allow this.

#### To add a route to SSL VPN tunnel mode clients - web-based manager:

1. Go to **Network > Static Routes** and select **Create New**.
2. Enter the following information and select **OK**.

|                            |                                                                                                                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Destination IP/Mask</b> | 10.11.254.0/24<br><br>This IP address range covers both ranges that you assigned to SSL VPN tunnel-mode users. See <a href="#">Creating the tunnel client range addresses on page 3074</a> . |
| <b>Device</b>              | Select the SSL VPN virtual interface, <b>ssl.root</b> for example.                                                                                                                           |

In this example, the **IP Pools** field on the **VPN > SSL-VPN Settings** page is not used because each web portal specifies its own tunnel IP address range.

---

## Client device certificate authentication with multiple groups

In the following example, we require clients connecting to a FortiGate SSL VPN to have a device certificate installed on their machine in order to authenticate to the VPN.

Employees (in a specific OU in AD) will be required to have a device certificate to connect, while vendors (in a separate OU in AD) will *not* be required to have a device certificate.

This can *only* be performed in the CLI console.

---

The Authentication-rule option is only available in the CLI as an advanced setting to achieve your requirements. It is not available on the GUI. So in **VPN > SSL-VPN Settings**, do *not* enable **Require Client Certificate**, but selectively enable `client-cert` in each authentication-rule based on the requirements through CLI instead.

---

### Configuring SSL VPN shared settings and authentication rules - CLI:

The following example assumes that remote LDAP users/groups have been pre-configured.

```
config vpn ssl settings
 set servercert "Fortinet_Factory"
 set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
 set port 443
 set source-interface "wan1"
 set source-address "all"
 set default-portal "full-access"
 config authentication-rule
 edit 1
 set source-interface "wan1"
 set source-address "all"
 set groups "Employees"
 set portal "full-access"
 set client-cert enable
 next
 edit 2
 set source-interface "wan1"
 set source-address "all"
 set groups "Vendors"
 set portal "full-access"
 set client-cert disable <-- Set by default and will not be displayed.
 next
 end
end
```

Configure the remainder of the SSL VPN tunnel as normal (creating a firewall policy allowing SSL VPN access to the internal network, including the VPN groups, necessary security profiles, etc.).

If configured correctly, only the 'Employees' group should require a client certificate to authenticate to the VPN.

## Troubleshooting

This section contains tips to help you with some common challenges of SSL VPNs.

- Enter the following to display debug messages for SSL VPN:

```
diagnose debug application sslvpn -1
```

This command enables debugging of SSL VPN with a debug level of -1. The -1 debug level produces detailed results.

- Enter the following command to verify the debug configuration:

```
diagnose debug info
debug output: disable
console timestamp: disable
console no user log message: disable
sslvpn debug level: -1 (0xffffffff)
CLI debug level: 3
```

This output verifies that SSL VPN debugging is enabled with a debug level of -1, and shows what filters are in place. The output above indicates that debug output is disabled, so debug messages are not displayed. The output also indicates that debugging has not been enabled for any software systems.

- Enter the following to enable displaying debug messages:

```
diagnose debug enable
```

To view the debug messages, log into the SSL VPN portal. The CLI displays debug output similar to the following:

```
FGT60C3G10002814 # [282:root]SSL state:before/accept initialization (172.20.120.12)
[282:root]SSL state:SSLv3 read client hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write server hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write change cipher spec A (172.20.120.12)
[282:root]SSL state:SSLv3 write finished B (172.20.120.12)
[282:root]SSL state:SSLv3 flush data (172.20.120.12)
[282:root]SSL state:SSLv3 read finished A:system lib(172.20.120.12)
[282:root]SSL state:SSLv3 read finished A (172.20.120.12)
[282:root]SSL state:SSL negotiation finished successfully (172.20.120.12)
[282:root]SSL established: DHE-RSA-AES256-SHA SSLv3 Kx=DH Au=RSA Enc=AES(256) Mac=SHA1
```

- Enter the following to stop displaying debug messages:

```
diagnose debug disable
```

The following is a list of potential issues. The suggestions below are not exhaustive, and may not reflect your network topology.

### There is no response from the SSL VPN URL.

- Go to **VPN > SSL-VPN Settings** and check the SSL VPN port assignment. Also, verify that the SSL VPN policy is configured correctly.
- Check the URL you are attempting to connect to. It should follow this pattern:

```
https://<FortiGate IP>:<Port>/remote/login
```

- Ensure that you are using the correct port number in the URL.

#### FortiClient cannot connect.

Read the Release Notes to ensure that the version of FortiClient you are using is compatible with your version of FortiOS.

#### Tunnel-mode connection shuts down after a few seconds.

This issue can occur when there are multiple interfaces connected to the Internet (for example, a dual WAN). Upgrade to the latest firmware then use the following CLI command:

```
config vpn ssl settings
 set route-source-interface enable
end
```

**When you attempt to connect using FortiClient or in Web mode, you are returned to the login page, or you receive the following error message: “Unable to logon to the server. Your user name or password may not be configured properly for this connection. (-12).”**

- Ensure that cookies are enabled in your browser.
- If you are using a remote authentication server, ensure that the FortiGate is able to communicate with it.
- Access to the web portal or tunnel will fail if Internet Explorer has the privacy Internet Options set to High. If set to High, Internet Explorer will block cookies that do not have a compact privacy policy, and that use personally identifiable information without your explicit consent.

**You receive an error message stating: “Destination address of Split Tunneling policy is invalid.”**

The SSL VPN security policy uses the **ALL** address as its destination. Change the address to that of the protected network instead.

#### The tunnel connects but there is no communication.

Go to **Network > Static Routes** and ensure that there is a static route to direct packets destined for the tunnel users to the SSL VPN interface.

**You can connect remotely to the VPN tunnel but are unable to access the network resources.**

Go to **Policy & Objects > IPv4 Policy** and examine the policy allowing VPN access to the local network. If the destination address is set to all, create a firewall address for the internal network. Change the destination address and attempt to connect remotely again.

#### Users are unable to download the SSL VPN plugin.

Go to **VPN > SSL-VPN Portals** to make sure that the option to **Limit Users to One SSL-VPN Connection at a Time** is disabled. This allows users to connect to the resources on the portal page while also connecting to the VPN through FortiClient.

#### Users are being assigned to the wrong IP range.

Ensure that the same IP Pool is used in VPN Portal and VPN Settings to avoid conflicts. If there is a conflict, the portal settings will be used.

### Flow-based (vdom) AntiVirus profiles in SSL VPN web mode limitation

In flow mode vdom, SSL VPN web mode doesn't block antivirus even when `av-profile` is set (however, SSL VPN tunnel mode AV profile does work).

### Sending tunnel statistics to FortiAnalyzer

By default, logged events include tunnel-up and tunnel-down status events. Other events, by default, will appear in the FortiAnalyzer report as "No Data Available". More accurate results require logs with `action=tunnel-stats`, which is used in generating reports on the FortiAnalyzer (rather than the tunnel-up and tunnel-down event logs). The FortiGate does not, by default, send `tunnel-stats` information.

To allow VPN `tunnel-stats` to be sent to FortiAnalyzer, configure the FortiGate unit as follows using the CLI:

```
config system settings
 set vpn-stats-log ipsec ssl
 set vpn-stats-period 300
end
```

### HTTP header information

The X-Content-Type-Options header is added to internal pages of SSL VPN to comport with PCI-DSS compatibility. Strict-Transport-Security is added to the HTTP header for the same reason.

# Chapter 28 - System Administration

## System administration

Welcome and thank you for selecting Fortinet products for your network protection.

This guide explains how to get started with a FortiGate unit, as well as examining basic configuration tasks, best practices, and more advanced configuration options.

### How this guide is organized

This guide contains the following sections:

[What's New in FortiOS 5.6](#) informs you about new system features in FortiOS 5.6.

[Administrators](#) describes the tasks that can be done to add and secure administrative access to a FortiGate.

[Central management](#) describes how to configure the FortiGate unit to use FortiManager as a method of maintaining the device and other features that FortiManager has to facilitate the administration of multiple devices.

[Monitoring](#) discusses the various methods of monitoring both the FortiGate unit and the network traffic through a range of different tools available within FortiOS.

[Replacement messages](#) explains how to view and customize various replacement messages on the FortiGate.

[Administration for schools](#) shares basic practices administrators in school systems can employ to meet the challenges of maintaining a network and access to the Internet

[PPTP and L2TP](#) contains information on configuring PPTP and L2TP VPNs as well as PPTP passthrough.

[Session helpers](#) explains how to use session helpers to analyze the data in the packet bodies of some protocols and adjust the firewall to allow those protocols to send packets through the firewall.

[Advanced concepts](#) describes more involved administrative topics to enhance network security and traffic efficiency.

## What's New in FortiOS 5.6

This section describes new system administration features added to FortiOS 5.6.3, 5.6.1, and 5.6.0.

### FortiOS 5.6.3

The following new features were added to FortiOS 5.6.3.

#### **Disallow use of default/empty password for local admins (421579) (434075) (448821) (449795)**

When logging in using a local admin with the default or empty password, a warning prompt will appear upon login. Admins will be logged out if they have no permissions.

#### **BFD echo mode support when in Transparent mode (enable/disable blocking land attacks) (441740)**

Support has been added allowing you to enable or disable blocking land attacks.

This option is disabled by default. Since its a system settings option you can enable or disable blocking land attacks for individual VDOMs if your FortiGate is operating with multiple VDOMs.

Another reason to enable this feature would be if your FortiGate is blocking BFD echo packets that should be allowed to pass through the FortiGate. For example, a FortiGate operating in Transparent mode between two routers with a policy that allows all traffic may block BFD echo communication between the routers if blocking land attacks is disabled.

Enabling blocking land attacks allows BFD echo packets to pass through the FortiGate. Use the following command to block land attacks and allow BFD echo packets.

#### **Syntax**

```
config system settings
 set block-land-attack enable
end
```

### FortiOS 5.6.1

#### **Use self-sign as default GUI certificate if BIOS cert is using SHA-1 (403152)**

For increased security, SHA-1 certificate has been replaced by self-sign certificate as the default GUI certificate, if the BIOS certificate is using SHA-1.

#### **Administrator timeout override per access profile (413543)**

The GUI is often used for central monitoring. To do this requires the inactivity timeout to be increased, to avoid an admin having to constantly log in over again. This new feature allows the **admintimeout** value, under `config system accprofile`, to be overridden per access profile.

Note that this can be achieved on a per-profile basis, to avoid the option from being unintentionally set globally.

**CLI Syntax - Configure admin timeout**

```

config system accprofile
 edit <name>
 set admintimeout-override {enable | disable}
 set admintimeout <0-480> - (default = 10, 0 = unlimited)
 next
end

```

**New execute script command (423159)**

A new `execute` command has been introduced to merge arbitrary configlets into the running configuration from script. The command's authentication can be carried out using either username and password or with a certificate. This command supports FTP/TFTP and SCP.

An important benefit of this feature is that if the configuration in the script fails (i.e. a syntax error), the system will revert back to running configurations without interrupting the network.

**CLI Syntax - Load script from FTP/TFTP/SCP server to firewall**

```

execute restore scripts <ftp | tftp |
 scp> <dir / filename in server> <server ip> <username> <password>

```

**FortiOS 5.6****Remove CLI commands from 1-CPU platforms (405321)**

Two CLI commands that set CPU affinity have been removed from 1-CPU platforms since they do not have any impact on these platforms. The commands are `config system global > set miglog-affinity` and `config system global > set av-affinity <string>`.

**New SNMP trap for bypass events (307329)**

When bypass mode is enabled or disabled on FortiGate units that are equipped with bypass interfaces and support AMC modules, a new SNMP trap is generated and logs bypass events.

**Implement SNMP support for NAT Session monitoring which includes new SNMP OIDs (383661)**

FortiOS 5.6 implements a new feature providing SNMP support for NAT session monitoring. The resulting new SNMP object identifier (OID) is:

```

FORTINET-FORTIGATE-
MIB:fortinet.fnFortiGateMib.fgFirewall.fgFwIppools.fgFwIppTables.fgFwIppStatsTable.fgFwIppStatsEntry
1.3.6.1.4.1.12356.101.5.3.2.1.1

```

Additionally, there are eight new items:

```

.fgFwIppStatsName .1
.fgFwIppStatsType .2
.fgFwIppStatsStartIp .3

```

```
.fgFwIppStatsEndIp .4
.fgFwIppStatsTotalSessions .5
.fgFwIppStatsTcpSessions .6
.fgFwIppStatsUdpSessions .7
.fgFwIppStatsOtherSessions .8
```

### New extended database version OIDs for AV and IPS (402162)

New extended database version OIDs ensure accurate display of the AntiVirus and IPS databases in use when you go to **System > FortiGuard**.

### Administrator password encryption hash upgraded from SHA1 to SHA256 (391576)

The encryption has for administrator passwords is upgraded from SHA1 to SHA256.

Downgrades from FortiOS 5.6->5.4->5.2->5.0 will keep the administrator password usable. If you need to downgrade to FortiOS 4.3, remove the password before the downgrade, then login after the downgrade and re-set password.

### Allow multiple FortiManager addresses when configuring central management (388083)

Central management configuration can now support multiple FortiManager addresses. This feature is mainly to help the case where the FortiGate unit is behind NAT.

### FortiGuard can determine a FortiGate's location from its public IP address (393972)

A new CLI command allows users to determine a FortiGate's location from its public IP address through FortiGuard .

The new CLI command is `diagnose sys waninfo`.

### Deletion of multiple saved configurations supported (308936)

The FortiGate will save multiple configurations and images when `revision-backup-on-logout` and `revision-image-auto-backup` are enabled in `config system global`.

The deletion of multiple saved configurations is now possible due to changes in the CLI command `execute revision delete config <revision ID>`. Where the command only allowed for one revision ID at a time, it now allows almost ten.

### New CLI option to limit script output size (388221)

The new CLI command `set output-size` limits the size of an auto script in megabytes and prevents the memory from being used up by the script's output.

### CLI Syntax

```
config system auto-script
 edit <script name>
 set output-size <integer>
 next
end
```

Enter an integer value from 10 to 1024. Default is 10.

### Enable / disable logging of SSL connection events (375582)

New CLI commands are added to give the user the option to enable or disable logging of SSL connection events.

#### CLI Syntax

```
config system global
 set log-ssl-connection {enable | disable}
end
```

Default is `disable`.

### Enabling or disabling static key ciphers (379616)

There is a new option in `system global` to enable or disable static key ciphers in SSL/TLS connections (e.g., AES128-SHA, AES256-SHA, AES128-SHA256, AES256-SHA256). The default is `enable`.

#### CLI Syntax

```
config system global
 set ssl-static-key-ciphers {enable | disable}
end
```

### Enhancements to IPS Signatures page (285543)

The IPS signatures list page now shows which IPS package is currently deployed. You can also change the IPS package by hovering over the information icon next to the IPS package name. Text appears that links directly to the FortiGate's **System > FortiGuard** page from the IPS Signatures list page.

### Combine multiple commands into a CLI alias (308921)

You can add one or more CLI command to a CLI alias, then use the `alias` command to run the alias that you have created to execute the stored commands. For example, create the following `alias` to run the `get system status` command:

```
config system alias
 edit "version"
 set command "get system status"
 end
```

Then you can use the following command to run the alias:

```
alias version
```

You can use command abbreviations (for example: `g sys stat` instead of `get system status`). Use quotes around the syntax if there are spaces (there usually are).

You can enter `alias` followed by a `?` to view the aliases that you have added.

You can add multiple commands to an alias by pressing **Ctrl-Enter** after the first line. Press enter at the end of subsequent lines. And the end of the last line add second quote and press Enter to end the command.

```
config system alias
 edit "debug_flow"
 set command "diag debug enable
diag debug flow show console enable"
```

```
end
```

You can include config commands in an alias as well, for example, create the following alias to bring the port1 and port2 interfaces down:

```
config system alias
edit port12down
set command "config system interface
edit port1
set status down
next
edit port2
set status down
end"
end
```

You can combine config, execute, get, and diagnose commands in the same alias, for example:

```
config system alias
edit "show-info"
set command "show full-configuration alertemail setting
get sys status
dia sys top"
end
```

## Administrators

By default, the FortiGate has a super administrator account, called `admin`, which cannot be deleted. Additional administrators can be added for various functions, each with a unique user name, password, and set of access privileges.

The following tasks can be done to add and secure administrative access to a FortiGate:

- [Administrator profiles](#)
- [Adding a local administrator](#)
- [LDAP authentication for administrators](#)
- [Other methods of administrator authentication](#)
- [Administrator logout](#)
- [Monitoring administrators](#)
- [Management access](#)
- [Security precautions](#)

### Administrator profiles

Administrator profiles define what the administrator can do when logged into the FortiGate. When you set up an administrator account, you also assign an administrator profile dictating what the administrator will see. Depending on the nature of the administrator's work, access level or seniority, you can allow them to view and configure as much, or as little, as required.

#### super\_admin profile

This profile has access to all components of FortiOS, including the ability to add and remove other system administrators. For some administrative functions, such as backing up and restoring the configuration, `super_admin` access is required. The `super_admin` profile cannot be deleted or modified, to ensure that there is always a method to administer the FortiGate.

Lower level administrator profiles cannot backup or restore the FortiOS configuration.

---

The `super_admin` profile is used by the default `admin` account. It is recommended to add a password and rename this account once you have set up your FortiGate. In order to rename the default account, a second admin account is required. For more information, see ["Administrators" on page 3089](#).

### Creating profiles

To configure administrator profiles go to **System > Admin Profiles** and select **Create New**.

On the **New Administrator Profile** page, you define the components of FortiOS that will be available to view and/or edit. For example, you can configure a profile so that the administrator can only access the **Firewall Configuration**, which includes firewall policies, addresses, services, schedules, packet capture, and some other

parts of the FortiGate configuration. Any other aspects of the FortiGate configuration, including VPNs and security profiles, will be hidden from this administrator.

### Administrator timeout override per access profile

With the release of FortiOS 5.6.1, administrator profiles can be configured to increase inactivity timeout and facilitate use of the GUI for central monitoring. This new feature allows the `admintimeout` value, under `config system accprofile`, to be overridden per access profile.

Note that this can be achieved on a per-profile basis, to avoid the option from being unintentionally set globally.

#### CLI Syntax - Configure admin timeout

```
config system accprofile
 edit <name>
 set admintimeout-override {enable | disable}
 set admintimeout <0-480> - (default = 10, 0 = unlimited)
 next
end
```

### Adding a local administrator

Only administrators with read-write privileges for **Administrator Users** can create a new administrator account.

#### To add an administrator - GUI

1. Go to **System > Administrators**.
2. Select **Create New**.
3. Add a **Name** for the administrator.

The name of the administrator should not contain the characters `<> ( ) # " ' .` Using these characters in the administrator account name can result in a cross site scripting (XSS) vulnerability.

4. Enter the **Password** for the user. This may be a temporary password that the administrator can change later. Passwords can be up to 256 characters in length. For more information on passwords, see the [Passwords](#) discussion in the Getting Started chapter.
5. Set **Type** to **Local User**.
6. Determine if you need to enable **Security** options **Two-factor Authentication** or **Restrict login to trusted hosts** or **Restrict admin to guest account provisioning only**.
7. Select **OK**.

The option to configure guest management administrator's through the GUI is new to FortiOS 5.6. To create the user group to be used for guest user accounts, go to [Managing Guest Access](#) in the [Authentication](#) chapter.

#### To add an administrator - CLI

```
config system admin
```

```
edit <admin_name>
 set password <password>
 set accprofile <profile_name>
 set guest-auth {enable | disable}
 set user-groups <group-name>
end
```

The CLI command `set user-groups` can only be used when `guest-auth` is set to `enable`.

## LDAP authentication for administrators

Administrators can use remote authentication, such as LDAP, to connect to the FortiGate.

To do this, requires three steps:

- configure the LDAP server
- add the LDAP server to a user group
- configure the administrator account

### Configure the LDAP server

First set up the LDAP server as you normally would, and include a group to bind to.

#### To configure the LDAP server - GUI

1. Go to **User & Device > LDAP Servers** and select **Create New**.
2. Enter a **Name** for the server.
3. Enter the **Server IP** address or name.
4. Enter the **Common Name Identifier** and **Distinguished Name**.
5. Set the **Bind Type** to **Regular** and enter the **User DN** and **Password**.
6. Select **OK**.

#### To configure the LDAP server - CLI

```
config user ldap
 edit <ldap_server_name>
 set server <server_ip>
 set cnid cn
 set dn DC=XYZ,DC=COM
 set type regular
 set user name CN=Administrator,CN=Users,DC=XYZ,DC=COM
 set password <password>
 set member-attr <group_binding>
 end
```

### Add the LDAP server to a user group

Next, create a user group that will include the LDAP server that was created above.

#### To create a user group - GUI

1. Go to **User & Device > User Groups** and select **Create New**.
2. Enter a **Name** for the group.

3. In the section labeled **Remote groups**, select **Create New**.
4. Select the **Remote Server** from the drop-down list.
5. Select **OK**.

#### To create a user group - CLI

```
config user group
 edit <group_name>
 config match
 edit 1
 set server-name <LDAP_server>
 set group-name <group_name>
 end
 end
 end
```

### Configure the administrator account

Now you can create a new administrator, where rather than entering a password, you will use the new user group and the wildcard option for authentication.

#### To create an administrator - GUI

1. Go to **System > Administrators** and select **Create New**.
2. In the **Administrator** field, enter the name for the administrator.
3. For **Type**, select **Match a user on a remote server group**.
4. Select the **User Group** created above from the drop-down list.
5. Select **Wildcard**. The Wildcard option allows for LDAP users to connect as this administrator.
6. Select an **Admin Profile**.
7. Select **OK**.

#### To create an administrator - CLI

```
config system admin
 edit <admin_name>
 set remote-auth enable
 set accprofile super_admin
 set wild card enable
 set remote-group ldap
 end
```

### Other methods of administrator authentication

Admin accounts can use a variety of methods for authentication, including RADIUS, TACACS+, and PKI.

#### RADIUS authentication for administrators

If you want to use a RADIUS server to authenticate administrators, you must:

- configure the FortiGate to access the RADIUS server
- create the RADIUS user group
- configure an administrator to authenticate with a RADIUS server.

## TACACS+ authentication for administrators

If you want to use a TACACS+ server to authenticate administrators, you must:

- configure the FortiGate to access the TACACS+ server
- create a TACACS+ user group
- configure an administrator to authenticate with a TACACS+ server.

## PKI certificate authentication for administrators

To use PKI authentication for an administrator, you must:

- configure a PKI user
- create a PKI user group
- configure an administrator to authenticate with a PKI certificate.

## Administrator lockout

By default, the FortiGate sets the number of password retries at three, allowing the administrator a maximum of three attempts to log into their account before locking the account for a set amount of time.

Both the number of attempts (`admin-lockout-threshold`) and the wait time before the administrator can try to enter a password again (`admin-lockout-duration`) can be configured within the CLI.

### To configure the lockout options:

```
config system global
 set admin-lockout-threshold <failed_attempts>
 set admin-lockout-duration <seconds>
end
```

The default value of `admin-lockout-threshold` is 3 and the range of values is between 1 and 10. The `admin-lockout-duration` is set to 60 seconds by default and the range of values is between 1 and 4294967295 seconds.

Keep in mind that the higher the lockout threshold, the higher the risk that someone may be able to break into the FortiGate unit.

### Example:

To set the `admin-lockout-threshold` to one attempt and the `admin-lockout-duration` to a five minute duration before the administrator can try to log in again, enter the commands:

```
config system global
 set admin-lockout-threshold 1
 set admin-lockout-duration 300
end
```

If the time span between the first failed login attempt and the `admin-lockout-threshold` failed login attempt is less than `admin-lockout-duration`, the lockout will be triggered.

## Monitoring administrators

You can view the administrators logged in using the **System Information** widget on the Dashboard. The **Current Administrator** row that shows the administrator logged in and the total number of administrators logged in. Selecting **Details** displays the administrators, where they are logging in from and how (CLI, GUI) and when they logged in.

You are also able to monitor the activities the administrators perform on the FortiGate using the event logging. Event logs include a number of options to track configuration changes.

### To set logging - GUI

1. Go to **Log & Report > Log Settings**.
2. Under **Event Logging**, select **Customize** and ensure **System activity event** is selected.
3. Select **Apply**.

### To set logging - CLI

```
config log eventfilter
 set event enable
 set system enable
end
```

To view the logs go to **Log & Report > System Events**.

## Management access

Management access defines how administrators are able to log on to the FortiGate. In NAT mode, access is configured for each of the FortiGate's interfaces, using the interface's IP to connect. In Transparent mode, a single management IP address is configured to allow access.

Management access can be via HTTP, HTTPS, Telnet, or SSH sessions. HTTPS and SSH are preferred as they are more secure. The management computer must connect to an interface that permits management access and its IP address must be on the same network. If you are using VDOMs, an administrator who is restricted to a specific VDOM must use a computer that connects to an interface on that VDOM.

You can allow remote administration of the FortiGate; however, it is not recommended, since it could compromise the security of the FortiGate. If you require remote administration, the following precautions can be taken to improve the security of a FortiGate:

- Use secure administrator passwords.
- Change these passwords regularly.
- Enable two-factor authentication for administrators.
- Enable secure administrative access to this interface using only HTTPS or SSH.
- Use Trusted Hosts to limit where the remote access can originate from.
- Do not change the system idle timeout from the default value of 5 minutes.

## Security precautions

One potential point of a security breach is at the management computer. Administrators who leave their workstations for a prolonged amount of time while staying logged into the GUI or CLI leave the firewall open to malicious intent.

When logging in using a local admin with the default or empty password, a warning prompt will appear upon login. Admins will be logged out if they have no permissions.

### Restrict logins from trusted hosts

Setting up trusted hosts for an administrator limits the addresses from where they can log into FortiOS. The trusted hosts configuration applies to all forms of administrative access including HTTPS, SSH, ping, and SNMP. When you identify a trusted host for an administrator account, FortiOS accepts that administrator's login only from one of the trusted hosts. A login, even with proper credentials, from a non-trusted host is dropped.

To identify trusted hosts, go to **System > Administrators**, edit the administrator account, enable **Restrict login to trusted hosts**, and add up to ten trusted host IP addresses.

To add two trusted hosts from the CLI:

```
config system admin
 edit <administrator-name>
 set trustedhost1 172.25.176.23 255.255.255.255
 set trustedhost2 172.25.177.0 255.255.255.0
 end
```

Trusted host IP addresses can identify individual hosts or subnets. Just like firewall policies, FortiOS searches through the list of trusted hosts in order and acts on the first match it finds. When you configure trusted hosts, start by adding specific addresses at the top of the list. Follow with more general IP addresses. You don't have to add addresses to all of the trusted hosts as long as all specific addresses are above all of the 0.0.0.0 0.0.0.0 addresses.

### Prevent concurrent administrator sessions

Concurrent administrator sessions occur when multiple people concurrently access the FortiGate using the same administrator account. This is allowed by default. If you wish to prevent this behavior go to **System > Settings** and disable **Allow multiple concurrent sessions for each administrator**.

From the CLI:

```
config system global
 set admin-concurrent disable
end
```

Note, if you disable concurrent sessions for an administrator, you will be allowed only one session with the same username even if it is from the same IP.

### Segregated administrative roles

To minimize the effect of an administrator causing errors to the FortiGate configuration and possibly jeopardizing the network, create individual administrative roles where none of the administrators have super\_admin

permissions. For example, one account is used solely to create security policies, another for users and groups, another for VPN, and so on.

## SSH log in time out

You can take up to 120 seconds to log into the FortiGate when using SSH. You can use the following CLI command to reduce this time to enhance security:

```
config system global
 set admin-ssh-grace-time <number_of_seconds>
end
```

The range can be between 10 and 3600 seconds.

## HTTPS redirect

When configuring the Administration Settings (found at **System > Settings**), you can also enable HTTP to **Redirect to HTTPS**. When enabled, if an administrator tries to connect to an interface using HTTP, this traffic will be automatically redirected to use HTTPS instead for a more secure connection.

## Administrator log in disclaimers

FortiOS can display a disclaimer before or after logging into the GUI or CLI (or both). In either case the administrator must read and accept the disclaimer before they can proceed.

Use the following command to display a disclaimer before logging in:

```
config system global
 set pre-login-banner enable
end
```

Use the following command to display a disclaimer after logging in:

```
config system global
 set post-login-banner enable
end
```

You can customize the replacement messages for these disclaimers by going to **System > Replacement Messages**. Select **Extended View** to view and edit the **Administrator** replacement messages.

From the CLI:

```
config system replacemsg admin pre_admin-disclaimer-text
config system replacemsg admin post_admin-disclaimer-text
```

## Disable the console interface

You can disable your FortiGate's console interface to prevent any unwanted login attempts:

```
config system console
 set login disable
end
```

## Disable other interfaces

If any of the interfaces on the FortiGate are not being used, disable traffic on that interface. This avoids someone plugging in network cables and potentially causing network bypass or loop issues.

**To disable an interface - GUI**

1. Go to **Network > Interfaces**.
2. Select the interface from the list and select **Edit**.
3. For **Administrative Access**, select **Down**.
4. Select **OK**.

**To disable an interface - CLI**

```
config system interface
 edit <interface_name>
 set status down
 end
```

**Self-signed GUI certificates**

For increased security, SHA-1 certificate has been replaced by self-sign certificate as the default GUI certificate, if the BIOS certificate is using SHA-1.

## Central management

Administering one or two FortiGate units is fairly simple enough, especially when they are in the same room or building. However, if you are administering many FortiGate units that may be located in locations in a large geographical area, or in the world, you will need a more efficient method of maintaining firmware upgrades, configuration changes, and updates.

The FortiManager family of appliances supply the tools needed to effectively manage any size Fortinet security infrastructure, from a few devices to thousands of appliances. FortiManager appliances provide centralized policy-based provisioning, configuration, and update management, as well as end-to-end network monitoring for added control. Managers can control administrative access and simplify policy deployment using role-based administration to define user privileges for specific management domains and functions by aggregating collections of Fortinet appliances and agents into independent management domains. By locally hosting security content updates for managed devices and agents, FortiManager appliances minimize web filtering rating request response time and maximize network protection.

This chapter describes the basics of using FortiManager as an administration tool for multiple FortiGate units. It describes the basics of setting up a FortiGate unit in FortiManager and some key management features you can use within FortiManager to manage the FortiGate unit. For full details and instructions on FortiManager, see the FortiManager Administration Guide.

This section includes the topics:

- [Adding a FortiGate to FortiManager](#)
- [Configuration through FortiManager](#)
- [Firmware updates](#)
- [FortiGuard](#)
- [Backup and restore configurations](#)
- [Administrative domains](#)

In order for the FortiGate unit and FortiManager unit to properly connect, both units must have compatible firmware. To find out if your firmware is compatible, refer to the FortiOS or FortiManager Release Notes.

---

## Adding a FortiGate to FortiManager

Before you can maintain a FortiGate unit using a FortiManager unit, you need to add it to the FortiManager. This requires configuration on both the FortiGate and FortiManager. This section describes the basics to configure management using a FortiManager device.

Central management configuration can now support multiple FortiManager addresses. This feature is mainly to help the case where the FortiGate unit is behind NAT.

## FortiGate configuration

These steps ensure that the FortiGate unit will be able to receive updated antivirus and IPS updates and allow remote management through the FortiManager system or FortiCloud service. You can add a FortiGate unit whether it is running in either NAT mode or transparent mode. The FortiManager appliance provides remote management of a FortiGate unit over TCP port 541.

If you have not already done so, register the FortiGate unit by visiting <http://support.fortinet.com> and select **Product Registration**. By registering your unit, you will receive updates to the FortiGuard services and will also ensure your access to technical support.

You must enable the FortiGate management option so the FortiGate unit can accept management updates to firmware and FortiGuard services.

### To configure the FortiGate unit - GUI

1. Log in to the FortiGate unit.
2. Go to **System > Settings**.
3. Under **Central Management**, select FortiManager.
4. Enter the **IP/Domain Name** of the FortiManager unit.
5. Select **Apply**.

As an additional security measure, you can also select **Registration Password** and enter a password to connect to the FortiManager.

After you select **Apply**, a message appears stating that the FortiGate's request was received by the FortiManager and is now waiting for confirmation.

On the FortiManager, go to **Device Manager** and use the **Add Device** wizard.

If your FortiGate has no connectivity, see [FortiGuard Licensing for FortiGates with Limited or No Connectivity](#) for information on configuring your FortiManager and FortiGate.

---

### To configure the FortiGate unit - CLI

```
config system central-management
 set type fortimanager
 set fmg <ip_address>
end
```

To use the registration password, enter:

```
execute central-mgmt register-device <fmg-serial-no><fmg-register-password><fgt-username><fgt-password>
```

## Configuring an SSL connection

An SSL connection can be configured between the two devices and an encryption level selected. Use the following CLI commands in the FortiGate CLI to configure the connection:

```
config system central-management
```

```
set enc-algorithm {default | high | low}
end
```

The `default` encryption automatically sets high and medium encryption algorithms. Algorithms used for high, medium, and low follows openssl definitions:

- **High** - Key lengths larger than 128 bits, and some cipher suites with 128-bit keys.

Algorithms are: DHE-RSA-AES256-SHA:AES256-SHA: EDH-RSA-DES-CBC3-SHA: DES-CBC3-SHA:DES-CBC3-MD5:DHE-RSA-AES128-SHA:AES128-SHA

- **Medium** - Key strengths of 128 bit encryption.

Algorithms are: RC4-SHA:RC4-MD5:RC4-MD

- **Low** - Key strengths of 64 or 56 bit encryption algorithms but excluding export cipher suites

Algorithms are: EDH-RSA-DES-CBC-SHA; DES-CBC-SHA; DES-CBC-MD5.

## FortiManager configuration

Once the connection between the FortiGate unit and the FortiManager unit has been configured, you can add the FortiGate to the Device Manager in the FortiManager unit's GUI. For details on completing the configuration, see the [FortiManager Administration Guide](#).

## Configuration updates through FortiManager

With the FortiManager system, you can monitor and configure multiple FortiGate units from one location. Using the FortiManager's Device Manager, you can view the FortiGate units and make the usual configuration updates and changes, without having to log in and out of multiple FortiGate units.

FortiManager enables you to complete the configuration, by going to the Device Manager, selecting the FortiGate unit and using the same menu structure and pages as you would see in the FortiGate web-based manager. All changes to the FortiGate configuration are stored locally on the FortiManager unit until you synchronize with the FortiGate unit.

When a FortiGate unit is under control of a FortiManager system, administrators will not be able to change the configuration using the FortiGate. When trying to change options, the unit displays a message that it is configured through FortiManager, and any changes may be reverted.

With the release of FortiOS 5.6, central management configuration can now support multiple FortiManager addresses. This feature is mainly to help the case where the FortiGate unit is behind NAT.

## Global objects

If you are maintaining a number of FortiGate units within a network, many of the policies and configuration elements will be the same across the corporation. In these instances, the adding and editing of many of the same policies will become a tedious and error-prone activity. With FortiManager global objects, this level of configuration is simplified.

A global object is an object that is not associated specifically with one device or group. Global objects include security policies, a DNS server, VPN, and IP pools.

The Global Objects window is where you can configure global objects and copy the configurations to the FortiManager device database for a selected device or a group of devices. You can also import configurations from the FortiManager device database for a selected device and modify the configuration as required.

When configuring or creating a global policy object the interface, prompts, and fields are the same as creating the same object on a FortiGate unit using the FortiGate GUI.

## Locking the FortiGate GUI

When you use the FortiManager to manage multiple FortiGate units, a local FortiGate unit becomes locked from any configuration changes using the GUI for most administrators. The `super_admin` will still be able to make changes to the configuration; however, this is not recommended as it may cause conflicts with the FortiManager.

## FortiGuard

The FortiGuard Distribution Network (FDN) provides FortiGuard services for your FortiManager system and its managed devices and FortiClient agents. The FDN is a world-wide network of FortiGuard Distribution Servers (FDS), which update the FortiGuard services on your FortiManager system on a regular basis so that your FortiManager system is protected against the latest threats.

In FortiGuard Management, you can configure the FortiManager system to act as a local FDS, or use a web proxy server to connect to the FDN. FortiManager systems acting as a local FDS synchronize their FortiGuard service update packages with the FDN, then provide these updates and look up replies to your private network's FortiGate devices. The local FDS provides a faster connection, reducing Internet connection load and the time required to apply frequent updates, such as antivirus signatures, to many devices.

The default port used for FortiGuard services is UDP/8888.

The FortiGuard services available on the FortiManager system include:

- Antivirus and IPS engines and signatures
- Web filtering and email filtering rating databases and lookups (select systems)
- Vulnerability scan and management support for FortiAnalyzer

To view and configure these services, go to **FortiGuard > Advanced Settings** on your FortiManager.

FortiManager can also connect to the FortiGuard Distribution Network (FDN) to receive push updates for IPS signatures and antivirus definitions. These updates can then be used to update multiple FortiGate units throughout an organization. By using the FortiManager as the host for updates, bandwidth use is minimized as updates are downloaded to one source instead of many.

To receive IPS and antivirus updates from FortiManager, indicate an alternate IP address on the FortiGate unit.

### To configure updates from FortiManager

1. Go to **System > FortiGuard** on your FortiGate.
2. Under **AntiVirus & IPS Updates**, enable both **Accept push updates** and **Use override push**.
3. Enter the IP address of the FortiManager unit.
4. Select **Apply**.

The FortiManager can also be operated as a local FDS server when it is in a closed network with no Internet connectivity. See [FortiGuard Licensing for FortiGates with Limited or No Connectivity](#).

## New extended database version OIDs for AV and IPS

In FortiOS 5.6, new extended database version OIDs ensure accurate display of the AntiVirus and IPS databases in use when you go to **System > FortiGuard**.

## Enhancements to IPS Signatures page

The IPS signatures list page now shows which IPS package is currently deployed. Users can also change their IPS package by hovering over the information icon next to the IPS package name. Text will appear that links directly to the FortiGate's **System > FortiGuard** page from the IPS Signatures list page.

## The central management FortiGuard server list can include FQDNs

This feature, introduced in FortiOS 5.4.0, implements support of FQDN, to make it an option for central-management server-list. This feature can be set through the GUI and the CLI.

### GUI Changes

On **System > FortiGuard > Override FortiGuard Servers > Create New / Edit**, a new option, **FQDN** is added for **Address Type**.

### CLI Changes

```
config server-list
 edit 1
 set server-type {update|rating}
 set addr-type {ipv4|ipv6|fqdn} <== added fqdn
 set server-address ipv4
 set server-address6 ipv6
 set fqdn FQDN <== added
 end
end
```

## Sending malware statistics to FortiGuard

To support following malware trends and making zero-day discoveries, FortiGate units send encrypted statistics to FortiGuard about IPS, Application Control, and AntiVirus events detected by the FortiGuard services running on your FortiGate. FortiGuard uses the statistics collected to achieve a balance between performance and security effectiveness by moving inactive signatures to an extended signature database.

The statistics include some non-personal information that identifies your FortiGate and its country. The information is never shared with external parties. You can choose to disable the sharing of this information by entering the following CLI command:

```
config system global
 set fds-statistics disable
end
```

## Configuring FortiGuard licensing for FortiGates with limited or no connectivity

If you purchased FortiGuard services and registered your FortiGate unit, a FortiGate connected to the Internet should automatically connect to the FortiGuard Distribution Network (FDN) to validate the license and download FDN updates. In some high security environments however, Internet service from internal FortiGate appliances is restricted. This section describes how to configure a FortiGate with limited or no internet connectivity to allow a local FortiManager appliance to act as a local FortiGuard Distribution Server (FDS) and to provide both license validation and FDN updates.

## Preliminary steps

1. Register the FortiGate by logging into [Fortinet Support](#) and going to **Asset > Register/Renew**. For a physical FortiGate appliance, enter the serial number. For a FortiGate virtual machine, enter the registration number. Finish the steps to complete registration.
2. For FortiGate VMs, the registration process creates a unique license file that is available under **Asset > View/Manage Products**. Select the correct device, and download the license file.

This section assumes:

- internal FortiGate appliances can access a local FortiManager physical or virtual appliance.
- the FortiManager is operating with 5.6 firmware.

The FortiManager Administration Guide (version 5.6) provides information on what you must do before you can use your FortiManager as a local FDS. Consult the FortiGuard section of the [FortiManager online help](#) for details.

The following topics are covered in this section:

- [Configure FortiManager as a local FDN](#)
- [Configure FortiGate to access a local FortiManager as FDN](#)
- [Useful troubleshooting commands](#)

## Configure FortiManager as a local FDN

The following procedures assist in the configuration of a FortiManager to provide license validation and FDN updates to a FortiGate with limited or no internet connectivity.

- [Configure FortiManager with Internet connectivity as a local FDN server](#)
- [Configure FortiManager without Internet connectivity as a local FDN server](#)

### Configure FortiManager with Internet connectivity as a local FDN server

1. From the FortiManager GUI, select **System Settings > Network**.
2. Check the following **Service Access** options on interfaces that will serve FortiGates as the local FDN server:
  - **FortiGate Updates**
  - **Web Filtering**
3. Select **FortiGuard > Settings**.
4. Enable the types of FDN services that you want to provide through FortiManager's built-in FDS.
5. Click **Apply**.  
The built-in FDS attempts to connect to the FDN.

Add these steps to configure FortiManager to access FDN services through a proxy server:

6. Expand **FortiGuard AntiVirus and IPS Settings**.
  - a. Enable **Use Web Proxy**.
  - b. Enter the IP address and credentials for the proxy server.
7. Expand **FortiGuard Web Filter and Email Filter Settings**.
  - a. Enable **Use Web Proxy**.
  - b. Enter the IP address and credentials for the proxy server.

8. If the proxy server requires authentication, enter the user name and password.
9. Click **Apply**.

### Configure FortiManager without Internet connectivity as a local FDN server

The FortiManager can be operated as a local FDS server when it is in a closed network with no Internet connectivity.

Without a connection to a FortiGuard server, update packages and licenses must be manually downloaded from support, and then uploaded to the FortiManager. Through this feature, known as **Closed Network Mode**, the FortiManager can then provide updates and validate licenses for local FortiGate units without Internet access.

To configure the FortiManager in Closed Network Mode, complete the following tasks:

- [Enable Closed Network Mode](#)
- [Request FortiGate license validation information](#)
- [Download FortiGuard service update files](#)
- [Configure FortiManager in Closed Network Mode](#)

### Enable Closed Network Mode

1. From the FortiManager GUI, go to **FortiGuard > Settings** and disable **Enable Communication with FortiGuard Server**.

Or, from the FortiManager CLI, enable Closed Network Mode by disabling FDS access from the public FDN:

```
config fmupdate publicnetwork
 set status disable
end
```

Once in Closed Network Mode, you must manually import FortiManager service packages, updates, and license upgrades.

---

### Request FortiGate license validation information

1. Create a Customer Service ticket with [Fortinet Support](#) under **Assistance > Create Ticket > Customer Service > Submit Ticket**.
2. Enter the serial number. Under **Category**, select **CS Contract/License**.
3. In the **Comment** field, ask for an "entitlement file" for the FortiGate. Provide the serial number and license number available in **Asset > Manage/View Products > <Select product>**.

#### Example:

Serial Number: FGVM010000024628

License Number: FGVM0035444

As with asset registration, for large numbers of FortiGates you can attach a spreadsheet of serial and license numbers for Customer Service. They will provide a single entitlement file that contains validation information for all FortiGates in the spreadsheet. All FortiGates must be registered under the same account. Devices registered under different accounts cannot be combined into the same entitlement file.

---

4. You will receive an entitlement file from Customer Service.

### Download FortiGuard service update files

1. From [Fortinet Support](#), navigate to **Download > FortiGuard Service Updates**. Download the **Virus Definition**, **Attack Definition**, and **Mobile Malware** files for the appropriate version of FortiGate and FortiOS. These files are named in the form vsigupdate\*.pkg and nids\*.pkg.
2. Export the FortiGuard Web Filter and Anti-Spam service updates from a FortiManager that has Internet connectivity by entering the following CLI command:

```
execute fmupdate {ftp | scp | tftp} export <type> <remote_file> <ip> <port>
<remote_path> <user> <password>
```

Enter types url and spam.

| Variable           | Description                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {ftp   scp   tftp} | Select the file transfer protocol to use: ftp, scp, or tftp.                                                                                                            |
| <type>             | Select the type of file to export or import. The following options are available: av-ips, fct-av, url, spam, file-query, license-fgt, license-fct, custom-url, or domp. |
| <remote_file>      | Update manager packet file name on the server or host.                                                                                                                  |
| <ip>               | Enter the FQDN or the IP address of the server.                                                                                                                         |
| <port>             | Enter the port to connect to on the remote SCP host. Range: 1 to 65535 .                                                                                                |
| <remote_path>      | Enter the name of the directory of the file to download from the FTP server or SCP host. If the directory name has spaces, use quotes instead.                          |
| <user>             | Enter the user name to log into the FTP server or SCP host.                                                                                                             |
| <password>         | Enter the password to log into the FTP server or SCP host.                                                                                                              |

### Configure FortiManager in Closed Network Mode

Go to **FortiGuard > Settings** to configure FortiManager as a local FDS server and to upload update packages and licenses.

FortiGuard Server and Service Settings

Enable Communication with FortiGuard Server

OFF

Enable Antivirus and IPS Service

ON

|               |                                 |                                         |                                         |                                         |                              |

Upload Options for FortiClient

Antivirus/IPS Packages

Upload

Apply

1. Toggle **OFF Enable Communication with FortiGuard Server** to disable communication with the FortiGuard servers.
2. Toggle **ON Enable Antivirus and IPS Service**.  
Select software versions for FortiGate, FortiClient, FortiAnalyzer, and FortiMail.
3. Toggle **ON Enable Web Filter Service**.  
When uploaded to FortiManager, the Web Filter database is displayed.
4. Toggle **ON Enable Email Filter Service**.  
When uploaded to FortiManager, the Email Filter database is displayed.

5. Under **Upload Options for FortiGate/FortiMail**
  - Upload **AntiVirus/IPS Packages**. Browse for the file you downloaded from the Customer Service Support portal on your management computer. Select **OK** to upload the package to FortiManager. Repeat for each file downloaded from the Customer Service Support portal.
  - Upload **Web Filter Database**. Browse for the file you exported from the FortiManager that is connected to the Internet. Select **OK** to upload the package to FortiManager in the closed network mode. As the database can be large, uploading with the CLI is recommended. See the instructions below
  - Upload **Email Filter Database**. Browse for the file you exported from the FortiManager that is connected to the Internet. Select **OK** to upload the package to FortiManager in closed network mode. As the database can be large, uploading with the CLI is recommended. See the instructions below.
  - Select **Service License** to import the FortiGate license. Browse for the entitlement file on your management computer. Select **OK** to upload the package to FortiManager. A license file can be obtained from support by requesting your account entitlement for the device (see ["Configure FortiManager without Internet connectivity as a local FDN server" on page 3103](#)).
6. Under **Upload Options for FortiClient**, select **AntiVirus/IPS Packages** to upload the FortiClient AntiVirus/IPS packages. Browse for the file downloaded from the Customer Service & Support portal on your management computer. Select **OK** to upload the package to FortiManager.

### Uploading packages with the CLI

You can upload packages and licenses with the CLI. You should use this method when packages are large, such as database packages.

First, disable communications with the FortiGuard server and enable a closed network with the following CLI commands:

```
config fmupdate publicnetwork
 set status disable
end
```

Then, upload an update package or license by loading the package or license file to an FTP, SCP, or TFTP server.

Run the following CLI command:

```
execute fmupdate { ftp | scp | tftp } import < av-ips | fct-av | url | spam | file-query |
 license-fgt | license-fct | custom-url | domp > <remote_file> <ip> <port> <remote_
 path> <user> <password>
```

### Configure FortiGate without Internet connectivity to access a local FortiManager as FDN

By default, FortiGate connects to the public FDN to validate its license and download security feature updates, including databases and engines for security feature updates such as AntiVirus and IPS. Your FortiGate can be configured to use a local FortiManager for both license validation and FDN updates.

In the case of a FortiGate without Internet access, the full configuration must be done before the license is uploaded. The moment the FortiGate receives a license file (from the GUI or CLI), it immediately attempts to access the public FDN to validate the license. Until the license is validated, an administrator cannot log in to the GUI and some CLI commands are unavailable, including those needed to define a local FDN server. This makes it very difficult to add the necessary commands to point the FortiGate to a local FortiManager for license validation.

This document describes how to configure a FortiGate for local FDN access, and provides a workaround to fix a FortiGate that is unable to access a public license validation server.

Follow this procedure to configure a FortiGate to use a local FortiManager for FDN access:

Completing these steps in a different order may cause the process to fail, and make the FortiGate unable to validate its license.

### From the FortiGate CLI:

1. Configure central management settings:

```
config system central-management
config server-list
edit 1
set server-type update rating
set server-address <fortimanager_ip>
next
end
set include-default-servers disable
end
```

2. Upload the license using TFTP using the CLI:

```
execute restore vmlicense tftp <filename>.lic <tftp_ip>
```

The FortiGate will reboot.

3. Complete the central management configuration:

```
config system central-management
set fmg <fortimanager_ip>
end
```

### From the FortiManager GUI:

You must manually add devices to the FortiManager unit.

As a result of the CLI commands entered on your FortiGate unit, the device is displayed on the FortiManager GUI in the **Unregistered Devices** list, located in the **Device Manager** pane for the root ADOM.

When ADOMs are enabled, the device must be assigned to an ADOM when it is registered.

To manually add devices:

1. Confirm that central management is enabled for the device (as above).
2. In FortiManager, select the root ADOM, and go to **Device Manager**.
3. In the tree menu, click **Unregistered Devices**. The content pane displays the unregistered devices.
4. Select the unregistered device or devices, then click **Add**. The **Add Device** dialog box opens.
5. If ADOMs are enabled, select the ADOM in the **Add the following device(s) to ADOM** list. If ADOMs are disabled, select **root**.

| Device Name      | Credential | Assign New Device Name |
|------------------|------------|------------------------|
| FGT6HD3916800525 | admin      | External-Primary       |

6. Type the login and password for the device(s).

7. Click **OK** to register the device(s).

The devices are added.

### Troubleshooting

The following commands can be useful for determining the state of license validation and FDN service connectivity, and gathering information about any connectivity failures. For additional troubleshooting commands, visit the [FortiOS 5.6 CLI Reference](#) site.

#### On FortiGate:

- `get system status`
- `get webfilter status`
- `get system auto-update version`
- `get system auto-update status`

#### On FortiGate-VM:

- `diagnose hardware sysinfo vm full`
- `diagnose debug vm-print-license`
- `diagnose hardware sysinfo vminfo`

#### On FortiManager:

- `diagnose fmupdate vm-license`

### Firmware updates

A FortiManager unit can also perform firmware updates for multiple FortiGate units, saving time rather than upgrading each FortiGate unit individually.

The FortiManager unit stores local copies of firmware images, either by downloading images from the Fortinet Distribution Network (FDN) or by accepting firmware images that are uploaded from the management computer.

If you are using the FortiManager unit to download firmware images, the FDN first validates device licenses and support contracts and then provides a list of currently available firmware images. For devices with valid Fortinet Technical Support contracts, you can download new firmware images from the FDN and the firmware release notes.

After firmware images have been either downloaded from the FDN or imported to the firmware list, you can either schedule or immediately upgrade/downgrade a device or group of device's firmware.

See the [FortiManager Administration Guide](#) for more information on updating the FortiGate firmware using the FortiManager central management.

## Administrative domains

FortiManager administrative domains enable the super\_admin to create groupings of devices for configured administrators to monitor and manage. FortiManager can manage a large number of Fortinet appliances. This enables administrators to maintain managed devices specific to their geographic location or business division. This also includes FortiGate units with multiple configured VDOMs.

Each administrator is tied to an administrative domain (ADOM). When that particular administrator logs in, they see only those devices or VDOMs configured for that administrator and ADOM. The one exception is the super\_admin account that can see and maintain all administrative domains and the devices within those domains.

Administrative domains are not enabled by default and enabling and configuring the domains can only be performed by the super\_admin.

## Backup and restore configurations

A FortiManager unit stores configuration files for backup and restore purposes. A FortiManager also enables you to save revisions of configuration files. Configuration backups occur automatically when the administrator logs out or the administrator login session expires.

FortiManager also enables you to view differences between different configurations to identify where changes have been made.

## Monitoring

With network administration, the first step is installing and configuring the FortiGate unit to be the protector of the internal network. Once the system is running efficiently, the next step is to monitor the system and network traffic, making configuration changes as necessary when a threat or vulnerability is discovered.

This chapter discusses the various methods of monitoring both the FortiGate unit and the network traffic through a range of different tools available within FortiOS.

This section includes the topics:

- [Dashboard](#)
- [Monitor menus](#)
- [Logging](#)
- [Alert email](#)
- [SNMP](#)
- [SNMP get command syntax](#)

## Dashboard

The FortiOS dashboard provides a location to view real-time system information. By default, the dashboard displays the key statistics of the FortiGate unit itself, providing the memory and CPU status, as well as the health of the ports, whether they are up or down and their throughput.

The FortiOS 5.6 **Dashboard** has a new layout with a Network Operations Center (NOC) view with a focus on alerts. Widgets are interactive; by clicking or hovering over most widgets, the user can get additional information or follow links to other pages.

Enhancements to the GUI dashboard and its widgets are:

- Multiple dashboard support.
- VDOM and global dashboards.
- Updated resize control for widgets.
- Notifications moved to the top header bar (moved existing dashboard notifications to the header and added additional ones).
- Reorganization of **Add Widget** dialog.
- New **Host Scan Summary** widget.
- New **Vulnerabilities Summary** widget that displays endpoint vulnerability information much like the FortiClient Enterprise Management Server (EMS) summary.
- Multiple bug fixes.

Features that were only visible through old dashboard widgets have been placed elsewhere in the GUI:

- Restore configuration.
- Configuration revisions.
- Firmware management.
- Enabling / disabling VDOMs.
- Changing inspection mode.
- Changing operation mode.
- Shutdown / restart device.
- Changing hostname.
- Changing system time.

The following **widgets** are displayed by default:

- [System Information](#)
- [Licenses](#)
- [FortiCloud](#)
- [Security Fabric](#)
- [Administrators](#)
- [CPU](#)
- [Memory](#)
- [Sessions](#)
- [Bandwidth](#)
- [Virtual Machine](#) (on VMs and new to FortiOS 5.6.1)

The following **optional** widgets are available:

- [Interface Bandwidth](#)
- [Disk Usage](#)

- Security Fabric Risk
- Advanced Threat Protection Statistics
- Log Rate
- Session Rate
- Sensor Information
- HA Status
- Host Scan Summary
- Vulnerabilities Summary
- FortiView (new to FortiOS 5.6.1)

The following widgets have been **removed**:

- CLI Console
- Unit Operation
- Alert Message Console

## System Information

| System Information |                                            |
|--------------------|--------------------------------------------|
| Hostname           | FG100D3G15818864                           |
| Serial Number      | FG100D3G15818864                           |
| Firmware           | v5.6.0 build1435                           |
| Mode               | NAT (Proxy-based)                          |
| System Time        | 2017/03/22 14:05:04                        |
| Uptime             | 00:00:31:34                                |
| WAN IP             | 209.87.240.98 (🇨🇦 Kanata, Ontario, Canada) |

Only appears when you click on the widget. Click on the System page you want to go to.

### FortiGuard WAN IP blacklist service is now online

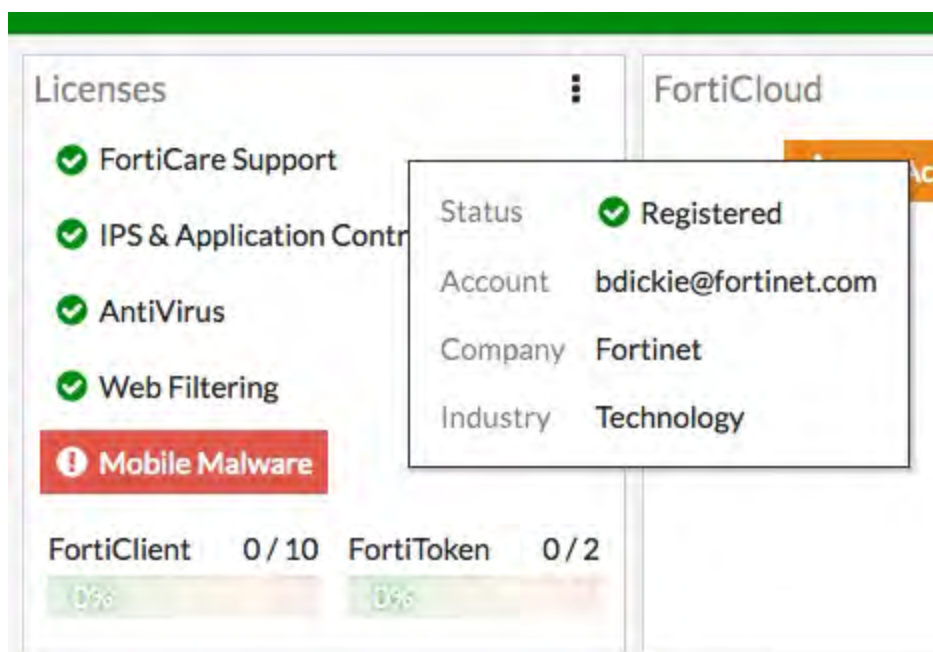

The FortiGuard WAN IP blacklist service was not online in FortiOS 5.6.0. In FortiOS 5.6.1, a notification appears on the **Dashboard** when WAN IP is blacklisted. Clicking on the notification (bell icon) brings up the blacklist details.

## Licenses

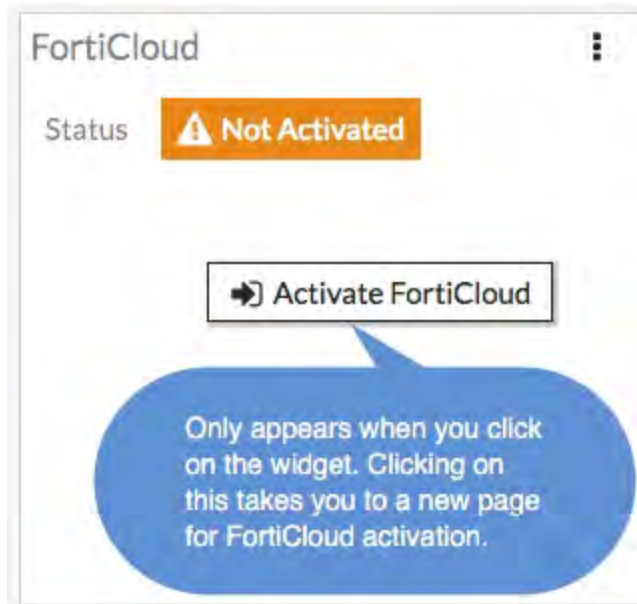

Hovering over the **Licenses** widget will cause status information (and, where applicable, database information) on the licenses to be displayed for **FortiCare Support**, **IPS & Application Control**, **AntiVirus**, **Web Filtering**, **Mobile Malware**, and **FortiClient**. The image below shows **FortiCare Support** information along with the registrant's company name and industry.

Clicking in the **Licenses** widget will provide you with links to other pages, such as **System > FortiGuard** or contract renewal pages.

## FortiCloud

This widget displays FortiCloud status and provides a link to activate FortiCloud.

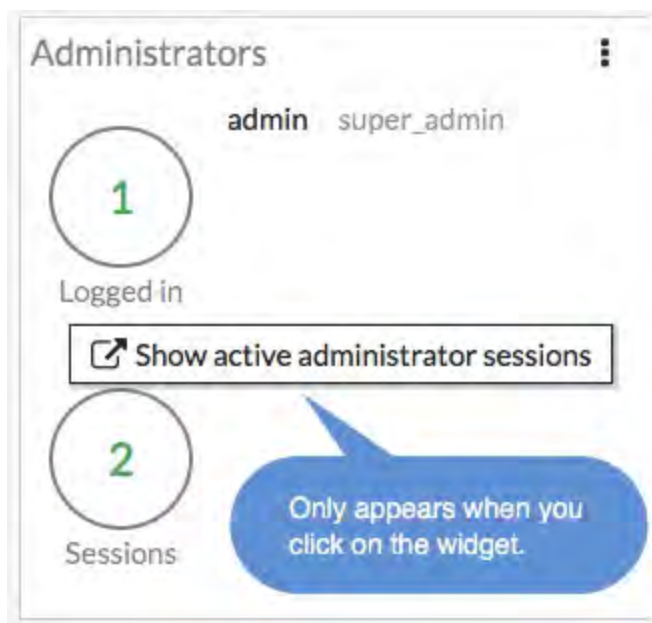

### Fortinet Security Fabric

The **Security Fabric** widget is documented in the [Security Fabric](#) section of the **What's New** document.

### Administrators

This widget allows you to view which administrators are logged in and how many sessions are active. The link directs you to a page displaying active administrator sessions.

### CPU

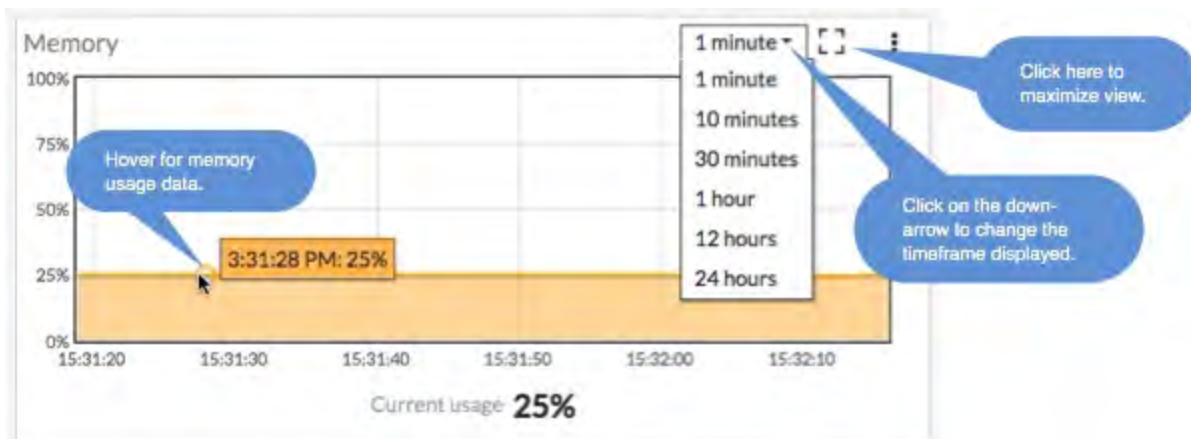

The real-time CPU usage is displayed for different timeframes.

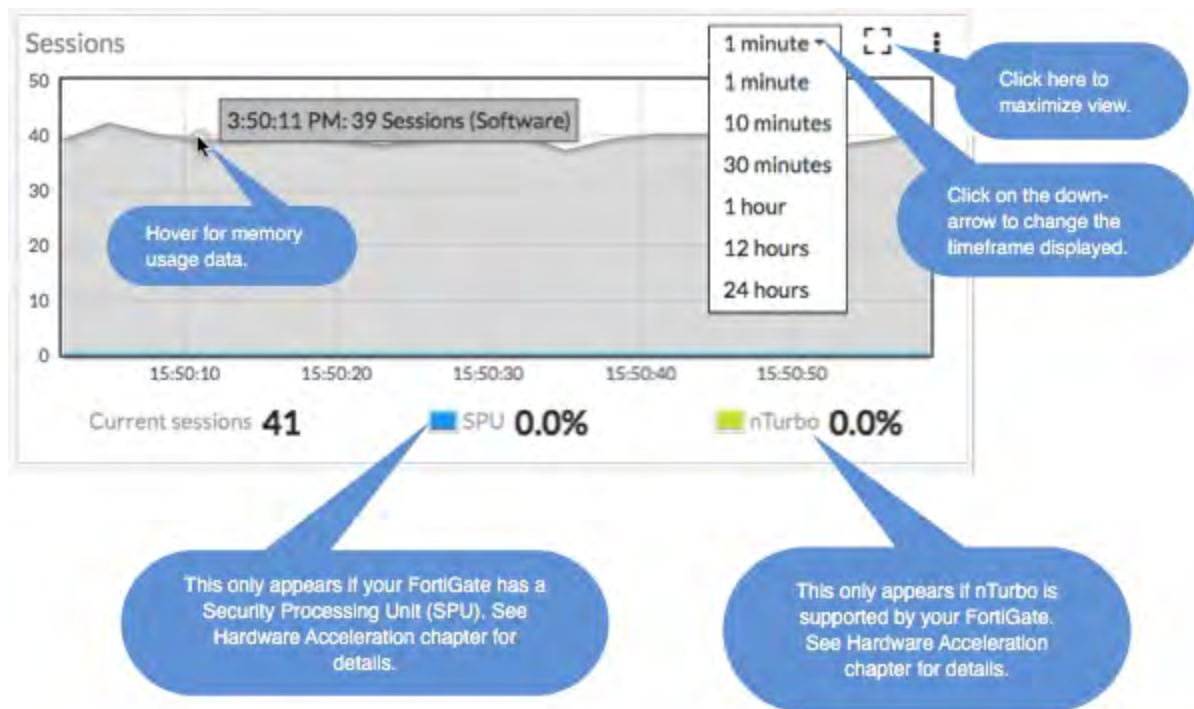

## Memory

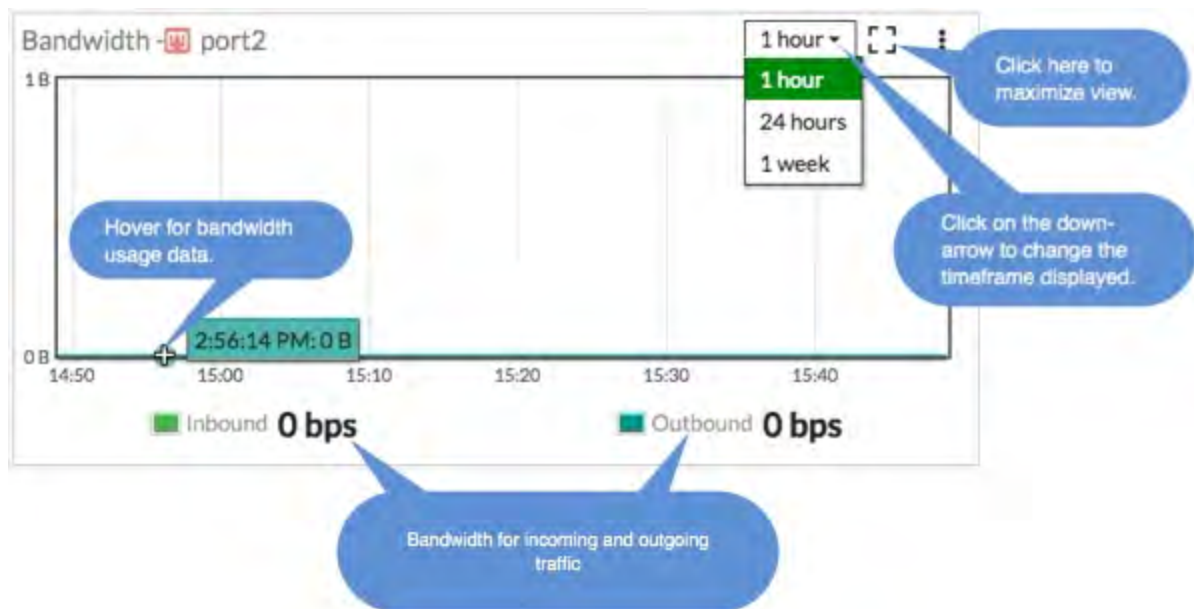

Real-time memory usage is displayed for different time frames. Hovering over any point on the graph displays percentage of memory used along with a timestamp.

## Sessions

## Bandwidth

## Virtual Machine

FortiOS 5.6.1 introduces a VM widget with these features:

- License status and type.
- CPU allocation usage.
- License RAM usage.
- VMX license information (if the VM supports VMX).
- If the VM license specifies 'unlimited' the progress bar is blank.
- If the VM is in evaluation mode, it is yellow (warning style) and the dashboard show evaluation days used.
- Widget is shown by default in the dashboard of a FortiOS VM device.
- Removed VM information from License widget at **Global > Dashboard**.
- License info and **Upload License** button provided on page **Global > System > FortiGuard**.
- Updated 'Upload VM License' page:
  - Added license RAM usage and VMX instance usage.
  - Replaced file input component.

## Monitor menus

The **Monitor** menus enable you to view session and policy information and other activity occurring on your FortiGate unit. The monitors provide the details of user activity, traffic and policy usage to show live activity. Monitors are available for DHCP, routing, security policies, traffic shaping, load balancing, security features, VPN, users, and WiFi.

## Logging

FortiOS provides a robust logging environment that enables you to monitor, store, and report traffic information and FortiGate events, including attempted log ins and hardware status. Depending on your requirements, you can log to a number of different hosts.

To configure logging in the web-based manager, go to **Log & Report > Log Settings**.

To configure logging in the CLI use the commands `config log <log_location>`.

For details on configuring logging see the [Logging and Reporting Guide](#).

If you will be using several FortiGate units, you can also use a FortiAnalyzer unit for logging. For more information, see the FortiAnalyzer Administration Guide.

## Syslog server

An industry standard for collecting log messages, for off-site storage. In the web-based manager, you are able to send logs to a single syslog server, however in the CLI you can configure up to three syslog servers where you can also use multiple configuration options. For example, send traffic logs to one server, antivirus logs to another. The FortiGate unit sends Syslog traffic over UDP port 514. Note that if a secure tunnel is configured for communication to a FortiAnalyzer unit, then Syslog traffic will be sent over an IPsec connection, using UDP 500/4500, Protocol IP/50.

To configure a Syslog server in the web-based manager, go to **Log & Report > Log Settings**. In the CLI use the commands:

```
config log syslogd setting
 set status enable
 set server <IP address or FQDN of syslog server>
end
```

Further options are available when enabled to configure a different port, facility and server IP address.

For Syslog traffic, you can identify a specific port/IP address for logging traffic. Configuration of these services is performed in the CLI, using the command `set source-ip`. When configured, this becomes the dedicated port to send this traffic over.

For example, to set the source IP of a Syslog server to be on the DMZ1 port with an IP of 192.168.4.5, the commands are:

```
config log syslogd setting
 set status enable
 set source-ip 192.168.4.5
end
```

You must configure the secure tunnel on **both** ends of the tunnel, the FortiGate unit and the FortiAnalyzer unit.

---

## Alert email

As an administrator, you want to be certain you can respond quickly to issues occurring on your network or on the FortiGate unit. Alert emails provide an efficient and direct method of notifying an administrator of events. By configuring alert messages, you can define the threshold when a problem becomes critical and needs attention. When this threshold is reached, the FortiGate unit will send an email to one or more individuals, notifying them of the issue.

In the following example, the FortiGate unit is configured to send email to two administrators (admin1 and admin2) when multiple intrusions are detected every two minutes. The FortiGate unit has its own email address on the mail server.

### To configure the email service

1. Go to **System > Advanced**.
2. In the **Email Service**, enable **Use Custom Email Server**, complete the following and select **Apply**:

|                         |                                                                                                                                                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SMTP Server</b>      | Enter the address or name of the email server. For example, <code>smtp.example.com</code> .                                                                                                                                              |
| <b>Default Reply To</b> | Enter an email address to associate with the alert email. This field is optional. If you enter an email address here, it overrides the email address entered when configuring alert email in <b>Log &amp; Report &gt; Alert E-mail</b> . |
| <b>Authentication</b>   | Enable authentication if required by the email server.                                                                                                                                                                                   |
| <b>Security mode</b>    | Choose between <i>None</i> , <i>SMTPS</i> or <i>STARTTLS</i>                                                                                                                                                                             |
| <b>Port</b>             | 25                                                                                                                                                                                                                                       |

### To configure alert email - GUI

1. Go to **Log & Report > Alert E-mail**.
2. Enter the information:

|                   |                       |
|-------------------|-----------------------|
| <b>Email from</b> | fortigate@example.com |
| <b>Email to</b>   | admin1@example.com    |
|                   | admin2@example.com    |

3. For the **Interval Time**, enter 2.
4. Select **Intrusion Detected**.
5. Select **Apply**.

### To configure alert email - CLI

```
config system email-server
 set port 25
 set server smtp.example.com
 set authenticate enable
 set username FortiGate
 set password *****
end
config alertemail setting
 set username fortigate@example.com
 set mailto1 admin1@example.com
 set mailto2 admin2@example.com
 set filter category
 set IPS-logs enable
end
```

## SNMP

Simple Network Management Protocol (SNMP) enables you to monitor hardware on your network. You can configure the hardware, such as the FortiGate SNMP agent, to report system information and send traps (alarms or event messages) to SNMP managers. An SNMP manager, or host, is a typically a computer running an application that can read the incoming trap and event messages from the agent and send out SNMP queries to the SNMP agents. A FortiManager unit can act as an SNMP manager to one or more FortiGate units. FortiOS supports SNMP using IPv4 and IPv6 addressing.

By using an SNMP manager, you can access SNMP traps and data from any FortiGate interface or VLAN subinterface configured for SNMP management access. Part of configuring an SNMP manager is to list it as a host in a community on the FortiGate unit it will be monitoring. Otherwise, the SNMP monitor will not receive any traps from that FortiGate unit or be able to query that unit.

The FortiGate SNMP implementation is read-only. SNMP v1, v2c, and v3 compliant SNMP managers have read-only access to FortiGate system information through queries and can receive trap messages from the FortiGate unit.

To monitor FortiGate system information and receive FortiGate traps, you must first compile the Fortinet and FortiGate Management Information Base (MIB) files. A MIB is a text file that describes a list of SNMP data objects that are used by the SNMP manager. These MIBs provide information the SNMP manager needs to interpret the SNMP trap, event, and query messages sent by the FortiGate unit SNMP agent.

FortiGate core MIB files are available for download by going to **System > SNMP** and selecting the download link on the page.

The Fortinet implementation of SNMP includes support for most of RFC 2665 (Ethernet-like MIB) and most of RFC 1213 (MIB II). For more information, see "[Fortinet MIBs](#)". RFC support for SNMP v3 includes Architecture for SNMP Frameworks (RFC 3411), and partial support of User-based Security Model (RFC 3414).

SNMP traps alert you to events that occur such as a full log disk or a virus detected.

SNMP fields contain information about the FortiGate unit, such as CPU usage percentage or the number of sessions. This information is useful for monitoring the condition of the unit on an ongoing basis and to provide more information when a trap occurs.

The FortiGate SNMP v3 implementation includes support for queries, traps, authentication, and privacy. Authentication and encryption are configured in the CLI. See the `system snmp user` command in the FortiGate CLI Reference.

### New to FortiOS 5.6

#### New SNMP trap for bypass events

When bypass mode is enabled or disabled on FortiGate units that are equipped with bypass interfaces and support AMC modules, a new SNMP trap is generated and logs bypass events.

#### Implement SNMP support for NAT Session monitoring which includes new SNMP OIDs

FortiOS 5.6 implements a new feature providing SNMP support for NAT session monitoring. The resulting new SNMP object identifier (OID) is:

FORTINET-FORTIGATE-

MIB:fortinet.fnFortiGateMib.fgFirewall.fgFwIppools.fgFwIppTables.fgFwIppStatsTable.fgFwIppStatsEntry  
1.3.6.1.4.1.12356.101.5.3.2.1.1

Additionally, there are eight new items:

- .fgFwIppStatsName .1
- .fgFwIppStatsType .2
- .fgFwIppStatsStartIp .3
- .fgFwIppStatsEndIp .4
- .fgFwIppStatsTotalSessions .5
- .fgFwIppStatsTcpSessions .6
- .fgFwIppStatsUdpSessions .7
- .fgFwIppStatsOtherSessions .8

## SNMP configuration settings

Before a remote SNMP manager can connect to the FortiGate agent, you must configure one or more FortiGate interfaces to accept SNMP connections by going to **Network > Interfaces**. Select the interface and, in the **Administrative Access**, select **SNMP**.

For VDOMS, SNMP traps can only be sent on interfaces in the management VDOM. Traps cannot be sent over other interfaces outside the management VDOM.

To configure SNMP settings, go to **System > SNMP**.

|                                                                                                    |                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SNMP Agent</b>                                                                                  | Select to enable SNMP communication.                                                                                                                                                                                                                           |
| <b>Description</b>                                                                                 | Enter descriptive information about the FortiGate unit. The description can be up to 35 characters.                                                                                                                                                            |
| <b>Location</b>                                                                                    | Enter the physical location of the FortiGate unit. The system location description can be up to 35 characters long.                                                                                                                                            |
| <b>Contact</b>                                                                                     | Enter the contact information for the person responsible for this FortiGate unit. The contact information can be up to 35 characters.                                                                                                                          |
| <b>SNMP v1/v2c section</b><br>To create a new SNMP community, see <a href="#">SNMP Community</a> . |                                                                                                                                                                                                                                                                |
| <b>Community Name</b>                                                                              | The name to identify the community.                                                                                                                                                                                                                            |
| <b>Queries</b>                                                                                     | Indicates whether queries protocols (v1 and v2c) are enabled or disabled. A green check mark indicates queries are enabled; a gray x indicates queries are disabled. If one query is disabled and another one enabled, there will still be a green check mark. |

|                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Traps</b>                                                                                       | Indicates whether trap protocols (v1 and v2c) are enabled or disabled. A green check mark indicates traps are enabled; a gray x indicates traps are disabled. If one query is disabled and another one enabled, there will still be a green check mark.                                                                                                                         |

| <b>Protocol</b>                | The SNMP protocol. In the v1 row, this means that the settings are for SNMP v1. In the v2c row, this means that the settings are for SNMP v2c.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Local</b>                   | <p>Enter the remote port numbers (port 162 for each by default) that the FortiGate unit uses to send SNMP v1 or SNMP v2c traps to the SNMP managers in this community. Select the <b>Enable</b> check box to activate traps for each SNMP version.</p> <p><b>Note:</b> The SNMP client software and the FortiGate unit must use the same port for traps.</p>                                                                                                                                                                         |
| <b>Remote</b>                  | <p>Enter the remote port number (port 162 is default) that the FortiGate unit uses to send SNMP v1 or v2c traps to the SNMP managers in this community.</p> <p><b>Note:</b> The SNMP client software and the FortiGate unit must use the same port for queries.</p>                                                                                                                                                                                                                                                                  |
| <b>Enable</b>                  | Select to activate traps for each SNMP version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>SNMP Event</b>              | <p>Enable each SNMP event for which the FortiGate unit should send traps to the SNMP managers in this community.</p> <p><b>CPU Over usage</b> traps sensitivity is slightly reduced, by spreading values out over 8 polling cycles. This prevents sharp spikes due to CPU intensive short-term events such as changing a policy.</p> <p><b>Power Supply Failure</b> event trap is available only on some models.</p> <p><b>AMC interfaces enter bypass mode</b> event trap is available only on models that support AMC modules.</p> |
| <b>Enable</b>                  | Select to enable the SNMP event.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Create New SNMP V3 User</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>User Name</b>               | Enter the name of the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Security Level</b>          | Select the type of security level the user will have.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Notification Host</b>       | Enter the IP address of the notification host. If you want to add more than one host, after entering the IP address of the first host, select the plus sign to add another host.                                                                                                                                                                                                                                                                                                                                                     |
| <b>Enable Query</b>            | Select to enable or disable the query. By default, the query is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Port</b>                    | Enter the port number in the field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Events</b>                  | Select the SNMP events that will be associated with that user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Gigabit interfaces

When determining the interface speed of a FortiGate unit with a 10G interface, the IF-MIB.ifSpeed may not return the correct value. IF-MIB.ifSpeed is a 32-bit gauge used to report interface speeds in bits/second and cannot convert to a 64-bit value. The 32-bit counter wrap the output too fast to be accurate.

In this case, you can use the value ifHighSpeed. It reports interface speeds in megabits/second. This ensures that 10Gb interfaces report the correct value.

## SNMP agent

You need to first enter information and enable the FortiGate SNMP Agent. Enter information about the FortiGate unit to identify it so that when your SNMP manager receives traps from the FortiGate unit, you will know which unit sent the information.

### To configure the SNMP agent - GUI

1. Go to **System > SNMP**.
2. Select **Enable** for the **SNMP Agent**.
3. Enter a descriptive name for the agent.
4. Enter the location of the FortiGate unit.
5. Enter a contact or administrator for the SNMP Agent or FortiGate unit.
6. Select **Apply**.

### To configure SNMP agent - CLI

```
config system snmp sysinfo
 set status enable
 set contact-info <contact_information>
 set description <description_of_FortiGate>
 set location <FortiGate_location>
end
```

## SNMP community

An SNMP community is a grouping of devices for network administration purposes. Within that SNMP community, devices can communicate by sending and receiving traps and other information. One device can belong to multiple communities, such as one administrator terminal monitoring both a firewall SNMP and a printer SNMP community.

Add SNMP communities to your FortiGate unit so that SNMP managers can connect to view system information and receive SNMP traps.

You can add up to three SNMP communities. Each community can have a different configuration for SNMP queries and traps. Each community can be configured to monitor the FortiGate unit for a different set of events. You can also add the IP addresses of up to 8 SNMP managers to each community.

When the FortiGate unit is in virtual domain mode, SNMP traps can only be sent on interfaces in the management virtual domain. Traps cannot be sent over other interfaces.

### To add an SNMP v1/v2c community - GUI

1. Go to **System > SNMP**.
2. In the **SNMP v1/v2c** area, select **Create New**.

3. Enter a **Community Name**.
4. Enter the IP address and Identify the SNMP managers that can use the settings in this SNMP community to monitor the FortiGate unit.
5. Select the interface if the SNMP manager is not on the same subnet as the FortiGate unit.
6. Enter the **Port** number that the SNMP managers in this community use for SNMP v1 and SNMP v2c queries to receive configuration information from the FortiGate unit. Select the **Enable** check box to activate queries for each SNMP version.
7. Enter the Local and Remote port numbers that the FortiGate unit uses to send SNMP v1 and SNMP v2c traps to the SNMP managers in this community.
8. Select the **Enable** check box to activate traps for each SNMP version.
9. Select **OK**.

#### To add an SNMP v1/v2c community - CLI

```
config system snmp community
 edit <index_number>
 set events <events_list>
 set name <community_name>
 set query-v1-port <port_number>
 set query-v1-status {enable | disable}
 set query-v2c-port <port_number>
 set query-v2c-status {enable | disable}
 set status {enable | disable}
 set trap-v1-lport <port_number>
 set trap-v1-rport <port_number>
 set trap-v1-status {enable | disable}
 set trap-v2c-lport <port_number>
 set trap-v2c-rport <port_number>
 set trap-v2c-status {enable | disable}
 end
```

#### To add an SNMP v3 community - GUI

1. Go to **System > SNMP**.
2. In the **SNMP v3** area, select **Create New**.
3. Enter a **User Name**.
4. Select a **Security Level** and associated authorization algorithms.
5. Enter the IP address of the **Notification Host** SNMP managers that can use the settings in this SNMP community to monitor the FortiGate unit.
6. Enter the **Port** number that the SNMP managers in this community use to receive configuration information from the FortiGate unit. Select the **Enable** check box to activate queries for each SNMP version.
7. Select the **Enable** check box to activate traps.
8. Select **OK**.

#### To add an SNMP v3 community - CLI

```
config system snmp user
 edit <index_number>
 set security-level [auth-priv | auth-no-priv | no-auth-no-priv]
 set queries enable
 set query-port <port_number>
 set notify-hosts <ip_address>
```

```
set events <event_selections>
end
```

## Enabling on the interface

Before a remote SNMP manager can connect to the FortiGate agent, you must configure one or more FortiGate interfaces to accept SNMP connections.

### To configure SNMP access - GUI

1. Go to **Network > Interfaces**.
2. Choose an interface that an SNMP manager connects to and select **Edit**.
3. In **Administrative Access**, select **SNMP**.
4. Select **OK**.

### To configure SNMP access - CLI

```
config system interface
edit <interface_name>
set allowaccess snmp
end
```

If the interface you are configuring already has protocols that are allowed access, use the command `append allowaccess snmp` instead, or else the other protocols will be replaced. For more information, see Adding and removing options from lists.

## Fortinet MIBs

The FortiGate SNMP agent supports Fortinet proprietary MIBs as well as standard RFC 1213 and RFC 2665 MIBs. RFC support includes support for the parts of RFC 2665 (Ethernet-like MIB) and the parts of RFC 1213 (MIB II) that apply to FortiGate unit configuration.

There are two MIB files for FortiGate units - the Fortinet MIB, and the FortiGate MIB. The Fortinet MIB contains traps, fields and information that is common to all Fortinet products. The FortiGate MIB contains traps, fields and information that is specific to FortiGate units. Each Fortinet product has its own MIB. If you use other Fortinet products you will need to download their MIB files as well. Both MIB files are used for FortiOS and FortiOS Carrier; there are no additional traps for the Carrier version of the operating system.

The Fortinet MIB and FortiGate MIB along with the two RFC MIBs are listed in tables in this section. You can download the two FortiGate MIB files from Fortinet Customer Support. The Fortinet MIB contains information for Fortinet products in general. the Fortinet FortiGate MIB includes the system information for The FortiGate unit and version of FortiOS. Both files are required for proper SNMP data collection.

To download the MIB files, go to **System > SNMP** and select a MIB link in the **FortiGate SNMP MIB** section.

Your SNMP manager may already include standard and private MIBs in a compiled database that is ready to use. You must add the Fortinet proprietary MIB to this database to have access to the Fortinet specific information.

There were major changes to the MIB files between FortiOS Carrier v3.0 and v4.0. You need to use the new MIBs for FortiOS Carrier v4.0 or you may mistakenly access the wrong traps and fields.

MIB files are updated for each version of FortiOS. When upgrading the firmware ensure that you updated the Fortinet FortiGate MIB file as well.

### Fortinet MIBs

| MIB file name or RFC                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FORTINET-CORE-MIB.mib</b>        | <p>The Fortinet MIB includes all system configuration information and trap information that is common to all Fortinet products.</p> <p>Your SNMP manager requires this information to monitor FortiGate unit configuration settings and receive traps from the FortiGate SNMP agent.</p>                                                                                                                                                              |
| <b>FORTINET-FORTIGATE-MIB.mib</b>   | <p>The FortiGate MIB includes all system configuration information and trap information that is specific to FortiGate units.</p> <p>Your SNMP manager requires this information to monitor FortiGate configuration settings and receive traps from the FortiGate SNMP agent. FortiManager systems require this MIB to monitor FortiGate units.</p>                                                                                                    |
| <b>RFC-1213 (MIB II)</b>            | <p>The FortiGate SNMP agent supports MIB II groups with these exceptions.</p> <ul style="list-style-type: none"> <li>• No support for the EGP group from MIB II (RFC 1213, section 3.11 and 6.10).</li> <li>• Protocol statistics returned for MIB II groups (IP/ICMP/TCP/UDP/etc.) do not accurately capture all FortiGate traffic activity. More accurate information can be obtained from the information reported by the Fortinet MIB.</li> </ul> |
| <b>RFC-2665 (Ethernet-like MIB)</b> | <p>The FortiGate SNMP agent supports Ethernet-like MIB information. FortiGate SNMP does not support for the dot3Tests and dot3Errors groups.</p>                                                                                                                                                                                                                                                                                                      |

SNMP improvements for dynamic routing include support for RFC 4750 OSPF Version 2 Management Information Base and RFC 5643 Management Information Base for OSPFv3. These changes add the capability of logging dynamic routing activity. Examples include sending OSPF routing events or changes to a syslog server or FortiAnalyzer or changes in neighborhood status.

### Device Detection for SNMP Traps in FortiOS 5.4.0

This setting is related to the device detection feature. It allows SNMP traps to detect when a new device comes online. Within SNMP configurations there is a configurable timeout setting that periodically checks for the device. When a check determines that the device is present a trap is sent.

In the GUI, when configuring an SNMP object, one of the settings is a checkbox, under **SNMP Events** for **Device detected**.

To configure the SNMP object in the CLI use the following syntax:

```
config system snmp community
 edit <community ID number>
 set name <string>
 set events device-new
 end
```

In order to configure the idle timeout for the device, use the following syntax in the CLI:

```
config system global
 set device-idle-timeout <integer of time in seconds>
end
```

The time value for the field can be set from 30 to 31536000.

## SNMP get command syntax

Normally, to get configuration and status information for a FortiGate unit, an SNMP manager would use an SNMP get commands to get the information in a MIB field. The SNMP get command syntax would be similar to:

```
snmpget -v2c -c <community_name> <address_ipv4> {<OID> | <MIB_field>}
```

...where...

<community\_name> is an SNMP community name added to the FortiGate configuration. You can add more than one community name to a FortiGate SNMP configuration. The most commonly used community name is public.

<address\_ipv4> is the IP address of the FortiGate interface that the SNMP manager connects to.

{<OID> | <MIB\_field>} is the object identifier (OID) for the MIB field or the MIB field name itself.

The SNMP get command gets firmware version running on the FortiGate unit. The community name is public. The IP address of the interface configured for SNMP management access is 10.10.10.1. The firmware version MIB field is fgSysVersion and the OID for this MIB field is 1.3.6.1.4.1.12356.101.4.1.1. The first command uses the MIB field name and the second uses the OID:

```
snmpget -v2c -c public 10.10.10.1 fgSysVersion.0
snmpget -v2c -c public 10.10.10.1 1.3.6.1.4.1.12356.101.4.1.1.0
```

The OIDs and object names used in these examples are dependent on the version of MIB and are subject to change.

## Replacement messages

The replacement message list in **System > Replacement Messages** enables you to view and customize replacement messages. Highlight the replacement messages you wish to edit and customize the message content to your requirements. Hit **Save** when done. If you do not see the message you want to edit, search the Extended View option (in the upper right-hand corner of the screen).

Should you make a major error to the code, you can select the **Restore Default** to return to the original message and code base.

For connections requiring authentication, the FortiGate unit uses HTTP to send an authentication disclaimer page for the user to accept before a security policy is in effect. Therefore, the user must initiate HTTP traffic first in order to trigger the authentication disclaimer page. Once the disclaimer is accepted, the user can send whatever traffic is allowed by the security policy.

## Replacement message images

You can add images to replacement messages to:

- Disclaimer pages
- Login pages
- Declined disclaimer pages
- Login failed page
- Login challenge pages
- Keepalive pages

Image embedding is also available to the endpoint NAC download portal and recommendation portal replacement messages, as well as HTTP replacement messages.

Supported image formats are GIF, JPEG, TIFF and PNG. The maximum file size supported is 6000 bytes.

## Adding images to replacement messages

### To upload an image for use in a message

1. Go to **System > Replacement Messages**.
2. Select **Manage Images** at the top of the page.
3. Select **Create New**.
4. Enter a **Name** for the image.
5. Select the **Content Type**.
6. Select **Browse** to locate the file and select **OK**.

The image that you include in a replacement message, must have the following html:

```
<img src=%%IMAGE: <config_image_name>%% size=<bytes> >
```

For example:

```

```

## Modifying replacement messages

Replacement messages can be modified to include a message or content that suits your organization.

Use the expand arrows to view the replacement message list for a given category. Messages are in HTML format. To change a replacement message, go to **System > Replacement Messages** select the replacement message that you want to modify. At the bottom pane of the window, you can see the message on one side and the HTML code on the other side. The message view changes in real-time as you change the content.

A list of common replacement messages appears in the main window. To see the entire list and all categories of replacement messages, in the upper-right corner of the window, select **Extended View**.

## Replacement message categories

### Alert Email replacement messages

The FortiGate unit adds the replacement messages listed in this category to alert email messages sent to administrators. If you enable the option **Send alert email for logs based on severity** in **Log & Report**, you control whether or not replacement messages are sent by alert email based on how you set the **Minimum log level**.

For more information on Alert emails, see the Monitoring chapter.

### Authentication replacement messages

The FortiGate unit uses the text of the authentication replacement messages for various user authentication HTML pages that are displayed when a user is required to authenticate because a security policy includes at least one identity-based policy that requires firewall users to authenticate.

These replacement message pages are for authentication using HTTP and HTTPS. You cannot customize the firewall authentication messages for FTP and Telnet.

The authentication login page and the authentication disclaimer include replacement tags and controls not found on other replacement messages.

Users see the authentication login page when they use a VPN or a security policy that requires authentication. You can customize this page in the same way as you modify other replacement messages.

There are some unique requirements for these replacement messages:

- The login page must be an HTML page containing a form with ACTION="/" and METHOD="POST"
- The form must contain the following hidden controls:
  - `<INPUT TYPE="hidden" NAME="%%MAGICID%%" VALUE="%%MAGICVAL%%">`
  - `<INPUT TYPE="hidden" NAME="%%STATEID%%" VALUE="%%STATEVAL%%">`
  - `<INPUT TYPE="hidden" NAME="%%REDIRID%%" VALUE="%%PROTURI%%">`
- The form must contain the following visible controls:
  - `<INPUT TYPE="text" NAME="%%USERNAMEID%%" size=25>`
  - `<INPUT TYPE="password" NAME="%%PASSWORDID%%" size=25>`

### Example

The following is an example of a simple authentication page that meets the requirements listed above.

```
<HTML><HEAD><TITLE>Firewall Authentication</TITLE></HEAD>
 <BODY><H4>You must authenticate to use this service.</H4>
<FORM ACTION="/" method="post">
 <INPUT NAME="%%MAGICID%%" VALUE="%%MAGICVAL%%" TYPE="hidden">
<TABLE ALIGN="center" BGCOLOR="#00cccc" BORDER="0"
 CELLPADDING="15" CELLSPACING="0" WIDTH="320"><TBODY>
<TR><TH>Username:</TH>
 <TD><INPUT NAME="%%USERNAMEID%%" SIZE="25" TYPE="text"> </TD></TR>
<TR><TH>Password:</TH>
 <TD><INPUT NAME="%%PASSWORDID%%" SIZE="25" TYPE="password"> </TD></TR>
<TR><TD COLSPAN="2" ALIGN="center" BGCOLOR="#00cccc">
 <INPUT NAME="%%STATEID%%" VALUE="%%STATEVAL%%" TYPE="hidden">
 <INPUT NAME="%%REDIRID%%" VALUE="%%PROTURI%%" TYPE="hidden">
 <INPUT VALUE="Continue" TYPE="submit"> </TD></TR>
```

```
</TBODY></TABLE></FORM></BODY></HTML>
```

### Captive Portal Default replacement messages

The Captive Portal Default replacement messages are used for wireless authentication only. You must have a VAP interface with the security set as captive portal to trigger these replacement messages.

### Device Detection Portal replacement message

The FortiGate unit displays the replacement message when the FortiGate unit cannot determine the type of BYOD or handheld device is used to connect the network.

### Email replacement messages

The FortiGate unit sends the mail replacement messages to email clients using IMAP, POP3, or SMTP when an event occurs such as antivirus blocking a file attached to an email that contains a virus. Email replacement messages are text messages.

If the FortiGate unit supports SSL content scanning and inspection these replacement messages can also be added to IMAPS, POP3S, and SMTPS email messages.

### Endpoint Control replacement message

The FortiGate unit displays the replacement message when the FortiClient Endpoint Security software is not installed or registered correctly with the FortiGate unit.

### FortiGuard Web Filtering replacement messages

The FortiGate unit sends the FortiGuard Web Filtering replacement messages to web browsers using the HTTP protocol when FortiGuard web filtering blocks a URL, provides details about blocked HTTP 4xx and 5xx errors, and for FortiGuard overrides. FortiGuard Web Filtering replacement messages are HTTP pages.

If the FortiGate unit supports SSL content scanning and inspection and if **Protocol Recognition > HTTPS Content Filtering Mode** is set to Deep Scan in the antivirus profile, these replacement messages can also replace web pages downloaded using the HTTPS protocol.

### FTP replacement messages

The FortiGate unit sends the FTP replacement messages listed in the table below to FTP clients when an event occurs such as antivirus blocking a file that contains a virus in an FTP session. FTP replacement messages are text messages.

### HTTP replacement messages

The FortiGate unit sends the HTTP replacement messages listed in the following table to web browsers using the HTTP protocol when an event occurs such as antivirus blocking a file that contains a virus in an HTTP session. HTTP replacement messages are HTML pages.

If the FortiGate unit supports SSL content scanning and inspection, and if under HTTPS in the protocol option list has Enable Deep Scan enabled, these replacement messages can also replace web pages downloaded using the HTTPS protocol.

### NNTP replacement messages

The FortiGate unit sends the NNTP replacement messages NNTP clients when an event occurs such as antivirus blocking a file attached to an NNTP message that contains a virus. NNTP replacement messages are text messages.

### Spam replacement messages

The FortiGate unit adds the Spam replacement messages to SMTP server responses if the email message is identified as spam and the spam action is discard. If the FortiGate unit supports SSL content scanning and inspection these replacement messages can also be added to SMTPS server responses.

### NAC quarantine replacement messages

The page that is displayed for the user depends on whether NAC quarantine blocked the user because a virus was found, a DoS sensor detected an attack, an IPS sensor detected an attack, or a DLP rule with action set to **Quarantine IP address** or **Quarantine Interface** matched a session from the user.

The default messages inform the user of why they are seeing this page and recommend they contact the system administrator. You can customize the pages as required, for example to include an email address or other contact information or if applicable a note about how long the user can expect to be blocked.

### SSL VPN replacement messages

The SSL VPN login replacement message is an HTML replacement message that formats the FortiGate SSL VPN portal login page. You can customize this replacement message according to your organization's needs. The page is linked to FortiGate functionality and you must construct it according to the following guidelines to ensure that it will work.

- The login page must be an HTML page containing a form with `ACTION="%%SSL_ACT%%"` and `METHOD="%%SSL_METHOD%%"`
- The form must contain the `%%SSL_LOGIN%%` tag to provide the login form.
- The form must contain the `%%SSL_HIDDEN%%` tag.

### Web Proxy replacement messages

The FortiGate unit sends Web Proxy replacement messages when a web proxy event occurs that is detected and matches the web proxy configuration. These replacement messages are web pages that appear within your web browser.

The following web proxy replacement messages require an identity-based security policy so that the web proxy is successful. You can also enable FTP-over-HTTP by selecting the **FTP** option in **System > Network > Explicit Proxy**.

### Traffic quota control replacement messages

When user traffic is going through the FortiGate unit and it is blocked by traffic shaping quota controls, users see the **Traffic shaper block message** or the **Per IP traffic shaper block message** when they attempt to connect through the FortiGate unit using HTTP.

The traffic quota HTTP pages should contain the `%%QUOTA_INFO%%` tag to display information about the traffic shaping quota setting that is blocking the user.

### MM1 replacement messages

MM1 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile.

You must have **Remove Blocked** selected within the MMS profile if you want to remove the content that is intercepted during MMS scanning on the FortiGate unit.

### MM3 replacement messages

MM3 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile.

You must have **Remove Blocked** selected within the MMS profile if you want to remove the content that is intercepted during MMS scanning on the unit.

### MM4 replacement messages

MM4 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile.

### MM7 replacement messages

MM7 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile.

### MMS replacement messages

The MMS replacement message is sent when a section of an MMS message has been replaced because it contains a blocked file. This replacement message is in HTML format.

The message text is:

```
<HTML><BODY>This section of the message has been replaced because it contained a blocked
file</BODY></HTML>
```

### Replacement message groups

Replacement message groups enable you to view common messages in groups for large carriers. Message groups can be configured by going to **Config > Replacement Message Group**.

Using the defined groups, you can manage specific replacement messages from a single location, rather than searching through the entire replacement message list.

If you enable virtual domains (VDOMs) on the FortiGate unit, replacement message groups are configured separately for each virtual domain. Each virtual domain has its own default replacement message group, configured from **System > Replacement Messages Group**.

When you modify a message in a replacement message group, a Reset icon appears beside the message in the group. You can select this Reset icon to reset the message in the replacement message group to the default version.

All MM1/4/7 notification messages for FortiOS Carrier (and MM1 retrieve-conf messages) can contain a SMIL layer and all MM4 notification messages can contain an HTML layer in the message. These layers can be used to brand messages by using logos uploaded to the FortiGate unit via the 'Manage Images' link found on the replacement message group configuration page.

## Administration for schools

For system administrator in the school system it is particularly difficult to maintain a network and access to the Internet. There are potential legal liabilities if content is not properly filtered and children are allowed to view pornography and other non-productive and potentially dangerous content. For a school, too much filtering is better than too little. This section describes some basic practices administrators can employ to help maintain control without being too draconian for access to the internet.

### Security policies

The default security policies in FortiOS allow all traffic on all ports and all IP addresses. Not the most secure. While applying UTM profiles can help to block viruses, detect attacks and prevent spam, this doesn't provide a solid overall security option. The best approach is a layered approach; the first layer being the security policy.

When creating outbound security policies, you need to know the answer to the question "What are the students allowed to do?" The answer is surf the web, connect to FTP sites, send/receive email, and so on.

Once you know what the students need to do, you can research the software used and determine the ports the applications use. For example, if the students only require web surfing, then there are only two ports (80 - HTTP and 443 - HTTPS) needed to complete their tasks. Setting the security policies to only allow traffic through two ports (rather than all 65,000), this will significantly lower any possible exploits. By restricting the ports to known services, means stopping the use of proxy servers, as many of them operate on a non-standard port to hide their traffic from URL filtering or HTTP inspection.

### DNS

Students should not be allowed to use whatever DNS they want. this opens another port for them to use and potentially smuggle traffic on. The best approach is to point to an internal DNS server and only allow those devices out on port 53. Its the same approach one would use for SMTP. Only allow the mail server to use port 25 since nothing else should be sending email.

If there is no internal DNS server, then the list of allowed DNS servers they can use should be restrictive. One possible exploit would be for them to set up their own DNS server at home that serves different IPs for known hosts, such as having Google.com sent back the IP for playboy.com.

### Encrypted traffic (HTTPS)

Generally speaking, students should not be allowed to access encrypted web sites. Encrypted traffic cannot be sniffed, and therefore, cannot be monitored. HTTPS traffic should only be allowed when necessary. Most web sites a student needs to access are HTTP, not HTTPS. Due to the nature of HTTPS protocol, and the fact that encryption is an inherent security risk to your network, its use should be restricted.

Adding a security policy that encompasses a list of allowed secure sites will ensure that any HTTPS sites that are required are the only sites a student can go to.

### FTP

For the most part, students should not be using FTP. FTP is not HTTP or HTTPS so you cannot use URL filtering to restrict where they go. This can be controlled with destination IPs in the security policy. With a policy that specifically outlines which FTP addresses are allowed, all other will be blocked.

## Example security policies

Given these requirements, an example set of security policies could look like the following illustration. In a large setup, all the IPs for the students are treated by one of these four policies.

### Simple security policy setup

<input type="checkbox"/>	Seq. No.	ID	Source	Destination	Schedule	Service	Action	Status
<input type="checkbox"/>	1	2	Student PCs	Allowed Websites	always	HTTPS	✓	✓
<input type="checkbox"/>	2	3	Student PCs	all	always	HTTP	✓	✓
<input type="checkbox"/>	3	4	Student PCs	Allowed DNS	always	DNS	✓	✓
<input type="checkbox"/>	4	5	Student PCs	Allowed FTP	always	FTP	✓	✓
<input type="checkbox"/>	5		all	all	always	ANY	✗	Implicit

The last policy in the list, included by default, is a deny policy. This adds to the potential of error that could end up allowing unwanted traffic to pass. The deny policy ensures that any traffic making it to this point is stopped. It can also help in further troubleshooting by viewing the logs for denied traffic.

With these policies in place, even before packet inspection occurs, the FortiGate, and the network are fairly secure. Should any of the UTM profiles fail, there is still a basic level of security.

## UTM security profiles

### AntiVirus profiles

Antivirus screening should be enabled for any service you have enabled in the security policies. In the case above, HTTP, FTP, as well as POP3 and SMTP (assuming there is email access for students). There is not a virus scan option for HTTPS, because the content is encrypted. Generally speaking, most of the network traffic will be students surfing the web.

To configure antivirus profiles in the web-based manager, go to **Security Profiles > AntiVirus**, or use the CLI commands under `config antivirus profile`.

### Web filtering

The actual filtering of URLs, sites and content, should be performed by FortiGuard. It is easier for the network administrator. Web sites are constantly being monitored, and new ones reviewed and added to the FortiGuard databases every day. The FortiGuard categories provide an extensive list of offensive and non-productive sites.

As well, there are additional settings to include in a web filtering profile to best contain a student's web browsing.

- Web URL filtering should be enabled to set up exemptions for web sites that are blocked or reasons other than category filtering. It also prevents the use of IP addresses to get around web filtering.
- Block invalid URLs - HTTPS only. This option inspects the HTTPS certificate and looks at the URL to ensure it's valid. It is common for proxy sites to create an HTTPS certificate with a garbage URL. If the site is legitimate, it should be set up correctly. If the site approach to security is to ignore it, then their security policy puts your network at risk and the site should be blocked.
- Enable **Block malicious URLs discovered by FortiSandbox**. If the FortiSandbox discovers a threat, the source URL will be added to the list of URLs to be blocked by the FortiGate.

Web filtering options are configured in the GUI by going to **Security Profiles > Web Filter**, or in the CLI under `config webfilter profile`.

## Categories and Classifications

For the selection of what FortiGuard categories and classifications that should be blocked, that is purely based on the school system and its Internet information policy.

## Email Filtering

Other than specific teacher-led email inboxes, there is no reason why a student should be able to access, read or send personal email. Ports for POP3, SMTP and IMAP should not be opened in a security policies.

## IPS

The intrusion protection profiles should be used to ensure the student PCs are not vulnerable to attacks, nor do you want students making attacks. As well, IPS can do more than simple vulnerability scans. With a FortiGuard subscription, IPS signatures are pushed to the FortiGate unit. New signatures are released constantly for various intrusions as they are discovered.

FortiOS includes a number of predefined IPS sensors that you can enable by default. Selecting the all\_default signature is a good place to start as it includes the major signatures.

To configure IPS sensors in the GUI, go to **Security Profiles > Intrusion Protection**, on the CLI use commands under `config ips sensor`.

## Application control

Application control uses IPS signatures to limit the use of instant messaging and peer-to-peer applications which can lead to possible infections on a student's PC. FortiOS includes a number of pre-defined application categories. To configure and maintain application control profiles in the GUI, go to **Security Profiles > Application Control**. In the CLI use commands under `config application list`.

Some applications to consider include proxies, botnets, toolbars and P2P applications.

## Logging

Turn on all logging. Every option in this section should be enabled. This is not where you decide what you are going to log. It is simply defining what the UTM profiles can log.

Logging everything is a way to monitor traffic on the network, see what student's are utilizing the most, and locate any potential holes in your security plan. As well, keeping this information may help to prove negligence later in necessary.

## PPTP and L2TP

A virtual private network (VPN) is a way to use a public network, such as the Internet, as a vehicle to provide remote offices or individual users with secure access to private networks. FortiOS supports the Point-to-Point Tunneling Protocol (PPTP), which enables interoperability between FortiGate units and Windows or Linux PPTP clients. Because FortiGate units support industry standard PPTP VPN technologies, you can configure a PPTP VPN between a FortiGate unit and most third-party PPTP VPN peers.

This section describes how to configure PPTP and L2TP VPNs as well as PPTP passthrough.

This section includes the topics:

- [How PPTP VPNs work](#)
- [FortiGate unit as a PPTP server](#)
- [Configuring the FortiGate unit for PPTP VPN](#)
- [Configuring the FortiGate unit for PPTP pass through](#)
- [Testing PPTP VPN connections](#)
- [Logging VPN events](#)
- [Configuring L2TP VPNs](#)
- [L2TP configuration overview](#)

### How PPTP VPNs work

The Point-to-Point Tunneling Protocol enables you to create a VPN between a remote client and your internal network. Because it is a Microsoft Windows standard, PPTP does not require third-party software on the client computer. As long as the ISP supports PPTP on its servers, you can create a secure connection by making relatively simple configuration changes to the client computer and the FortiGate unit.

PPTP uses Point-to-Point protocol (PPP) authentication protocols so that standard PPP software can operate on tunneled PPP links. PPTP packages data in PPP packets and then encapsulates the PPP packets within IP packets for transmission through a VPN tunnel.

When the FortiGate unit acts as a PPTP server, a PPTP session and tunnel is created as soon as the PPTP client connects to the FortiGate unit. More than one PPTP session can be supported on the same tunnel. FortiGate units support PAP, CHAP, and plain text authentication. PPTP clients are authenticated as members of a user group.

Traffic from one PPTP peer is encrypted using PPP before it is encapsulated using Generic Routing Encapsulation (GRE) and routed to the other PPTP peer through an ISP network. PPP packets from the remote client are addressed to a computer on the private network behind the FortiGate unit. PPTP packets from the remote client are addressed to the public interface of the FortiGate unit. See the figure below.

PPTP control channel messages are not authenticated, and their integrity is not protected. Furthermore, encapsulated PPP packets are not cryptographically protected and may be read or modified unless appropriate encryption software such as Secure Shell (SSH) or Secure File Transfer Protocol (SFTP) is used to transfer data after the tunnel has been established.

As an alternative, you can use encryption software such as Microsoft Point-to-Point Encryption (MPPE) to secure the channel. MPPE is built into Microsoft Windows clients and can be installed on Linux clients. FortiGate units support MPPE.

### Packet encapsulation

Shown above, traffic from the remote client is addressed to a computer on the network behind the FortiGate unit. When the PPTP tunnel is established, packets from the remote client are encapsulated and addressed to the FortiGate unit. The FortiGate unit forwards disassembled packets to the computer on the internal network.

When the remote PPTP client connects, the FortiGate unit assigns an IP address from a reserved range of IP addresses to the client PPTP interface. The PPTP client uses the assigned IP address as its source address for the duration of the connection.

When the FortiGate unit receives a PPTP packet, the unit disassembles the PPTP packet and forwards the packet to the correct computer on the internal network. The security policy and protection profiles on the FortiGate unit ensure that inbound traffic is screened and processed securely.

PPTP clients must be authenticated before a tunnel is established. The authentication process relies on FortiGate user group definitions, which can optionally use established authentication mechanisms such as RADIUS or LDAP to authenticate PPTP clients. All PPTP clients are challenged when a connection attempt is made.

## FortiGate unit as a PPTP server

In the most common Internet scenario, the PPTP client connects to an ISP that offers PPP connections with dynamically-assigned IP addresses. The ISP forwards PPTP packets to the Internet, where they are routed to the FortiGate unit.

### FortiGate unit as a PPTP server

If the FortiGate unit will act as a PPTP server, there are a number of steps to complete:

- Configure user authentication for PPTP clients.
- Enable PPTP.
- Specify the range of addresses that are assigned to PPTP clients when connecting
- Configure the security policy.

### Configuring user authentication for PPTP clients

To enable authentication for PPTP clients, you must create user accounts and a user group to identify the PPTP clients that need access to the network behind the FortiGate unit. Within the user group, you must add a user for each PPTP client.

You can choose to use a plain text password for authentication or forward authentication requests to an external RADIUS, LDAP, or TACACS+ server. If password protection will be provided through a RADIUS, LDAP, or TACACS+ server, you must configure the FortiGate unit to forward authentication requests to the authentication server.

This example creates a basic user/password combination.

## Configuring a user account

### To add a local user - GUI

1. Go to **User & Device > User Definition** and select **Create New**.
2. Select **Local User**
3. Enter a **User Name**.
4. Enter a **Password** for the user. The password should be at least six characters.
5. Select **OK**.

### To add a local user - CLI

```
config user local
 edit <username>
 set type password
 set passwd <password>
 end
```

## Configuring a user group

To ease configuration, create user groups that contain users in similar categories or departments.

### To create a user group - GUI

1. Go to **User & Device > User Group** and select **Create New**.
2. Enter a **Name** for the group.
3. Select the **Type** of **Firewall**.
4. From the **Available Users** list, select the required users and select the right-facing arrow to add them to the **Members** list.
5. Select **OK**.

### To create a user group - CLI

```
config user group
 edit <group_name>
 set group-type firewall
 set member <user_names>
 end
```

## Enabling PPTP and specifying the PPTP IP address range

The PPTP address range specifies the range of addresses reserved for remote PPTP clients. When a PPTP client connects to the FortiGate unit, the client is assigned an IP address from this range. Afterward, the FortiGate unit uses the assigned address to communicate with the PPTP client.

The address range that you reserve can be associated with private or routable IP addresses. If you specify a private address range that matches a network behind the FortiGate unit, the assigned address will make the PPTP client appear to be part of the internal network.

PPTP requires two IP addresses, one for each end of the tunnel. The PPTP address range is the range of addresses reserved for remote PPTP clients. When the remote PPTP client establishes a connection, the

FortiGate unit assigns an IP address from the reserved range of IP addresses to the client PPTP interface or retrieves the assigned IP address from the PPTP user group. If you use the PPTP user group, you must also define the FortiGate end of the tunnel by entering the IP address of the unit in **Local IP** (web-based manager) **or** `local-ip` (CLI). The PPTP client uses the assigned IP address as its source address for the duration of the connection.

PPTP configuration is only available through the CLI. In the example below, PPTP is enabled with the use of an IP range of 192.168.1.1 to 192.168.1.10 for addressing and the user group is `hr_staff`.

FortiOS 5.4.0 and later versions allow the start and end IPs in the PPTP address range to be in the same 16-bit subnet. Earlier versions require that the start and end IPs in the PPTP address range be in the same 24-bit subnet, for example, 192.168.1.1 - 192.168.1.254. .

```
config vpn pptp
 set status enable
 set ip-mode range
 set eip 192.168.1.10
 set sip 192.168.1.1
 set usrgrp hr_staff
end
```

In this example, PPTP is enabled with the use of a user group for addressing, where the IP address of the PPTP server is 192.168.1.2 and the user group is `hr_admin`.

```
config vpn pptp
 set status enable
 set ip-mode range
 set local-ip 192.168.2.1
 set usrgrp hr_admin
end
```

## Adding the security policy

The security policy specifies the source and destination addresses that can generate traffic inside the PPTP tunnel and defines the scope of services permitted through the tunnel. If a selection of services are required, define a service group.

### To configure the firewall for the PPTP tunnel - GUI

1. Go to **Policy & Objects > IPv4** or **Policy & Objects > IPv6** and select **Create New**.
2. Complete the following and select **OK**:

<b>Incoming Interface</b>	The FortiGate interface connected to the Internet.
<b>Source Address</b>	Select the name that corresponds to the range of addresses that you reserved for PPTP clients.
<b>Outgoing Interface</b>	The FortiGate interface connected to the internal network.
<b>Destination Address</b>	Select the name that corresponds to the IP addresses behind the FortiGate unit.

<b>Schedule</b>	always
<b>Service</b>	ALL
<b>Action</b>	ACCEPT

### To configure the firewall for the PPTP tunnel - CLI

```
config firewall policy or config firewall policy6
edit 1
 set srcintf <interface to internet>
 set dstintf <interface to internal network>
 set srcaddr <reserved_range>
 set dstaddr <internal_addresses>
 set action accept
 set schedule always
 set service ALL
end
```

## Configuring the FortiGate unit for PPTP VPN

To arrange for PPTP packets to pass through the FortiGate unit to an external PPTP server, perform the following tasks in the order given:

- Configure user authentication for PPTP clients.
- Enable PPTP on the FortiGate unit and specify the range of addresses that can be assigned to PPTP clients when they connect.
- Configure PPTP pass through on the FortiGate unit.

## Configuring the FortiGate unit for PPTP passthrough

To forward PPTP packets to a PPTP server on the network behind the FortiGate unit, you need to perform the following configuration tasks on the FortiGate unit:

- Define a virtual IP address that points to the PPTP server.
- Create a security policy that allows incoming PPTP packets to pass through to the PPTP server.

The address range is the external (public) ip address range which requires access to the internal PPTP server through the FortiGate virtual port-forwarding firewall.

IP addresses used in this document are fictional and follow the technical documentation guidelines specific to Fortinet. Real external IP addresses are not used.

### Configuring a virtual IP address

The virtual IP address will be the address of the PPTP server host.

### To define a virtual IP for PPTP passthrough - GUI

1. Go to **Policy & Objects > Virtual IPs**.
2. Select **Create New**.

3. Choose the **VIP Type**.
4. Enter the name of the VIP, for example, `PPTP_Server`.
5. Select the **External Interface** where the packets will be received for the PPTP server.
6. Enter the **External IP Address** for the VIP.
7. Select **Port Forwarding**.
8. Set the **Protocol to TCP**.
9. Enter the **External Service Port** of 1723, the default for PPTP.
10. Enter the **Map to Port** to 1723.
11. Select **OK**.

#### To define a virtual IP for PPTP passthrough - CLI

```
config firewall vip or config firewall vip6
edit PPTP_Server
 set extintf <interface>
 set extip <ip_address>
 set portforward enable
 set protocol tcp
 set extport 1723
 set mappedport 1723
 set mappedip <destination IP address range>
end
```

You can also use `config firewall vip46` to define a virtual IP from an IPv4 address to an IPv6 address or `config firewall vip64` to define a virtual IP from an IPv6 address to an IPv4 address.

### Configuring a port-forwarding security policy

To create a port-forwarding security policy for PPTP passthrough you must first create an address range reserved for the PPTP clients.

#### To create an address range - GUI

1. Go to **Policy & Objects > Addresses** and select **Create New**.
2. Select a **Category**.
3. Enter a **Name** for the range, for example, `External_PPTP`.
4. Select a **Type** of **Subnet/IP Range**.
5. Enter the IP address range.
6. Select the **Interface** to the Internet.
7. Select **OK**.

#### To create an address range - CLI

```
config firewall address OR config firewall address6
edit External_PPTP
 set type ip_range
 set start-ip <ip_address>
 set end-ip <ip_address>
 set associated-interface <internet_interface>
end
```

With the address set, you can add the security policy.

### To add the security policy - GUI

1. Go to **Policy & Objects > IPv4** or **Policy & Objects > IPv6** and select **Create New**.
2. Complete the following and select **OK**:

<b>Incoming Interface</b>	The FortiGate interface connected to the Internet.
<b>Source Address</b>	Select the address range created in the previous step.
<b>Outgoing Interface</b>	The FortiGate interface connected to the PPTP server.
<b>Destination Address</b>	Select the VIP address created in the previous steps.
<b>Schedule</b>	always
<b>Service</b>	PPTP
<b>Action</b>	ACCEPT

### To add the security policy - CLI

```
config firewall policy or config firewall policy6
 edit <policy_number>
 set srcintf <interface to internet>
 set dstintf <interface to PPTP server>
 set srcaddr <address_range>
 set dstaddr <PPTP_server_address>
 set action accept
 set schedule always
 set service PPTP
 end
```

## Testing PPTP VPN connections

To confirm that a PPTP VPN between a local network and a dialup client has been configured correctly, at the dialup client, issue a ping command to test the connection to the local network. The PPTP VPN tunnel initializes when the dialup client attempts to connect.

## Logging VPN events

PPTP VPN, activity is logged when enabling VPN logging. The FortiGate unit connection events and tunnel status (up/down) are logged.

### To log VPN events

1. Go to **Log & Report > Log Settings**.
2. Enable **Event Logging**.
3. Select **VPN activity event**.
4. Select **Apply**.

**To view event logs**

1. Go to **Log & Report > VPN Events**.
2. If the option is available to set the log location list, select disk or memory.
3. Select a log event and select **Details**.

## Configuring L2TP VPNs

This section describes how to configure a FortiGate unit to establish a Layer Two Tunneling Protocol (L2TP) tunnel with a remote dialup client. The FortiGate implementation of L2TP enables a remote dialup client to establish an L2TP tunnel with the FortiGate unit directly.

According to RFC 2661, an Access Concentrator (LAC) can establish an L2TP tunnel with an L2TP Network Server (LNS). In a typical scenario, the LAC is managed by an ISP and located on the ISP premises; the LNS is the gateway to a private network. When a remote dialup client connects to the Internet through the ISP, the ISP uses a local database to establish the identity of the caller and determine whether the caller needs access to an LNS through an L2TP tunnel. If the services registered to the caller indicate that an L2TP connection to the LNS is required, the ISP LAC attempts to establish an L2TP tunnel with the LNS.

A FortiGate unit can be configured to act as an LNS. The FortiGate implementation of L2TP enables a remote dialup client to establish an L2TP tunnel with the FortiGate unit directly, bypassing any LAC managed by an ISP. The ISP must configure its network access server to forward L2TP traffic from the remote client to the FortiGate unit directly whenever the remote client requires an L2TP connection to the FortiGate unit.

When the FortiGate unit acts as an LNS, an L2TP session and tunnel is created as soon as the remote client connects to the FortiGate unit. The FortiGate unit assigns an IP address to the client from a reserved range of IP addresses. The remote client uses the assigned IP address as its source address for the duration of the connection.

More than one L2TP session can be supported on the same tunnel. FortiGate units can be configured to authenticate remote clients using a plain text user name and password, or authentication can be forwarded to an external RADIUS or LDAP server. L2TP clients are authenticated as members of a user group.

For site-to-site connections, Windows servers use IPsec encryption when you configure the VPN to connect to an L2TP server.

---

Traffic from the remote client must be encrypted using IPsec before it is encapsulated and routed to the FortiGate unit. Packets originating at the remote client are addressed to a computer on the private network behind the FortiGate unit. Encapsulated packets are addressed to the public interface of the FortiGate unit. See the figure below.

When the FortiGate unit receives an L2TP packet, the unit disassembles the packet and forwards the packet to the correct computer on the internal network. The security policy and protection profiles on the FortiGate unit ensure that inbound traffic is screened and processed securely.

## L2TP encapsulation

FortiGate units cannot deliver non-IP traffic such as Frame Relay or ATM frames encapsulated in L2TP packets — FortiGate units support the IPv4 and IPv6 addressing schemes only

## Network topology

The remote client connects to an ISP that determines whether the client requires an L2TP connection to the FortiGate unit. If an L2TP connection is required, the connection request is forwarded to the FortiGate unit directly.

### Example L2TP configuration

### L2TP infrastructure requirements

- The FortiGate unit must be operating in NAT mode and have a static public IP address.
- The ISP must configure its network access server to forward L2TP traffic from remote clients to the FortiGate unit directly.
- The remote client must not generate non-IP traffic (Frame Relay or ATM frames).

### L2TP configuration overview

To configure a FortiGate unit to act as an LNS, you perform the following tasks:

- Create an L2TP user group containing one user for each remote client.
- Enable L2TP on the FortiGate unit and specify the range of addresses that can be assigned to remote clients when they connect.
- Define firewall source and destination addresses to indicate where packets transported through the L2TP tunnel will originate and be delivered.
- Create the security policy and define the scope of permitted services between the source and destination addresses.
- Configure the remote clients.

### Authenticating L2TP clients

L2TP clients must be authenticated before a tunnel is established. The authentication process relies on FortiGate user group definitions, which can optionally use established authentication mechanisms such as RADIUS or LDAP to authenticate L2TP clients. All L2TP clients are challenged when a connection attempt is made.

To enable authentication, you must create user accounts and a user group to identify the L2TP clients that need access to the network behind the FortiGate unit.

You can choose to use a plain text password for authentication or forward authentication requests to an external RADIUS or LDAP server. If password protection will be provided through a RADIUS or LDAP server, you must configure the FortiGate unit to forward authentication requests to the authentication server.

## Enabling L2TP and specifying an address range

The L2TP address range specifies the range of addresses reserved for remote clients. When a remote client connects to the FortiGate unit, the client is assigned an IP address from this range. Afterward, the FortiGate unit uses the assigned address to communicate with the remote client.

The address range that you reserve can be associated with private or routable IP addresses. If you specify a private address range that matches a network behind the FortiGate unit, the assigned address will make the remote client appear to be part of the internal network.

To enable L2TP and specify the L2TP address range, use the `config vpn l2tp` CLI command.

The following example shows how to enable L2TP and set the L2TP address range using a starting address of 192.168.10.80 and an ending address of 192.168.10.100 for an existing group of L2TP users named L2TP\_users:

```
config vpn l2tp
 set sip 192.168.10.80
 set eip 192.168.10.100
 set status enable
 set usrgroup L2TP_users
end
```

## Defining firewall source and destination addresses

Before you define the security policy, you must define the source and destination addresses of packets that are to be transported through the L2TP tunnel:

- For the source address, enter the range of addresses that you reserved for remote L2TP clients (for example 192.168.10.[80-100]).
- For the destination address, enter the IP addresses of the computers that the L2TP clients need to access on the private network behind the FortiGate unit (for example, 172.16.5.0/24 for a subnet, or 172.16.5.1 for a server or host, or 192.168.10.[10-15] for an IP address range).

### To define the firewall source address

1. Go to **Policy & Objects > Addresses** and select **Create New**.
2. Select **Address**.
3. In the **Name** field, type a name that represents the range of addresses that you reserved for remote clients (for example, Ext\_L2TPrange).
4. In **Type**, select **IP Range**.
5. In the **Subnet / IP Range** field, type the corresponding IP address range.
6. In **Interface**, select the FortiGate interface that connects to the clients.
7. This is usually the interface that connects to the Internet.
8. Select **OK**.

### To define the firewall destination address

1. Go to **Policy & Objects > Addresses** and select **Create New**.
2. In the **Address Name** field, type a name that represents a range of IP addresses on the network behind the FortiGate unit (for example, `Int_L2TPaccess`).
3. In **Type**, select **IP Range**.
4. In the **IP Range** field, type the corresponding IP address range.
5. In **Interface**, select the FortiGate interface that connects to the network behind the FortiGate unit.
6. Select **OK**.

### Adding the security policy

The security policy specifies the source and destination addresses that can generate traffic inside the L2TP tunnel and defines the scope of services permitted through the tunnel. If a selection of services are required, define a service group.

### To define the traffic and services permitted inside the L2TP tunnel

1. Go to **Policy & Objects > IPv4** or **Policy & Objects > IPv6** and select **Create New**.
2. Enter these settings:

<b>Name</b>	Input a name for the policy.
<b>Incoming Interface</b>	Select the FortiGate interface to the Internet.
<b>Outgoing Interface</b>	Select the FortiGate interface to the internal (private) network.
<b>Source Address</b>	Select the name that corresponds to the address range that reserved for L2TP clients (for example, <code>Ext_L2TPrange</code> ).
<b>Destination Address</b>	Select the name that corresponds to the IP addresses behind the FortiGate unit (for example, <code>Int_L2TPaccess</code> ).
<b>Schedule</b>	Select ALWAYS, or if a select schedule is required instead, select a schedule that you defined previously.
<b>Service</b>	Select ALL, or if selected services are required instead, select the service group that you defined previously.
<b>Action</b>	ACCEPT

3. Select **OK**.

### Configuring a Linux client

This procedure outlines how to install L2TP client software and run an L2TP tunnel on a Linux computer. Obtain an L2TP client package that meets your requirements (for example, `rp-l2tp`). If needed to encrypt traffic, obtain L2TP client software that supports encryption using IPsec.

To establish an L2TP tunnel with a FortiGate unit that has been set up to accept L2TP connections, you can obtain and install the client software following these guidelines:

1. If encryption is required, you will need to verify the IPsec configuration.
2. Download and install the L2TP client package.

3. Configure an L2TP connection to run the L2TP program.
4. Configure routes to determine whether all or some of your network traffic will be sent through the tunnel. You must define a route to the remote network over the L2TP link and a host route to the FortiGate unit.
5. Run `l2tpd` to start the tunnel.

Follow the software supplier's documentation to complete the steps.

To configure the system, you need to know the public IP address of the FortiGate unit, and the user name and password that has been set up on the FortiGate unit to authenticate L2TP clients. Contact the FortiGate administrator if required to obtain this information.

## Monitoring L2TP sessions

You can display a list of all active sessions and view activity by port number. By default, port 1701 is used for L2TP VPN-related communications. If required, active sessions can be stopped from this view. Use **FortiView > All Sessions**.

## Testing L2TP VPN connections

To confirm that a VPN between a local network and a dialup client has been configured correctly, at the dialup client, issue a ping command to test the connection to the local network. The VPN tunnel initializes when the dialup client attempts to connect.

## Logging L2TP VPN events

You can configure the FortiGate unit to log VPN events. For L2TP VPNs, connection events and tunnel status (up/down) are logged.

### To log VPN events - GUI

1. Go to **Log & Report > Log Settings**.
2. Enable the storage of log messages to one or more locations.
3. Select **Enable**, and then select **VPN activity event**.
4. Select **Apply**.

### To log VPN events - CLI

```
config log memory setting
 set diskfull overwrite
 set status enable
end
config log eventfilter
 set vpn enable
end
```

## Session helpers

FortiOS uses session helpers to process sessions that have special requirements. Session helpers function like proxies by getting information from the session and performing support functions required by the session. For example:

- The SIP session helper looks inside SIP messages and performs NAT (if required) on the IP addresses in the SIP message and opens pinholes to allow media traffic associated with the SIP session to pass through the FortiGate unit.
- The FTP session helper can keep track of multiple connections initiated from a single FTP session. The session helper also permits an FTP server to actively open a connection back to a client program.
- The TNS session helper sniffs the return packet from an initial 1521 SQLNET exchange and then uses the port and session information uncovered in that return TNS redirect packet to add a temporary firewall policy that accepts the new port and IP address supplied as part of the TNS redirect.

The session helper configuration binds a session helper to a TCP or UDP port and protocol. When a session is accepted by a firewall policy on that port and protocol the FortiOS passes the session to the session helper configured with this command. The session is processed by the session helper.

If your FortiGate accepts sessions that require a session helper on different ports than those defined by the session-helper configuration, then you can add more entries to the session helper configuration. You can have multiple session helper configurations for a given protocol because only the matching configuration is used.

Use the `show system session-helper` command to view the current session helper configuration.

This section includes the topics:

- [Viewing the session helper configuration](#)
- [Changing the session helper configuration](#)
- [DCE-RPC session helper \(dcerpc\)](#)
- [DNS session helpers \(dns-tcp and dns-udp\)](#)
- [File transfer protocol \(FTP\) session helper \(ftp\)](#)
- [H.323 and RAS session helpers \(h323 and ras\)](#)
- [Media Gateway Controller Protocol \(MGCP\) session helper \(mgcp\)](#)
- [ONC-RPC portmapper session helper \(pmap\)](#)
- [PPTP session helper for PPTP traffic \(pptp\)](#)
- [Remote shell session helper \(rsh\)](#)
- [Real-Time Streaming Protocol \(RTSP\) session helper \(rtsp\)](#)
- [Session Initiation Protocol \(SIP\) session helper \(sip\)](#)
- [Trivial File Transfer Protocol \(TFTP\) session helper \(tftp\)](#)
- [Oracle TNS listener session helper \(tns\)](#)

## Viewing the session helper configuration

You can view the session helpers enabled on your FortiGate unit in the CLI using the commands below. The following output shows the first two session helpers. The number of session helpers can vary to around 20.

```
show system session-helper
config system session-helper
edit 1
 set name pptp
 set port 1723
 set protocol 6
next
 set name h323
 set port 1720
 set protocol 6
end
.
.
```

The configuration for each session helper includes the name of the session helper and the port and protocol number on which the session helper listens for sessions. Session helpers listed on protocol number 6 (TCP) or 17 (UDP). For a complete list of protocol numbers see [Assigned Internet Protocol Numbers](#).

For example, the output above shows that FortiOS listens for PPTP packets on TCP port 1723 and H.323 packets on port TCP port 1720.

If a session helper listens on more than one port or protocol the more than one entry for the session helper appears in the `config system session-helper` list. For example, the `pmap` session helper appears twice because it listens on TCP port 111 and UDP port 111. The `rsh` session helper appears twice because it listens on TCP ports 514 and 512.

## Changing the session helper configuration

Normally you will not need to change the configuration of the session helpers. However in some cases you may need to change the protocol or port the session helper listens on.

### Changing the protocol or port that a session helper listens on

Most session helpers are configured to listen for their sessions on the port and protocol that they typically use. If your FortiGate unit receives sessions that should be handled by a session helper on a non-standard port or protocol you can use the following procedure to change the port and protocol used by a session helper. The following example shows how to change the port that the `pmap` session helper listens on for Sun RPC portmapper TCP sessions. By default `pmap` listens on TCP port 111.

#### To change the port that the `pmap` session helper listens on to TCP port 112

1. Confirm that the TCP `pmap` session helper entry is 11 in the session-helper list:

```
show system session-helper 11
config system session-helper
edit 11
 set name pmap
 set port 111
 set protocol 6
next
```

```
end
```

2. Enter the following command to change the TCP port to 112.

```
config system session-helper
edit 11
set port 112
end
```

3. The pmap session helper also listens on UDP port 111. Confirm that the UDP pmap session helper entry is 12 in the session-helper list:

```
show system session-helper 12
config system session-helper
edit 12
set name pmap
set port 111
set protocol 17
next
end
```

4. Enter the following command to change the UDP port to 112.

```
config system session-helper
edit 12
set port 112
end
```

Use the following command to set the h323 session helper to listen for ports on the UDP protocol.

### To change the protocol that the h323 session helper listens on

1. Confirm that the h323 session helper entry is 2 in the session-helper list:

```
show system session-helper 2
config system session-helper
edit 2
set name h323
set port 1720
set protocol 6
next
end
```

2. Enter the following command to change the protocol to UDP.

```
config system session-helper
edit 2
set protocol 17
end
```

If a session helper listens on more than one port or protocol, then multiple entries for the session helper must be added to the session helper list, one for each port and protocol combination. For example, the rtsp session helper listens on TCP ports 554, 7070, and 8554 so there are three rtsp entries in the session-helper list. If your FortiGate unit receives rtsp packets on a different TCP port (for example, 6677) you can use the following command to configure the rtsp session helper to listen on TCP port 6677.

### To configure a session helper to listen on a new port and protocol

```
config system session-helper
edit 0
```

```
set name rtsp
set port 6677
set protocol 6
end
```

## Disabling a session helper

In some cases you may need to disable a session helper. Disabling a session helper just means removing it from the session-helper list so that the session helper is not listening on a port. You can completely disable a session helper by deleting all of its entries from the session helper list. If there are multiple entries for a session helper on the list you can delete one of the entries to prevent the session helper from listening on that port.

### To disable the mgcp session helper from listening on UDP port 2427

1. Enter the following command to find the mgcp session helper entry that listens on UDP port 2427:

```
show system session-helper
.
.
.
edit 19
 set name mgcp
 set port 2427
 set protocol 17
next
.
.
.
```

2. Enter the following command to delete session-helper list entry number 19 to disable the mgcp session helper from listening on UDP port 2427:

```
config system session-helper
delete 19
```

By default the mgcp session helper listens on UDP ports 2427 and 2727. The previous procedure shows how to disable the mgcp protocol from listening on port 2427. The following procedure completely disables the mgcp session helper by also disabling it from listening on UDP port 2727.

### To completely disable the mgcp session helper

1. Enter the following command to find the mgcp session helper entry that listens on UDP port 2727:

```
show system session-helper
.
.
.
edit 20
 set name mgcp
 set port 2727
 set protocol 17
next
.
.
.
```

2. Enter the following command to delete session-helper list entry number 20 to disable the mgcp session helper from listening on UDP port 2727:

```
config system session-helper
```

delete 20

## DCE-RPC session helper (dcerpc)

Distributed Computing Environment Remote Procedure Call (DCE-RPC) provides a way for a program running on one host to call procedures in a program running on another host. DCE-RPC (also called MS RPC for Microsoft RPC) is similar to ONC-RPC. Because of the large number of RPC services, for example, MAPI, the transport address of an RPC service is dynamically negotiated based on the service program's universal unique identifier (UUID). The Endpoint Mapper (EPM) binding protocol in FortiOS maps the specific UUID to a transport address.

To accept DCE-RPC sessions you must add a security policy with service set to any or to the DEC-RPC pre-defined service (which listens on TCP and UDP ports 135). The dcerpc session helper also listens on TCP and UDP ports 135.

The session allows FortiOS to handle DCE-RPC dynamic transport address negotiation and to ensure UUID-based security policy enforcement. You can define a security policy to permit all RPC requests or to permit by specific UUID number.

In addition, because a TCP segment in a DCE-RPC stream might be fragmented, it might not include an intact RPC PDU. This fragmentation occurs in the RPC layer; so FortiOS does not support parsing fragmented packets.

The DCE-RPC session helper does not support destination NAT (DNAT) or Firewall VIPs unless you are using the OXID Resolver service (also called IOXIDResolver).

## DNS session helpers (dns-tcp and dns-udp)

FortiOS includes two DNS session helpers, dns-tcp, a session helper for DNS over TCP, and dns-udp, a session helper for DNS over UDP.

To accept DNS sessions you must add a security policy with service set to any or to the DNS pre-defined service (which listens on TCP and UDP ports 53). The dns-udp session helper also listens on UDP port 53. By default the dns-tcp session helper is disabled. If needed you can use the following command to enable the dns-tcp session helper to listen for DNS sessions on TCP port 53:

```
config system session-helper
 edit 0
 set name dns-tcp
 set port 53
 set protocol 6
 end
```

## File transfer protocol (FTP) session helper (ftp)

The FTP session helper monitors PORT, PASV and 227 commands and NATs the IP addresses and port numbers in the body of the FTP packets and opens ports on the FortiGate unit as required.

To accept FTP sessions you must add a security policy with service set to any or to the FTP, FTP\_Put, and FTP\_GET pre-defined services (which all listen on TCP port 21).

## H.323 and RAS session helpers (h323 and ras)

The H.323 session helper supports secure H.323 voice over IP (VoIP) sessions between terminal endpoints such as IP phones and multimedia devices. In H.323 VoIP networks, gatekeeper devices manage call registration, admission, and call status for VoIP calls. The FortiOS h323 session helper supports gatekeepers installed on two different networks or on the same network.

To accept H.323 sessions you must add a security policy with service set to any or to the H323 pre-defined service (which listens on TCP port numbers 1720 and 1503 and on UDP port number 1719). The h323 session helper listens on TCP port 1720.

The ras session helper is used with the h323 session helper for H.323 Registration, Admission, and Status (RAS) services. The ras session helper listens on UDP port 1719.

### Alternate H.323 gatekeepers

The h323 session helper supports using H.323 alternate gatekeepers. All the H.323 end points must register with a gatekeeper through the Registration, Admission, and Status (RAS) protocol before they make calls. During the registration process, the primary gatekeeper sends Gatekeeper Confirm (GCF) and Registration Confirm (RCF) messages to the H.323 end points that contain the list of available alternate gatekeepers.

The alternate gatekeeper provides redundancy and scalability for the H.323 end points. If the primary gatekeeper fails the H.323 end points that have registered with that gatekeeper are automatically registered with the alternate gatekeeper. To use the H.323 alternate gatekeeper, you need to configure security policies that allow H.323 end points to reach the alternate gatekeeper.

## Media Gateway Controller Protocol (MGCP) session helper (mgcp)

The Media Gateway Control Protocol (MGCP) is a text-based application layer protocol used for VoIP call setup and control. MGCP uses a master-slave call control architecture in which the media gateway controller uses a call agent to maintain call control intelligence, while the media gateways perform the instructions of the call agent.

To accept MGCP sessions you must add a security policy with service set to any or to the MGCP predefined service (which listens on UDP port numbers 2427 and 2727). The h323 session helper also listens on UDP port numbers 2427 and 2727.

The MGCP session helper does the following:

- VoIP signaling payload inspection. The payload of the incoming VoIP signaling packet is inspected and malformed packets are blocked.
- Signaling packet body inspection. The payload of the incoming MGCP signaling packet is inspected according to RFC 3435. Malformed packets are blocked.
- Stateful processing of MGCP sessions. State machines are invoked to process the parsed information. Any out-of-state or out-of-transaction packet is identified and properly handled.
- MGCP Network Address Translation (NAT). Embedded IP addresses and ports in packet bodies is properly translated based on current routing information and network topology, and is replaced with the translated IP address and port number, if necessary.
- Manages pinholes for VoIP traffic. To keep the VoIP network secure, the IP address and port information used for media or signaling is identified by the session helper, and pinholes are dynamically created and closed during call setup.

## ONC-RPC portmapper session helper (pmap)

Open Network Computing Remote Procedure Call (ONC-RPC) is a widely deployed remote procedure call system. Also called Sun RPC, ONC-RPC allows a program running on one host to call a program running on another. The transport address of an ONC-RPC service is dynamically negotiated based on the service's program number and version number. Several binding protocols are defined for mapping the RPC program number and version number to a transport address.

To accept ONC-RPC sessions you must add a security policy with service set to any or to the ONC-RPC pre-defined service (which listens on TCP and UDP port number 111). The RPC portmapper session helper (called pmap) handles the dynamic transport address negotiation mechanisms of ONC-RPC.

## PPTP session helper for PPTP traffic (pptp)

The PPTP session help supports port address translation (PAT) for PPTP traffic. PPTP provides IP security at the Network Layer. PPTP consists of a control session and a data tunnel. The control session runs over TCP and helps in establishing and disconnecting the data tunnel. The data tunnel handles encapsulated Point-to-Point Protocol (PPP) packets carried over IP.

To accept PPTP sessions that pass through the FortiGate unit you must add a security policy with service set to any or to the PPTP pre-defined service (which listens on IP port 47 and TCP port 1723). The pptp session helper listens on TCP port 1723.

PPTP uses TCP port 1723 for control sessions and Generic Routing Encapsulation (GRE) (IP protocol 47) for tunneling the encapsulated PPP data. The GRE traffic carries no port number, making it difficult to distinguish between two clients with the same public IP address. PPTP uses the source IP address and the Call ID field in the GRE header to identify a tunnel. When multiple clients sharing the same IP address establish tunnels with the same PPTP server, they may get the same Call ID. The call ID value can be translated in both the control message and the data traffic, but only when the client is in a private network and the server is in a public network.

PPTP clients can either directly connect to the Internet or dial into a network access server to reach the Internet. A FortiGate unit that protects PPTP clients can translate the clients' private IP addresses to a pool of public IP addresses using NAT port translation (NAT-PT). Because the GRE traffic carries no port number for address translation, the pptp session helper treats the Call ID field as a port number as a way of distinguishing multiple clients.

After the PPTP establishing a TCP connection with the PPTP server, the client sends a start control connection request message to establish a control connection. The server replies with a start control connection reply message. The client then sends a request to establish a call and sends an outgoing call request message. FortiOS assigns a Call ID (bytes 12-13 of the control message) that is unique to each PPTP tunnel. The server replies with an outgoing call reply message that carries its own Call ID in bytes 12-13 and the client's call ID in bytes 14-15. The pptp session helper parses the control connection messages for the Call ID to identify the call to which a specific PPP packet belongs. The session helper also identifies an outgoing call request message using the control message type field (bytes 8-9) with the value 7. When the session helper receives this message, it parses the control message for the call ID field (bytes 12-13). FortiOS translates the call ID so that it is unique across multiple calls from the same translated client IP. After receiving outgoing call response message, the session helper holds this message and opens a port that accepts GRE traffic that the PPTP server sends. An outgoing call request message contains the following parts:

- The protocol used for the outgoing call request message (usually GRE)
- Source IP address (PPTP server IP)

- Destination IP address (translated client IP)
- Destination port number (translated client call ID)

The session helper identifies an outgoing call reply message using the control message type field (bytes 8-9) with the value 8. The session helper parses these control messages for the call ID field (bytes 12-13) and the client's call ID (bytes 14-15). The session helper then uses the client's call ID value to find the mapping created for the other direction, and then opens a pinhole to accept the GRE traffic that the client sends.

An outgoing call reply message contains the following parts:

- Protocol used for the outgoing call reply message (usually GRE)
- Source IP address (PPTP client IP)
- Destination IP address (PPTP server IP)
- Destination port number (PPTP server Call ID)

Each port that the session opens creates a session for data traffic arriving in that direction. The session helper opens the following two data sessions for each tunnel:

- Traffic from the PPTP client to the server, using the server's call ID as the destination port
- Traffic from the PPTP server to the client, using the client's translated call ID as the destination port

The default timeout value of the control connection is 30 minutes. The session helper closes the pinhole when the data session exceeds the timeout value or is idle for an extended period.

## Remote shell session helper (rsh)

Using the remote shell program (RSH), authenticated users can run shell commands on remote hosts. RSH sessions most often use TCP port 514. To accept RSH sessions you must add a security policy with service set to any or to the RSH pre-defined service (which listens on TCP port number 514).

FortiOS automatically invokes the rsh session helper to process all RSH sessions on TCP port 514. The rsh session helper opens ports required for the RSH service to operate through a FortiGate unit running NAT or transparent and supports port translation of RSH traffic.

## Real-Time Streaming Protocol (RTSP) session helper (rtsp)

The Real-Time Streaming Protocol (RTSP) is an application layer protocol often used by SIP to control the delivery of multiple synchronized multimedia streams, for example, related audio and video streams. Although RTSP is capable of delivering the data streams itself it is usually used like a network remote control for multimedia servers. The protocol is intended for selecting delivery channels (like UDP, multicast UDP, and TCP) and for selecting a delivery mechanism based on the Real-Time Protocol (RTP). RTSP may also use the SIP Session Description Protocol (SDP) as a means of providing information to clients for aggregate control of a presentation consisting of streams from one or more servers, and non-aggregate control of a presentation consisting of multiple streams from a single server.

To accept RTSP sessions you must add a security policy with service set to any or to the RTSP pre-defined service (which listens on TCP ports 554, 770, and 8554 and on UDP port 554). The rtsp session helper listens on TCP ports 554, 770, and 8554.

The rtsp session help is required because RTSP uses dynamically assigned port numbers that are communicated in the packet body when end points establish a control connection. The session helper keeps track of the port numbers and opens pinholes as required. In Network Address Translation (NAT) mode, the session helper translates IP addresses and port numbers as necessary.

In a typical RTSP session the client starts the session (for example, when the user selects the Play button on a media player application) and establishes a TCP connection to the RTSP server on port 554. The client then sends an OPTIONS message to find out what audio and video features the server supports. The server responds to the OPTIONS message by specifying the name and version of the server, and a session identifier, for example, 24256-1.

The client then sends the DESCRIBE message with the URL of the actual media file the client wants to play. The server responds to the DESCRIBE message with a description of the media in the form of SDP code. The client then sends the SETUP message, which specifies the transport mechanisms acceptable to the client for streamed media, for example RTP/RTCP or RDT, and the ports on which it receives the media.

In a NAT configuration the rtsp session helper keeps track of these ports and addresses translates them as necessary. The server responds to the SETUP message and selects one of the transport protocols. When both client and server agree on a mechanism for media transport the client sends the PLAY message, and the server begins streaming the media.

### **Session Initiation Protocol (SIP) session helper (sip)**

The sip session helper is described in the VoIP Solutions: SIP Guide.

### **Trivial File Transfer Protocol (TFTP) session helper (tftp)**

To accept TFTP sessions you must add a security policy with service set to any or to the TFTP pre-defined service (which listens on UDP port number 69). The TFTP session helper also listens on UTP port number 69.

TFTP initiates transfers on UDP port 69, but the actual data transfer ports are selected by the server and client during initialization of the connection. The tftp session helper reads the transfer ports selected by the TFTP client and server during negotiation and opens these ports on the firewall so that the TFTP data transfer can be completed. When the transfer is complete the tftp session helper closes the open ports.

### **Oracle TNS listener session helper (tns)**

The Oracle Transparent Network Substrate (TNS) listener listens on port TCP port 1521 for network requests to be passed to a database instance. The Oracle TNS listener session helper (tns) listens for TNS sessions on TCP port 1521. TNS is a foundation technology built into the Oracle Net foundation layer and used by SQLNET.

## Advanced concepts

This section provides configuration concepts and techniques to enhance your network security and includes the topics:

- [Single firewall vs. multiple virtual domains](#)
- [Modem](#)
- [FortiExtender](#)
- [Assigning IP address by MAC address](#)
- [IP addresses for self-originated traffic](#)
- [Disk](#)
- [CLI Scripts](#)

- [Opening TCP 113](#)
- [Obfuscate HTTP responses](#)

You can also find a collection of practical articles on Fortinet's [Cookbook](#) site under [Resources > SysAdmin Notes](#).

### Single firewall vs. multiple virtual domains

A typical FortiGate setup, with a small to mid-range appliance, enables you to include a number of subnets on your network using the available ports and switch interfaces. This can potentially provide a means of having three or more mini networks for the various groups in a company. Within this infrastructure, multiple network administrators have access to the FortiGate to maintain security policies.

However, the FortiGate unit may not have enough interfaces to match the number of departments in the organization. If the FortiGate unit is running in transparent mode however, there is only one interface, and multiple network branches through the FortiGate are not possible.

A FortiGate unit with Virtual Domains (VDOMs) enabled, provides a means to provide the same functionality in transparent mode as a FortiGate in NAT mode. VDOMs are a method of dividing a FortiGate unit into two or more virtual units that function as multiple independent units. VDOMs can provide separate security policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network. For administration, an administrator can be assigned to each VDOM, minimizing the possibility of error or fouling network communications.

By default, most FortiGate units support 10 VDOMs. Many FortiGate models support purchasing a license key to increase the maximum number.

#### Single firewall vs. vdoms

When VDOMs are not enabled, and the FortiGate unit is in transparent mode, all the interfaces on your unit become broadcast interfaces. The problem is there are no interfaces free for additional network segments.

A FortiGate with three interfaces means only limited network segments are possible without purchasing more FortiGate devices.

With multiple VDOMs you can have one of them configured in transparent mode, and the rest in NAT mode. In this configuration, you have an available transparent mode FortiGate unit you can drop into your network for troubleshooting, and you also have the standard.

This example shows how to enable VDOMs on the FortiGate unit and the basic and create a VDOM accounting on the DMZ2 port and assign an administrator to maintain the VDOM. First enable Virtual Domains on the FortiGate unit.

### To enable VDOMs - web-based manager

1. Go to **System > Dashboard > Status**.
2. In the **System Information** widget, select **Enable** for **Virtual Domain**.

Note that on FortiGate-60 series and lower models, you need to enable VDOMs in the CLI only.

The FortiGate unit logs you out. Once you log back in, you will notice that the menu structure has changed. This reflects the global settings for all Virtual Domains.

### To enable VDOMs - CLI

```
config system global
 set vdom-admin enable
end
```

Next, add the VDOM called accounting.

#### To add a VDOM - web-based manager

1. Go to **Global > VDOM > VDOM**, and select **Create New**.
2. Enter the VDOM name `accounting`.
3. Select **OK**.

#### To add a VDOM - CLI

```
config vdom
 edit <new_vdom_name>
end
```

With the Virtual Domain created, you can assign a physical interface to it, and assign it an IP address.

#### To assign physical interface to the accounting Virtual Domain - web-based manager

1. Go to **Global > Network > Interface**.
2. Select the DMZ2 port row and select **Edit**.
3. For the **Virtual Domain** drop-down list, select **accounting**.
4. Select the **Addressing Mode** of **Manual**.
5. Enter the IP address for the port of 10.13.101.100/24.
6. Set the **Administrative Access** to **HTTPS** and **SSH**.
7. Select **OK**.

#### To assign physical interface to the accounting Virtual Domain - CLI

```
config global
 config system interface
 edit dmz2
 set vdom accounting
 set ip 10.13.101.100/24
 set allowaccess https ssh
 next
 end
```

## Modem

FortiGate units support the use of wireless, 3G and 4G modems connected using the USB port or, if available, the express card slot. Modem access provides either primary or secondary (redundant) access to the Internet. For FortiGate units that do not include an internal modem (those units with an “M” designation), the modem interface will not appear in the web-based manager until enabled in the CLI. To enable the modem interface enter the CLI commands:

```
config system modem
 set status enable
end
```

You will need to log out of the FortiGate and log back in to see the modem configuration page at **Network > Modem**. Once enabled, modem options become available by going to **Network > Interfaces**.

Note that the modem interface is only available when the FortiGate unit is in NAT mode.

To configure modem settings, go to **> Network > Modem**.

Configuring the modem settings is a matter of entering the ISP phone number, user name and password. Depending on the modem, additional information may need to be supplied such as product identifiers, and initialization strings.

The FortiGate unit includes a number of common modems within its internal database. You can view these by selecting the **Configure Modem** link on the **Modem Settings** page. If your modem is not on the list, select **Create New** to add the information. This information is stored on the device, and will remain after a reboot.

Fortinet has an online database of modem models and configuration settings through FortiGuard. A subscription to the FortiGuard services is not required to access the information. As models are added, you can select the **Configure Modem** link and select **Update Now** to download new configurations.

## USB modem port

Each USB modem has a specific dial-out port. This will be indicated with the documentation for your modem. To enable the correct USB port, use the CLI commands:

```
config system modem
 set wireless-port {0 | 1 | 2}
end
```

To test the port, use the diagnose command:

```
diagnose sys modem com /1
```

The 1 will be the value of your USB port selected. The response will be:

```
Serial port: /dev/l
Press Ctrl+W to exit.
```

If the port does not respond the output will be:

```
Can not open modem device '/dev/l' : Broken pipe
```

## Modes

The FortiGate unit allows for two modes of operation for the modem; stand alone and redundant. In stand alone mode, the modem connects to a dialup ISP account to provide the connection to the Internet. In redundant mode, the modem acts as a backup method of connecting to the Internet, should the primary port for this function fails.

Configuring either stand alone or redundant modes are very similar. The primary difference is the selection of the interface that the modem will replace in the event of it failing, and the configuration of a PING server to monitor the chosen interface.

### Configuring stand alone mode

Configuring stand alone mode is a matter of configuring the modem information and the dialing mode. The dial mode is either **Always Connect** or **Dial on demand**. Selecting **Always Connect** ensures that once the modem has connected, it remains connected to the ISP. Selecting **Dial on Demand**, the modem only calls the ISP if packets are routed to the modem interface. Once sent, the modem will disconnect after a specified amount of time.

**To configure standalone mode as needed - GUI**

1. Go to **Network > Modem**.
2. Select the **Mode** of **Standalone**.
3. Select the **Dial Mode** of **Dial on Demand**.
4. Select the number of redials the modem attempts if connection fails to 5.
5. Select **Apply**.

**To configure standalone mode as needed- CLI**

```
config system modem
 set status enable
 set mode standalone
 set auto-dial enable
 set redial 5
end
```

**Configuring redundant mode**

Redundant mode provides a backup to an interface, typically to the Internet. If that interface fails or disconnects, the modem automatically dials the configured phone number(s). Once connected, the FortiGate unit routes all traffic to the modem interface until the monitored interface is up again. The FortiGate unit pings the connection to determine when it is back online.

For the FortiGate to verify when the interface is back up, you need to configure a Ping server for that interface. You will also need to configure security policies between the modem interface and the other interfaces of the FortiGate unit to ensure traffic flow.

**To configure redundant mode as needed - GUI**

1. Go to **Network > Modem**.
2. Select the **Mode** of **Redundant**.
3. Select the interface the modem takes over from if it fails.
4. Select the **Dial Mode** of **Dial on Demand**.
5. Select the number of redials the modem attempts if connection fails to 5.
6. Select **Apply**.

**To configure standalone mode as needed- CLI**

```
config system modem
 set status enable
 set mode redundant
 set interface wan1
 set auto-dial enable
 set redial 5
end
```

**Link Health Monitor**

Adding a link health monitor is required for routing fail over traffic. A link health monitor will confirm the connectivity of the device's interface

### To add a link health monitor

```
config system link-monitor
 edit "Example1"
 set srcint <Interface_sending_probe>
 set server <ISP_IP_address>
 set protocol <Ping or http>
 set gateway-ip <the_gateway_IP_to_reach_the_server_if_required>
 set failtime <failure_count>
 set interval <seconds>
 set update-cascade-interface enable
 set update-static-route enable
 set status enable
 end
```

### Additional modem configuration

The CLI provides additional configuration options when setting up the modem options including adding multiple ISP dialing and initialization options and routing. For more information, see the CLI Reference.

### Modem interface routing

The modem interface can be used in FortiOS as a dedicated interface. Once enabled and configured, you can use it in security policies and define static and dynamic routing. Within the CLI commands for the modem, you can configure the distance and priority of routes involving the modem interface. The CLI commands are:

```
config system modem
 set distance <route_distance>
 set priority <priority_value>
end
```

For more information on the routing configuration in the CLI, see the CLI Reference. For more information on routing and configuring routing, see the Advanced Routing Guide.

## Assigning IP address by MAC address

To prevent users from changing their IP addresses and causing IP address conflicts or unauthorized use of IP addresses, you can bind an IP address to a specific MAC address using DHCP.

Use the CLI to reserve an IP address for a particular client identified by its device MAC address and type of connection. The DHCP server then always assigns the reserved IP address to the client. The number of reserved addresses that you can define ranges from 10 to 200 depending on the FortiGate model.

After setting up a DHCP server on an interface by going to **Network > Interfaces**, select the blue arrow next to **Advanced** to expand the options. If you know the MAC address of the system select **Create New** to add it, or if the system has already connected, locate it in the list, select the check box and select **Add from DHCP Client List**.

You can also match an address to a MAC address in the CLI. In the example below, the IP address 10.10.10.55 for User1 is assigned to MAC address 00:09:0F:30:CA:4F.

```
config system dhcp reserved-address
 edit User1
 set ip 10.10.10.55
 set mac 00:09:0F:30:CA:4F
 set type regular
 end
```

## IP addresses for self-originated traffic

On the FortiGate unit, there are a number of protocols and traffic that is specific to the internal workings of FortiOS. For many of these traffic sources, you can identify a specific port/IP address for this self-originating traffic. The following traffic can be configured to a specific port/IP address:

- SNMP
- Syslog
- alert email
- FortiManager connection IP
- FortiGuard services
- FortiAnalyzer logging
- NTP
- DNS
- Authorization requests such as RADIUS
- FSSO

Configuration of these services is performed in the CLI. In each instance, there is a command `set source-ip`. For example, to set the source IP of NTP to be on the DMZ1 port with an IP of 192.168.4.5, the commands are:

```
config system ntp
 set ntpsync enable
 set syncinterval 5
 set source-ip 192.168.4.5
end
```

To see which services are configured with source-ip settings, use the `get` command:

```
get system source-ip status
```

The output will appear similar to the sample below:

```
NTP: x.x.x.x
DNS: x.x.x.x
SNMP: x.x.x.x
Central Management: x.x.x.x
FortiGuard Updates (AV/IPS): x.x.x.x
FortiGuard Queries (WebFilter/SpamFilter): x.x.x.x
```

## Disk

To view the status and storage information of the local disk on your FortiGate unit, go to **System > Advanced**. The **DiskSettings** menu appears only on FortiGate units with an internal hard or flash disk.

### Formatting the disk

The internal disk of the FortiGate unit (if available) can be formatted by going to **System > Advanced** and selecting **Disk Settings**.

Formatting the disk will erase all data on it, including databases for antivirus and IPS; logs, quarantine files, and WAN optimization caches. The FortiGate unit requires a reboot once the disk has been formatted.

## Setting space quotas

If the FortiGate unit has an internal hard or flash disk, you can allocate the space on the disk for specific logging and archiving, and WAN optimization. By default, the space is used on an as required basis. As such, a disk can fill up with basic disk logging, leaving less potential space for quarantine.

By going to **System > Advanced**, you can select the **Edit** icon for **Logging and Archiving** and **WAN Optimization & Web Cache** and define the amount of space each log, archive and WAN optimization has on the disk.

## CLI Scripts

To upload bulk CLI commands and scripts, go to **System > Advanced**.

Scripts are text files containing CLI command sequences. Scripts can be used to deploy identical configurations to many devices. For example, if all of your devices use identical security policies, you can enter the commands required to create the security policies in a script, and then deploy the script to all the devices which should use those same settings.

Use a text editor such as Notepad or other application that creates simple text files. Enter the commands in sequence, with each line as one command, similar to examples throughout the FortiOS documentation set.

If you are using a FortiGate unit that is not remotely managed by a FortiManager unit or the FortiGuard Analysis and Management Service, the scripts you upload are executed and discarded. If you want to execute a script more than once, you must keep a copy on your management PC.

If your FortiGate unit is configured to use a FortiManager unit, you can upload your scripts to the FortiManager unit, and run them from any FortiGate unit configured to use the FortiManager unit. If you upload a script directly to a FortiGate unit, it is executed and discarded.

If your FortiGate unit is configured to use FortiGuard Analysis and Management Service, scripts you upload are executed and stored. You can run uploaded scripts from any FortiGate unit configured with your FortiGuard Analysis and Management Service account. The uploaded script files appear on the FortiGuard Analysis and Management Service portal web site.

## Uploading script files

After you have created a script file, you can then upload it through **System > Advanced**. When a script is uploaded, it is automatically executed.

Commands that require the FortiGate unit to reboot when entered in the command line will also force a reboot if included in a script.

### To execute a script

1. Go to **System > Advanced**.
2. Enable **Configuration Scripts**.
3. Select **Upload and Run a New Script** to locate the script file.
4. Select **Apply**.

If the FortiGate unit is not configured for remote management, or if it is configured to use a FortiManager unit, uploaded scripts are discarded after execution. Save script files to your management PC if you want to execute them again later.

If the FortiGate unit is configured to use the FortiGuard Analysis and Management Service, the script file is saved to the remote server for later reuse. You can view the script or run it from the FortiGuard Analysis and Management Service portal web site.

### Auto repeat of CLI commands

Occasionally there is a need to repeatedly run a diagnose command over a long period of time (like checking CPU or memory usage, or checking proxy health), Previously, this could only be done with external console connections. With FortiOS 5.4.0, this can be done in a script using the `interval` and `repeat` commands.

Scripts can be uploaded as a file from the CLI or GUI. To upload scripts from the GUI go to **System > Advanced > Configuration Scripts** and upload and run the script.

To configure the schedule and scripts, use the following syntax:

```
config system auto-script
 edit <ScriptName>
 set interval
 set repeat
 set script
 end
end
```

`interval` the interval time in seconds between instances of the script running.

`repeat` the number of times to repeat the running of the script. The value 0 is used to set an infinite number of repetitions.

`start` **select** `manual` to start the script manually or `auto` to start the script automatically

`script` the contents of the script.

This feature may not be available on all models as a hard drive is necessary to make use of it.

### CLI option to limit script output size

The release of FortiOS 5.6 includes a new CLI command `set output-size` limits the size of an auto script in megabytes and prevents the memory from being used up by the script's output.

#### CLI Syntax

```
config system auto-script
 edit <script name>
 set output-size <integer>
 next
end
```

Enter an integer value from 10 to 1024. Default is 10.

### Rejecting PING requests

The factory default configuration of your FortiGate unit allows the default external interface to respond to ping requests. Depending on the model of your FortiGate unit the actual name of this interface will vary. For the most secure operation, you should change the configuration of the external interface so that it does not respond to ping requests. Not responding to ping requests makes it more difficult for a potential attacker to detect your FortiGate unit from the Internet. One such potential threat are Denial of Service (DoS) attacks.

A FortiGate unit responds to ping requests if ping administrative access is enabled for that interface.

### To disable ping administrative access - web-based manager

1. Go to **System > Network > Interface**.
2. Choose the external interface and select **Edit**.
3. Clear the **Ping Administrative Access** check box.
4. Select **OK**.

In the CLI, when setting the allowaccess settings, by selecting the access types and not including the PING option, that option is then not selected. In this example, only HTTPS is selected.

### To disable ping administrative access - CLI

```
config system interface
 edit external
 set allowaccess https
 end
```

## Opening TCP 113

Although seemingly contrary to conventional wisdom of closing ports from hackers, this port, which is used for ident requests, should be opened.

Port 113 initially was used as an authentication port, and later defined as an identification port (see RFC 1413). Some servers may still use this port to help in identifying users or other servers and establish a connection. Because port 113 receives a lot of unsolicited traffic, many routers, including on the FortiGate unit, close this port.

The issue arises in that unsolicited requests are stopped by the FortiGate unit, which will send a response saying that the port is closed. In doing so, it also lets the requesting server know there is a device at the given address, and thus announcing its presence. By enabling traffic on port 113, requests will travel to this port, and will most likely, be ignored and never responded to.

By default, the ident port is closed. To open it, use the following CLI commands:

```
config system interface
 edit <port_name>
 set ident_accept enable
 end
```

You could also further use port forwarding to send the traffic to a non-existent IP address and thus never have a response packet sent.

## Obfuscate HTTP responses from SSL VPN

The FortiGate unit can obfuscate the HTTP responses from SSL VPN servers. By default this option is not enabled. To obfuscate HTTP headers, use the following CLI command:

```
config vpn ssl settings
 set url-obscuration {enable | disable}
end
```

## Blocking land attacks in Transparent mode

Enabling blocking land attacks allows BFD echo packets to pass through the FortiGate.

Since its a system settings option you can enable or disable blocking land attacks for individual VDOMs if your FortiGate is operating with multiple VDOMs.

Another reason to enable this feature would be if your FortiGate is blocking BFD echo packets that should be allowed to pass through the FortiGate. For example, a FortiGate operating in Transparent mode between two routers with a policy that allows all traffic may block BFD echo communication between the routers if blocking land attacks is disabled.

Use the following command to block land attacks and allow BFD echo packets. This option is disabled by default.

**Syntax**

```
config system settings
 set block-land-attack enable
end
```

# Chapter 29 - Traffic Shaping

## Traffic shaping

Welcome and thank you for selecting Fortinet products for your network protection.

With the ever-increasing demands on network systems for a number of protocols, including email, HTTP traffic both internally and externally to the internet, voice over IP, FTP, and more, slow traffic is becoming a reality. Important traffic may even be dropped or slowed to an unusable speed. Web traffic delays can result in a loss of revenue for businesses.

Traffic shaping attempts to normalize traffic peaks and bursts to prioritize certain flows over others. There is a physical limitation to the amount of data which can be buffered and to the length of time it can be buffered.

FortiGate units provide Quality of Service (QoS) by applying bandwidth limits and prioritization. Using traffic shaping, you can adjust how your FortiGate unit allocates resources to different traffic types to improve performance and stability of latency sensitive or bandwidth intensive network applications.

This chapter describes Quality of Service (QoS), traffic shaping, FortiGate traffic shaping algorithms, and includes configuration procedures for traffic shaping on FortiGate units.

This guide contains the following sections:

[The purpose of traffic shaping](#) describes traffic shaping theories and quality of service.

[Traffic shaping methods](#) lists different methods of applying traffic shaping within FortiOS, and explains how to use ToS and Differentiated Services.

[Examples](#) provides basic application scenarios for shapers.

[Troubleshooting traffic shaping](#) lists diagnose commands to use for determining if traffic shapers are working correctly.

## What's new in FortiOS 5.6

This chapter describes new traffic shaping features added to FortiOS 5.6.3.

### FortiOS 5.6.3

These features first appeared in FortiOS 5.6.3.

#### Support schedule on traffic shaping policy (450337)

In FortiOS 5.6, a new traffic "shaping-policy" feature was added, but it lacked the ability to apply different shaping profiles at different times. This feature addresses this issue by adding a "schedule" attribute to the shaping policy.

This feature is currently only available via the CLI, and you can use this feature to apply a reoccurring schedule to your traffic shaping policies. The default recurring schedule options available are **always** or **none**. You can also create new schedules or schedule groups under **Policy & Objects > Schedules**. This allows you to create custom recurring or one-time schedules that can then be applied to your traffic shaping policies using the commands below.

#### Syntax

```
config firewall shaping-policy
 edit <shaping policy ID>
 set schedule {always | none}
 end
```

## The purpose of traffic shaping

Traffic shaping, or traffic management, controls the bandwidth available and sets the priority of traffic processed by the policy to control the volume of traffic for a specific period (bandwidth throttling) or rate the traffic is sent (rate limiting).

Traffic shaping attempts to normalize traffic peaks and bursts to prioritize certain flows over others. But there is a physical limitation to the amount of data which can be buffered and to the length of time. Once these thresholds have been surpassed, frames and packets will be dropped, and sessions will be affected in other ways.

A basic traffic shaping approach is to prioritize certain traffic flows over other traffic whose potential loss is less disadvantageous. This would mean that you accept certain sacrifices in performance and stability on low-priority traffic, to increase or guarantee performance and stability to high-priority traffic.

If, for example, you are applying bandwidth limitations to certain flows, you must accept the fact that these sessions can be limited and therefore negatively impacted.

Note that traffic shaping is effective for normal IP traffic at normal traffic rates. Traffic shaping is not effective during periods when traffic exceeds the capacity of the FortiGate unit. Because packets must be received by the FortiGate unit before they are subject to traffic shaping, if the FortiGate unit cannot process all of the traffic it receives, then dropped packets, delays, and latency are likely to occur.

To ensure that traffic shaping is working at its best, make sure that the interface Ethernet statistics show no errors, collisions or buffer overruns.

Accelerated interfaces (NPx network processors and CE) affect traffic shaping. For more information, see the FortiOS [Hardware acceleration](#) guide.

## Quality of Service

Quality of Service (QoS) is the capability to adjust some quality aspects of your overall network traffic. This can include such techniques as priority-based queuing and traffic policing. Because bandwidth is finite and because some types of traffic are slow, jitter or packet loss sensitive, bandwidth intensive, or operation critical, QoS can be a useful tool for optimizing the performance of the various applications on your network.

Before implementing QoS, organizations should first identify the types of traffic that are important to the organization, the types of traffic that use high amounts of bandwidth, and the types of traffic that are sensitive to latency or packet loss.

For example, a company might want to guarantee sufficient bandwidth for revenue producing e-commerce traffic. They need to ensure that transactions can be completed and that clients do not experience service delays and interruptions. At the same time, the company may need to ensure low latency for voice over IP (VoIP) traffic used by sales and customer support, while traffic latency and bursts may be less critical to the success of other network applications such as long term, resumable file transfers. Many organizations discover that QoS is especially important for managing their voice and streaming multi-media traffic. These types of traffic can rapidly consume bandwidth and are sensitive to latency.

Discovering the needs and relative importance of each traffic type on your network will help you to design an appropriate overall approach, including how you will configure each available QoS component technique. Some organizations discover that they only need to configure bandwidth limits for some services. Other organizations

determine that they need to fully configure interface and security policy bandwidth limits for all services, and prioritize queuing of critical services relative to traffic rate.

You can implement QoS on FortiGate units using the following techniques:

<b>Traffic policing</b>	Drops packets that do not conform to bandwidth limitations.
<b>Traffic shaping</b>	Ensures that the traffic may consume bandwidth at least at the guaranteed rate by assigning a greater priority queue if the guarantee is not being met. Also ensures that the traffic cannot consume bandwidth greater than the maximum at any given instance in time. Flows greater than the maximum rate are subject to traffic policing.
<b>Queuing</b>	Transmits packets in order of their assigned priority queue for that physical interface. All traffic in a higher priority traffic queue must be completely transmitted before traffic in lower priority queues will be transmitted.

When deciding how to configure QoS techniques, it can be helpful to know when FortiGate units employ each technique in the overall traffic processing flow, and the considerations that arise from those mechanisms.

## Traffic policing

The FortiGate unit begins to process traffic as it arrives (ingress) and departs (egress) on an interface. In later phases of the network processing, such as enforcing maximum bandwidth use on sessions handled by a security policy, if the current rate for the destination interface or traffic regulated by that security policy is too high, the FortiGate unit may drop the packet. Time spent on prior processing, such as web filtering, decryption or IPS, is often wasted on packets that are not forwarded. This applies to VLAN interfaces and physical interfaces.

You can prevent this wasted effort on ingress by configuring the FortiGate unit to preemptively drop excess packets when they are received at the source interface, before most other traffic processing is performed:

```
config system interface
 edit <interface_name>
 set inbandwidth <rate_int>
 next
end
```

where <rate\_int> is the bandwidth limit in Kb/s. Excess packets will be dropped. If inbandwidth is 0, the rate is not limited.

A similar command is available that can be performed on egress as well using the CLI commands:

```
config system interface
 edit <interface_name>
 set outbandwidth <rate_int>
 next
end
```

As with ingress, setting the rate to 0 (zero) sets the rate to unlimited.

Rate limiting traffic accepted by the interface enables you to restrict incoming traffic to rates that, while no longer the full capacity of the interface, at the traffic shaping point in the processing are more likely to result in acceptable rates of outgoing traffic per destination interface or all security policies. This conserves FortiGate processing resources for those packets that are more likely to be viable completely to the point of egress.

Excessive traffic policing can degrade network performance rather than improve it. For more details on factors that affect traffic policing, see [Important considerations on page 3180](#).

NP6 interfaces on FortiGate devices don't fully support bandwidth limits. When you set the outbandwidth setting on an NP6 interface, the FortiGate implements a lower bandwidth limit than the one that you configure. The inbandwidth setting has no effect on an NP6 interface, unless you disable NP offloading for the traffic on that interface.

## Bandwidth guarantee, limit, and priority interactions

After packet acceptance, the FortiGate unit classifies traffic and may apply traffic policing at additional points during processing. It may also apply QoS techniques, such as prioritization and traffic shaping. Traffic shaping consists of a mixture of traffic policing to enforce bandwidth limits, and priority queue adjustment to assist packets in achieving the guaranteed rate.

If you have configured prioritization, the FortiGate unit prioritizes egressing packets by distributing them among FIFO (first in, first out) queues associated with each possible priority number. Each physical interface has six priority queues. Virtual interfaces do not have their own queues, and instead use the priority queues of the physical interface to which they are bound.

Each physical interface's six queues are queue 0 to queue 5, where queue 0 is the highest priority queue. However, for the reasons described below, you may observe that your traffic uses only a subset of those six queues. Some traffic may always use a certain queue number. Some queuing may vary by the packet rate or mixture of services. Some queue numbers may be used only by through traffic for which you have configured traffic shaping in the security policy that applies to that traffic session. For example:

- Administrative access traffic will always use queue 0.
- Traffic matching security policies **without** traffic shaping may use queue 0, queue 1, or queue 2. Which queue will be used depends on the priority value you have configured for packets with that ToS (type of service) bit value, if you have configured ToS-based priorities.
- Traffic matching security policies **with** traffic shaping may use any queue. Which queue will be used depends on whether the packet rate is currently below the guaranteed bandwidth (queue 0), or above the guaranteed bandwidth. Packets at rates greater than the maximum bandwidth limit are dropped.
- If the global tos-based-priority is low (3), the priority in a traffic-shaper is medium (2) and a packet flows through a policy that refers to the shaper, the packet will be assigned the priority defined by the shaper, in this case medium (2).

Prioritization and traffic shaping behavior varies by your configuration, the service types and traffic volumes, and by whether the traffic is through traffic, or the traffic originates from or terminates at the FortiGate unit itself.

## FortiGate traffic

Security Policies do not apply to Administrative access to the FortiGate through HTTPS or SSH, or IPsec tunnel negotiations, and therefore FortiGate units do not apply traffic shaping. Such traffic also uses the highest priority queue, queue 0. In other words:

packet priority = 0

Exceptions to this rule include traffic types that are connections related to a session governed by a security policy.

For example, if you have enabled scanning by FortiGuard antivirus, traffic from the sender technically terminates at the FortiGate proxy that scans that traffic type; the FortiGate unit initiates a second connection that transmits scanned content to its destination. Because the second connection's traffic is technically originating from the

FortiGate proxy and therefore the FortiGate unit itself, it uses the highest priority queue, queue 0. However, this connection is logically associated with through traffic, and is therefore subject to possible bandwidth enforcement and guarantees in its governing security policy. In this way, it behaves partly like other through traffic.

## Through traffic

For traffic passing through the FortiGate unit, the method a FortiGate unit uses to determine the priority queue varies by whether Traffic Shaping is enabled or not. Packets may or may not use a priority queue directly or indirectly derived from the type of service (ToS) bit — sometimes used instead with differentiated services — in the packet's IP header.

If Traffic Shaping is not applied to a security policy, the FortiGate unit neither limits nor guarantees bandwidth, and traffic for that session uses the priority queue determined directly by matching the ToS bit in its header with your configured values:

```
config system global
set traffic-priority tos
set traffic-priority-level {high | low | medium}
end
```

or, if you have configured a priority specifically for that ToS bit value:

```
config system tos-based-priority
edit <id_int>
set tos [0-15]
set priority {high | low | medium}
end
```

where `tos` is the value of the ToS bit in the packet's IP header, and `high` has a priority value of 0 and `low` is 2. Priority values configured in the second location will override the global ToS-based priority. In other words:

packet priority = ToS-based priority

For example, you might specify that packets with a ToS bit value of 2 should use queue 0, the highest priority queue:

```
config system tos-based-priority
edit 15
set tos 2
set priority high
next
end
```

If traffic shaping is applied to a security policy using a shared shaper, the FortiGate unit may subject packets to traffic policing or priority queue increases in an effort to meet bandwidth guarantees configured in the shaper.

For example, you might create a Shared Shaper, where `high` has a priority value of 1 and `low` is 3, and `<rate>` is the bandwidth limit in kilobits per second:

```
config firewall shaper traffic-shaper
edit <shaper_name>
...
set priority {high | medium | low}
set maximum-bandwidth <rate>
set guaranteed-bandwidth <rate>
end
```

Note that it is also necessary to create a traffic shaping policy and set it to use the shared shaper:

```
config firewall shaping-policy
 edit <policy ID>
 ...
 set srcaddr <source address>
 set dstaddr <destination address>
 set service <service name>
 set dstintf <destination interface list>
 set traffic-shaper <shaper_name>
end
```

The diagram below illustrates traffic queuing as the packet rate increases.

### Traffic queuing as the packet rate increases

- If the current packet rate is less than Guaranteed Bandwidth, packets use priority queue 0:

packet priority = 0

- If the current packet rate is greater than Guaranteed Bandwidth but less than Maximum Bandwidth, the FortiGate unit assigns a priority queue by adding the numerical value of the security policy-based priority, where the value of `High` is 1, and `Low` is 3, with the numerical value of the ToS-based priority, where `high` has a priority value of 0 and `low` is 2. Because the two values are added, depending on the configured ToS-based priorities, packets in this category could use queues from queue 1 to queue 5. In other words:

packet priority = ToS-based priority + security policy-based priority

- If you have enabled Traffic Shaping in the security policy, and the security policy's Traffic Priority is `Low` (value 3), and the priority normally applied to packets with that ToS bit is `medium` (value 1), then packets have a total packet priority of 4, and use priority queue 4.
- If the current packet rate exceeds Maximum Bandwidth, excess packets are dropped.

## Calculation and regulation of packet rates

Packet rates specified for Maximum Bandwidth or Guaranteed Bandwidth are:

$$\text{rate} = \text{amount} / \text{time}$$

where rate is expressed in kilobits per second (Kb/s).

Burst size at any given instant cannot exceed the amount configured in Maximum Bandwidth. Packets in excess are dropped. Packets deduct from the amount of bandwidth available to subsequent packets and available bandwidth regenerates at a fixed rate. As a result, bandwidth available to a given packet may be less than the configured rate, down to a minimum of 0 Kb/s.

Rate calculation and behavior can alternatively be described using the token bucket metaphor, where:

- A traffic flow has an associated bucket, which represents burst size bounds, and is the size of your configured bandwidth limit.
- The bucket receives tokens, which represent available bandwidth, at the fixed configured rate.
- As time passes, tokens are added to the bucket, up to the capacity of the bucket; excess tokens are discarded.
- When a packet arrives, the packet must deduct bandwidth tokens from the bucket equal to its packet size in order to egress.
- Packets cannot egress if there are insufficient tokens to pay for its egress; these nonconforming packets are dropped.

Bursts are not redistributed over a longer interval, so bursts are propagated rather than smoothed, although their peak size is limited.

Maximum burst size is the capacity of the bucket (the configured bandwidth limit); actual size varies by the current number of tokens in the bucket, which may be less than bucket capacity, due to deductions from previous packets and the fixed rate at which tokens accumulate. A depleted bucket refills at the rate of your configured bandwidth limit. Bursts cannot borrow tokens from other time intervals. This behavior is illustrated in the graph below.

### Bursts and bandwidth limits over time

By limiting traffic peaks and token regeneration in this way, the available bandwidth at any given moment may be less than bucket capacity, but your limit on the total amount per time interval is ensured. Total bandwidth use during each interval of 1 second is at most the integral of your configured rate.

You may observe that external clients, such as FTP or BitTorrent clients, initially report rates between Maximum Bandwidth and twice that of Maximum Bandwidth, depending on the size of their initial burst. This is notably so when a connection is initiated following a period of no network activity. The apparent discrepancy in rates is caused by a difference in perspective when delimiting time intervals. A burst from the client may initially consume all tokens in the bucket, and before the end of 1 second, as the bucket regenerates, be allowed to consume almost another bucket's worth of bandwidth. From the perspective of the client, this constitutes one time interval. From the perspective of the FortiGate unit, however, the bucket cannot accumulate tokens while full; therefore, the time interval for token regeneration begins **after** the initial burst, and does not contain the burst. These different points of reference result in an initial discrepancy equal to the size of the burst — the client's rate contains it, but the FortiGate unit's rate does not. If the connection is sustained to its limit and time progresses over an increasing number of intervals, however, this discrepancy decreases in importance relative to the bandwidth total, and the client's reported rate will eventually approach that of the FortiGate unit's configured rate limit.

For example, your Maximum Bandwidth might be 50 Kb/s and there has been no network activity for one or more seconds. The bucket is full. A burst from an FTP client immediately consumes 50 Kb. Because the bucket completely regenerates over 1 second, by the time almost another 1 second has elapsed from the initial burst, traffic can consume another 49.999 Kb, for a total of 99.999 Kb between the two points in time. From the vantage point of an external FTP client regulated by this bandwidth limit, it therefore initially appears that the bandwidth limit is 99.999 Kb/s, almost twice the configured limit of 50 Kb/s. However, bucket capacity only regenerates at your configured rate of 50 Kb/s, and so the connection can only consume a maximum of 50 Kb during each second thereafter. The result is that as bandwidth consumption is averaged over an increasing number of time

intervals, each of which are limited to 50 Kb/s, the effects of the first interval's doubled bandwidth size diminishes proportionately, and the client's reported rate eventually approaches your configured rate limit. The effects are shown in the table below.

#### Effects of a 50 Kb/s limit on client reported rates

Total size transferred (Kb)	Time (s)	Rate reported by client (Kb/s)
99.999 (50 + 49.999)	1	99.999
149.999	2	74.999
199.999	3	66.666
249.999	4	62.499
299.999	5	59.998
349.999	6	58.333
...	...	...

Guaranteed Bandwidth can also be described using a token bucket metaphor. However, because this feature attempts to achieve or exceed a rate rather than limit it, the FortiGate unit does not discard non-conforming packets, as it does for Maximum Bandwidth; instead, when the flow does not achieve the rate, the FortiGate unit increases the packets' priority queue, in an effort to increase the rate.

Guaranteed and maximum bandwidth rates apply to the bidirectional total for all sessions controlled by the security policy. For example, an FTP connection may entail two separate connections for the data and control portion of the session; some packets may be reply traffic rather than initiating traffic. All packets for both connections are counted when calculating the packet rate for comparison with the guaranteed and maximum bandwidth rate.

## Important considerations

By implementing QoS, you trade some performance and/or stability from traffic X by discarding packets or introducing latency in order to improve performance and stability of traffic Y. The best traffic shaping configuration for your network will balance the needs of each traffic flow by considering not only the needs of your particular organization, but also the resiliency and other characteristics of each particular service.

For example, you may find that web browsing traffic is both more resistant to interruptions or latency and less business critical than UDP or VoIP traffic, and so you might implement less restrictive QoS measures on UDP or VoIP traffic than on HTTP traffic.

An appropriate QoS configuration will also take into account the physical limits of your network devices, and the interactions of the aforementioned QoS mechanisms, described in [Bandwidth guarantee, limit, and priority interactions on page 3175](#).

You may choose to configure QoS differently based upon the hardware limits of your network and FortiGate unit. Traffic shaping may be less beneficial in extremely high-volume situations where traffic exceeds a network interface's or your FortiGate model's overall physical capacity. A FortiGate unit must have enough resources, such as memory and processing power, to process all traffic it receives, and to process it at the required rate; if it

does not have this capacity, then dropped packets and increased latency are likely to occur. For example, if the total amount of memory available for queuing on a physical interface is frequently exceeded by your network's typical packet rates, frames and packets must be dropped. In such a situation, you might choose to implement QoS using a higher model FortiGate unit, or to configure an incoming bandwidth limit on each interface.

Incorrect traffic shaping configurations can actually further degrade certain network flows, because excessive discarding of packets or increased latency beyond points that can be gracefully handled by that protocol can create additional overhead at upper layers of the network, which may be attempting to recover from these errors. For example, a configuration might be too restrictive on the bandwidth accepted by an interface, and may therefore drop too many packets, resulting in the inability to complete or maintain a SIP call.

To optimize traffic shaping performance, first ensure that the network interface's Ethernet statistics are clean of errors, collisions, or buffer overruns. To check the interface, enter the following diagnose command to see the traffic statistics:

```
diagnose hardware deviceinfo nic <port_name>
```

If these are not clean, adjust FortiGate unit and settings of routers or other network devices that are connected to the FortiGate unit. For more information, see [Troubleshooting traffic shaping on page 3216](#).

Once Ethernet statistics are clean, you may want to use only some of the available FortiGate QoS techniques, or configure them differently, based upon the nature of FortiGate QoS mechanisms described in [Bandwidth guarantee, limit, and priority interactions on page 3175](#).

Configuration considerations include:

- For maximum bandwidth limits, ensuring that bandwidth limits at the source interface and/or the security policy are not too low, which can cause the FortiGate unit to discard an excessive number of packets.
- For prioritization, considering the ratios of how packets are distributed between available queues, and which queue is used by which types of services. If you assign most packets to the same priority queue, it negates the effects of configuring prioritization. If you assign many high bandwidth services to high priority queues, lower priority queues may be starved for bandwidth and experience increased or indefinite latency. For example, you may want to prioritize a latency-sensitive service such as SIP over a bandwidth-intensive service such as FTP. Consider also that bandwidth guarantees can affect the queue distribution, assigning packets to queue 0 instead of their typical queue in high-volume situations.
- You may or may not want to guarantee bandwidth, because it causes the FortiGate unit to assign packets to queue 0 if the guaranteed packet rate is not currently being met. Comparing queuing behavior for lower-bandwidth and higher-bandwidth situations, this would mean that effects of prioritization only become visible as traffic volumes rise and exceed their guarantees. Because of this, you might want only some services to use bandwidth guarantees, to avoid the possibility that in high-volume situations all traffic uses the same queue, thereby negating the effects of configuring prioritization.
- For prioritization, configure prioritization for all through traffic. You may want to configure prioritization by either ToS-based priority or security policy priority, but not both. This simplifies analysis and troubleshooting.

Traffic subject to both security policy and ToS-based priorities will use a combined priority from both of those parts of the configuration, while traffic subject to only one of the prioritization methods will use only that priority. If you configure both methods, or if you configure either method for only a subset of your traffic, packets for which a combined priority applies will frequently receive a lower priority queue than packets for which you have only configured one priority method, or for which you have not configured prioritization.

For example, if both ToS-based priority and security policy priority both dictate that a packet should receive a "medium" priority, in the absence of bandwidth guarantees, a packet will use queue 3, while if only ToS-based priority had been configured, the packet would have used queue 1, and if only security policy-based priority had

been configured, the packet would have used queue 2. If no prioritization had been configured at all, the packet would have used queue 0.

For example alternative QoS implementations that illustrate these considerations, see [Examples on page 3205](#).

## Traffic shaping methods

In FortiOS, there are three types of traffic shaping configurations. Each has a specific function, and all can be used together in varying configurations. Policy shaping enables you to define the maximum bandwidth and the guaranteed bandwidth set for a security policy. Per-IP shaping enables you to define traffic control on a more granular level. Application traffic shaping goes further, enabling traffic controls on specific applications or application groupings.

This chapter describes the types of traffic shapers and how to configure them in the web-based manager and the CLI.

To configure traffic shaping in the web-based manager, you must enable the **Traffic Shaping** feature under System > Feature Visibility.

---

## Traffic shaping options

When configuring traffic shaping for your network, there are three different methods to control the flow of network traffic to ensure that the desired traffic gets through while also limiting bandwidth for less important or bandwidth consuming traffic. The three methods are the following:

- **Shared policy shaping** - bandwidth management by security policies
- **Per-IP shaping** - bandwidth management by user IP addresses
- **Application control shaping** - bandwidth management by application

Shapers allow you to define how traffic will flow by setting the traffic priority, bandwidth and DSCP options. Shared policy shapers and Per-IP shapers are created under Policy & Objects > Traffic Shapers.

Traffic Shapers are then enabled within the traffic shaping policy, under Policy & Objects > Traffic Shaping Policy.

Application control shaping can be applied to any traffic shaping policy, under Policy & Objects > Traffic Shaping Policy. You can control traffic by application category, application, and/or URL category.

To apply application control shaping, you must first enable application control at the policy level, under Policy & Objects > IPv4 Policy.

---

Traffic shaping policies allow you to apply traffic shaping measures to any traffic matching your criteria. The criteria must specify a source, a destination, a service, and the outgoing interface. Also, at least one type of shaper must be enabled to create a traffic shaping policy.

The three different traffic shaping options offered by the FortiGate unit can be enabled at the same time within a single traffic shaping policy. Generally, the hierarchy for traffic shapers in FortiOS is:

- Application control shaper
- Shared policy shaper
- Per-IP shaper

Within this hierarchy, if an application control list has a traffic shaper defined, it will always have precedence over any other policy shaper. For example, the Facebook application control example shown in [Application control shaping on page 3192](#) will supersede any security policy enabled traffic shapers. While the Facebook application may reach its maximum bandwidth, the user can still have the bandwidth room available from the Shared Shaper and, if enabled, the Per-IP shaper.

Equally, any security policy shared shaper will have precedence over any per-IP shaper. However, traffic that exceeds any of these shapers will be dropped. For example, the policy shaper will take effect first, however, if the per-IP shaper limit is reached first, then traffic for that user will be dropped even if the shared shaper limit for the policy has not been exceeded.

## Shared policy shaping

Traffic shaping by security policy enables you to control the maximum and/or guaranteed throughput for any security policies specified in the Traffic Shaping Policy.

When configuring a shaper, you can select to apply the bandwidth shaping per policy or for all policies. Depending on your selection, the FortiGate unit will apply the shaping rules differently.

By default shared shapers apply shaping evenly to all policies using it. For **Per policy** and **All policies using this shaper** options to appear in the web-based interface, you must first enable it in the CLI. Go to Policy & Objects > Traffic Shapers and right-click on the shaper to edit it in the CLI. Enter:

```
set per-policy enable
end
```

### Per policy

When selecting a shared shaper to be **per policy**, the FortiGate unit will apply the shaping rules defined to each security policy individually.

For example, if a shaper is set to per policy with a maximum bandwidth of 1000 Kb/s and applied to four security policies, each policy has the same maximum bandwidth of 1000 Kb/s.

Per policy traffic shaping is compatible with client/server (active-passive) transparent mode WAN optimization rules. Traffic shaping is ignored for peer-to-peer WAN optimization and for client/server WAN optimization not operating in transparent mode.

### For all policies using a shaper

When selecting a shared shaper to be for all policies -**All Policies using this shaper** - the FortiGate unit applies the shaping rules to all policies using the same shaper. For example, the shaper is set to be per policy with a maximum bandwidth of 1000 Kb/s. There are four security policies monitoring traffic through the FortiGate unit. All four have the shaper enabled. Each security policy must share the defined 1000 Kb/s, and is set on a first come, first served basis. For example, if policy 1 uses 800 Kb/s, the remaining three must share 200 Kb/s. As policy 1 uses less bandwidth, it is opened up to the other policies to use as required. Once used, any other policies will encounter latency until free bandwidth opens from a policy currently in use.

## Maximum and guaranteed bandwidth

The maximum bandwidth instructs the security policy what the largest amount of traffic allowed using the policy. Depending on the service or the users included for the security policy, this number can provide a larger or smaller throughput depending on the priority you set for the shaper.

The **Maximum Bandwidth** can be set to a value of between 1 and 16776000 kbit/s. The Web-Based Manager gives an error if any value outside of this range is used, but in the CLI a value of 0 can be entered. Setting the maximum bandwidth to 0 provides unlimited bandwidth.

The guaranteed bandwidth ensures there is a consistent reserved bandwidth available for a given service or user. When setting the guaranteed bandwidth, ensure that the value is significantly less than the bandwidth capacity of the interface, otherwise no other traffic will pass through the interface or very little an potentially causing unwanted latency.

## Traffic priority

Select a Traffic Priority of high, medium or low, so the FortiGate unit manages the relative priorities of different types of traffic. For example, a policy for connecting to a secure web server that needed to support e-commerce traffic should be assigned a high traffic priority. Less important services should be assigned a low priority. The firewall provides bandwidth to low-priority connections only when bandwidth is not needed for high-priority connections.

Be sure to enable traffic shaping on all security policies. If you do not apply any traffic shaping rule to a policy, the policy is set to high priority by default. Distribute security policies over all three priority queues.

## Traffic shaping policy order

The traffic shaping policies must also be placed in the correct order in the traffic shaping policy list page to get the desired results. It is necessary to arrange your traffic shaping policies into a sequence that places your more granular policies above general internet access policies. For example, you would place any policies with application control shaping at the top of the traffic shaping policy list. More general traffic shaping policies with shared policy shapers and/or Per-IP shapers would follow.

The policy list page is located under Policy & Objects > Traffic Shaping Policy. You can change the order of your policies by selecting the far left column to move the policy up or down. Make sure that the **Seq.#** column is shown on your menu to easily verify a policy's position in the sequence.

The following example illustrates how to order your policies. The high priority VoIP traffic shaping policy is placed at the top of the list, followed by restrictive policies to control streaming media, and your general internet access policy is placed last.

Seq.#	Source Address	Destination	Outgoing Interface	Shared Shaper	Reverse Shaper	Service	Application	Application Category
IPv4 (1 - 4)								
1	• all	• all	• wan1	guarantee-100kbps	guarantee-100kbps	• ALL	• SIP	• VoIP
2	• all	• all	• wan1	limited_bandwidth	limited_bandwidth	• ALL	• Vimeo • YouTube	• Video/Audio
3	• all	• all	• wan1	high-priority	high-priority	• ALL		

## Traffic Shaping Policy Configuration Settings

To configure a traffic shaping policy go to Policy & Objects > Traffic Shaping Policy and select the **Create New** "Plus" sign to create a new traffic shaping policy.

Set the "**Matching Criteria**" to the default options shown below or specify the criteria so that it matches a specific security policy.

<b>Source</b>	<b>*all</b> (default)
<b>Destination</b>	<b>*all</b> (default)
<b>Service</b>	<b>*ALL</b> (default)
<b>Application Category</b>	- Choose an application category to apply shaping to a specific category of applications. For example, P2P, Social.Media, or VoIP.
<b>Application</b>	- Choose an application to specify which applications you wish to apply traffic shaping to. For example, YouTube, Vimeo, or Facebook.
<b>URL Category</b>	- Choose a URL category to block a subset of applications. For example, potentially liable websites, security risks, or bandwidth consuming services.

Set **Apply shaper** to the following:

<b>Outgoing Interface</b>	<b>*any</b> (Set this to the external interface you wish to apply shaping to. For example, wan1 is often used.)
<b>Shared Shaper</b>	Choose one of the default shared shapers: guarantee-100kbps, high-priority, medium-priority, low-priority, shared-1M-pipe or create your own under Policy & Objects > Traffic Shapers. Shared Shapers share the allotted bandwidth with any security policies using them (unless they are set to per-policy in the CLI). This affects uploads or outbound traffic.
<b>Reverse Shaper</b>	Choose one of the default shared shapers: guarantee-100kbps, high-priority, medium-priority, low-priority, shared-1M-pipe, or create your own under Policy & Objects > Traffic Shapers. This affects downloads or inbound traffic.
<b>Per-IP Shaper</b>	Enable a Per-IP Shaper if you want to apply shaping by bandwidth management by user IP addresses. Shapers are created under Policy & Objects > Traffic Shapers. Per-IP shapers affect downloads and uploads.
<b>Enable this policy</b>	Policies are enabled by default, but if you wish to disable a traffic shaping policy de-select it here.

**To create the traffic shaping policy - CLI:**

```
config firewall shaping-policy
edit <shaping policy ID>
set srcaddr <source address>
```

```

set dstaddr <destination address>
set service <service name>
set schedule {always | none}
application <application name>
app-category <application category ID list>
url-category <URL category ID list>
dstintf <destination interface list>
traffic-shaper <shared shaper name>
traffic-shaper-reverse <reverse traffic shaper name>
per-ip-shaper <per IP shaper name>
end

```

## VLAN, VDOM and virtual interfaces

Policy-based traffic shaping does not use queues directly. It shapes the traffic and if the packet is allowed by the security policy, then a priority is assigned. That priority controls what queue the packet will be put in upon egress. VLANs, VDOMs, aggregate ports and other virtual devices do not have queues and as such, traffic is sent directly to the underlying physical device where it is queued and affected by the physical ports. This is also the case with IPsec connections.

## Shared traffic shaper configuration settings

To configure a shared traffic shaper go to **Policy & Objects > Traffic Shapers** and select the **Create New** “Plus” sign to create a new traffic shaper.

<b>Type</b>	Select <b>Shared</b> .
<b>Name</b>	Enter a name for the traffic shaper.
<b>Apply Shaper</b>	<p>When selecting a shaper to be <b>Per Policy</b>, the FortiGate unit will apply the shaping rules defined to each security policy individually. For example, if a shaper is set to per policy, with a maximum bandwidth of 1000 Kb/s, any security policies that have that shaper enabled will get 1000 Kb/s of bandwidth each.</p> <p>When selecting a shaper to be for all policies - <b>For All Policies Using This Shaper</b> - the FortiGate unit applies the shaping rules to all policies using the same shaper. For example, the shaper is set to be per policy with a maximum bandwidth of 1000 Kb/s. There are four security policies monitoring traffic through the FortiGate unit. All four have the shaper enabled. Each security policy must share the defined 1000 Kb/s, and is set on a first come, first served basis. For example, if policy 1 uses 800 Kb/s, the remaining three must share 200 Kb/s. As policy 1 uses less bandwidth, that open bandwidth becomes available to the other policies to use as required. Once used, any other policies will encounter latency until free bandwidth opens from a policy currently in use.</p>

<b>Traffic Priority</b>	<p>Select level of importance <b>Priority</b> so the FortiGate unit manages the relative priorities of different types of traffic. For example, a policy for connecting to a secure web server needed to support e-commerce traffic should be assigned a high traffic priority. Less important services should be assigned a low priority.</p> <p>If you do not apply any traffic shaping priority, the priority is set to high priority by default.</p>
<b>Maximum Bandwidth</b>	<p>The maximum bandwidth instructs the security policy what the largest amount of traffic allowed using the policy. Depending on the service or the users included for the security policy, this number can provide a larger or smaller throughput depending on the priority you set for the shaper.</p> <p>Setting <b>Maximum Bandwidth</b> to 0 (zero) provides unlimited bandwidth.</p>
<b>Guaranteed Bandwidth</b>	<p>The guaranteed bandwidth ensures that a consistent reserved bandwidth is available for a given service or user. Ensure that you set the bandwidth to a value that is significantly less than the bandwidth capacity of the interface. Otherwise little to no traffic will pass through the interface and potentially cause unwanted latency.</p> <p>Setting <b>Guaranteed Bandwidth</b> to 0 (zero) provides unlimited bandwidth.</p>
<b>DSCP</b>	<p>Enter the number for the DSCP value. You can use the FortiGate Differentiated Services feature to change the DSCP (Differentiated Services Code Point) value for all packets accepted by a policy. The network can use these DSCP values to classify, mark, shape, and police traffic, and to perform intelligent queuing. DSCP features are applied to traffic by configuring the routers on your network to apply different service levels to packets depending on the DSCP value of the packet. For more information, see <a href="#">Traffic shaping methods</a>.</p>

### Shared Shaper Per Policy Example

The following steps creates a Per Policy traffic shaper called "Throughput" with a maximum traffic amount of 720,000 Kb/s, and a guaranteed traffic of 150,000 Kb/s with a high traffic priority.

#### To create the shared shaper - web-based manager:

1. Go to **Policy & Objects > Traffic Shapers** and select the **Create New** "Plus" sign.
2. Set the **Type** to **Shared**.
3. Enter the **Name** *Throughput*.
4. Set the **Apply shaper** field to **Per Policy**.

By default shared shapers apply shaping evenly to all policies using it. For **Per policy** and **All policies using this shaper** options to appear in the web-based interface, you must first enable it in the CLI. Go to Policy & Objects > Traffic Shapers and right-click on the shaper to edit it in the CLI. Enter:

```
set per-policy enable
end
```

5. Set the **Traffic Priority** to **High**.
6. Select the **Maximum Bandwidth** check box and enter the value 150000.
7. Select the **Guaranteed Bandwidth** check box and enter the value 120000.
8. Select **OK**.

#### To create the shared shaper - CLI:

```
config firewall shaper traffic-shaper
edit Throughput
set per-policy enable
set maximum-bandwidth 150000
set guaranteed-bandwidth 120000
set priority high
end
```

## Per-IP shaping

Traffic shaping by IP enables you to apply traffic shaping to all source IP addresses in the security policy. As well as controlling the maximum bandwidth users of a selected policy, you can also define the maximum number of concurrent sessions.

Per-IP traffic shaping enables you limit the behavior of every member of a policy to avoid one user from using all the available bandwidth - it now is shared within a group equally. Using a per-IP shaper avoids having to create multiple policies for every user you want to apply a shaper. Per-IP traffic shaping is not supported over NP2 interfaces.

### Per-IP traffic shaping configuration settings

To configure per-IP traffic shaping go to **Policy & Objects > Traffic Shapers > Per-IP** and select the **Create New** "Plus" sign.

<b>Type</b>	Select <b>Per-IP</b> .
<b>Name</b>	Enter a name for the per-IP traffic shaper.
<b>Maximum Bandwidth</b>	<p>The maximum bandwidth instructs the security policy what the largest amount of traffic allowed using the policy. Depending on the service or the users included for the security policy, this number can provide a larger or smaller throughput depending on the priority you set for the shaper.</p> <p>Setting <b>Maximum Bandwidth</b> to 0 (zero) provides unlimited bandwidth.</p>

<b>Maximum Concurrent Connections</b>	Enter the maximum allowed concurrent connection.
<b>Forward DSCP Reverse DSCP</b>	Enter the number for the DSCP value. You can use the FortiGate Differentiated Services feature to change the DSCP (Differentiated Services Code Point) value for all packets accepted by a policy. The network can use these DSCP values to classify, mark, shape, and police traffic, and to perform intelligent queuing. DSCP features are applied to traffic by configuring the routers on your network to apply different service levels to packets depending on the DSCP value of the packet. For more information, see <a href="#">Traffic shaping methods</a> .

### Example

The following steps create a Per-IP traffic shaper called “Accounting” with a maximum traffic amount of 720,000 Kb/s, and the number of concurrent sessions of 200.

#### To create the shared shaper - web-based manager:

1. Go to **Policy & Objects > Traffic Shapers** and select the **Create New** “Plus” Icon.
2. Set the **Type** to **Per-IP**.
3. Enter the **Name** *Accounting*.
4. Enable the **Maximum Bandwidth** and enter the value *720000*.
5. Enable the **Maximum Concurrent Sessions** and enter the value *200*.
6. Select **OK**.

#### To create the shared shaper - CLI:

```
config firewall shaper per-ip-shaper
edit Accounting
set max100-bandwidth 720000
set max-concurrent-session 200
end
```

### Adding a Per-IP traffic shaper to a traffic shaping policy

Per-IP traffic shaping is supported by IPv6 security policies. You can add any Per-IP traffic shaper to an IPv6 security policy in the CLI.

### Example

The following steps show you how to add an existing Per-IP traffic shaper to an IPv6 security policy. Make sure that you have already created a Per-IP traffic shaper under Policy & Objects > Traffic Shapers.

#### To add a Per-IP traffic shaper to an IPv6 security policy - web-based manager:

1. Go to **Policy & Objects > IPv6 Policy** and click the **Create New** “Plus” icon to create an internet access policy.
2. Set the following:

<b>Name</b>	Enter a descriptive name.
<b>Incoming Interface</b>	Internal
<b>Source address</b>	All
<b>Outgoing interface</b>	wan1
<b>Destination address</b>	all
<b>Schedule</b>	Always
<b>Service</b>	Any
<b>Action</b>	Accept

3. Select **OK**.
4. Go to Policy & Objects > Traffic Shaping Policy and the **Create New** “Plus” icon to create a new traffic shaping policy.
5. To apply your traffic shaping policy to the security policy you created earlier set the **Matching Criteria** to the following:

<b>Source</b>	all
<b>Destination address</b>	all
<b>Service</b>	ALL
<b>Application Category</b>	-
<b>Application</b>	-
<b>URL Category</b>	-

6. Under **Apply shaper**, set the following:

<b>Outgoing interface</b>	any (The outgoing interface should match the outgoing interface of the security policy you wish to apply shaping to.)
<b>Shared Shaper</b>	-
<b>Reverse Shaper</b>	-
<b>Per-IP Shaper</b>	Enable <b>Per-IP Shaper</b> and select your shaper from the dropdown menu.
<b>Enable this policy</b>	Enable this policy.

7. Select **OK**.
8. On the policy list page, move the Per-IP Shaper to the top of the list by clicking on the far left column to drag and drop it.

There are two methods to configure traffic shaping in the CLI. You can add a Per-IP shaper directly to an IPv6 security policy, or you can add a Per-IP shaper to a traffic shaping policy. The second method will allow you to apply traffic shaping based on the interface and can therefore affect multiple security policies easily. The first method requires that you enable traffic shaping individually in ALL policies using the same two interfaces.

#### To add a Per-IP traffic shaper to an IPv6 security policy- CLI:

```
config firewall policy6
 edit <security policy ID number>
 set per-ip-shaper <per IP shaper name>
 end
```

#### To add a Per-IP traffic shaper to an IPv6 traffic shaping policy -CLI:

```
config firewall shaping-policy
 edit 1 <security policy ID number>
 set ip-version 6
 set srcaddr <source address>
 set dstaddr <destination address>
 set service <service name>
 set dstintf <outgoing interface>
 set per-ip-shaper <per IP shaper name>
 end
```

## Application control shaping

Traffic shaping is also possible for specific applications, too. Application control shaping works in conjunction with a Shared Shaper or Per-IP Shaper. You must create a shaper with the bandwidth settings you would like to enforce or edit one of the predefined shapers in the Policy & Objects > Traffic Shapers menu.

Traffic shaping policies allow you to enable these shapers and configure application control options. In the traffic shaping policy, you can set an **Application Category**, **Application**, and **URL Category**. You must also specify which security policies to apply your shaper to by setting the **Matching Criteria**. You can create a traffic shaping policy in the Policy & Objects > Traffic Shaping Policy section.

For application control shaping to work, application control must be enabled in a security policy, through Policy & Objects > IPv4 Policy or Policy & Objects > IPv6 Policy under **Security Profiles**.

Also, application control shaping will only affect applications that are set to pass in the Security Profiles > Application Control menu.

For more information on application control, see the FortiOS [Security profiles](#) Guide.

## Example

This example sets the traffic shaping definition for Facebook to a medium priority, a default traffic shaper.

#### To add traffic shaping for Facebook - web-based manager:

1. Go to Policy & Objects > IPv4 Policy to create a general Internet access security policy.
2. Select the **Create New** "Plus" icon in the upper right corner of the screen to create a new security policy (or edit an

existing Internet access policy).

3. Set the following to enable application control within a security policy:

<b>Name</b>	<Enter a descriptive name.>
<b>Incoming Interface</b>	Internal
<b>Source address</b>	All
<b>Outgoing interface</b>	wan1
<b>Destination address</b>	all
<b>Schedule</b>	Always
<b>Service</b>	Any
<b>Action</b>	Accept
<b>Application Control</b>	Under Security Profiles, enable <b>Application Control</b> and select the default application control profile.

4. Select **OK**.
5. Go to Policy & Objects > Traffic Shaping Policy and the **Create New** “Plus” icon to create a new traffic shaping policy.
6. To apply your traffic shaping policy to the security policy you created earlier set the **Matching Criteria** to the following:

<b>Source</b>	all
<b>Destination address</b>	all
<b>Service</b>	ALL
<b>Application Category</b>	Social.Media
<b>Application</b>	Facebook
<b>URL Category</b>	Social Networking

7. Under **Apply shaper**, set the following:

<b>Outgoing interface</b>	any (The outgoing interface should match the outgoing interface of the security policy you wish to apply shaping to.)
<b>Shared Shaper</b>	Enable <b>Shared Shaper</b> and select <b>medium-priority</b> from the drop down menu.
<b>Reverse Shaper</b>	Enable <b>Shared Shaper</b> and select <b>medium-priority</b> from the drop down menu.
<b>Enable this policy</b>	Enable this policy.

8. Select **OK**.
9. On the policy list page, move the facebook traffic shaping policy to the top of the list by clicking on the far left column to drag and drop it.

### To create a traffic shaping policy for Facebook - CLI:

```
config firewall shaping-policy
edit 1 <shaping policy ID number>
set srcaddr all
set dstaddr all
set service ALL
set application 15832
set app-category 23 <Social.Media>
set url-category 37 <Social Networking>
set dstintf wan1 <outgoing interface>
set traffic-shaper medium-priority
set reverse-traffic-shaper medium-priority
end
```

## Reverse direction traffic shaping

The shaper you select in the traffic shaping policy (shared shaper) will affect the traffic in the direction defined in the policy. For example, if the source port is lan and the destination is wan1, the shaping affects the flow in this direction only — affecting the upload speed of the outbound traffic. By selecting **Shared Traffic Shaper Reverse Direction**, you can define the traffic shaper for the policy in the opposite direction to affect the download speed of the inbound traffic. In this example, from wan 1 to lan.

### To add a reverse shaper

1. Go to Policy & Objects > Traffic Shaping Policy.
2. Click **Create New** or select an existing policy and click **Edit**.
3. Set the **Matching Criteria** to match the interfaces of any security policies you wish to affect.
4. Navigate to the **Apply shaper** section, enable the **Shared Shaper**, and select a shaper from the dropdown menu.
5. Enable the **Reverse Shaper** and select a shaper from the dropdown menu.
6. Select **OK**.

### Setting the reverse direction only

There may be instances where you only need traffic shaping for incoming connections, which is in the “reverse” direction of typical traffic shapers.

### To add a reverse shaper - web-based manager:

1. Go to Policy & Objects > Traffic Shaping Policy.
2. Click **Create New** or select an existing policy and click **Edit**.
3. Set the **Matching Criteria** to match the interfaces of any security policies you wish to affect.
4. Navigate to the **Apply shaper** section, enable the **Reverse Shaper** and select a shaper from the dropdown menu.
5. Select **OK**.

**To configure a reverse-only shaper in a traffic shaping policy - CLI:**

```
config firewall shaping-policy
 edit <policy_number>
 set reverse-traffic-shaper medium-priority
 end
```

**To configure a reverse-only shaper within a security policy- CLI:**

```
config firewall policy
 edit <policy_number>
 ...
 set traffic-shaper-reverse <shaper_name>
 end
```

## Enabling traffic shaping in the security policy

Historically, FortiOS traffic shapers have always been enabled within a security policy. This is no longer the easiest way to apply shapers, since in FortiOS 5.4 traffic shaping is now configured in the traffic shaping policy section, under Policy & Objects > Traffic Shaping Policy. However, you can still enable traffic shapers within a security policy using CLI commands and it will then appear in the web-based manager afterwards. The shapers always go into effect after any DoS detection policies, and before any routing or packet scanning occurs.

Traffic shaping is also supported for IPv6 policies.

This is not the recommended method, as it is easier to keep track of and order your traffic shaping policies if you configure them within a traffic shaping policy.

**To enable traffic shaping within a security policy- CLI:**

```
config firewall policy
 edit <policy number>
 ...
 set traffic-shaper <shaper name>
 set reverse-traffic-shaper <shaper name>
 set per-ip-shaper <per IP shaper name>
 end
```

Shared shapers affect outbound traffic heading to a destination. To affect inbound traffic, or downloads, enable the **Reverse Shaper**, too. For more information, see [Reverse direction traffic shaping on page 3194](#).

## Scheduling Traffic Shaping Policies

In FortiOS 5.6.3, a new scheduling feature was added to traffic shaping policies to apply different shaping profiles at different times (450337). This "schedule" attribute is currently only available via the CLI, and you can use this feature to apply a reoccurring schedule to your traffic shaping policies. The default recurring schedule options available are **always** or **none**. You can also create new schedules or schedule groups under **Policy & Objects > Schedules**. This allows you to create custom recurring or one-time schedules that can then be applied to your traffic shaping policies using the commands below.

## Syntax

```
config firewall shaping-policy
edit <shaping policy ID>
set schedule {always | none}
end
```

## Type of Service priority

Type of service (ToS) is an 8-bit field in the IP header that enables you to determine how the IP datagram should be delivered, using criteria of Delay, Throughput, Priority, Reliability, and Cost. Each quality helps gateways determine the best way to route datagrams. A router maintains a ToS value for each route in its routing table. The lowest priority ToS is 0; the highest is 7 when bits 3, 4, and 5 are all set to 1. There are other seldom used or reserved bits that are not listed here.

Together these bits are the ToS variable of the `tos-based-priority` command. The router tries to match the ToS of the datagram to the ToS on one of the possible routes to the destination. If there is no match, the datagram is sent over a zero ToS route. Using increased quality may increase the cost of delivery because better performance may consume limited network resources.

Each bit represents the priority as per [RFC 1349](#):

- 1000 - minimize delay
- 0100 - maximize throughput
- 0010 - maximize reliability
- 0001 - minimize monetary cost

The ToS value is set in the CLI using the commands:

```
config system tos-based-priority
edit <sequence-number>
set tos [0-15]
set priority [high | medium | low]
end
```

Where `tos` is the value of the type of service bit in the IP datagram header with a value between 0 and 15, and `priority` is the priority of this type of service priority. These priority levels conform to the firewall traffic shaping priorities, as defined in [RFC 1349](#).

For example, if you want to configure the FortiGate unit so that reliability is the first priority, set the `tos` value to 4.

```
config system tos-based-priority
edit 1
set tos 4
set priority high
end
```

For a list of ToS values and their DSCP equivalents see [Traffic shaping methods on page 3183](#).

## Example

```
config system tos-based-priority
edit 1
set tos 1
set priority low
```

```
next
edit 4
 set tos 4
 set priority medium
next
edit 6
 set tos 6
 set priority high
next
end
```

## ToS in FortiOS

Traffic shaping and ToS follow the following sequence:

- The CLI command `tos-based-priority` acts as a `tos-to-priority` mapping. FortiOS maps the ToS to a priority when it receives a packet.
- Traffic shaping settings adjust the packet's priority according the traffic.
- Deliver the packet based on its priority.

## Traffic Shaping Units of Measurement

Bandwidth speeds are measured in kilobits per second (Kbps), and bytes that are sent/received are measured in megabytes (MB). Occasionally this can cause confusion depending on whether your ISP uses kilobits per second (kbps), kilobytes (KB), megabits per second (mbps), or gigabits per second (gbps).

### Download Speeds

- 1 kilobyte per second (KBps) = 8 kilobits per second (Kbps)
- 1 megabit per second (Mbps) = 1,000,000 bits per second (bps)
- 1 gigabit per second (Gbps) = 1,000 megabits per second (Mbps)

### File Sizes

- 1 megabyte (MB) = 1,024 kilobytes (KB)
- 1 gigabyte (GB) = 1,024 megabytes (MB) or 1,048,576 kilobytes (KB)

### To change a shaper's unit of measurement - CLI

```
config firewall shaper traffic-shaper
 edit <shaper name>
 set bandwidth-unit {kbps | mbps | gbps}
 end
```

## Differentiated Services

Differentiated Services describes a set of end-to-end Quality of Service (QoS) capabilities. End-to-end QoS is the ability of a network to deliver service required by specific network traffic from one end of the network to another. By configuring differentiated services, you configure your network to deliver particular levels of service for different packets based on the QoS specified by each packet.

Differentiated Services (also called DiffServ) is defined by RFC 2474 and 2475 as enhancements to IP networking to enable scalable service discrimination in the IP network without the need for per-flow state and signaling at every hop. Routers that can understand differentiated services sort IP traffic into classes by inspecting the DS field in IPv4 header or the Traffic Class field in the IPv6 header.

You can use the FortiGate Differentiated Services feature to change the DSCP (Differentiated Services Code Point) value for all packets accepted by a policy. The network can use these DSCP values to classify, mark, shape, and police traffic, and to perform intelligent queuing. DSCP features are applied to traffic by configuring the routers on your network to apply different service levels to packets depending on the DSCP value of the packet.

If the differentiated services feature is not enabled, the FortiGate unit treats traffic as if the DSCP value is set to the default (00), and will not change IP packets' DSCP field. DSCP values are also not applied to traffic if the traffic originates from a FortiGate unit itself.

The FortiGate unit applies the DSCP value and IPsec encryption to the differentiated services (formerly ToS) field in the first word of the IP header. The typical first word of an IP header, with the default DSCP value, is 4500:

- 4 for IPv4
- 5 for a length of five words
- 00 for the default DSCP value

You can change the packet's DSCP field for traffic initiating a session (forward) or for reply traffic (reverse) and enable each direction separately and configure it in the security policy.

Changes to DSCP values in a security policy effect new sessions. If traffic must use the new DSCP values immediately, clear all existing sessions.

DSCP is enabled using the CLI command:

```
config firewall policy
 edit <policy_number>
 ...
 set diffserv-forward enable
 set diffservcode-forward <binary_integer>
 set diffserv-reverse enable
 set diffservcode-rev <binary_integer>
 end
```

For more information on the different DSCP commands, see the examples below and the CLI Reference. If you only set `diffserv-forward` and `diffserv-reverse` without setting the corresponding `diffservcode` values, the FortiGate unit will reset the bits to zero.

For a list of DSCP values and their ToS equivalents see [Differentiated Services on page 3197](#). DSCP values can also be defined within a shared shaper as a single value, and per-IP shaper for forward and reverse directions.

## DSCP examples

For all the following DSCP examples, the FortiGate and client PC configuration is the following diagram and used firewall-based DSCP configurations.

### Example

In this example, an ICMP ping is executed between User 1 and FortiGate B, through a FortiGate unit. DSCP is disabled on FortiGate B, and FortiGate A contains the following configuration:

```

config firewall policy
 edit 2
 set srcintf port6
 set dstintf port3
 set src addr all
 set dstaddr all
 set action accept
 set schedule always
 set service ALL
 set diffserv-forward enable
 set diffservcode-forward 101110
 end

```

As a result, FortiGate A changes the DSCP field for outgoing traffic, but not to its reply traffic. The binary DSCP values used map to the following hexadecimal

ToS field values, which are observable by a sniffer (also known as a packet tracer):

- DSCP 000000 is TOS field 0x00
- DSCP 101110 is TOS field 0xb8, the recommended DSCP value for expedited forwarding (EF)

If you performed an ICMP ping between User 1 and User 2, the following output illustrates the IP headers for the request and the reply by sniffers on each of FortiGate unit's network interfaces. The right-most two digits of each IP header are the ToS field, which contains the DSCP value.

## Example

In this example, an ICMP ping is executed between User 1 and FortiGate B, through FortiGate A. DSCP is disabled on FortiGate B, and FortiGate A contains the following configuration:

```
config firewall policy
 edit 2
 set srcintf port6
 set dstintf port3
 set src addr all
 set dstaddr all
 set action accept
 set schedule always
 set service ALL"
 set diffserv-forward enable
 set diffserv-rev enable
 set diffservcode-forward 101110
 set diffservcode-rev 101111
 end
```

As a result, FortiGate A changes the DSCP field for both outgoing traffic and its reply traffic. The binary DSCP values in map to the following hexadecimal ToS field values, which are observable by a sniffer (also known as a packet tracer):

- DSCP 000000 is TOS field 0x**00**
- DSCP 101110 is TOS field 0x**b8**, the recommended DSCP value for expedited forwarding (EF)
- DSCP 101111 is TOS field 0x**bc**

If you performed an ICMP ping between User 1 and User 2, the output below illustrates the IP headers observed for the request and the reply by sniffers on each of FortiGate A's and FortiGate B's network interfaces. The right-most two digits of each IP header are the ToS field, which contains the DSCP value.

## Example

In this example, an ICMP ping is executed between User 1 and FortiGate B, through FortiGate A. DSCP is enabled for both traffic directions on FortiGate A, and enabled only for reply traffic on FortiGate B. FortiGate A contains the following configuration:

```
config firewall policy
 edit 2
 set srcintf port6
 set dstintf port3
 set src addr all
 set dstaddr all
 set action accept
 set schedule always
 set service ALL
 set diffserv-forward enable
 set diffserv-rev enable
 set diffservcode-forward 101110
 set diffservcode-rev 101111
 end
```

FortiGate B contains the following configuration:

```
config firewall policy
 edit 2
 set srcintf wan2
 set dstintf internal
 set src addr all
 set dstaddr all
 set action accept
 set schedule always
 set service ALL
 set diffserv-rev enable
 set diffservcode-rev 101101
 end
```

As a result, FortiGate A changes the DSCP field for both outgoing traffic and its reply traffic, and FortiGate B changes the DSCP field only for reply traffic. The binary DSCP values in this configuration map to the following hexadecimal ToS field values:

- DSCP 000000 is TOS field **0x00**
- DSCP 101101 is TOS field **0xb4**
- DSCP 101110 is TOS field **0xb8**, the recommended DSCP value for expedited forwarding (EF)
- DSCP 101111 is TOS field **0xbc**

If you performed an ICMP ping between User 1 and User 2, the output below illustrates the IP headers observed for the request and the reply by sniffers on each of FortiGate A's and FortiGate B's network interfaces. The right-most two digits of each IP header are the ToS field, which contains the DSCP value.

## Example

In this example, HTTPS and DNS traffic is sent from User 1 to FortiGate B, through FortiGate A. DSCP is enabled for both traffic directions on FortiGate A, and enabled only for reply traffic on FortiGate B. FortiGate A contains the following configuration:

```
config firewall policy
 edit 2
 set srcintf port6
 set dstintf port3
 set src addr all
 set dstaddr all
 set action accept
 set schedule always
 set service ALL
 set diffserv-forward enable
 set diffserv-rev enable
 set diffservcode-forward 101110
 set diffservcode-rev 101111
 end
```

FortiGate B contains the following configuration:

```
config firewall policy
 edit 2
```

```

set srcintf wan2
set dstintf internal
set src addr all
set dstaddr all
set action accept
set schedule always
set service ALL
set diffserv-rev enable
set diffservcode-rev 101101
end

```

As a result, FortiGate A changes the DSCP field for both outgoing traffic and its reply traffic, but FortiGate B changes the DSCP field only for reply traffic which passes through its internal interface. Since the example traffic does not pass through the internal interface, FortiGate B does not mark the packets. The binary DSCP values in this configuration map to the following hexadecimal ToS field values:

- DSCP 000000 is TOS field **0x00**
- DSCP 101101 is TOS field **0xb4**, which is configured on FortiGate B but not observed by the sniffer because the example traffic originates from the FortiGate unit itself, and therefore does not match that security policy.
- DSCP 101110 is TOS field **0xb8**, the recommended DSCP value for expedited forwarding (EF)
- DSCP 101111 is TOS field **0xbc**

If you sent HTTPS or DNS traffic from User 1 to FortiGate B, the following would illustrate the IP headers observed for the request and the reply by sniffers on each of FortiGate A's and FortiGate B's network interfaces. The right-most two digits of each IP header are the ToS field, which contains the DSCP value.

## ToS and DSCP traffic mapping

There are two types of traffic mapping: Type of Service (ToS) or DSCP (Differentiated Services Code Point). Only one method can be used at a time, with ToS set as the default method. You can set the type used and attributes in the CLI.

### To set ToS or DSCP traffic mapping

```

config system global
 set traffic-priority {tos | dscp}
 set traffic-priority-level {low | medium | high }
end

```

### Mapping of DSCP and ToS hexadecimal values for QoS

Service Class	DSCP Bits	DSCP Value	ToS Value	ToS Hexidecimal
Network Control	111000	56-63	224	0xE0
Internetwork Control	110000	48-55	192	0xC0

Service Class	DSCP Bits	DSCP Value	ToS Value	ToS Hexidecimal
<b>Critical - Voice Data (RTP)</b>	101110	46	184	0xB8
	101000	40	160	0xA0
<b>Flash Override Video Data</b>	100010	34	136	0x88
	100100	36	144	0x90
	100110	38	152	0x98
	100000	32	128	0x80
<b>Flash Voice Control</b>	011010	26	104	0x68
	011100	28	112	0x70
	011110	30	120	0x78
	011000	24	96	0x60
<b>Immediate Deterministic (SNA)</b>	010010	18	72	0x48
	010100	20	80	0x50
	010110	22	88	0x58
	010000	16	64	0x40
<b>Priority Controlled Load</b>	001010	10	40	0x28
	001100	12	48	0x30
	001110	14	56	0x38
	001000	8	32	0x20
<b>Routine - Best Effort</b>	000000	0	0	0x00
<b>Routine - Penalty Box</b>	000010	2	8	0x08

## Traffic Shaper Monitor

You can view statistical information about traffic shapers and their bandwidth from FortiView > Traffic Shaping.

**Refresh** the information on the page.

**Table View** shows the following columns by default: Shaper, Bytes (Sent/Received), Sessions, Bandwidth, or Dropped Bytes. For more display options, right-click on the column header.

**Bubble Chart** shows you which resources consume the most bandwidth. Double-click on a shaper to view more details. Determine whether more granular shaping is required by looking at the bandwidth usage by sources, destinations, applications, policies, and sessions.

**FortiView Settings** include the following options:

- Include Local traffic (Realtime Only)
- Include Unscanned Applications (Applications View Only)
- Auto update realtime visualizations
- Interval (seconds)
- Threat Weight Settings

## Examples

While it is possible to configure QoS using a combination of security policies and ToS based priorities, and to distribute traffic over all six of the possible queues for each physical interface, the results of those configurations can be more difficult to analyze due to their complexity. In those cases, prioritization behavior can vary by several factors, including traffic volume, ToS (type of service) or differentiated services markings, and correlation of session to a security policy.

The following simple examples illustrate QoS configurations using either prioritization by security policy, or prioritization by ToS bit, but not both. The examples also assume you are not configuring traffic shaping for interfaces that receive hardware acceleration from network processing units (NPU).

### QoS using priority from security policies

Configurations implementing QoS using the priority values defined in the security policies are capable of applying bandwidth limits and guarantees.

In addition to configuring traffic shaping, you may also choose to limit the bandwidth accepted by each interface. This can be useful in scenarios where the bandwidth received on source interfaces frequently exceeds the maximum bandwidth limit defined in the security policy. Rather than waste processing power on packets that will get dropped later in the process, you may choose to preemptively police the traffic.

If you decide to implement QoS using security policies rather than ToS bit, the FortiGate unit applies QoS to all packets controlled by the policy. This type of control is less granular than prioritization by ToS bit, but has the benefits of correlating quality of service to a security policy. This correlation enables you to distribute traffic over up to four of the possible 6 priority queues (queue 0 to queue 3), does not require other devices in your network to set or respect the ToS bit, and enables you to configure bandwidth limits and guarantees.

In the following example, we limit the bandwidth accepted by each source interface, limit the bandwidth used by sessions controlled by the security policy, and then configure prioritized queuing on the destination interface based upon the priority in the security policy, subject to alternative assignment to queue 0 when necessary to achieve the guaranteed packet rate.

#### To limit bandwidth accepted by an interface

In the CLI, enter the following commands:

```
config system interface
 edit <name_str>
 set inbandwidth <rate_int>
 next
end
```

where `<rate_int>` is the bandwidth limit in Kb/s. Excess packets will be dropped.

#### To configure bandwidth guarantees, limits, and priorities

1. Go to **Policy & Objects > Traffic Shapers** and select the Create New “Plus” sign.
2. Select **Shared** or **Per-IP**.
3. Enter a name for the shaper.

4. Select the **Traffic Priority**.  
High has a priority value of 1, Medium is 2, and Low is 3. While the current packet rate is below Guaranteed Bandwidth, the FortiGate unit will disregard this setting, and instead use priority queue.
5. Enable **Max Bandwidth** and enter a value.  
Packets greater than this rate will be discarded.
6. Enable **Guaranteed Bandwidth** and enter a value, if any.  
Bandwidth guarantees affect prioritization. While packet rates are less than this rate, they use priority queue 0. If this is not the effect you intend, consider entering a small guaranteed rate, or enter 0 to effectively disable bandwidth guarantees.
7. Enable **DSCP** and set a value.
8. Select **OK**.

**Per-IP shapers** also include the option to set a maximum number of concurrent connections and to set both **Forward DSCP** and **Reverse DSCP**.

## Sample configuration

This sample configuration limits ingressing bandwidth to 500 Kb/s. It also applies separate traffic shapers to FTP and HTTP traffic. In addition to the interface bandwidth limit, HTTP traffic is subject to a security policy bandwidth limit of 200 Kb/s.

All egressing FTP traffic greater than 10 Kb/s is subject to a low priority queue (queue 3), while all egressing HTTP traffic greater than 100 Kb/s is subject to a medium priority queue (queue 2). That is, unless FTP traffic rates are lower than their guaranteed rate, and web traffic rates are greater than their guaranteed rate, FTP traffic is lower priority than web traffic.

Traffic less than these guaranteed bandwidth rates use the highest priority queue (queue 0).

Set the inbandwidth limits. This setting is only available in the CLI:

```
config system interface
 edit wan1
 set inbandwidth 500
 next
end
```

Create traffic shapers for FTP and HTTP.

### To configure an FTP shaper - web-based manager:

1. Go to **Policy & Objects > Traffic Shapers**, and select the **Create New** "Plus" icon.
2. Select **Shared**.
3. Enter **FTP** for the name of the shaper.
4. Set **Traffic Priority** to **Low**.
5. Select the **Guaranteed Bandwidth** checkbox and enter **10** Kbps.
6. Select the **Maximum Bandwidth** checkbox and enter **500** Kbps.
7. Select **OK**.
8. Select the FTP shaper, right-click it, and select **Edit in CLI**. Type the following command:

```
set per-policy
```

```
end
```

#### To configure an HTTP shaper - web-based manager:

1. Select the **Create New** “Plus” icon.
2. Set **Type** to **Shared**.
3. Enter **HTTP** for the name of the shaper.
4. Set **Traffic Priority** to **Medium**.
5. Select the **Guaranteed Bandwidth** checkbox and enter **100 Kbps**.
6. Select the **Maximum Bandwidth** checkbox and enter **200 Kbps**.
7. Select **OK**.
8. Select the HTTP shaper, right-click it, and select **Edit in CLI**. Type the following command:

```
set per-policy
end
```

#### To add the FTP shaper to a traffic shaping policy - web-based manager:

1. Go to **Policy & Objects > Traffic Shaping Policy** and click **Create New** to create a traffic shaping policy for FTP.
2. Set the **Matching Criteria** to the following:

<b>Source</b>	<b>all</b>
<b>Destination address</b>	<b>all</b>
<b>Service</b>	<b>FTP</b>

3. Under **Apply shaper**, set the following:

<b>Outgoing interface</b>	any (The outgoing interface should match the outgoing interface of the security policy you wish to apply shaping to.)
<b>Shared Shaper</b>	Enable <b>Shared Shaper</b> and select <b>FTP</b> from the dropdown menu.
<b>Reverse Shaper</b>	Enable <b>Shared Shaper</b> and select <b>FTP</b> from the dropdown menu.
<b>Enable this policy</b>	Enable this policy.

4. Select **OK**.

#### To add the HTTP shaper to a traffic shaping policy - web-based manager:

1. Go to **Policy & Objects > Traffic Shaping Policy** and click **Create New** to create a traffic shaping policy for HTTP.
2. Set the **Matching Criteria** to the following:

<b>Source</b>	<b>all</b>
---------------	------------

<b>Destination address</b>	<b>all</b>
<b>Service</b>	<b>HTTP</b>

3. Under **Apply shaper**, set the following:

<b>Outgoing interface</b>	any (The outgoing interface should match the outgoing interface of the security policy you wish to apply shaping to.)
<b>Shared Shaper</b>	Enable <b>Shared Shaper</b> and select <b>HTTP</b> from the dropdown menu.
<b>Reverse Shaper</b>	Enable <b>Shared Shaper</b> and select <b>HTTP</b> from the dropdown menu.
<b>Enable this policy</b>	Enable this policy.

4. Select **OK**.
5. On the policy list page, move the FTP traffic shaping policy to the top of the list by clicking on the far left column to drag and drop it. The HTTP traffic shaping policy should be below the FTP policy, and more general internet access policies should be at the bottom of the policy list.

#### To configure the FTP and HTTP shapers - CLI:

```
config firewall shaper traffic-shaper
edit FTP
set maximum-bandwidth 500
set guaranteed-bandwidth 10
set per-policy enable
set priority low
next
edit HTTP
set maximum-bandwidth 200
set guaranteed-bandwidth 100
set per-policy enable
set priority medium
end
```

#### To add each shaper to a traffic shaping policy- CLI:

```
config firewall shaping-policy
edit 1 <shaping policy ID number>
set srcaddr all
set dstaddr all
set service ALL
set dstintf wan1 <outgoing interface>
set traffic-shaper FTP
next
edit 2 <shaping policy ID number>
set srcaddr all
set dstaddr all
set service ALL
set dstintf wan1 <outgoing interface>
set traffic-shaper HTTP
next
move 1 before 2
```

```
end
```

## QoS using priority from ToS or differentiated services

Configurations implementing QoS using the priority values defined in either global or specific ToS bit values are not capable of applying bandwidth limits and guarantees, but are capable of prioritizing traffic at per-packet levels, rather than uniformly to all services matched by the security policy.

In addition to configuring traffic prioritization, you may also choose to limit bandwidth being received by each interface. This can sometimes be useful in scenarios where you want to limit traffic levels, but do not want to configure traffic shaping within a security policy. This has the benefit of policing traffic at a point before the FortiGate unit performs most processing.

Note that if you implement QoS using ToS octet rather than security policies, the FortiGate unit applies QoS on a packet by packet basis, and priorities may be different for packets and services controlled by the same security policy. This is more granular control than prioritization by security policies, but has the drawbacks that quality of service is may not be uniform for multiple services controlled by the same security policy, packets will only use up to three of the six possible queues (queue 0 to queue 2), and bandwidth cannot be guaranteed. Other devices in your network must also be able to set or preserve ToS bits.

In this example, we limit the bandwidth accepted by each source interface, and then configure prioritized queuing on the destination interface based upon the value of the ToS bit located in the IP header of each accepted packet.

To limit bandwidth accepted by an interface, in the CLI, enter the following commands:

```
config system interface
 edit <name_str>
 set inbandwidth <rate_int>
 next
end
```

where `<rate_int>` is the bandwidth limit in Kb/s. Excess packets will be dropped.

To configure priorities, in the CLI, configure the global priority value using the following commands:

```
config system global
 set tos-based-priority {high | low | medium}
end
```

where `high` has a priority value of 0 and `low` is 2.

If you want to prioritize some ToS bit values differently than the global ToS-based priority, configure the priority for packets with that ToS bit value using the following commands:

```
config system tos-based-priority
 edit <id_int>
 set tos [0-15]
 set priority {high | low | medium}
 next
end
```

where `tos` is the value of the ToS bit in the packet's IP header, and `high` has a priority value of 0 and `low` is 2. Priority values configured in this location will override the global ToS-based priority.

## Sample configuration

This sample configuration limits ingress bandwidth to 500 Kb/s. It also queues egress traffic based upon the ToS bit in the IP header of ingress packets.

Unless specified for the packet's ToS bit value, packets use the low priority queue (queue 2). For ToS bit values 4 and 15, the priorities are specified as medium (value 1) and high (value 0), respectively.

```
config system interface
 edit wan1
 set inbandwidth 500
 next
end
config system global
 set tos-based-priority low
end
config system tos-based-priority
 edit 4
 set tos 4
 set priority medium
 next
 edit 15
 set tos 15
 set priority high
 next
end
```

## Example setup for VoIP

In this example, there are three traffic shaping requirements for a network:

- Voice over IP (VoIP) requires a guaranteed, high-priority for bandwidth for telephone communications.
- FTP bursts must be contained so as not to consume any available bandwidth. As such this traffic needs to be throttled to a smaller amount.
- A consistent bandwidth requirement is needed for all other email and web-based traffic.

To enable this requirement, you need to create three separate shapers and three traffic shaping policies for each traffic type.

In this example, the values used are not recommended values.

### Creating the traffic shapers

First create the traffic shapers that define the maximum and guaranteed bandwidth. The shared shapers will be used with some applied per-policy and some applied to all policies, to better control traffic.

#### VoIP shaper

The VoIP functionary is a key component to the business as a communication tool and as such requires a guaranteed bandwidth. This shaper will be a high priority shaper.

**To create a VoIP shaper - web-based manager:**

1. Go to **Policy & Objects > Traffic Shapers** and select **Create New**.
2. Set the **Type** to **Shared**.

3. Enter the **Name** `voip`.
4. Set the **Traffic Priority** to **High**.
5. Select **Maximum Bandwidth** and enter `1000` Kb/s.
6. Select **Guaranteed Bandwidth** and enter `800` Kb/s.
7. Select **OK**.
8. Select the HTTP shaper, right-click it, and select **Edit in CLI**. Type the following command:

```
set per-policy
end
```

#### To create a VoIP shaper - CLI:

```
config firewall shaper traffic-shaper
edit voip
set maximum-bandwidth 1000
set guaranteed-bandwidth 800
set per-policy enable
set priority high
end
```

Setting the shaper to **per-policy** ensures that regardless of the number of policies that use this shaper, the defined bandwidth will always be the same. At the same time, the bandwidth is continually guaranteed at 800 Kb/s but if available can be as much as 1000 Kb/s. Setting the priority to high ensures that the FortiGate unit always considers VoIP traffic the most important.

### FTP shaper

The FTP shaper sets the maximum bandwidth to use to avoid sudden spikes by sudden uploading or downloading of large files, and interfering with other more important traffic.

#### To create a FTP shaper - web-based manager:

1. Go to **Policy & Objects > Traffic Shapers** and **Create New**.
2. Set the **Type** to **Shared**.
3. Enter the **Name** `ftp`.
4. Set the **Traffic Priority** to **Low**.
5. Select **Maximum Bandwidth** and enter `200` Kb/s
6. Select **Guaranteed Bandwidth** and enter `200` Kb/s.
7. Select **OK**.

#### To create a FTP shaper - CLI:

```
config firewall shaper traffic-shaper
edit ftp
set maximum-bandwidth 200
set guaranteed-bandwidth 200
set priority low
end
```

For this shaper, the maximum and guaranteed bandwidth are set low and to the same value. In this case, the bandwidth is restricted to a specific amount. Setting the traffic priority low ensures that more important traffic will be able to pass before FTP traffic.

### Regular traffic shaper

The regular shaper sets the maximum bandwidth and guaranteed bandwidth for everyday business traffic such as web and email traffic.

#### To create a regular shaper - web-based manager:

1. Go to **Policy & Objects > Traffic Shapers** and **Create New**.
2. Set the **Type** to **Shared**.
3. Enter the **Name** `daily_traffic`.
4. Set the **Traffic Priority** to **Medium**.
5. Select **Maximum Bandwidth** and enter `600 Kb/s`
6. Select **Guaranteed Bandwidth** and enter `600 Kb/s`.
7. Select **OK**.

#### To create a regular shaper - CLI:

```
config firewall shaper traffic-shaper
edit daily_traffic
 set maximum-bandwidth 600
 set guaranteed-bandwidth 600
 set per-policy enable
 set priority medium
end
```

For this shaper, the maximum and guaranteed bandwidth are set to a moderate value of 600 Kb/s. It is also set for per policy, which ensures each security policy for day-to-day business traffic has the same distribution of bandwidth.

### Creating Traffic Shaping Policies

To employ the shapers, create traffic shaping policies that apply to your existing security policy. Create a separate policy for each service and apply the shaper to the outgoing interface you would like to use. For example, a policy for FTP traffic, a policy for SIP and so on.

For the following steps the VoIP traffic shaper is enabled as well as the reverse direction. This ensures that return traffic for a VoIP call has the same guaranteed bandwidth as the outgoing call. The example below shows how to enable each traffic shaper in a traffic shaping policy.

In this example, the traffic shaping policies will apply shaping to the following security policy:

<b>Incoming interface</b>	lan (Internal interface)
<b>Source address</b>	All
<b>Outgoing interface</b>	WAN1

<b>Destination address</b>	All
<b>Schedule</b>	always
<b>Service</b>	all
<b>Action</b>	ACCEPT

#### To create a VOIP traffic shaping policy- web-based manager:

1. Go to **Policy & Objects > Traffic Shaping Policy** and select **Create New**.
2. Now create a traffic shaping policy that matches the settings you entered for your security policy:

<b>Source</b>	All
<b>Destination</b>	All
<b>Service</b>	All
<b>Application Category</b>	VoIP
<b>Application</b>	SIP
<b>URL Category</b>	Internet Telephony
<b>Outgoing Interface</b>	wan1

3. Enable **Shared Shaper**, select the voip shaper created in the previous steps.
4. Enable **Reverse Shaper**, select the voip shaper created in the previous steps.
5. Select **Enable this policy**.
6. Select **OK**.

#### To create a VOIP traffic shaping policy- CLI:

```
config firewall shaping-policy
edit 1 <shaping policy ID number>
set srcaddr all
set dstaddr all
set service ALL
set application 34640 <SIP>
set app-category 3 <VoIP>
set url-category 76 <Internet Telephony>
set dstintf wan1 <outgoing interface>
set traffic-shaper voip <high priority custom shaper>
set reverse-traffic-shaper voip <high priority custom shaper>
end
```

#### To create an FTP traffic shaping policy- web-based manager:

1. Go to **Policy & Objects > Traffic Shaping Policy** and select **Create New**.
2. Now create a traffic shaping policy that matches the settings you entered for your security policy:

<b>Source</b>	All
<b>Destination</b>	All
<b>Service</b>	FTP
<b>Outgoing Interface</b>	wan1

3. Enable **Shared Shaper**, select the FTP shaper created in the previous steps.
4. Enable **Reverse Shaper**, select the FTP shaper created in the previous steps.
5. Select **Enable this policy**.
6. Select **OK**.

#### To create an FTP traffic shaping policy- CLI:

```
config firewall shaping-policy
edit 2 <shaping policy ID number>
set srcaddr all
set dstaddr all
set service FTP
set dstintf wan1 <outgoing interface>
set traffic-shaper FTP <low priority custom shaper>
set reverse-traffic-shaper FTP <low priority custom shaper>
end
```

#### To create a Regular traffic shaping policy- web-based manager:

1. Go to **Policy & Objects > Traffic Shaping Policy** and select **Create New**.
2. Now create a traffic shaping policy that matches the settings you entered for your security policy:

<b>Source</b>	All
<b>Destination</b>	All
<b>Service</b>	ALL
<b>Outgoing Interface</b>	wan1

3. Enable **Shared Shaper**, select the medium-priority shaper.
4. Enable **Reverse Shaper**, select the medium-priority shaper.
5. Select **Enable this policy**.
6. Select **OK**.

#### To create a Regular traffic shaping policy- CLI:

```
config firewall shaping-policy
edit 3 <shaping policy ID number>
set srcaddr all
set dstaddr all
set service ALL
set dstintf wan1 <outgoing interface>
set traffic-shaper medium-priority <default shaper>
set reverse-traffic-shaper medium-priority <default shaper>
```

```
end
```

**To order your traffic shaping policies- CLI:**

```
config firewall shaping-policy
 move 1 before 2
 move 3 below 2
end
```

Ensure that your high priority SIP/VoIP policy is at the top of the policy list, the low priority FTP shaper comes second, and the medium priority regular-traffic shaper comes last. Restrictive policies should always go above more general access policies.

---

**Alternate Method of enabling traffic shaping in the security policy**

It is also possible to create three separate security policies for each type of traffic (VoIP, FTP, and regular). You can enable traffic shaping individually within each security policy in the CLI only, like the example shown below:

**To enable traffic shaping in the security policy - CLI:**

```
config firewall policy
 edit 6
 set srcintf <internal_interface>
 set scraddr all
 set dstintf wan1
 set dstaddr all
 set action accept
 set schedule always
 set service sip
 set traffic-shaper voip
 set reverse-traffic-shaper voip
 end
```

## Troubleshooting traffic shaping

This chapter outlines some troubleshooting tips and steps to diagnose the shapers and whether they are working correctly. These diagnose commands include:

- `diagnose sys tos-based-priority`
- `diagnose firewall shaper traffic-shaper`
- `diagnose firewall per-ip-shaper`
- `diagnose debug flow`

### Interface diagnosis

To optimize traffic shaping performance, first ensure that the network interface's Ethernet statistics are clean of errors, collisions, or buffer overruns. To check the interface, enter the following diagnose command to see the traffic statistics:

```
diagnose hardware deviceinfo nic <port_name>
```

### Shaper diagnose commands

There are specific diagnose commands you can use to verify the configuration and flow of traffic, including packet loss due to the employed shaper.

All of these diagnose troubleshooting commands are supported in both IPv4 and IPv6.

#### ToS command

Use the following command to list command to view information of the ToS lists and traffic.

```
diagnose sys tos-based-priority
```

This example displays the priority value currently correlated with each possible ToS bit value. Priority values are displayed in order of their corresponding ToS bit values, which can range between 0 and 15, from lowest ToS bit value to highest.

For example, if you have not configured ToS-based priorities, the following appears...

```
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
```

...reflecting that all packets are currently using the same default priority, high (value 0).

If you have configured a ToS-based priority of `low` (value 2) for packets with a ToS bit value of 3, the following appears...

```
0 0 0 2 0 0 0 0 0 0 0 0 0 0 0 0
```

...reflecting that most packets are using the default priority value, except those with a ToS bit value of 3.

### Shared shaper

To view information for the shared traffic shaper for security policies enter the command

```
diagnose firewall shaper traffic-shaper list
```

The resultant output displays the information on all available shapers. The more shapers available the longer the list. For example:

```
name Throughput
maximum-bandwidth 1200000 Kb/sec
guaranteed-bandwidth 50000 Kb/sec
current-bandwidth 0 B/sec
priority 1
packets dropped 0
```

Additional commands include:

```
diagnose firewall shaper traffic-shaper state - provides the total number of traffic shapers on
the FortiGate unit.
diagnose firewall shaper traffic-shaper stats - provides summary statistics on the shapers.
Sample output looks like the following:
shapers 9 ipv4 0 ipv6 0 drops 0
```

## Per-IP shaper

To view information for the per-IP shaper for security policies enter the command

```
diagnose firewall shaper per-ip-shaper list
```

The resultant output displays the information on all available per-IP shapers. The more shapers available the longer the list. For example:

```
name accounting_group
maximum-bandwidth 200000 Kb/sec
maximum-concurrent-session 55
packet dropped 0
```

Additional commands include:

```
diagnose firewall shaper per-ip-shaper state - provides the total number of per-ip shapers on
the FortiGate unit.
diagnose firewall shaper per-ip-shaper stats - provides summary statistics on the shapers.
Sample output looks like the following:
memory allocated 3 packet dropped: 0
```

You can also clear the per-ip statistical data to begin a fresh diagnoses using:

```
diagnose firewall shaper per-ip-shaper clear
```

## Packet loss with statistics on shapers

For each shaper there are counters that allow to verify if packets have been discarded. To view this information, in the CLI, enter the command `diagnose firewall shaper`. The results will look similar to the following output:

```
diagnose firewall shaper traffic-shaper list
name limit_GB_25_MB_50_LQ
maximum-bandwidth 50 Kb/sec
guaranteed-bandwidth 25 Kb/sec
current-bandwidth 51 Kb/sec
priority 3
dropped 1291985
```

The diagnose command output is different if the shapers are configured either per-policy or shared between policies.

For per-IP the output would be:

```
diagnose firewall shaper per-ip-shaper list

name accounting_group
maximum-bandwidth 200000 Kb/sec
maximum-concurrent-session 55
packet dropped 3264220
```

## Packet lost with the debug flow

When using the debug flow diagnostic command, there is a specific message information that a packet has exceed the shaper limits and therefor discarded:

```
diagnose debug flow show console enable
diagnose debug flow filter addr 10.143.0.5
diagnose debug flow trace start 1000

id=20085 trace_id=11 msg="vd-root received a packet(proto=17, 10.141.0.11:3735-
>10.143.0.5:5001) from port5."
id=20085 trace_id=11 msg="Find an existing session, id=0000eabc, original direction"
id=20085 trace_id=11 msg="exceeded shaper limit, drop"
```

## Session list details with dual traffic shaper

When a Security Policy has a different traffic shaper for each direction, it is reflected in the session list output from the CLI:

```
diagnose sys session list

session info: proto=6 proto_state=02 expire=115 timeout=3600 flags=00000000 sock
flag=00000000 sockport=0 av_idx=0 use=4
origin-shaper=Limit_25Mbps prio=1 guarantee 25600/sec max 204800/sec traffic 48/sec
reply-shaper=Limit_100Mbps prio=1 guarantee 102400/sec max 204800/sec traffic 0/sec
ha_id=0 hakey=44020
policy_dir=0 tunnel=/
state=may_dirty rem os rs
statistic(bits/packets/allow_err): org=96/2/1 reply=0/0/0 tuples=2
orgin->sink: org pre->post, reply pre->post dev=2->3/3->2 gwy=10.160.0.1/0.0.0.0
hook=pre dir=org act=dnat 192.168.171.243:2538->192.168.182.110:80(10.160.0.1:80)
hook=post dir=reply act=snat 10.160.0.1:80->192.168.171.243:2538(192.168.182.110:80)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0 serial=00011e81 tos=ff/ff app=0
dd_type=0 dd_rule_id=0
```

## Additional Information

- Packets discarded by the shaper impact flow-control mechanisms like TCP. For more accurate testing results prefer UDP protocol.
- Traffic shaping accuracy is optimum for security policies without a protection profile where no FortiGate content inspection is processed.

- Do not oversubscribe an outbandwidth throughput. For example,  $\text{sum}[\text{guaranteed BW}] < \text{outbandwidth}$ . For accuracy in bandwidth calculation, it is required to set the “outbandwidth” parameter on the interfaces. For more information see [Bandwidth guarantee, limit, and priority interactions on page 3175](#).
- The FortiGate unit is not prioritizing traffic based on the DSCP marking configured in the security policy. However, ToS based prioritizing can be made at ingress. For more information see [Traffic shaping methods on page 3183](#).

# Chapter 30 - Transparent Mode

## Transparent mode

This guide explains how to use a FortiGate in Transparent Mode. It includes the following sections:

- [Introduction to Transparent Mode](#): an overview of Transparent mode, including available features.
- [Transparent Mode Installation](#): instructions for installing a FortiGate in Transparent mode.
- [Networking in Transparent Mode](#): how networking is configured in Transparent mode.
- [Firewalls and Security in Transparent Mode](#): information about using firewalls and security scanning in Transparent mode.
- [IPsec VPN in Transparent Mode](#): configuring IPsec VPNs using FortiGates in Transparent mode.
- [Using FortiManager and FortiAnalyzer](#): using external management and logging.
- [High Availability in Transparent Mode](#): configuring Transparent FortiGates in HA mode.
- [Best Practices](#): the best practices for using Transparent mode.

## What's new in FortiOS 5.6

The following new features have been added for Transparent Mode in FortiOS 5.6:

### Using the Management IP address to populate `pac-file-url`

You can now use the Management IP address to populate `pac-file-url` in Transparent Mode. Previously, only the interface IP could be used.

#### CLI syntax

```
config vdom
 edit root
 config system settings
 set opmode transparent
 set manageip 192.168.0.34/24
 end
 config web-proxy explicit
 set pac-file-server-status enable
 get pac-file-url [url.pac]
 end
 end
```

## Introduction to Transparent Mode

This section contains a [basic overview of Transparent mode](#), as well as a [chart showing features available in Transparent mode](#).

### What is Transparent Mode?

A FortiGate unit can operate in one of two modes: Transparent or NAT mode.

In Transparent mode, the FortiGate is installed between the internal network and the router. In this mode, the FortiGate does not make any changes to IP addresses and only applies security scanning to traffic. When a FortiGate is added to a network in Transparent mode, no network changes are required, except to provide the FortiGate with a management IP address. Transparent mode is used primarily when there is a need to increase network protection but changing the configuration of the network itself is impractical.

In NAT mode, a FortiGate unit is installed as a gateway or router between two networks. This allows the FortiGate to hide the IP addresses of the private network using network address translation (NAT).

### Transparent Mode Features

Different FortiOS features are available depending on whether your FortiGate is in Transparent or NAT mode. The following table shows which features are available for each mode.

For a FortiGate in Transparent mode, the maximum number of Interfaces per VDOM is 254. This value includes both physical and virtual interfaces.

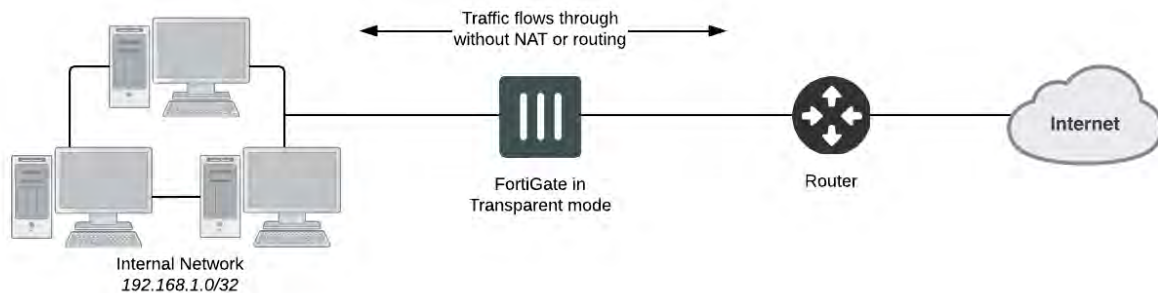

Feature/capability	NAT	Transparent	Comment
Unicast Routing / Policy Based routing	YES	NO	
VIP / IP pools / NAT	YES	YES	Configurable from CLI only in transparent mode
Multicast routing	YES	NO - Options available to forward multicast packets	
L2 forwarding	NO	YES	In Transparent mode, other frames than IP can be forwarded but with no UTM processing.
Firewall (packet filtering / NAT / Authentication)	YES	YES	

Feature/capability	NAT	Transparent	Comment
IPv6 capable	YES	YES	
Traffic shaping - TOS classification	YES	YES	
Hardware acceleration	YES	YES	
All Security profile features (ex IPS, Application Control, Web Filtering, etc ...)	YES	YES	
Security Fabric	YES	NO	
FortiView	YES	YES	
IPsec gateway	YES	YES - Policy based mode only	
SSL gateway	YES	NO	
High-Availability (HA) - Virtual Cluster	YES	YES	
802.3ad (LACP / port aggregation)	YES	YES	
HA port redundancy	YES	YES	FortiGate hardware dependent
802.1q - VLAN trunking	YES	YES	
802.1d - Spanning Tree	NO	NO - option to forward BPDUs	
Logging and reporting (disk and memory logging, FortiCloud, syslog, and FortiAnalyzer)	YES	YES	
Managed by FortiManager	YES	YES	

## Transparent Mode Installation

This section contains information about [installing a FortiGate in Transparent mode](#) and using a [virtual wire pair](#), to simplify Transparent mode. It also contains information about [configuring the FortiGate's management IP](#).

### Installing a FortiGate in Transparent mode

Changing to Transparent mode removes most configuration changes made in NAT mode. To keep your current NAT mode configuration, backup the configuration using the **System Information** widget, found in the **Dashboard**.

1. Before connecting the FortiGate unit to your network, go to the **Dashboard** and locate enter the following command into the **CLI Console**:

```
config system settings
 set opmode transparent
 set manageip <address and netmask>
 set gateway <address>
end
```

2. Access the web-based manager by browsing to the new management IP.
3. (Optional) The FortiGate unit's DNS Settings are set to use FortiGuard DNS servers by default, which is sufficient for most networks. However, if you need to change the DNS servers, go to **Network > DNS** and add **Primary** and **Secondary** DNS servers. Select **Apply**.
4. If your network uses IPv4 addresses, go to **Policy & Objects > IPv4 Policy** and select **Create New** to add a security policy that allows users on the private network to access the Internet.

If your network uses IPv6 addresses, go to **Policy & Objects > IPv6 Policy** and select **Create New** to add a security policy that allows users on the private network to access the Internet. If the IPv6 menu option is not available, go to **System > Feature Visibility**, turn on **IPv6**, and select **Apply**. For more information on IPv6 networks, see the IPv6 Handbook.

Set the **Incoming Interface** to the internal interface and the **Outgoing Interface** to the Internet-facing interface

(typically WAN1). You will also need to set **Source Address**, **Destination Address**, **Schedule**, and **Service** according to your network requirements. You can set these fields to the default all/ALL settings for now but should create the appropriate objects later after the policies have been verified.

5. Make sure the **Action** is set to **ACCEPT**. Select **OK**.

It is recommended to avoid using any security profiles, such as AntiVirus or web filtering, until after you have successfully installed the FortiGate unit. After the installation is verified, you can apply any required security profiles.

For more information about using security profiles, see the Security Profiles handbook.

6. Go to the **Dashboard** and locate the **System Resources** widget. Select **Shutdown** to power off the FortiGate unit.  
Alternatively, you can also use the CLI command `execute shutdown`.
7. Connect the FortiGate unit between the internal network and the router.
8. Connect the Internet-facing interface to the router's internal interface and connect the internal network to the FortiGate using an internal port (typically port 1).
9. Power on the FortiGate unit. You will experience downtime before the FortiGate unit starts up completely.

## Results

Users on the internal network are now able to browse to the Internet. They should also be able to connect to the Internet using any other protocol or connection method that you defined in the security policy.

If a FortiGate unit operating in Transparent mode is installed between your internet network and a server that is providing a network service to the internal network, such as DNS or DHCP, you must add a wan1-to-internal policy to allow the server's response to flow through the FortiGate unit and reach the internal network.

## Using a Virtual Wire Pair to Simplify Transparent Mode

A virtual wire pair consists of two interfaces that have no IP addresses and all traffic received by one interface in the pair can only be forwarded out the other; as controlled by firewall policies. Since the interfaces do not have IP addresses, you can insert a virtual wire pair into a network without having to make any changes to the network. A virtual wire pair can include redundant and 802.3ad aggregate (LACP) interfaces.

Interfaces used in a virtual wire pair cannot be used for admin access to the ISFW FortiGate. Before creating a virtual wire pair, make sure you have a different port configured to allow admin access using your preferred protocol.

---

1. Go to **Network > Interfaces** and select **Create New > Virtual Wire Pair**. Add two ports to the virtual wire pair. These ports cannot be part of a switch, such as the default **internal/lan** interface.
2. Go to **Policy & Objects > IPv4 Virtual Wire Pair Policy** and create a policy will allow traffic to flow between the two ports. Give the policy an appropriate **Name**. Select the direction that traffic is allowed to flow. Configure the other firewall options as needed.
3. If necessary, create a second virtual wire pair policy allowing traffic to flow between the ports in the opposite direction.

Traffic can now flow between the two ports. Go to **FortiView > Policies** to see traffic flowing through both policies.

## Management IP configuration

A FortiGate in Transparent mode can be assigned with a single IP address for remote access management and multiple static routes can be configured. This can be used if in-band management wants to be applied.

When out-of-band management is desired (dedicated interface for remote management access), it is recommended to use a separate VDOM in NAT mode.

### In-band management details and example

The management IP address is bound to all ports or VLANs belonging to the same VDOM. Remote access services are subject to the same rules as in NAT mode, and must be enabled/disabled on each port.

#### Example of management IP configuration in Transparent mode:

```
config system settings
 set manageip 10.1.1.100/255.255.255.0
end
config router static
 edit 1
 set gateway 10.1.1.254
 next
end
config system interface
 edit port1
 set allowaccess ping ssh https snmp
 end
```

It is also possible to add a second IP address for management and additional default routes:

```
config system settings
 set opmode transparent
 set manageip 192.168.182.136/255.255.254.0 10.1.1.1/255.255.255.0
end

config router static
 edit 1
```

```
 set gateway 192.168.183.254
next
edit 2
 set gateway 10.1.1.254
next
end
```

---

`ping-server` (dead gateway detection) is not supported in Transparent mode.

---

### Out-of-band management details and example

When VDOM is enabled and the VDOMs are operating in Transparent mode, it is recommended, to avoid L2 loops and allow more routing flexibility, to keep one VDOM (generally the root VDOM) in NAT mode, with one or more VLAN or physical interface as out-of-band management.

---

The management VDOM must have IP connectivity to the Internet to allow communication with the FDS and retrieve services information (AV, IPS, Fortiguard filtering, Support...). All syslog and FortiManager communication also go through the management VDOM.

---

## Networking in Transparent Mode

This section contains information about networking concepts in Transparent mode. It contains the following topics:

- [Packet Forwarding](#)
- [Network Address Translation \(NAT\)](#)
- [VLANs and Forwarding Domains](#)
- [Inter-VDOM links between NAT and Transparent VDOMs](#)
- [Packet Forwarding using Cisco Protocols](#)
- [Configuration Example](#)

## Packet Forwarding

The following sections include information about configuring packet forwarding in Transparent mode:

- [MAC learning and L2 Forwarding Table](#)
- [Broadcast, Multicast, and Unicast Forwarding](#)
- [Multicast Processing](#)
- [Source MAC Addresses](#)
- [ARP Table](#)
- [Verifying the Forwarding Database](#)
- [Spanning Tree BPDUs Forwarding](#)
- [Non-IPv4 Ethernet frames forwarding](#)

### MAC learning and L2 Forwarding Table

When operating in Transparent mode, a FortiGate behaves like an L2 switch in accordance with 802.1d principles:

- The forwarding database (FDB) is populated with the network devices MAC addresses during a MAC learning process, based on the source addresses seen in the Ethernet frames ingressing a FortiGate port. Static MAC entries can also be configured using the following CLI command:

```
config system mac-address-table
 edit 00:01:02:03:04:05
 set interface "port3"
 next
end
```

The FDB table can be verified with the following command: `diagnose netlink brctl name host TP.b`

- Ethernet IP frames forwarding is based on known MAC address on each port.
- As Spanning Tree is not running on the FortiGate, a port that comes up goes immediately into forwarding or flooding state. This last state will not occur once unicast MAC addresses are present in the FDB.

If the FortiGate in Transparent mode bridges traffic to a router or host using a virtual MAC for one direction and a different physical MAC for the other direction (for example when VRRP or HSRP protocols are used), it is highly recommended to create a static MAC entry for the virtual MAC. This is to make sure that the virtual MAC address is present in the FDB.

## Broadcast, Multicast, and Unicast Forwarding

In Transparent mode, IPv4 packets are typically only forwarded by the FortiGate from a port to another port when a firewall policy is matched with action ACCEPT.

Below are exceptions.

- **L2 (IP) Broadcast frames forwarding:**

L2 (IP) means a L2 frame type 0x0800 (IP) or 0x0806 (ARP)

- **ARP:** by default, ARP broadcasts and ARP reply packets are flooded/forwarded on all ports or VLANs belonging to the same forwarding domain, without the need of firewall policies between the ports. This default behavior is necessary to allow the population of the FDB and allow further firewall policy lookup (see section Transparent mode Firewall processing for more details). This option is configurable at the interface settings level with the parameter `arpforward` (enabled by default).
- **Non-ARP:** To forward non-ARP broadcasts, the following CLI command is used:

```
config system interface
 edit "port2"
 set broadcast-forward enable
 next
end
```

- **L2 (IP) Multicast frames forwarding:** the FortiGate does not forward frames with multicast destination MAC addresses by default. Multicast traffic such as one used by routing protocols or streaming media may need to traverse the FortiGate which should not interfere this communication.

Fortinet recommends that the FortiGate is set up using Multicast policies. This allows for greater control and predictability on traffic behavior. However Multicast traffic may be forwarded through a Transparent mode device using the `multicast-skip-policy` setting. This is detailed in the section ["Multicast Processing" on page 3229](#)

- **L2 (IP) Unicast frames forwarding:** a frame with a unicast destination MAC address is subject to firewall processing before being forwarded (see ["Firewall Policy Look Up" on page 3242](#) for more details). This does not apply to ARP replies.

## Multicast Processing

In Transparent mode, a FortiGate does not forward frames with multicast destination MAC addresses by default. If multicast traffic is required, multicast policies are recommended to allow finer control of this traffic.

### Forwarding all multicast traffic with policy

Multicast traffic may have to be forwarded through a Transparent mode device using the `multicast-skip-policy` system setting. This is the configuration for this solution:

```
config system settings
 set multicast-skip-policy enable
end
```

In that case, no check is performed on sources/destinations/interfaces. A multicast packet received on an interface is flooded unconditionally to all interfaces (except the incoming interface) belonging to the same forwarding domain.

### Configuring firewall multicast-policy

The use of `firewall multicast-policy` allows a finer control over the multicast packets. Hereafter are some commented examples. Note that the parameter `multicast-skip-policy` mentioned above must be left to disabled.

Those policies can only be configured from the CLI.

#### 1- Simple policy

```
config firewall multicast-policy
 edit 1
 set action accept
 next
end
```

In that case, no check is performed on sources/destinations/interfaces. A multicast packet received on an interface is flooded unconditionally to all interfaces (except the incoming interface) belonging to the same forwarding domain.

#### 2- To restrict incoming and outgoing interfaces:

```
config firewall multicast-policy
 edit 1
 set srcintf "port1"
 set dstintf "port2"
 set action accept
 next
end
```

**3- To be more restrictive (example to allow RIP2 packets from port1 to port2 and sourced by 10.10.0.10):**

```
config firewall multicast-policy
edit 1
set srcintf "port1"
set srcaddr 10.10.0.10 255.255.255.255
set dstintf "port2"
set dstaddr 224.0.0.9 255.255.255.255
set action accept
next
end
```

**4- This policy will allow all 224.0.0.0/255 range (OSPF, RIPv2, DVMRP...) from port1 to port2**

```
config firewall multicast-policy
edit 1
set srcintf "port1"
set dstintf "port2"
set dstaddr 224.0.0.0 255.255.255
set action accept
next
end
```

**Source MAC Addresses**

When a FortiGate is in Transparent Mode, it does not typically alter the original source and destination address of packets that flow through the unit. Because of this, end devices do not “see” the MAC address of the FortiGate. However, if network address translation (NAT) is enabled by a firewall policy, the source MAC address will be the MAC address of the FortiGate's management interface.

IP packets that are initiated by the FortiGate (remote management, access to FortiGuard server...) are sent in L2 Ethernet frames that have a source MAC address of the interface in the virtual domain (VDM) with the lowest MAC address. Below is an example with port2 and port3 in the same VDM, remote access done via port3, but the sniffer trace showing MAC address of port2. The address of port2 is shown in bold.

```
diagnose hardware deviceinfo nic port2
[...]
Current_HWaddr 00:09:0F:85:3F:C4
Permanent_HWaddr 00:09:0F:85:3F:C4

fgt300 (global) # diagnose hardware deviceinfo nic port3
[...]
Current_HWaddr 00:09:0F:85:3F:C5
Permanent_HWaddr 00:09:0F:85:3F:C5

diagnose sniffer packet port3 "port 80" 6
3.774236 port3 -- 192.168.171.165.2619 -> 192.168.182.136.80: syn 3961770249
0x0000 0009 0f85 3fc4 0009 0f09 3204 0800 4500 ? 2...E.
0x0010 0030 8071 4000 7e06 98d7 c0a8 aba5 c0a8 .0.q@.~
0x0020 b688 0a3b 0050 ec23 d109 0000 0000 7002 ...;.P.# p.
0x0030 ffff d7e7 0000 0204 05b4 0101 0402
```

**ARP Table**

In Transparent mode, the Address Resolution Protocol (ARP) table is used in the following situations:

- For IP traffic received or originated by the FortiGate itself, and in destination of the management device or next-hop.
- When IPsec is used, the FortiGate uses its ARP table to forward the traffic from the IPsec tunnel to the local destination host(s).

All other forwarding decision is based on the Forwarding Database (FDB) table or optional settings.

## Verifying the Forwarding Database

To view all instances of the forwarding database (FDB), use the following CLI command:

```
diagnose netlink brctl list
```

### Example

```
FGT # diagnose netlink brctl list

list bridge information
1. root.b fdb: size=256 used=6 num=7 depth=2 simple=no
2. mgmt.b fdb: size=256 used=5 num=4 depth=2 simple=no
Total 2 bridges
```

Here above we can see two bridge instances for 2 VDOMs in Transparent mode: `root` and `mgmt`.

- This command will dump the L2 forwarding table for each VDOM bridge instance:

```
diagnose netlink brctl name host <VDOM_name>.b
```

### Example for the root VDOM:

```
FGT# diag netlink brctl name host root.b

show bridge control interface root.b host.
fdb: size=256, used=6, num=7, depth=2, simple=no
Bridge root.b host table
```

port	no	device	devname	mac addr	tth	atributes
2	7	wan2	02:09:0f:78:69:00	0	Local Static	
5	6	trunk_1	02:09:0f:78:69:01	0	Local Static	
3	8	dmz	02:09:0f:78:69:01	0	Local Static	
4	9	internal	02:09:0f:78:69:02	0	Local Static	
3	8	dmz	00:80:c8:39:87:5a	194		
4	9	internal	02:09:0f:78:67:68	8		
1	3	wan1	00:09:0f:78:69:fe	0	Local Static	

## Spanning Tree BPDUs Forwarding

Spanning tree Bridge Protocol Data Units (BPDUs) are not forwarded by default in Transparent Mode. To forward spanning tree BPDUs, the following setting can be applied on each interface where this is required:

```
config system interface
 edit port1
 set stpforward enable
 next
end
```

## Non-IPv4 Ethernet frames forwarding

In the situation where non IP frames (or non Ethernet II) frames need to be accepted on a port, the parameter `l2forward` can be enabled (disabled by default). This can be used to forward frames such as PPPoE PADI, Appletalk, on other ports belonging to the same forwarding domain.

The procedure is the following:

```
config system interface
 edit port1
 set l2forward enable
 next
 edit port2
 set l2forward enable
 next
end
```

## Network Address Translation (NAT)

While NAT is generally not used by a FortiGate in Transparent mode, both [source network address translation \(SNAT\)](#) and [destination network address translation \(DNAT\)](#) can be configured.

### Configuring SNAT

Source Network Address Translation (SNAT) is an option available in Transparent mode and configurable in CLI only, using the following commands:

```
config firewall ippool
 edit "nat-out"
 set endip 192.168.183.48
 set startip 192.168.183.48
 set interface vlan18_p3
 next
end

config firewall policy
 edit 3
 set srcintf "vlan160_p2"
 set dstintf "vlan18_p3"
 set srcaddr "all"
 set dstaddr "all"
 set action accept
 set ippool enable
 set poolname "nat-out"
 set schedule "always"
 set service "ALL"
 set nat enable
 next
end
```

The sniffer trace below shows the source IP 192.168.182.93 being source translated to 192.168.183.48:

```
fgt300 (TP) # diagnose sniffer packet any "host 10.2.2.1" 4

interfaces=[any]
filters=[host 10.2.2.1]
4.891970 vlan160_p2 in 192.168.182.93 -> 10.2.2.1: icmp: echo request
```

```
4.892003 vlan18_p3 out 192.168.183.48 -> 10.2.2.1: icmp: echo request
4.892007 port3 out 192.168.183.48 -> 10.2.2.1: icmp: echo request
4.933216 vlan18_p3 in 10.2.2.1 -> 192.168.183.48: icmp: echo reply
4.933249 vlan160_p2 out 10.2.2.1 -> 192.168.182.93: icmp: echo reply
4.933253 port2 out 10.2.2.1 -> 192.168.182.93: icmp: echo reply
```

### Configuring DNAT

The following example shows how to configure Destination Network Address Translation (DNAT) using a virtual IP on a FortiGate in Transparent Mode:

```
config firewall vip
 edit "vip1"
 set extip 192.168.183.48
 set extintf "vlan160_p2"
 set mappedip 192.168.182.78
 next
end

config firewall policy
 edit 4
 set srcintf "vlan160_p2"
 set dstintf "vlan18_p3"
 set srcaddr "all"
 set dstaddr "vip1"
 set action accept
 set schedule "always"
 set service "ALL"
 next
end
```

If the mappedip is on a different subnet than the management IP, the FortiGate must have a valid route to this destination

---

The sniffer trace below shows the destination IP 192.168.183.48 being translated to 192.168.182.78:

```
fgt300 (TP) # diagnose sniffer packet any "icmp" 4

interfaces=[any]
filters=[icmp]
4.126138 vlan160_p2 in 192.168.182.93 -> 192.168.183.48: icmp: echo request
4.126190 vlan18_p3 out 192.168.182.93 -> 192.168.182.78: icmp: echo request
4.126196 port3 out 192.168.182.93 -> 192.168.182.78: icmp: echo request
4.126628 vlan18_p3 in 192.168.182.78 -> 192.168.182.93: icmp: echo reply
4.126661 vlan160_p2 out 192.168.183.48 -> 192.168.182.93: icmp: echo reply
4.126667 port2 out 192.168.183.48 -> 192.168.182.93: icmp: echo reply
```

### VLANs and Forwarding Domains

The following sections include information about configuring virtual local area networks (VLANs) and forwarding domains in Transparent mode:

- [VLANs in Transparent Mode](#)
- [Forwarding Domains in Transparent Mode](#)
- [VLANs vs Forwarding Domains](#)
- [VLAN Forwarding](#)
- [Unknown VLANs and VLAN Forwarding](#)
- [VLAN Trunking and MAC Address Learning](#)
- [VLAN Translation](#)

## VLANs in Transparent Mode

A VLAN configured on a physical port is used to classify a packet in a broadcast domain in ingress and to tag packet in egress. A VLAN on the FortiGate conforms to the standard 802.1q. The following rules apply to VLAN configuration:

- a VLAN ID can be used only once on the same physical port
- the same VLAN ID can be used on a different port
- the VLAN ID range is from 1 to 4094

## Forwarding Domains in Transparent Mode

A forwarding domain is used to create separate broadcast domains and confine traffic across two or more ports. It also allows learning the same MAC in different VLANs (IVL).

A forwarding domain and its associated ID number are unique across one VDOM, or a FortiGate with VDOMs disabled. Each new VDOM will create a new bridge instance in the FortiGate.

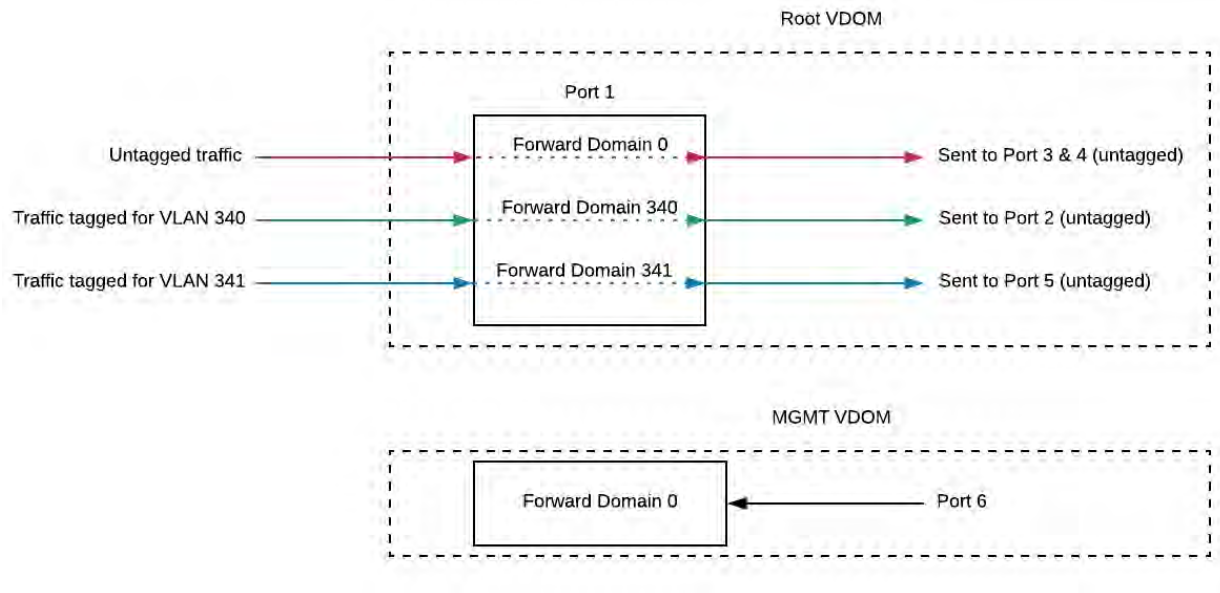

Even though the forwarding domain ID is not in relation with the actual VLAN numbers, it is recommended, for maintenance and troubleshooting purposes, to configure one forwarding domain per VLAN and use the same forwarding domain ID as the VLANs ID.

Once forwarding domains are configured, it is possible to configure firewall policies only between ports or VLAN belonging to the same forwarding domain.

---

## Example configuration

This example has three forwarding domains and VLANs configured. In this example, there are two VDOMs in Transparent Mode: root and MGMT. Forwarding domain 0 is the default on the FortiGate or VDOM in Transparent Mode.

- Root VDOM has:
  - 3 forwarding domains, 0, 340, and 341.
  - VLAN 340 configured on port1; packets will be tagged with ID 340
  - VLAN 341 configured on port1; packets will be tagged with ID 341
  - All other ports are untagged
- MGMT VDOM has got only the default forwarding domain 0

The expected behavior is the following:

- Packets untagged ingressing port1, port3 and port4 belong to the same broadcast domain in the root VDOM
- Packets tagged with VLAN 340 ingressing port1 and Packets untagged ingressing port2 belong to the same broadcast domain in the root VDOM
- Packets tagged with VLAN 341 ingressing port1 and Packets untagged ingressing port5 belong to the same broadcast domain in the root VDOM
- Packets untagged ingressing port6 belong to a different broadcast domain in the MGMT VDOM

### CLI Syntax for forwarding domain 340

```
config system interface
 edit "VLAN340"
 set forward-domain 340
 set interface "port1"
 set vlanid 340
 next
 edit "port3"
 set forward-domain 340
```

```
next
end
```

## VLANs vs Forwarding Domains

There are several differences between VLAN and a forwarding domain configured on a FortiGate in Transparent Mode:

- A forwarding domain is used to create separated broadcast domains between VLANs and allow independent VLAN learning - IVL (MAC addresses in the FDB). This would be equivalent to creating VLANs on a regular L2 switch.

When VLANs are used in the network, configuring different forwarding domains is essential to avoid broadcast duplications. See also section Default VLAN forwarding behavior for additional information.

---

- VLANs configured on interfaces are only used for tagging packets egressing the port and classifying packets at ingress.
- The packets processed by the direct interface (or port) itself are always sent untagged and must be received untagged.

## VLAN Forwarding

VLAN forwarding allows you to forward all VLANs traffic of a trunk that was connecting two network devices and where the FortiGate has been introduced, without having to perform any further configuration.

It is recommended to configure forwarding domains for each VLAN and disable this parameter in order to avoid packet from looping into the trunk from one VLAN to another. By default, the parameter `vlanforward` is disabled on each physical interface of a FortiGate or VDOM in Transparent mode.

## Unknown VLANs and VLAN Forwarding

When a FortiGate receives a tagged frame with an unknown VLAN ID, traffic can be handled one of two ways, depending on whether VLAN forwarding is enabled or disabled.

By default, VLAN forwarding is disabled and any frames that are tagged with an unknown VLAN ID are dropped by the FortiGate.

If you enable VLAN forwarding, frames tagged with an unknown VLAN ID are forwarded from the port that received the frames to all other ports in the same forwarding domain(s). This allows you to insert the FortiGate between two devices using trunk ports without any further configuration.

## VLAN Trunking and MAC Address Learning

A FortiGate port becomes a trunk when 2 or more VLANs are configured on this port, in the same or different forwarding domains.

When trunks are configured on a FortiGate, it is essential to create forwarddomains, in order to avoid packets looping back on the VLANs of the trunk. This will confine all broadcasts and multicast traffic between the interfaces belonging to a same forward domain.

---

In the case where a trunk port is configured with a VLAN in a different forwarding domains, the MAC address of the network device connected to this port learns the FDB of each forwarding domain. This is Independent VLAN Learning (IVL).

## VLAN Translation

The same forwarding domain can include several different VLANs. Therefore, a frame ingressing an interface with a certain VLAN ID can be forwarded to another port with another VLAN ID. This is sometimes referred as VLAN translation.

## Inter-VDOM links between NAT and Transparent VDOMs

Inter-VDOM links between NAT and Transparent mode VDOMS can be useful for configurations where the NAT VDOMs that share a common Internet service route, which can be routed through a Transparent VDOM that provides additional functionality, like common Security inspection, WAN optimization, explicit proxying and so on.

Other examples include:

- Performing SSL offloading in the Transparent mode VDOM and providing Internet access through a NAT mode VDOM.
- Applying WAN optimization in a Transparent mode VDOM and other security features in the NAT mode VDOM.
- Using a dedicated Transparent mode VDOM for the explicit web proxy in front of a NAT mode VDOM that applies other security features.
- An ISP configuration with multiple per-tenant NAT mode VDOMs all sharing a single Internet connection but where the ISP only presents a single routed subnet. Each tenant can then be assigned an IP from the subnet for their respective VDOM link interface while using a single physical port to connect to the ISP router.

For more information about inter-VDOM links, please refer to the Virtual Domains handbook.

## Replay Traffic Scenario

Situations can arise where an identical TCP packet enters twice the FortiGate via 2 different ports. This can be due to a firewall or other network device redirecting packets out on the same port it has received it.

The FortiGate will in this condition detect a replay packet and drop it.

If the network topology or culprit devices cannot be changed to avoid this, the workaround on the FortiGate can be to disable TCP replay verification packets.

```
config system global
 set anti-replay | loose | strict | disable |
end
```

The debug flow diagnosis output hereafter shows the message indicating this condition:

```
id=20085 trace_id=179 msg="vd-VDOM_VLAN1 received a packet(proto=6, 10.10.253.9:10709
>10.10.248.5:25) from TO_EXTERNAL ."
id=20085 trace_id=179 msg="Find an existing session, id-00041475, original direction"
id=20085 trace_id=179 msg="replay packet, drop"
```

For additional diagnosis and troubleshooting procedures, go to <http://kb.fortinet.com>.

## Packet Forwarding using Cisco Protocols

In order to pass Cisco Discover Protocol (CDP) or Cisco VLAN Trunk Protocol (VTP) packets through a FortiGate in Transparent mode, the parameter `stpforward` must be applied on the port configuration. VTP and CDP packets are sent to the destination MAC address 01-00-0C-CC-CC-CC.

A Cisco NATIVE VLAN carries CDP/VTP frames. The frames of this VLAN must be received on the FortiGate physical interfaces (not VLAN sub-interface). Physical interfaces are the only ones that can send/accept non-tagged packets.

The example below will allow CDP and VTP packets to be sent from port3 up to the Remote unit, through two VDOMs, via one physical port and three port aggregations.

### Port and Port aggregation configuration:

```
config system interface
 edit "port1"
 set vdom "VD1"
 next
 edit "port2"
 set vdom "VD1"
 next
 edit "port3"
 set vdom "VD1"
 set stpforward enable
 next
 edit "port5"
 set vdom "VD3"
 next
 edit "port6"
 set vdom "VD3"
 next
 edit "port17"
 set vdom "VD2"
 next
 edit "port18"
 set vdom "VD2"
 next
 edit "port19"
 set vdom "VD2"
 next
 edit "port20"
 set vdom "VD2"
 next
 edit "LACP_VD2_IN"
 set vdom "VD2"
 set stpforward enable
 set type aggregate
 set member "port17" "port18"
 next
 edit "LACP_VD2_OUT"
 set vdom "VD2"
 set stpforward enable
 set type aggregate
```

```
 set member "port19" "port20"
 next
 edit "LACP_VD1"
 set vdom "VD1"
 set stpforward enable
 set type aggregate
 set member "port1" "port2"
 next
end
```

When using aggregation, the `stpforward` setting needs to be applied only on the port aggregation level, not on the physical port

This will also forward regular Spanning Tree BPDUs

### Verification with a sniffer trace:

```
FGT# diagnose sniffer packet any "" 4

41.365434 port3 in llc unnumbered, ui, flags [command], length 72
41.365437 LACP_VD1 out llc unnumbered, ui, flags [command], length 72
41.365439 port2 out llc unnumbered, ui, flags [command], length 72
41.365479 LACP_VD2_IN in llc unnumbered, ui, flags [command], length 72
41.365482 LACP_VD2_OUT out llc unnumbered, ui, flags [command], length 72
41.365484 port19 out llc unnumbered, ui, flags [command], length 72
```

See above the CDP packet flow from port3, LACP\_VD1 (port2), LACP\_VD2\_IN, LACP\_VD2\_OUT (port19).

The following sniffer trace command will filter only CDP or VTP packets :

```
FGT# diagnose sniffer packet port_name "ether host 01-00-0C-CC-CC-CC"
```

## Configuration Example

### Step 1: Create VLANs and forwarding domains

```
config system interface
 edit "vlan102_intern"
 set forward-domain 102
 set interface "port2"
 set vlanid 102
 next
 edit "vlan102_extern"
 set forward-domain 102
```

```
 set interface "port3"
 set vlanid 102
next
 edit "vlan103_intern"
 set forward-domain 103
 set interface "port2"
 set vlanid 103
next
 edit "vlan103_extern"
 set forward-domain 103
 set interface "port3"
 set vlanid 103
next
end
```

## Step 2: Create the appropriate Firewall Policies

```
config firewall policy
 edit 1
 set srcintf "vlan102_extern"
 set dstintf "vlan102_intern"
 set srcaddr "all"
 set dstaddr "all"
 set action accept
 set schedule "always"
 set service "ALL" next
 edit 2
 set srcintf "vlan102_intern"
 set dstintf "vlan102_extern"
 set srcaddr "all"
 set dstaddr "all"
 set action accept
 set schedule "always"
 set service "ALL" next
 edit 3
 set srcintf "vlan103_intern"
 set dstintf "vlan103_extern"
 set srcaddr "all"
 set dstaddr "all"
 set action accept
 set schedule "always"
 set service "ALL" next
 edit 4
 set srcintf "vlan103_extern"
 set dstintf "vlan103_intern"
 set srcaddr "all"
 set dstaddr "all"
 set action accept
 set schedule "always"
 set service "ALL" next
end
```

## Firewalls and Security in Transparent Mode

This section contains information about using firewalls and security scanning in Transparent mode. It contains the following topics:

- [Firewall Policy Look Up](#)
- [Firewall Session List](#)
- [Security Scanning](#)

### Firewall Policy Look Up

In Transparent mode, like in NAT mode, a firewall policy look up is based on the source and destination interfaces. The matching firewall policy will tell which actions to apply to the traffic, including logging and security scanning.

The FortiGate proceeds as follows to look for a matching firewall policy in Transparent mode:

- **Step 1:** an Ethernet IP frame ingresses a port (or a VLAN on a port), corresponding to a specific bridge instance (from the port VDOM and Forwarding domain). This frame contains a destination MAC address that we will call MAC\_D.
- **Step 2:** The FortiGate is making a MAC\_D address lookup in the bridge instance to determine the port where MAC\_D has been learned. This will be the destination interface.
- **Step 3:** The FortiGate is then looking for a firewall policy corresponding to the couple < source interface + destination interface >. If multiple policies with the same couple < source interface + destination interface > exist, the FortiGate screens all of them from TOP to BOTTOM (as displayed in the configuration), until a match is found. It is important to make sure that the most specific firewall policies are located at the top of the policy list, to make sure that traffic is matched to the appropriate policy.

### Firewall Session List

The flag **br** in the state line will indicate that this is a “bridged” session. See example below :

```
FGT# diagnose sys session list

session info: proto=17 proto_state=00 duration=59 expire=128 timeout=0 flags=000
00000 sockflag=00000000 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=
ha_id=0 hakey=0
policy_dir=0 tunnel=/
state=may_dirty br rem
statistic(bytes/packets/allow_err): org=385/5/1 reply=0/0/0 tuples=2
orgin->sink: org pre->post, reply pre->post dev=3->4/4->3 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 192.168.182.93:1025->4.2.2.1:53(0.0.0.0:0)
hook=post dir=reply act=noop 4.2.2.1:53->192.168.182.93:1025(0.0.0.0:0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=1 serial=000006d3 tos=ff/ff
imp2p=0 app=0
dd_type=0 dd_rule_id=0
```

## Security Scanning

Security scanning occurs in the same manner in NAT mode and Transparent mode. When a protection profile is enabled on a firewall policy for content inspection, the FortiGate acts like a transparent proxy for the protocols that need to be inspected.

The FortiGate will therefore intercept the TCP sessions and create its own session from client to server and server to client. The source and destination MAC addresses of the original L2 frames are however not altered in this communication, as described in the section Network operation : source MAC addresses in frames sent by or through the FortiGate.

Devices in the network communicating through the FortiGate do not know the presence of the FortiGate.

---

For more information about security scanning, see the Security Profiles handbook.

## Integrated Switch Fabric Access Control List Policies

### IPsec VPN in Transparent Mode

This section contains information about configuring IPsec virtual private networks (VPNs) in Transparent mode. It contains the following topics:

- [Using IPsec VPNs in Transparent Mode](#)
- [Example 1: Remote Sites with Different Subnets](#)
- [Example 2: Remote Sites on the Same Subnet](#)

### Using IPsec VPNs in Transparent Mode

In Transparent mode, IPsec VPN is supported in Policy-based configuration mode only.

IPsec VPN in Transparent mode can be used in those scenarios:

- Encrypt data over routed networks without changing anything on the routers. See example 1.
- Encrypt data over a non-routed transport network (extension of a LAN for example). See example 2.

The following rules apply to IPsec in Transparent mode:

- If both remote FortiGate IPsec gateways are not in the same broadcast domain (separated by routers):
  - The hosts on each side must be on different subnets.
  - The FortiGate management IP addresses must be in the same subnet as the local hosts. This is the preferred option.
- If both remote FortiGate IPsec gateways are in the same broadcast domain (separated by optical switches for examples), the hosts on each side can be :
  - On the same subnet
  - On different subnet if the appropriate static route is configured on the remote Fortigate
  - The FortiGate management IP addresses can be in any different subnet than the local hosts
- A firewall Policy with the action IPsec is used to send traffic to the remote device into the tunnel.

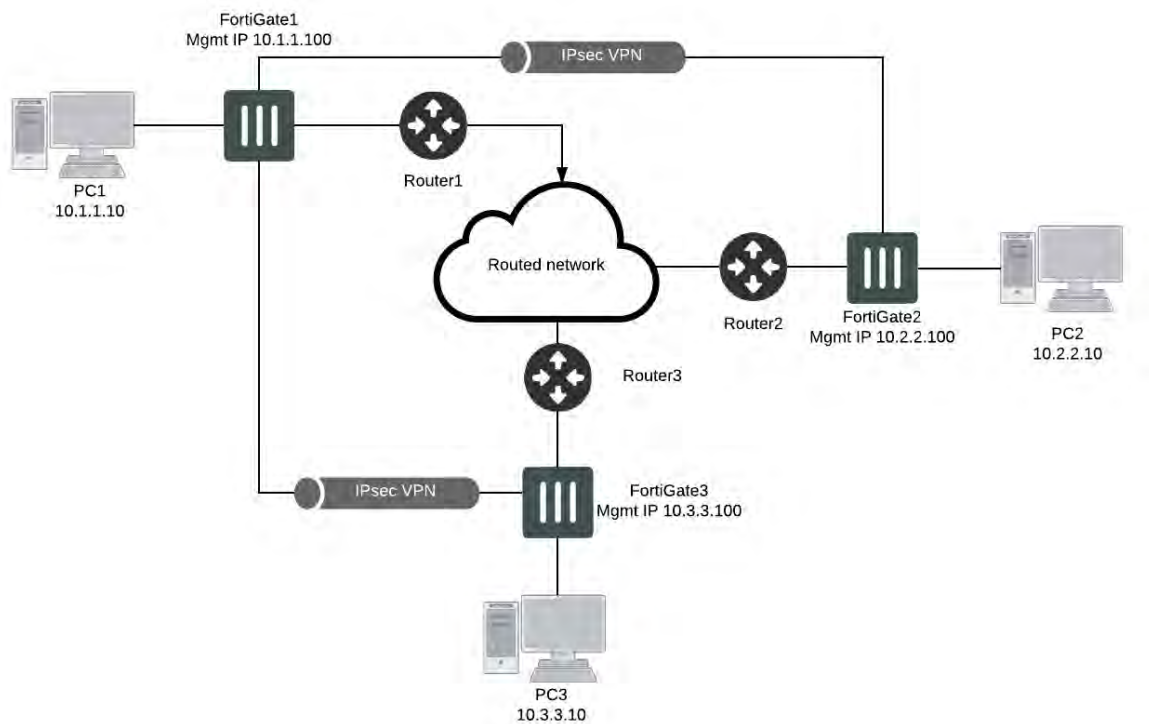

Therefore, it is important to place all remote devices on the appropriate ports of the Fortigate to allow a proper match < source interface + destination interface > . See section Transparent mode Firewall processing for more details.

This scenario requires that the remote hosts located on the remote FortiGate's protected subnets have their MAC addresses hardcoded in FortiGate's static MAC entry list. If this is not configured then it is expected to see outage in network communications.

---

## Example 1: Remote Sites with Different Subnets

This example provides a configuration example for IPsec VPN tunnels between three FortiGate in Transparent Mode in different subnets, as well as some troubleshooting steps.

The expectation for this example is that PC1 will be able to communicate via the IPsec tunnels with PC2 and PC3, which are in different subnets.

The requirements for this example are:

- Because both FortiGate are not in the same broadcast domain (separated by routers), the hosts on each side must be on different subnets.
- FortiGate management IP addresses must be in the same subnet as the local hosts
- The default gateways (router1, router2, router3) for PC1, PC2 and PC3 must be behind port2 in order for the FortiGate to match the appropriate Encrypt firewall policy (port1 --> port2)

### Configuration of FortiGate 1 (FGT1):

Only relevant parts of configuration are provided.

```
config system settings
 set opmode transparent
 set manageip 10.1.1.100/255.255.255.0
end

config router static
 edit 1
 set gateway 10.1.1.254
```

```
 next
end

config firewall address
 edit "10.1.1.0/24"
 set subnet 10.1.1.0 255.255.255.0
 next
 edit "10.2.2.0/24"
 set subnet 10.2.2.0 255.255.255.0
 next
 edit "10.3.3.0/24"
 set subnet 10.3.3.0 255.255.255.0
 next
end

config vpn ipsec phase1
 edit "to_FGT2"
 set proposal 3des-sha1 aes128-sha1 des-md5
 set remote-gw 10.2.2.100
 set psksecret fortinet
 next
 edit "to_FGT3"
 set proposal 3des-sha1 aes128-sha1 des-md5
 set remote-gw 10.3.3.100
 set psksecret fortinet
 next
end

config vpn ipsec phase2
 edit "to_FGT2"
 set keepalive enable
 set phasename "to_FGT2"
 set proposal 3des-sha1 aes128-sha1
 set dst-subnet 10.2.2.0 255.255.255.0
 set src-subnet 10.1.1.0 255.255.255.0
 next
 edit "to_FGT3"
 set keepalive enable
 set phasename "to_FGT3"
 set proposal 3des-sha1 aes128-sha1

 set vpntunnel "to_FGT3"
next
end
```

### Configuration of FortiGate 2 (FGT2):

Only relevant parts of configuration are provided.

```
config system settings
 set opmode transparent
 set manageip 10.2.2.100/255.255.255.0
end

config router static
 edit 1
 set gateway 10.2.2.254
 next
end

config firewall address
 edit "10.1.1.0/24"
 set subnet 10.1.1.0 255.255.255.0
 next
 edit "10.2.2.0/24"
 set subnet 10.2.2.0 255.255.255.0
 next
end

config vpn ipsec phase1
 edit "to_FGT1"
 set nattraversal disable
 set proposal 3des-sha1 aes128-sha1 des-md5
 set remote-gw 10.1.1.100
 set psksecret fortinet
 next
end

config vpn ipsec phase2
 edit "to_FGT1"
 set keepalive enable
 set phasename "to_FGT1"
 set proposal 3des-sha1 aes128-sha1
 set dst-subnet 10.1.1.0 255.255.255.0
 set src-subnet 10.2.2.0 255.255.255.0
 next
end
```

```

config firewall policy
edit 1
 set srcintf "port1"
 set dstintf "port2"
 set srcaddr "10.2.2.0/24"
 set dstaddr "10.1.1.0/24"
 set action ipsec
 set schedule "always"
 set service "ALL"
 set inbound enable
 set outbound enable
 set vpntunnel "to_FGT1"
next
end

```

## Troubleshooting procedure

All steps given when PC1 pings PC2.

### Verify if IPsec tunnels are up

```

FGT1 # diagnose vpn tunnel list

list all ipsec tunnel in vd 0

name=to_FGT2 ver=0 serial=1 10.1.1.100:0->10.2.2.100:0 lgwy=dyn tun=tunnel mode= auto
bound_if=0
proxyid_num=1 child_num=0 refcnt=7 ilast=0 olast=0
stat: rxp=0 txp=0 rxb=0 txb=0
dpd: mode=active on=1 idle=5000ms retry=3 count=0 seqno=1455
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=to_FGT2 proto=0 sa=0 ref=1 auto_negotiate=0 serial=5
 src: 10.1.1.0/255.255.255.0:0
 dst: 10.2.2.0/255.255.255.0:0

```

The above tunnel is down (output given as example)!

```

FGT2 # diagnose vpn tunnel list

list all ipsec tunnel in vd 0

name=to_FGT1 10.2.2.100:0->10.1.1.100:0 lgwy=dyn tun=tunnel mode=auto bound_if=0
proxyid_num=1 child_num=0 refcnt=7 ilast=1 olast=1
stat: rxp=0 txp=0 rxb=0 txb=0
dpd: mode=active on=1 idle=5000ms retry=3 count=0 seqno=21 natt:
mode=none draft=0 interval=0 remote_port=0
proxyid=to_FGT1 proto=0 sa=1 ref=2 auto_negotiate=0 serial=1
 src: 10.2.2.0/255.255.255.0:0
 dst: 10.1.1.0/255.255.255.0:0
SA: ref=3 options=00000009 type=00 soft=0 mtu=1436 expire=1771 replaywin=0 seq no=1
life: type=01 bytes=0/0 timeout=1773/1800
dec: spi=c1a8e951 esp=3des key=24 9213fdf22b150e01abb3535d1a647044eebf772b92f2f7ee
ah=sha1 key=20 66a38bf99f0b2d234f64b5a05187995c4f56f6bb
enc: spi=322067b4 esp=3des key=24 720e5680329937fb3630b7ed70bd41bb3114d3c269ae8b61
ah=sha1 key=20 e316113eb6ea03b014b3a5f9c1a3bd386637801a

```

The above tunnel is up!

**Verify that destination local hosts are seen in the ARP table (necessary for IPsec despite being in TP mode)**

```
FGT2 # get system arp
```

Address	Age(min)	Hardware Addr	Interface
10.2.2.10	2	00:50:56:00:76:04	root.b
10.2.2.254	0	00:09:0f:30:29:e4	root.b

**Using the debug flow command on the initiator side (example on FortiGate1)**

```
FGT1 # diagnose debug flow filter addr 10.1.1.10
FGT1 # diagnose debug flow show console enable
FGT1 # diagnose debug enable
FGT1 # diagnose debug flow trace start 50

FGT1 # id=36870 trace_id=615 msg="vd-root received a packet(proto=1, 10.1.1.10:512->10.2.2.10:8) from port1."

id=36870 trace_id=617 msg="Find an existing session, id-00000636, original direction"
id=36870 trace_id=617 msg="enter IPsec tunnel-to_FGT2"
id=36870 trace_id=617 msg="encrypted, and send to 10.2.2.100 with source 10.1.1.100"
id=36870 trace_id=617 msg="send out via dev-port2, dst-mac-00:09:0f:30:29:e0"
id=36870 trace_id=618 msg="vd-root received a packet(proto=1, 10.2.2.10:512->10.1.1.10:0) from port2."
id=36870 trace_id=618 msg="Find an existing session, id-00000636, reply direction"
id=36870 trace_id=618 msg="send out via dev-port1, dst-mac-00:50:56:00:76:03"
id=36870 trace_id=619 msg="vd-root received a packet(proto=1, 10.1.1.10:512->10.2.2.10:8) from port1."
id=36870 trace_id=619 msg="Find an existing session, id-00000636, original direction"
id=36870 trace_id=619 msg="enter IPsec tunnel-to_FGT2"
id=36870 trace_id=619 msg="encrypted, and send to 10.2.2.100 with source 10.1.1.100"
id=36870 trace_id=619 msg="send out via dev-port2, dst-mac-00:09:0f:30:29:e0"
id=36870 trace_id=620 msg="vd-root received a packet(proto=1, 10.2.2.10:512->10.1.1.10:0) from port2."
id=36870 trace_id=620 msg="Find an existing session, id-00000636, reply direction"
id=36870 trace_id=620 msg="send out via dev-port1, dst-mac-00:50:56:00:76:03"
```

The message "id=36870 trace\_id=615 msg="SA is not ready yet, drop" simply means that the tunnel was not up yet.

**Using the debug flow command on the receiver side (example on FortiGate2)**

```

FGT2 # diagnose debug flow filter addr 10.1.1.10
FGT2 # diagnose debug flow show console enable
FGT2 # diagnose debug enable
FGT2 # diagnose debug flow trace start 50

FGT2 # id=36870 trace_id=51 msg="vd-root received a packet(proto=1, 10.1.1.10:512->10.2.2.10:8) from port2."
id=36870 trace_id=51 msg="allocate a new session-00000435"
id=36870 trace_id=51 msg="Allowed by Policy-1:"
id=36870 trace_id=51 msg="send out via dev-port1, dst-mac-00:50:56:00:76:04"
id=36870 trace_id=52 msg="vd-root received a packet(proto=1, 10.2.2.10:512->10.1.1.10:0) from port1."
id=36870 trace_id=52 msg="Find an existing session, id-00000435, reply direction"
id=36870 trace_id=52 msg="enter IPsec tunnel-to_FGT1"
id=36870 trace_id=52 msg="encrypted, and send to 10.1.1.100 with source 10.2.2.100"
id=36870 trace_id=52 msg="send out via dev-port2, dst-mac-00:09:0f:30:29:e4"

```

**Using the sniffer trace (example on FortiGate2)**

```

FGT2 # diagnose sniffer packet any "host 10.2.2.10" 4

9.460021 root.b out arp who-has 10.2.2.10 tell 10.2.2.100
9.460028 port2 out arp who-has 10.2.2.10 tell 10.2.2.100
9.460034 port1 out arp who-has 10.2.2.10 tell 10.2.2.100
9.460462 port1 in arp reply 10.2.2.10 is-at 0:50:56:0:76:4
9.460462 root.b in arp reply 10.2.2.10 is-at 0:50:56:0:76:4
[...]
49.477368 port2 in 10.1.1.10 -> 10.2.2.10: icmp: echo request
49.477444 port1 out 10.1.1.10 -> 10.2.2.10: icmp: echo request
49.477898 port1 in 10.2.2.10 -> 10.1.1.10: icmp: echo reply
50.510023 port2 in 10.1.1.10 -> 10.2.2.10: icmp: echo request
50.510079 port1 out 10.1.1.10 -> 10.2.2.10: icmp: echo request
50.510524 port1 in 10.2.2.10 -> 10.1.1.10: icmp: echo reply

```

The above ARP process in Transparent mode with IPsec is allowing the Fortigate to:

- Identify the MAC address of the destination device 10.2.2.10
- Populate the MAC table (see below), which in turn will give a destination interface and allow a Firewall policy look-up

**Check the FDB entries for the destination**

```

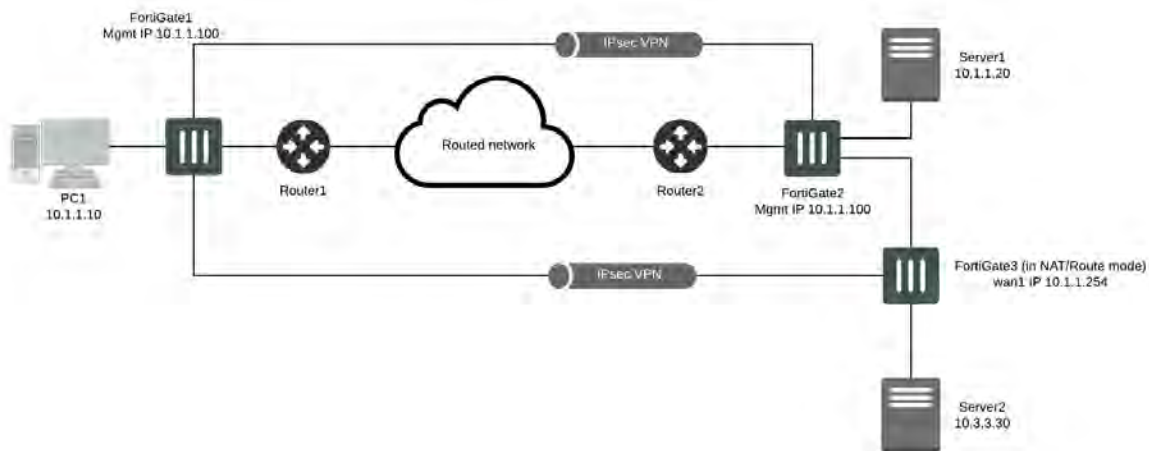

FGT2 # diagnose netlink brctl name host root.b

port no device devname mac addr ttl
[...
1 2 port1 00:50:56:00:76:04 0

```

## Example 2: Remote Sites on the Same Subnet

This example provides a configuration example for IPsec VPN tunnels between two FortiGate in Transparent Mode in the same subnet separated by a L2 transparent network and one remote subnet on the second site.

This scenario requires that PC1's MAC address is added to the FortiGate's static MAC table. The preferred scenario would be to have a router installed between the 2 FortiGate's.

The expectation for this example is that PC1 will be able to communicate via the IPsec tunnel with Server1 in the same subnet, and Server2 in a different subnet.

The requirements for this example are:

- The default gateway (FGT3) for PC1 and all remote device must be behind port2 of FGT1, in order for this FortiGate to match the appropriate Encrypt firewall policy (port1 --> port2)
- Despite being in Transparent mode, **FGT2 must have a valid route to Server2**
- FGT3 is used as a router between subnet 10.1.1.0/24 and 10.3.3.0/24.

PC1 MAC address added to FGT2 static MAC entries.

Server1 MAC address added to FGT1 static MAC entries.

### Configuration of FortiGate 1 (FGT1):

Only relevant parts of configuration are provided.

```
config system settings
 set opmode transparent
 set manageip 10.1.1.100/255.255.255.0
end

config router static
 edit 1
 set gateway 10.1.1.252
 next
end
```

```
config system mac-address-table
 edit 00:50:56:00:76:04 ==>Server1
 set interface port2
 next
end

config firewall address
 edit "all"
 next
 edit "Server1"
 set subnet 10.1.1.20 255.255.255.255
 next
 edit "Server2"
 set subnet 10.3.3.30 255.255.255.255
 next
 edit "10.1.1.0/24"
 set subnet 10.1.1.0 255.255.255.0
 next
 edit "gateway"
 set subnet 10.1.1.254 255.255.255.255
 next
end

config vpn ipsec phase1
 edit "to_FGT2"
 set proposal 3des-sha1 aes128-sha1 des-md5
 set remote-gw 10.1.1.200
 set psksecret fortinet
 next
end

config vpn ipsec phase2
 edit "to_FGT2"
 set keepalive enable
 set phasename "to_FGT2"
 set proposal 3des-sha1 aes128-sha1
 set src-subnet 10.1.1.0 255.255.255.0
 next
end

config firewall policy
 edit 1
 set srcintf "port1"
 set dstintf "port2"
 set srcaddr "10.1.1.0/24"
 set dstaddr "Server1"
 set action ipsec
 set schedule "always"
 set service "ALL"
 set inbound enable
 set outbound enable
 set vpntunnel "to_FGT2"
 next
 edit 2
 set srcintf "port1"
 set dstintf "port2"
 set srcaddr "10.1.1.0/24"
```

```

 set dstaddr "Server2"
 set action ipsec
 set schedule "always"
 set service "ALL"
 set inbound enable
 set outbound enable
 set vpntunnel "to_FGT2"
 next
edit 3
 set srcintf "port1"
 set dstintf "port2"
 set srcaddr "10.1.1.0/24"
 set dstaddr "gateway"
 set action ipsec
 set schedule "always"
 set service "ALL"
 set inbound enable
 set outbound enable
 set vpntunnel "to_FGT2"
next
end

```

Firewall Policy 3 is not mandatory and is only used to allow PC1 to test a ping reachability to its default gateway 10.1.1.254.

### Configuration of FortiGate 2 (FGT2):

Only relevant parts of configuration are provided.

```

config system settings
 set opmode transparent
 set manageip 10.1.1.200/255.255.255.0
end

config router static
 edit 1
 set gateway 10.1.1.252
 next
 edit 2
 set dst 10.3.3.0 255.255.255.0
 set gateway 10.1.1.254
 next
end

config system mac-address-table
 edit 00:50:56:00:76:03
 set interface wan1
 next
end

config firewall address
 edit "all"
 next
 edit "PC1"

```

```
 set subnet 10.1.1.10 255.255.255.255
 next
 edit "10.1.1.0/24"
 set subnet 10.1.1.0 255.255.255.0
 next
 edit "10.3.3.0/24"
 set subnet 10.3.3.0 255.255.255.0
 next
end

config vpn ipsec phase1
 edit "to_FGT1"
 set proposal 3des-sha1 aes128-sha1 des-md5
 set remote-gw 10.1.1.100
 set psksecret fortinet
 next
end

config vpn ipsec phase2
 edit "to_FGT1"
 set keepalive enable
 set phasename "to_FGT1"
 set proposal 3des-sha1 aes128-sha1
 set dst-subnet 10.1.1.0 255.255.255.0
 next
end

config firewall policy
 edit 1
 set srcintf "internal"
 set dstintf "wan1"
 set srcaddr "10.1.1.0/24"
 set dstaddr "PC1"
 set action ipsec
 set schedule "always"
 set service "ALL"
 set inbound enable
 set outbound enable
 set vpntunnel "to_FGT1"
 next
 edit 2
 set srcintf "internal"
 set dstintf "wan1"
 set srcaddr "10.3.3.0/24" set dstaddr "PC1"
 set action ipsec
 set schedule "always"
 set service "ALL" set inbound enable
 set outbound enable
 set vpntunnel "to_FGT1"
 next
end
```

## Troubleshooting procedure

### Check the ARP entries of PC1

```
C:\ arp -a
```

```
Interface: 10.1.1.10 --- 0x20003
Internet Address Physical Address Type
10.1.1.20 00-50-56-00-76-04 dynamic
10.1.1.254 00-09-0f-85-3f-c8 dynamic
```

MAC address **00-09-0f-85-3f-c8** is the FGT3 interface in subnet 10.1.1.0/24.

### FDB entries of FGT1

```
FGT1 (global) # diagnose netlink brctl name host Vdom1.b
```

```
show bridge control interface Vdom1.b host. fdb:
size=256, used=6, num=6, depth=1
```

```
Bridge Vdom1.b host table
```

port no	device	devname	mac addr	tvl	attributes
1	10	port1	00:50:56:00:76:03	0	
2	9	port2	00:50:56:00:76:04	44	static
2	9	port2	<b>00:09:0f:85:3f:c8</b>	13	
1	10	port1	00:09:0f:88:2f:69	0	Local Static
2	9	port2	00:09:0f:88:2f:68	0	Local Static
2	9	port2	<b>00:09:0f:23:01:d6</b>	0	

MAC address **00:09:0f:23:01:d6** is "internal" port MAC address of FGT2 00:09:0F:23:01:D6. This is the MAC address used for management in the Transparent mode VDOM of FGT2, chosen between the lowest MAC address between wan1 (00:09:0F:78:00:74) and internal (00:09:0F:23:01:D6).

### ARP entries of FGT2

```
FGT2 (TP) # get system arp
```

Address	Age(min)	Hardware Addr	Interface
10.1.1.20	82	00:50:56:00:76:04	TP.b
10.1.1.100	13	00:09:0f:88:2f:68	TP.b
<b>10.1.1.254</b>	<b>76</b>	<b>00:09:0f:85:3f:c8</b>	<b>TP.b</b>

it is important to have the entry for 10.1.1.254 which is the route to 10.3.3.0/24 .

### IPsec Tunnel verification on FGT1

```
FGT1 (Vdom1) # diagnose vpn tunnel list
```

```
list all ipsec tunnel in vd 3
```

```

name=to_FGT2 10.1.1.100:0->10.1.1.200:0 lgwy=dyn tun=tunnel mode=auto bound_if=0
proxyid_num=1 child_num=0 refcnt=10 ilast=0 olast=0
```

```

stat: rxp=2754 txp=2945 rxb=308448 txb=176700

```

### Sniffer trace on FGT1 when PC1 pings all 3 remote destinations

```

FGT1 (Vdom1) # diagnose sniffer packet any "icmp" 4

interfaces=[any]
filters=[icmp]
0.342268 port1 in 10.1.1.10 -> 10.3.3.30: icmp: echo request
0.342844 port2 in 10.3.3.30 -> 10.1.1.10: icmp: echo reply
0.342884 port1 out 10.3.3.30 -> 10.1.1.10: icmp: echo reply
0.771700 port1 in 10.1.1.10 -> 10.1.1.20: icmp: echo request
0.772504 port2 in 10.1.1.20 -> 10.1.1.10: icmp: echo reply
0.772539 port1 out 10.1.1.20 -> 10.1.1.10: icmp: echo reply
0.907377 port1 in 10.1.1.10 -> 10.1.1.254: icmp: echo request
0.907850 port2 in 10.1.1.254 -> 10.1.1.10: icmp: echo reply
0.907883 port1 out 10.1.1.254 -> 10.1.1.10: icmp: echo reply

```

### Sniffer trace on FGT1 filtered on IPsec protocol

```

FGT1 (Vdom1) # diagnose sniffer packet port2 "proto 50" 6

interfaces=[port2]
filters=[proto 50]
pcap_lookupnet: port2: no IPv4 address assigned

1.249003 port2 -- 10.1.1.100 -> 10.1.1.200: ip-proto-50 92
0x0000 0009 0f23 01d6 0009 0f88 2f68 0800 4500 ...# /h..E.
0x0010 0070 c9e6 0000 3f32 9a48 0a01 0164 0a01 .p ... ?2.H...d..
0x0020 01c8 1895 305f 0000 01e2 02b6 37b6 8b2c0_ 7..,

1.249478 port2 -- 10.1.1.200 -> 10.1.1.100: ip-proto-50 92
0x0000 0009 0f88 2f68 0009 0f23 01d6 0800 4500h...# ... E.
0x0010 0070 2e31 0000 3f32 35fe 0a01 01c8 0a01 .p.1..?25
0x0020 0164 3f14 8cb8 0000 01e2 324d 66e2 9236 .d? 2Mf..6

```

From the above trace, the MAC address **0009 0f88 2f68** is the MAC address of FGT1 port2 . This is the MAC address used for management in the Transparent mode VDOM of FGT1, chosen between the lowest MAC address between port1 (00:09:0F:88:2F:69) and port2 ( 00:09:0F:88:2F:68).

**Debug flow on FGT1 filtered on Server3**

```

FGT1 (Vdom1) # diagnose debug flow filter addr 10.3.3.30
FGT1 (Vdom1) # diagnose debug flow show console enable
FGT1 (Vdom1) # diagnose debug enable
FGT1 (Vdom1) # diagnose debug flow trace start 10

id=20085 trace_id=11 msg="vd-Vdom1 received a packet(proto=1, 10.1.1.10:512->10.3.3.30:8)
 from port1."
id=20085 trace_id=11 msg="Find an existing session, id-00004e85, original direction"
id=20085 trace_id=11 msg="enter IPsec tunnel-to_FGT2"
id=20085 trace_id=11 msg="encrypted, and send to 10.1.1.200 with source 10.1.1.100"
id=20085 trace_id=11 msg="send out via dev-port2, dst-mac-00:09:0f:23:01:d6"
id=20085 trace_id=12 msg="vd-Vdom1 received a packet(proto=1, 10.3.3.30:512->10.1.1.10:0)
 from port2."
id=20085 trace_id=12 msg="Find an existing session, id-00004e85, reply direction"
id=20085 trace_id=12 msg="send out via dev-port1, dst-mac-00:50:56:00:76:03"

```

From the trace above, **dst-mac-00:09:0f:23:01:d6** is "internal" port MAC address of FGT2 00:09:0F:23:01:D6. This is the MAC address used for management in the Transparent mode VDOM of FGT2, chosen between the lowest MAC address between wan1 (00:09:0F:78:00:74) and internal (00:09:0F:23:01:D6).

## Using FortiManager and FortiAnalyzer

FortiManager and FortiAnalyzer are supported similarly to NAT mode.

Establishing a communication to a FortiAnalyzer is done as per the example hereafter (from global level if VDOM is enabled). This setting is independent from being in Transparent mode. However, as stated earlier in this section the management VDOM must have IP connectivity to the FortiAnalyzer.

```
FGT (global) # show system fortianalyzer

config system fortianalyzer
 set status enable
 set server 10.2.2.2
end
```

## High Availability in Transparent Mode

This section contains information about configuring high availability in Transparent mode. It contains the following topics:

- [Virtual Clustering](#)
- [MAC Address Assignment](#)

Any other statement and feature description in this document apply to a FortiGate Cluster running in Active-Passive mode.

### Virtual Clustering

If VDOM (virtual domain) is enabled on a cluster operating Transparent Mode, HA Virtual Clustering can be configured in active-passive mode.

This will provide:

- Failover protection between two instances of a VDOM operating on two different FortiGate in the cluster.
- Load balancing between the FortiGate units on a per-VDOM basis.

The roles have been defined such as, in normal operation:

- FortiGate1 is Master for Vdom1 and Slave for Vdom2
- FortiGate2 is Master for Vdom2 and Slave for Vdom1

In case of a failure or reboot of a FortiGate, the remaining unit will become Master for Vdom1 and Vdom2.

The VDOMs given in this example are showing physical ports but a VDOM can also include VLAN interfaces.

---

The L2 connectivity between the FortiGate is showing 4 separate L2 switches, but it could also be one single switch on each side configured with appropriate VLANs.

---

### Configuration example

- FortiGate1:

```
FGT1 (global) # show system ha

config system ha
 set mode a-p
 set hbdev "port5" 0 "port6" 0
 set vcluster2 enable
 set override disable
 set priority 200
 config secondary-vcluster
 set override enable
 set priority 100
```

```
 set vdom "Vdom2"
 end
end
```

- **FortiGate2:**

```
FGT2 (global) # show system ha

config system ha
 set mode a-p
 set hbdev "port5" 0 "port6" 0
 set vcluster2 enable
 set override disable
 set priority 200
 config secondary-vcluster
 set override enable
 set priority 100
 set vdom "Vdom2"
 end
end
```

## MAC Address Assignment

If a cluster is operating in Transparent mode, the FortiGate Clustering Protocol (FGCP) assigns a virtual MAC address for the Master unit management IP address. Since you can connect to the management IP address from any interface, all of the FortiGate interfaces appear to have the same virtual MAC address.

## Best Practices

1. Create forwarding domains when VLANs are used and set `vlanforward to disable` on all relevant physical interface.
2. The forward-domain ID can be different to the VLAN ID, but it is recommended for troubleshooting and readability to keep them the same.
3. Only interfaces from the same forwarding domains can have firewall policies between each others.
4. In order to allow IVL (independent VLAN learning), the VLANs must be placed in separate forwarding domains.
5. If an out-of-band management is desired, use if possible a VDOM in NAT mode as management VDOM and create (an) other Transparent mode VDOM(s) for the user traffic.
6. As Spanning Tree BPDUs are not forwarded by default, insert the FortiGate with caution to avoid L2 loops.
7. Multicast packets are not forwarded by default; this might cause routing protocols (RIP2, OSPF) disruption.
8. When using HSRP or VRRP configure static MAC entries for the Virtual MAC addresses.

# Chapter 31 - Troubleshooting

## Troubleshooting

Welcome and thank you for selecting Fortinet products to protect your organization's network.

This guide is intended for administrators who need guidance on different network needs and information on basic and advanced troubleshooting.

This chapter contains the following topics:

- [Before you begin](#)
- [How this guide is organized](#)

### Before you begin

Before you begin using this guide, verify the following:

- You have administrative access to the FortiGate GUI and/or CLI.
- The FortiGate is integrated into your network.
- The operation mode is configured.
- The system time, DNS settings, administrator password, and network interfaces are configured.
- Firmware, FortiGuard AntiVirus, FortiGuard Application Control, and FortiGuard IPS are up to date.

To complete the tasks in this guide, you must have super\_admin administrative access (unless otherwise specified). Users with other types of administrative access may not be able to complete the troubleshooting tasks.

### How this guide is organized

This handbook chapter presents troubleshooting and problem solving issues that may help you with your FortiGate and contains the following sections:

- ["Troubleshooting methodologies" on page 3262](#) walks you through best practice concepts of FortiOS troubleshooting.
- ["Troubleshooting tools" on page 3266](#) describes some of the basic commands and parts of FortiOS that can help you with troubleshooting.
- ["Troubleshooting tips" on page 3292](#) presents most of the common issues and how to address them.
- ["Troubleshooting resources" on page 3316](#) identifies Fortinet resources for troubleshooting.

## Troubleshooting methodologies

This section explains how to prepare for troubleshooting, create a troubleshooting plan, and where to find additional resources.

The following topics are covered:

- Ensure you have administrator-level access to required equipment
- Establish a baseline
- Define the problem
- Create a troubleshooting plan
- Obtain any required equipment
- Consult Fortinet resources

## Ensure you have administrator-level access to required equipment

Before troubleshooting your FortiGate, you need administrator access to the equipment. If you're a client on a FortiGate that has virtual domains (VDOMs) enabled, you can often troubleshoot within your own VDOM.

However, you should inform the super admin for the FortiGate that you'll be performing troubleshooting tasks.

Also, you may need access to other networking equipment, such as switches, routers, and servers, to carry out tests. If you don't have access to this equipment, contact your network administrator for assistance.

## Establish a baseline

A FortiGate operates at all layers of the OSI model. For this reason, troubleshooting problems can become complex. Establishing baseline parameters for your system before a problem occurs helps to reduce the complexity when you need to troubleshoot.

Many of the guiding questions in the following sections compare the current problem to normal operation on your FortiGate. A best practice is to establish and record the normal operating status. Regular operation data shows trends, and allows you to see when changes occur and when there may be a problem. You can gather this data by using logs and SNMP tools to monitor the system performance or by regularly running information gathering commands and saving the output.

Back up your FortiOS configuration on a regular basis. This is a good practice and not only for troubleshooting. You can restore the backed up configuration as needed and save the time and effort of recreating it from the factory default settings.

You can use the following CLI commands to obtain normal operating data for a FortiGate:

<code>get system status</code>	Displays firmware versions and FortiGuard engine versions, and other system information
<code>get system performance status</code>	Displays CPU and memory states, average network usage, average sessions and session setup rate, virus caught, IPS attacks blocked, and uptime
<code>get hardware memory</code>	Displays information about memory
<code>get system session status</code>	Displays total number of sessions
<code>get router info routing-table all</code>	Displays all the routes in the routing table, including their type, source, and other useful data

<code>get ips session</code>	Displays memory used and maximum amount available to IPS as well and counts
<code>get webfilter ftgd-statistics</code>	Displays a list of FortiGuard related counts of status, errors, and other data
<code>diagnose sys session list</code>	Displays the list of current detailed sessions
<code>show system dns</code>	Displays the configured DNS servers
<code>diagnose sys ntp status</code>	Displays information about NTP servers

These commands are just a sample. You can run any commands for information gathering that apply to your system. For example, if you have active VPN connections, use the `get vpn *` series of commands to get more information about them.

To see an extensive snapshot of your system, you can use the `execute tac report` command. This command runs many diagnostic commands for specific configurations. Regardless of the features deployed on your FortiGate, this command records the current state of each feature. Then, if you need to perform troubleshooting later, you can run the same command again and compare the differences to quickly identify any suspicious output.

## Define the problem

The following questions help you define the problem. Be as specific as possible with your answers. Once you define the problem, you can search for a solution and then create a plan for how to solve it.

- **what's the problem?**  
The problem being observed isn't necessarily the actual problem. You should determine where the problem lies before starting to troubleshoot the FortiGate.
- **Was the device working before?**  
If the device never worked, it might be defective. For more information, see [Troubleshooting your FortiGate Installation](#) in the [Getting Started](#) chapter.
- **Can you reproduce the problem ?**  
If the problem is intermittent, it may be dependent on system load. Note that it may be difficult to troubleshoot an intermittent problem because it's difficult to reproduce.
- **What has changed?**  
Don't assume that nothing has changed in the network. Use the FortiGate event log to identify any possible configuration changes. Changes can be in the operating environment. For example, there might be a gradual increase in load as more sites are forwarded through the firewall.  
  
If something has changed, roll back the change and assess the impact.
- **What's the scope of the problem?**  
After you isolate the problem, determine what applications, users, devices, and operating systems are affected.

- What's not working? Be specific.
- Is there more than one thing that isn't working?
- Is it partly working? If so, what parts are working?
- Is it a connectivity issue for the entire device, or is there an application that isn't reaching the Internet?
- Where did the problem occur?
- When did the problem occur and to which users or groups of users?
- What components are involved?
- What applications are affected?
- Can you use a packet sniffer to trace the problem?
- Can you use system debugging or look in the session table to trace the problem?
- Do any of the log files indicate a failure has occurred?

The answers to these questions help you narrow down the problem and identify what you should check during your troubleshooting. The more things you can eliminate, the fewer things you need to check during troubleshooting. For this reason, be as specific and accurate as you can when you gather information.

## Create a troubleshooting plan

Once you define the problem and gather facts, you can create a troubleshooting plan to solve the problem.

You should list all possible causes of the problem that you can think of and how you can test for each possible cause. The plan acts as a checklist so that you know what you've tried and what's left to check. This is also important to have if more than one person is performing troubleshooting tasks. Be ready to add to your plan, as needed.

A troubleshooting plan is also useful when you contact Fortinet Support. It provides you with a record of information about the problem and the tasks that you tried to fix it.

## Providing supporting elements

If you contact [Fortinet Support](#) to speak to the Technology Assistance Center (TAC), be prepared to provide the following information:

- Firmware build version (use the `get system status` command)
- Network topology diagram
- Recent configuration file
- Recent debug log (optional)
- Summary of troubleshooting steps that you've already taken and the results.

Don't provide the output from the `execute tac` report unless TAC requests it. The output from this command is very large and isn't required in many cases.

---

## Obtain any required equipment

To test your solution, you may require additional networking equipment, computers, or other equipment.

Network administrators usually have additional networking equipment available to loan you, or a lab where you can bring the FortiGate unit to test.

If you don't have access to equipment, check for shareware applications that can perform the same tasks. Often, there are software solutions that you can use when hardware is too expensive.

## Consult Fortinet resources

After you define your problem, create a plan to find a solution, and carry out that plan. If you can't resolve the problem, see ["Troubleshooting resources" on page 3316](#).

## Troubleshooting tools

FortiOS provides a number of tools that help with troubleshooting both hardware and software issues. These tools include diagnostics and ports; ports are used when you need to understand the traffic coming in and going out on a specific port, for example, UDP 53, which is used by the FortiGate unit for DNS lookup and RBL lookup.

This section also contains information about troubleshooting FortiGuard issues.

- ["FortiOS diagnostics" on page 3266](#)
- ["FortiOS ports" on page 3288](#)
- ["FortiAnalyzer and FortiManager ports" on page 3289](#)
- ["FortiGuard troubleshooting" on page 3289](#)

## FortiOS diagnostics

FortiOS has a collection of diagnostic commands that you can use to troubleshoot and monitor the performance of your network. The `get` and `diagnose` CLI commands are the two main groups of diagnostic commands. Both commands display information about system resources, connections, and settings that allow you to locate problems or monitor system performance.

This topic includes diagnostics commands to help with:

- [Date and time](#)
- [Resource usage](#)
- [Proxy operation](#)
- [Hardware NIC](#)
- [Traffic trace](#)
- [Session table](#)
- [Firewall session setup rate](#)
- [Finding object dependencies](#)
- [Flow trace](#)
- [Packet sniffing and packet capture](#)
- [NPU-based interfaces](#)
- [Debug command](#)
- [The execute tac report command](#)
- [Other commands](#)

## Date and time

The system date and time are important for FortiGuard services, logging events, and sending alerts. The wrong time makes the log entries confusing and difficult to use.

Use Network Time Protocol (NTP) to set the date and time, if possible. This is an automatic method that doesn't require manual intervention. However, you must ensure that the port is allowed through the firewalls on your network. FortiToken synchronization requires NTP in many situations.

### How to set the date and time - GUI

1. Go to the **System Information** widget on the **Dashboard**. The date and time are displayed next to **System Time**.
2. To adjust the date and time settings, go to **System > Settings**.
3. In **System Time**, you can set the time zone, date and time, and select **NTP usage**.

### How to check the date and time - CLI

You can check the date and time using the CLI commands `execute date` and `execute time`.

```
config system global
 set timezone <integer>
end
config system ntp
 set type custom
 config ntpserver
 edit 1
 set server "ntp1.fortinet.net"
 next
 edit 2
 set server "ntp2.fortinet.net"
 next
 end
 set ntpsync enable
 set syncinterval 60
end
```

Use the `set timezone ?` command to display a list of timezones and the integers that represent them.

## Resource usage

Each program that runs on a computer has one or more processes associated with it. For example, if you open a Telnet program, it has an associated Telnet process. The same is true in FortiOS. All processes share system resources in FortiOS, including memory and CPU.

Use the `get system performance status` command to show the FortiOS performance status.

### Sample output:

```
FGT# get system performance status
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU0 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU1 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU2 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU3 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
Memory: 4050332k total, 527148k used (13%), 3381312k free (83%), 141872k freeable (3%)
```

```

Average network usage: 41 / 28 kbps in 1 minute, 54 / 44 kbps in 10 minutes, 42 / 34
kbps in 30 minutes
Average sessions: 33 sessions in 1 minute, 48 sessions in 10 minutes, 38 sessions in 30
minutes
Average session setup rate: 0 sessions per second in last 1 minute, 0 sessions per
second in last 10 minutes, 0 sessions per second in last 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 0 days, 22 hours, 59 minutes

```

Monitor the CPU and memory usage of internal processes, using the following command:

```
get system performance top <delay> <max_lines>
```

The data that the command lists includes the name of the daemon, the process ID, whether the process is sleeping or running, the CPU use percentage, and the memory use percentage.

**Sample output:**

```

get system performance top 10 100
Run Time: 0 days, 23 hours and 4 minutes
0U, 0N, 0S, 100I, 0WA, 0HI, 0SI, 0ST; 3955T, 3298F

```

## Proxy operation

Monitor proxy operations, using the following command:

```
diagnose test application <application> <option>
```

To display a list of available <application> values, enter:

```
diagnose test application ?
```

The <option> value depends on the application value that you use in the command. To display a list of available <option> values, enter:

```
diagnose test application <application> ?
```

For example, if the application is `http`, the CLI command that displays the `<option>` values is:

```
diagnose test application http ?
```

## Hardware NIC

Monitor hardware network operations, using the following command:

```
diagnose hardware deviceinfo nic <interface>
```

The information that this command shows is important because errors at the interface indicate data link or physical layer issues which may impact the performance of the FortiGate.

The following example shows a sample output when you set `<interface>` to `lan`:

```
System_Device_Name lan
Current_HWaddr 00:09:0f:68:35:60
Permanent_HWaddr 00:09:0f:68:35:60
State up
Link up
Speed 100
Duplex full
[.....]
Rx_Packets=5685708
Tx_Packets=4107073
Rx_Bytes=617908014
Tx_Bytes=1269751248
Rx_Errors=0
Tx_Errors=0
Rx_Dropped=0
Tx_Dropped=0
[...]
```

The `diagnose hardware deviceinfo nic` command displays a list of error names and values that are related to hardware. The following table describes possible hardware errors:

Field	Description
Rx_Errors = rx error count	Bad frame was marked as error by PHY
Rx_CRC_Errors + Rx_Length_Errors - Rx_Align_Errors	This error is only valid in 10/100M mode
Rx_Dropped or Rx_No_Buffer_Count	Running out of buffer space
Rx_Missed_Errors	Equals Rx_FIFO_Errors + CEXTERR (Carrier Extension Error Count); only valid in 1000M mode, which is marked by PHY
Tx_Errors = Tx_Aborted_Errors	ECOL (Excessive Collisions Count); only valid in half-duplex mode

Field	Description
	Late Collisions (LATECOL) Count
Tx_Window_Errors	Late collisions are collisions that occur after 64-byte time into the transmission of the packet while working in 10 to 100 Mb/s data rate and 512-byte time into the transmission of the packet while working in the 1,000 Mb/s data rate. This register only increments if transmits are enabled and the device is in half-duplex mode.
Rx_Dropped	See Rx_Errors
Tx_Dropped	Not defined
Collisions	Total number of collisions experienced by the transmitter; valid in half-duplex mode
Rx_Length_Errors	Transmission length error
Rx_Over_Errors	Not defined
Rx_CRC_Errors	Frame CRC error
Rx_Frame_Errors	Same as Rx_Align_Errors  This error is only valid in 10/100M mode.
Rx_FIFO_Errors	Same as Rx_Missed_Errors - a missed packet count
Tx_Aborted_Errors	See Tx_Errors
Tx_Carrier_Errors	The PHY should assert the internal carrier sense signal during every transmission. Failure to do so may indicate that the link has failed or the PHY has an incorrect link configuration. This register only increments if transmits are enabled. This register isn't valid in internal SerDes 1 mode (TBI mode for the 82544GC/EI) and is valid only when the Ethernet controller is operating at full duplex.
Tx_FIFO_Errors	Not defined
Tx_Heartbeat_Errors	Not defined
Tx_Window_Errors	See <a href="#">LATECOL</a>
Tx_Single_Collision_Frames	Counts the number of times that a successfully transmitted packet encountered a single collision  The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.

Field	Description
Tx_Multiple_Collision_Frames	A Multiple Collision Count which indicates the number of times that a transmit encountered more than one collision, but less than 16. The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Deferred	Counts defer events  A deferred event occurs when the transmitter can't immediately send a packet due to the medium being busy because another device is transmitting, the IPG timer hasn't expired, half-duplex deferral events are occurring, XOFF frames are being received, or the link isn't up. This register only increments if transmits are enabled. This counter doesn't increment for streaming transmits that are deferred due to TX IPG.
Rx_Frame_Too_Longs	The Rx frame is oversized
Rx_Frame_Too_Shots	The Rx frame is too short
Rx_Align_Errors	This error is only valid in 10/100M mode
Symbol Error Count	Counts the number of symbol errors between reads - SYMERRS.  The count increases for every bad symbol that's received, whether or not a packet is currently being received and whether or not the link is up. This register increments only in internal SerDes mode.

## Traffic trace

Traffic tracing allows you to follow a specific packet stream. This is useful to confirm that packets are taking the route you expect them to take on your network.

View the characteristics of a traffic session through specific security policies using:

```
diagnose sys session
```

Trace per-packet operations for flow tracing using:

```
diagnose debug flow
```

Trace per-Ethernet frame using:

```
diagnose sniffer packet
```

Trace a route from a FortiGate to a destination IP address

```
execute traceroute www.fortinet.com
traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms

```

## Session table

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all together instead of inspecting each packet individually. Each of these sessions has an entry in the session table that includes important information about the session.

### Use as a tool

Session tables are useful troubleshooting tools because they allow you to verify open connections. For example, if you have a web browser open to browse the Fortinet website, you would expect a session entry from your computer, on port 80, to the IP address for the Fortinet website. Another troubleshooting method is if there are too many sessions for FortiOS to process, you can examine the session table for evidence why this is happening.

You can view the FortiGate session table from using the FortiGate GUI or the CLI. The most useful troubleshooting data comes from the CLI. The session table in the GUI also provides useful summary information, particularly the current policy number that the session is using.

### GUI session information

You can view session information by going to the **FortiView** page. Read more about [FortiView consoles](#) in the Handbook's FortiView chapter.

### How to find which security policy a specific connection is using

Every program and device on your network must have a communication channel, or session, open to pass information. The FortiGate manages these sessions with features such as traffic shaping, antivirus scanning, and blocking known bad web sites. Each session has an entry in the session table.

You may want to find information for a specific session for troubleshooting. For example, if a secure web browser session isn't working properly, you can check the session table to ensure the session is still active and going to the proper address. The session table can also tell you the security policy number it matches, so you can check what's happening in that policy.

#### 1. Know your connection information.

You need to be able to identify the session you want. For this, you need the source IP address (usually your computer), the destination IP address (if you have it) and the port number which is determined by the program that you're using. Some commons ports are:

- Port 80 (HTTP for web browsing),
- Port 22 (SSH used for secure login and file transfers)
- Port 23 (Telnet for a text connection)
- Port 443 (HTTPS for secure web browsing)

## 2. Find your session and policy ID.

Go to **FortiView > All Sessions**. Find your session by finding your source IP address, destination IP address (if you have it), and port number. The policy ID is listed after the destination information. If the list of sessions is very long, you can filter the list to make it easier to find your session.

## 3. When there are many sessions, use a filter to help you find your session.

If there are multiple pages of sessions, it's difficult to find a single session. You can use a filter to block out sessions that you don't want. Click the search icon on the column heading to select the filter. Select **Source IP** and enter your source IP address. Now, only sessions that originate from your IP address are displayed in the session table. If the list is still too long, you can do the same for the **Source port**. That makes it easy to find your session and the security policy ID. When you're finished, clear the filters.

### CLI session information

The session table output that the `diagnose sys session list` command generates is very large. You can use filters to display only the session data that you're interested in.

An entry is placed in the session table for each traffic session passing through a security policy. The following command lists the information for a session in the table:

```
diagnose sys session list
```

The filter option displays specific information, for example:

```
diagnose sys session filter <option>
```

The values for <option> include the following:

clear	Clear session filter
dintf	Destination interface
dport	Destination port
dst	Destination IP address
duration	Duration of the session
expire	Expire
negate	Inverse filter
nport	NAT'd source port
nsrc	NAT'd source IP address
policy	Policy ID
proto	Protocol number

<code>proto-state</code>	Protocol state
<code>session-state1</code>	Session state1
<code>session-state2</code>	Session state2
<code>sintf</code>	Source interface
<code>sport</code>	Source port
<code>src</code>	Source IP address
<code>vd</code>	Index of virtual domain, -1 matches all

Even though UDP is a sessionless protocol, the FortiGate keeps track of the following states:

- When UDP reply doesn't have a value of 0
- When UDP reply has a value of 1

The following table displays firewall session states from the session table:

State	Description
<code>log</code>	Session is being logged
<code>local</code>	Session is originated from or destined for local stack
<code>ext</code>	Session is created by a firewall session helper
<code>may_dirty</code>	Session is created by a policy For example, the session for <code>ftp control channel</code> will have this state but <code>ftp data channel</code> won't. This is also seen when NAT is enabled.
<code>ndr</code>	Session will be checked by IPS signature
<code>nds</code>	Session will be checked by IPS anomaly
<code>br</code>	Session is being bridged (TP) mode

### Firewall session setup rate

The number of sessions that can be established in a set period of time is useful information. A session is an end-to-end TCP/IP connection for communication with a limited lifespan. If you record the setup rate during normal operation, when you experience problems you can compare the baseline setup rate to the rate that occurs when you're troubleshooting. This can be a useful step to help you define your problem.

A reduced firewall session setup rate can be the result of a number of things, such as a lack of system resources on the FortiGate or reaching the limit of your session count for your VDOM.

### To view your session setup rate method 1 - CLI

```
FGT# get system performance status
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU0 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU1 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU2 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU3 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
Memory: 4050332k total, 530512k used (13%), 3376844k free (83%), 142976k freeable (3%)
Average network usage: 131 / 90 kbps in 1 minute, 26 / 15 kbps in 10 minutes, 49 / 42
kbps in 30 minutes
Average sessions: 80 sessions in 1 minute, 30 sessions in 10 minutes, 42 sessions in 30
minutes
Average session setup rate: 3 sessions per second in last 1 minute, 0 sessions per
second in last 10 minutes, 0 sessions per second in last 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 1 days, 2 hours, 45 minutes
```

The information you're looking for is the average sessions section, in the above output. This example shows that there were 80 sessions in 1 minute, or an average of 3 sessions per second. The values for 10 minutes and 30 minutes allow you to take a longer average for a more reliable value if your FortiGate is working at maximum capacity. The smallest FortiGate can have 1,000 sessions established per second across the unit.

Remember that session setup rate is a global command. If you have multiple VDOMs configured with many sessions in each one, the session setup rate per VDOM will be slower than if there are no VDOMs configured.

### Finding object dependencies

An administrator may not be permitted to delete a configuration object if there are other configuration objects that depend on it. This command identifies other objects which depend on, or make reference to, the configuration object in question. If an error is displayed that an object is in use and can't be deleted, this command can help identify the source of the problem.

Additionally, if you have a virtual interface with objects that depend on it, you need to find and remove those dependencies before you delete the interface.

#### CLI method

When you run multiple VDOMs, you run this command in the global configuration only and it searches for the named object in both the most recently used global and VDOM configurations:

```
diagnose sys checkused <path.object.mkey>
```

For example, to verify which objects a security policy with an ID of 1 refers to, enter the following command:

```
diagnose sys checkused firewall.policy.policyid 1
```

To check what's referred to by interface `port1`, enter the following command:

```
diagnose sys checkused system.interface.name port1
```

To show all dependencies for an interface, enter the following command:

```
diagnose sys checkused system.interface.name <interface name>
```

### Sample output:

```
entry used by table firewall.address:name '10.98.23.23_host'
entry used by table firewall.address:name 'NAS'
entry used by table firewall.address:name 'all'
entry used by table firewall.address:name 'fortinet.com'
entry used by table firewall.vip:name 'TORRENT_10.0.0.70:6883'
entry used by table firewall.policy:policyid '21'
entry used by table firewall.policy:policyid '14'
entry used by table firewall.policy:policyid '19'
```

In this example, the interface has dependent objects, including four address objects, one VIP, and three security policies.

### GUI method

In the GUI, you can easily check and remove the object dependencies for an interface.

#### To remove interface object dependencies - GUI

1. Go to **Network > Interfaces**.  
The **Ref.** column displays the number of objects that refer to this interface.
2. Select the number in the **Ref.** column for the interface.  
A window listing the dependencies appears.
3. Use these detailed entries to locate and remove object references to this interface.  
The trash can icon changes from gray when you remove all object dependencies.
4. Remove the interface by selecting the check box for the interface, and select **Delete**.

### Flow trace

To trace the flow of packets through the FortiGate, use the following command:

```
diagnose debug flow trace start
```

Follow packet flow by setting a flow filter, using this command:

```
diagnose debug flow {filter | filter6} <option>
```

If your network uses IPv4, enter `filter`. If your network uses IPv6, enter `filter6`.

One of the following variables replaces `<option>`:

Variable	Description
<code>addr</code>	IPv4 or IPv6 address
<code>clear</code>	clear filter
<code>daddr</code>	destination IPv4 or IPv6 address

Variable	Description
dport	destination port
negate	inverse IPv4 or IPv6 filter
port	port
proto	protocol number
saddr	source address
sport	source port
vd	index of virtual domain; -1 matches all

diagnose debug flow output is recorded as event log messages which are then sent to a FortiCloud or a FortiAnalyzer, if connected. Don't run this command longer than necessary, since it generates significant amounts of data.

### To start flow monitoring with a specific number of packets - CLI:

```
diagnose debug flow trace start <N>
```

### To stop flow tracing at any time using - CLI:

```
diagnose debug flow trace stop
```

The following example shows the flow trace for a device with an IP address of 203.160.224.97:

```
diagnose debug enable
diagnose debug flow filter addr 203.160.224.97
diagnose debug flow show function-name enable
diagnose debug flow trace start 100
```

### Flow trace output example - HTTP

To observe the debug flow trace, connect to the web site at the following address (the display may vary slightly):

```
https://www.fortinet.com
```

Comment: SYN packet received:

```
id=20085 trace_id=209 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

SYN sent and a new session is allocated:

```
id=20085 trace_id=209 func=resolve_ip_tuple line=2799
msg="allocate a new session-00000e90"
```

Lookup for next-hop gateway address:

```
id=20085 trace_id=209 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.11.254 via port6"
```

Source NAT, lookup next available port:

```
id=20085 trace_id=209 func=get_new_addr line=1219
msg="find SNAT: IP-192.168.11.59, port-31925"
direction"
```

Matched security policy. Check to see which policy this session matches:

```
id=20085 trace_id=209 func=fw_forward_handler line=317
msg="Allowed by Policy-3: SNAT"
```

Apply source NAT:

```
id=20085 trace_id=209 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

SYN ACK received:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6, 203.160.224.97:80-
>192.168.11.59:31925) from port6."
```

Found existing session ID. Identified as the reply direction:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, reply direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=210 func=__ip_session_run_tuple
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

Lookup for next-hop gateway address for reply traffic:

```
id=20085 trace_id=210 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.3.221 via port5"
```

ACK received:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, original
direction"
```

Apply source NAT:

```
id=20085 trace_id=211 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from client:

```
id=20085 trace_id=212 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
id=20085 trace_id=212 func=resolve_ip_tuple_fast
line=2727 msg="Find an existing session, id-00000e90,
original direction"
```

Apply source NAT:

```
id=20085 trace_id=212 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from server:

```
id=20085 trace_id=213 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
203.160.224.97:80->192.168.11.59:31925) from port6."
```

Match existing session in reply direction:

```
id=20085 trace_id=213 func=resolve_ip_tuple_fast
line=2727 msg="Find an existing session, id-00000e90,
reply direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=213 func=__ip_session_run_tuple
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

### Flow trace output example - IPsec (policy-based)

```
id=20085 trace_id=1 msg="vd-root received a packet(proto=1, 10.72.55.240:1->10.71.55.10:8)
from internal."
id=20085 trace_id=1 msg="allocate a new session-00001cd3"
id=20085 trace_id=1 msg="find a route: gw-66.236.56.230 via wan1"
id=20085 trace_id=1 msg="Allowed by Policy-2: encrypt"
id=20085 trace_id=1 msg="enter IPsec tunnel-RemotePhase1"
id=20085 trace_id=1 msg="encrypted, and send to 15.215.225.22 with source 66.236.56.226"
id=20085 trace_id=1 msg="send to 66.236.56.230 via intf-wan1"
id=20085 trace_id=2 msg="vd-root received a packet (proto=1, 10.72.55.240:1-1071.55.10:8)
from internal."
id=20085 trace_id=2 msg="Find an existing session, id-00001cd3, original direction"
id=20085 trace_id=2 msg="enter IPsec ="encrypted, and send to 15.215.225.22 with source
66.236.56.226" tunnel-RemotePhase1"
id=20085 trace_id=2 msgid=20085 trace_id=2 msg="send to 66.236.56.230 via intf-wan1"
```

### Packet sniffing and packet capture

When you troubleshoot networks, it helps to look inside the header of the packets. This helps to determine if the packets, route, and destination are all what you expect. Packet capture can also be called a network tap, packet sniffing, or logic analyzing. FortiOS devices can sniff packets using CLI commands or capture packets using the GUI.

Packet sniffing using CLI commands is well-suited for spot checking traffic, but if you have complex filters to enter it can be a lot of work to enter them each time. You can also save the sniffing output. However, you must log to a file and then analyze the file later.

Packet capture in the GUI makes it easy for you to set up multiple filters at once and run only one or two as you need to. You can also use controls to start and stop capturing when you want to. You download packet capture output to your local computer as a \*.pcap file. You must use a third party application, such as Wireshark, to read \*.pcap files. This method is useful to send information to Fortinet support to help resolve an issue.

The following table presents a comparison between the two methods:

Features	Packet sniffing	Packet capture
Command location	CLI	GUI
Third party software required	puTTY to log plaintext output	Wireshark, or similar application, to read *.pcap files
Read output in plain text file	yes	no
Read output as *.pcap file using Wireshark, or similar application	no	yes
Easily configure single quick and simple filter	yes	no
Record packet interface	yes	no
Configure complex sniffer filters on multiple interface	no	yes
sniff IPv6	hard	easy
sniff non-IP packets	no	yes
Filter packets by protocol and/or port	easy	easy
Filter packets by source and/or destination address	easy	easy

## Packet sniffing

If you're running a constant traffic application, such as ping, packet sniffing can tell you if the traffic is reaching the destination, what the port of entry is on the FortiGate unit, if the ARP resolution is correct, and if the traffic is being sent back to the source as expected.

Sniffing packets can also tell you if the FortiGate is silently dropping packets for reasons such as Reverse Path Forwarding (RPF). RPF, also called anti-spoofing, prevents an IP packet from being forwarded if its source IP doesn't belong to a locally attached subnet (local interface) or isn't part of the routing between the FortiGate and another source (static route, RIP, OSPF, BGP). Note that you can disable RPF by turning on asymmetric routing

in the CLI (config system settings, set asymroute enable), but this disables stateful inspection on the FortiGate and causes many features to be turned off.

If you configure virtual IP addresses on your FortiGate, it will use those addresses instead of the physical IP addresses. You'll notice this when you're sniffing packets because all the traffic uses the virtual IP addresses. This is due to the ARP update that's sent out when the VIP address is configured.

Before you start sniffing packets on the CLI, you should prepare to capture the output to a file. A large amount of data may scroll by and you won't be able to see it without first saving it to a file. One method is to use a terminal program like puTTY to connect to the FortiGate CLI. Once the packet sniffing count is reached, you can end the session and analyze the output in the file.

The general form of the internal FortiOS packet sniffer command is:

```
diagnose sniffer packet <interface_name> <'filter'> <verbose> <count> <tsformat>
```

To stop the sniffer, type CTRL+C.

<b>&lt;interface_name&gt;</b>	The name of the interface to sniff, such as "port1" or "internal". This can also be "any" to sniff all interfaces.
<b>&lt;'filter'&gt;</b>	What to look for in the information the sniffer reads. "none" indicates no filtering, and all packets are displayed as the other arguments indicate.  The filter must be inside single quotes (').
<b>&lt;verbose&gt;</b>	The level of verbosity as one of:  <ol style="list-style-type: none"> <li>1 - print header of packets</li> <li>2 - print header and data from IP of packets</li> <li>3 - print header and data from Ethernet of packets</li> <li>4 - print header of packets with interface name</li> </ol>
<b>&lt;count&gt;</b>	The number of packets the sniffer reads before stopping. If you don't put a number here, the sniffer will run until you stop it with <CTRL+C>.
<b>&lt;tsformat&gt;</b>	The format of timestamp. <ul style="list-style-type: none"> <li>• a: absolute UTC time, yyyy-mm-dd hh:mm:ss.ms</li> <li>• l: absolute LOCAL time, yyyy-mm-dd hh:mm:ss.ms</li> <li>• otherwise: relative to the start of sniffing, ss.ms</li> </ul>

For a simple sniffing example, enter the CLI command `diagnose sniffer packet port1 none 1 3`. This displays the next three packets on the port1 interface using no filtering, and verbose level 1. At this verbosity level, you can see the source IP and port, the destination IP and port, action (such as ack), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets and that 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diagnose sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]
```

```
0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757

0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808

0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

For a more advanced example of packet sniffing, the following commands will report packets on any interface that are traveling between a computer with the host name of “PC1” and a computer with the host name of “PC2”. With verbosity 4 and above, the sniffer trace displays the interface names where traffic enters or leaves the FortiGate unit. Remember to stop the sniffer, type CTRL+C.

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2>" 4
```

or

```
FGT# diagnose sniffer packet any "(host <PC1> or host <PC2>) and icmp" 4
```

The following CLI command for a sniffer includes the ARP protocol in the filter which may be useful to troubleshoot a failure in the ARP resolution (for example, PC2 may be down and not responding to the FortiGate ARP requests).

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2> or arp" 4
```

## Packet capture

Packet capture tells you what is happening on the network at a low level. This can be very useful for troubleshooting problems, such as:

- Finding missing traffic
- Seeing if sessions are setting up properly
- Locating ARP problems such as broadcast storm sources and causes
- Confirming which address a computer is using on the network, if they have multiple addresses or are on multiple networks
- Confirming routing is working as you expect
- Connecting wireless clients
- Missing PING packets
- A particular type of packet is having problems, such as UDP, which is commonly used for streaming video

If you're running a constant traffic application such as ping, packet capture can tell you if the traffic is reaching the destination, how the port enters and exits the FortiGate, if the ARP resolution is correct, and if the traffic is returning to the source as expected. You can also use packet switching to verify that NAT or other configuration is translating addresses or routing traffic the way that you want it to.

Before you start capturing packets, you need to have a good idea of what you're looking for. Capture is used to confirm or deny your ideas about what's happening on the network. If you try capture without a plan to narrow your search, you can end up with too much data to effectively analyze. On the other hand, you need to capture enough packets to really understand all of the patterns and behavior that you're examining.

To use packet capture, the FortiGate must have a disk. You can enable the `capture-packet` in the firewall policy, using the following CLI commands:

```
config firewall policy
edit <id>
```

```

 set capture-packet enable
end

```

To configure packet capture filters, go to **Network > Packet Capture**.

When you add a packet capture filter, enter the following information and select **OK**.

<b>Interface</b>	<p>Select the interface to sniff from the drop-down menu.</p> <p>You must select one interface. You can't change the interface without deleting the filter and creating a new one, unlike the other fields.</p>
<b>Max Packets to Save</b>	<p>Enter the number of packets to capture before the filter stops.</p> <p>This number can't be zero. You can halt the capturing before this number is reached.</p>
<b>Enable Filters</b>	Select this option to specify filter fields
<b>Host(s)</b>	<p>Enter the IP address of one or more hosts</p> <p>Separate multiple hosts with commas. To enter a range, use a dash without spaces, for example 172.16.1.5-172.16.1.15, or enter a subnet.</p>
<b>Port(s)</b>	<p>Enter one or more ports to capture on the selected interface.</p> <p>Separate multiple ports with commas. To enter a range, use a dash without spaces, for example 88-90</p>
<b>VLAN(s)</b>	<p>Enter one or more VLANs (if any).</p> <p>Separate multiple VLANs with commas.</p>
<b>Protocol</b>	Enter one or more protocols. Separate multiple protocols with commas. To enter a range, use a dash without spaces, for example 1-6, 17, 21-25.
<b>Include IPv6 Packets</b>	Select this option if you're troubleshooting IPv6 networking, or if your network uses IPv6. Otherwise, leave it disabled.
<b>Include Non-IP Packets</b>	The protocols in the list are all IP based except for ICMP (ping). To capture non-IP based packets, select this feature. Examples of non-IP packets include IPsec, IGMP, ARP, and ICMP.

If you select a filter, you have the option to start and stop packet capture in the edit window, or download the captured packets. You can also see the filter status and the number of packets captured.

You can select the filter and start capturing packets. When the filter is running, the number of captured packets increases until it reaches the **Max Packet Count** or you stop it. When the filter is running, you can't download the output file.

When the packet capture is complete, you can download the \*.pcap file. You must use a third party application, such as Wireshark, to read \*.pcap files. This tool provides you with extensive analytics and the full contents of the packets that were captured.

To start, stop, or resume packet capture, use the symbols on the screen. These symbols are the same as those used for audio or video playback. Hover over the symbol to reveal explanatory text. Similarly, to download the \*.pcap file, use the download symbol on the screen.

## NPU-based interfaces

Many Fortinet products contain network processors, such as NP1, NP2, NP4, and NP6.

When you use the NPU-based interfaces, you can see only the initial session setup using the `diagnose debug flow` command. If the session is correctly programmed into the ASIC (fastpath), the `diagnose debug flow` command won't detect the packets that arrive at the CPU. If the NPU functionality is disabled, the CPU detects all packets. However, you should only use this for troubleshooting purposes.

First, obtain the NP4 or NP6 ID and the port numbers, using the following command:

```
diagnose npu {np4|npu6}list
```

### Sample output:

```
ID Model Slot Interface
0 On-board port1 fabric1 fabric3 fabric5
1 On-board fabric2 port2 base2 fabric4
```

Run the following commands:

```
diagnose npu {np4|npu6}fastpaf th disable <dev_id>
```

(where `dev_id` is the NP4 or NP6 number)

Then, run this command:

```
diagnose npu {np4|npu6}fastpath-sniffer enable port1
```

### Sample output:

```
NP4 Fast Path Sniffer on port1 enabled
```

This causes all traffic on **port1** of the network processor to be sent to the CPU. This means that you can take a standard sniffer trace and use other diagnose commands, if it's a standard CPU-driven port.

These commands only apply to the newer NP4 and NP6 interfaces.

## Debug command

Debugging output provides continuous, real-time event information. Debugging output continues until you stop or reboot the unit. Debugging output can affect system performance and is continually generated even though output might not be displayed in the CLI console.

Debugging information that's displayed in the console scrolls in the console display and may prevent you from entering CLI commands, such as, the command to disable the debug display. To turn off debugging output as the display scrolls by, press the **↑** key to recall the recent `diagnose debug` command, press backspace, and type "0", and **Enter**.

To enable debug output display, use the following command:

```
diagnose debug enable
```

Once you enable debug output display, specify the debuggin information that you require, using the following command:

```
diagnose debug <option> <level>
```

Debug command options include the following:

enable	Enable debug output
disable	Disable debug output
info	Show active debug level settings
reset	Reset all debug level to default
report	Report for tech support
crashlog	Crash log info
config-error-log	Configure error log info
sql-log-error	SQL log database error info
application	application
kernel	kernel
remote-extender	remote-extender
cli	Debug CLI
cmdb-trace	Trace CLI
rating	Display rating info
authd	Authentication daemon
fsso-polling	FSSO active directory poll module
flow	Trace packet flow in kernel
urlfilter	urlfilter
admin	Admin user

You can set the debug level at the end of the command. For example, typical values are 2 and 3:

```
diagnose debug application DHCPDS 2
diagnose debug application spamfilter 2
```

Fortinet Support will advise you about which debugging level you should use.

Timestamps can be enabled to the debug output using the following command:

```
diagnose debug console timestamp enable
```

When you finish examining the debug output, disable it, using the following command:

```
diagnose debug disable
```

### Debug output example

This example shows the IKE negotiation for a secure logging connection from a FortiGate to a FortiAnalyzer.

```
diagnose debug reset
diagnose vpn ike log-filter src-addr4 192.168.11.2
diagnose debug enable
```

### Sample output:

```
FGh_FtiLog1: IPsec SA connect 0 192.168.11.2->192.168.10.201:500, natt_mode=0 rekey=0
phase2=FGh_FtiLog1
FGh_FtiLog1: using existing connection, dpd_fail=0
FGh_FtiLog1: found phase2 FGh_FtiLog1
FGh_FtiLog1: IPsec SA connect 0 192.168.11.2 -> 192.168.10.201:500 negotiating
FGh_FtiLog1: overriding selector 225.30.5.8 with 192.168.11.2
FGh_FtiLog1: initiator quick-mode set pfs=1536...
FGh_FtiLog1: try to negotiate with 1800 life seconds.
FGh_FtiLog1: initiate an SA with selectors: 192.168.11.2/0.0.0.0->192.168.10.201,
ports=0/0, protocol=0/0
Send IKE Packet(quick_outI1):192.168.11.2:500(if0) -> 192.168.10.201:500, len=348
Initiator: sent 192.168.10.201 quick mode message #1 (OK)
FGh_FtiLog1: set retransmit: st=168, timeout=6.
```

In this example:

192.168.11.2->192.168.10.201:500	Source and destination gateway IP address
dpd_fail=0	Found existing Phase 1
pfs=1536...	Create new Phase 2 tunnel

### The execute tac report command

The `execute tac report` command runs an exhaustive series of diagnostic commands. It runs commands that are only needed if you're using certain features like high availability (HA), VPN tunnels, or a modem. The report takes a few minutes to finish because of the amount of output that's generated. If you're logging CLI output logged to a file, you can run this command to familiarize yourself with the diagnostic commands.

When you call Fortinet Customer Support, you may be asked to use the output from this CLI command to provide information about your FortiGate and its current state.

### Other commands

#### ARP table

To view the ARP cache, use the following command:

```
get system arp
```

To view the ARP cache in the system, use the following command:

```
diagnose ip arp list
```

#### Sample output:

```
index=14 ifname=internal 224.0.0.5 01:00:5e:00:00:05 state=00000040 use=72203
confirm=78203 update=72203 ref=1
index=13 ifname=dmz 192.168.3.100 state=00000020 use=1843 confirm=650179 update=644179
ref=2 ? VIP
index=13 ifname=dmz 192.168.3.109 02:09:0f:78:69:ff state=00000004 use=71743 confirm=75743
update=75743 ref=1
index=14 ifname=internal 192.168.11.56 00:1c:23:10:f8:20 state=00000004 use=10532
confirm=10532 update=12658 ref=4
```

To remove the ARP cache, use the following command:

```
execute clear system arp table
```

To remove a single ARP entry, use the following command:

```
diagnose ip arp delete <interface name> <IP address>
```

To add static ARP entries, use the following command:

```
config system arp-table
```

#### Time and date settings

Check time and date settings for log message timestamp synchronization (the Fortinet support group may request this) and for certificates that have a time requirement to check for validity. Use the following commands:

```
execute time
current time is: 12:40:48
last ntp sync:Thu Mar 16 12:00:21 2006
execute date
current date is: 2006-03-16
```

To force synchronization with an NTP server, use the following command:

```
config system ntp
set ntpsync {enable|disable}
end
```

If all devices have the same time, it helps to correlate log entries from different devices.

#### IP address

There may be times when you want to verify that the IP addresses assigned to the FortiGate interfaces are what you expect them to be. This is easily accomplished from the CLI, using the following command:

```
diagnose ip address list
```

The output from this command lists the IP address and mask (if available), the `index` of the interface (a type of ID number), and the `devname` (the interface name). While physical interface names are set, virtual interface names can vary. A good way to use this command is to list all of the virtual interface names. For `vsys_ha` and `vsys_fgfm`, the IP addresses are the local host, which are virtual interfaces that are used internally.

```
diagnose ip address list
```

```

IP=10.31.101.100->10.31.101.100/255.255.255.0 index=3 devname=internal
IP=172.20.120.122->172.20.120.122/255.255.255.0 index=5 devname=wan1
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=8 devname=root
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=11 devname=vsys_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=vsys_fgfm

```

## FortiOS ports

There are 65,535 ports in TCP and UDP stacks that applications can use when they communicate with each other. Many of these ports are commonly known to be associated with specific applications or protocols. These ports can be useful when you troubleshoot your network.

Use the following ports when you troubleshoot your FortiGate:

Port	Functionality
UDP 53	DNS lookup, RBL lookup
UDP 53 or UDP 8888	FortiGuard Antispam or Web Filtering rating lookup
UDP 53 (default) or UDP 8888 and UDP 1027 or UDP 1031	FDN server list - source and destination port numbers vary by originating or reply traffic
UDP 123	NTP synchronization
UDP 162	SNMP traps
UDP 514	SYSLOG - All FortiOS versions can use syslog to send log messages to remote syslog servers
TCP 22	Configuration backup to FortiManager unit or FortiGuard Analysis and Management Service
TCP 25	SMTP alert email, encrypted virus sample auto-submit
TCP 389 or TCP 636	LDAP or PKI authentication
TCP 443	FortiGuard Antivirus or IPS update - When you request updates from a FortiManager, instead of directly from the FDN, you must reconfigure this port must be as TCP 8890
TCP 443	FortiGuard Analysis and Management Service
TCP 514	FortiGuard Analysis and Management Service log transmission (OFTP)
TCP 514	SSL Management Tunnel to FortiGuard Analysis and Management Service
TCP 514	Quarantine, remote access to logs and reports on a FortiAnalyzer unit, device registration with FortiAnalyzer units (OFTP)
TCP 1812	RADIUS authentication

Port	Functionality
TCP 8000 and TCP 8002	FSSO
TCP 10151	FortiGuard Analysis and Management Service contract validation

## FortiAnalyzer and FortiManager ports

If you have a FortiAnalyzer or FortiManager on your network, you may need to use the following ports to troubleshoot network traffic:

Port	Functionality
UDP 53	DNS lookup
UDP 123	NTP synchronization
UDP 137-138	Windows share
UDP 162	SNMP traps
UDP 514	Syslog, log forwarding
TCP 21 or TCP 22	Log and report upload
TCP 25	SMTP alert email
TCP 389 or TCP 636	User name LDAP queries for reports
TCP 443	RVS update
TCP 1812	RADIUS authentication
TCP 3000	Log aggregation client

## FortiGuard troubleshooting

The FortiGuard service provides updates to AntiVirus (AV), Antispam (AS), Intrusion Protection Services (IPS), Webfiltering (WF), and more. The FortiGuard Distribution System (FDS) consists of a number of servers across the world that provide updates to your FortiGate. Problems can occur with connection to FDS, and its configuration on your local FortiGate. Some of the more common troubleshooting methods are listed here, including:

- [Troubleshooting process for FortiGuard updates](#)
- [FortiGuard server settings](#)

## Troubleshooting process for FortiGuard updates

The following process shows the logical steps that you should take when you troubleshoot problems with FortiGuard updates:

**1. Does the device have a valid licence that includes these services?**

Each device requires a valid FortiGuard license to access updates for some or all of these services. You can verify the status of the support contract for your devices at the [Fortinet Support website](#).

**2. If the device is part of a "high availability (HA)" cluster, do all members of the cluster have the same level of support?**

As with the previous step, you can verify the support contract status for all of the devices in your HA cluster at the Fortinet Support website.

**3. Are services enabled on the device?**

To see the FortiGuard information and status for a device, in the GUI go to **System > FortiGuard**. On that page you can verify the status of each component, and enable each service (if required). If there are problems, see the [FortiGuard](#) discussion in the [Fortinet Communication Ports and Protocols](#) chapter of the FortiOS Handbook.

**4. Can the device communicate with FortiGuard servers?**

Go to **System > FortiGuard** in the GUI and try to update AV and IPS, or test the availability of WF and AS default and alternate ports. If you encounter problems, see the [FortiGuard](#) discussion in the [Fortinet Communication Ports and Protocols](#) chapter of the FortiOS Handbook.

**5. Is there proper routing to reach the FortiGuard servers?**

Ensure there is a static or dynamic route that allows your FortiGate to reach the FortiGuard servers. Usually a generic default route to the internet is enough, but you may need to verify this if your network is complex.

**6. Are there issues with DNS?**

An easy way to test this is to attempt a traceroute from behind the FortiGate to an external network using the Fully Qualified Domain Name (FQDN) for a location. If the traceroute FQDN name doesn't resolve, you have general DNS problems.

**7. Is there anything upstream that might be blocking FortiGuard traffic, either on the network or ISP side?**

Many firewalls block all ports, by default, and ISPs often block ports that are low. There may be a firewall between the FortiGate and the FortiGuard servers that's blocking the traffic. FortiGuard uses port 53, by default, so if it's being blocked you need to either open a hole for it or change the port it's using.

**8. Is there an issue with source ports?**

It's possible that ports that the FortiGate uses to contact FortiGuard are being changed before they reach FortiGuard or on the return trip before they reach your FortiGate. A possible solution for this is to use a fixed-port at NAT'd firewalls to ensure the port remains the same. You can use packet sniffing to find more information about what's happening with ports.

**9. Are there security policies that include antivirus?**

If none of the security policies include antivirus, the antivirus database won't be updated. If antivirus is included, only the database type that's used will be updated.

## FortiGuard server settings

Your local FortiGate connects to remote FortiGuard servers to get updates to FortiGuard information, such as new viruses that may have been found or other new threats. This section shows ways that you can to display FortiGuard server information on your FortiGate, and how you can use that information and update it to fix potential problems.

## Displaying the server list

The `get webfilter status` or `diagnose debug rating` command shows the list of FDS servers that the FortiGate uses to send web filtering requests. Rating requests are only sent to the server at the top of the list in normal operation. Each server is probed for Round Trip Time (RTT) every two minutes.

Optionally, you can add a refresh rate to the end of this command to determine how often the server list is refreshed.

Rating may not be enabled on your FortiGate.

### To show the list of servers a FortiGate uses to send web filtering requests - CLI

```
get webfilter status
```

Sample output:

```
Locale : english
License : Contract
Expiration : Thu Oct 9 02:00:00 2011
== Server List (Mon Feb 18 12:55:48 2008) ==
```

IP	Weight	RTT	Flags	TZ	Packets	CurrLost	TotalLost
a.b.c.d	0	1	DI	2	1926879	0	11176
10.1.101.1	10	329		1	10263	0	633
10.2.102.2	20	169		0	16105	0	80
10.3.103.3	20	182		0	6741	0	776
10.4.104.4	20	184		0	5249	0	987
10.5.105.5	25	181		0	12072	0	178

### Output details

The server list includes the IP addresses of alternate servers if the first entry can't be reached. In this example, the IP addresses are not public addresses.

The following flags in `get webfilter status` indicate the server status:

Flag	Description
D	The server was found through the DNS lookup of the hostname.  If the hostname returns more than one IP address, all of them are flagged with D and are used first for INIT requests before falling back to the other servers.
I	The server to which the last INIT request was sent
F	The server hasn't responded to requests and is considered to have failed

Flag	Description
T	The server is currently being timed
S	<p>Rating requests can be sent to the server</p> <p>The flag is set for a server only in two cases:</p> <ol style="list-style-type: none"> <li>1. The server exists in the servers list received from the FortiManager or any other INIT server.</li> <li>2. The server list received from the FortiManager is empty so the FortiManager is the only server that the FortiGate knows, and it should be used as the rating server.</li> </ol>

### Sorting the server list

The server list is sorted first by weight. The server with the smallest RTT appears at the top of the list, regardless of weight. When a packet is lost (there has been no response in 2 seconds), it's re-sent to the next server in the list. Therefore, the top position in the list is selected based on RTT, while the other positions are based on weight.

### Calculating weight

The weight for each server increases with failed packets and decreases with successful packets. To lower the possibility of using a remote server, the weight isn't allowed to dip below a base weight. The base weight is calculated as the difference in hours between the FortiGate and the server multiplied by 10. The farther away the server is, the higher its base weight is and the lower it appears in the list.

## Troubleshooting tips

The following tips present common causes of problems.

### How to check hardware connections

- Are all of the cables and interfaces connected properly?
- Is the LED for the interface green?

### How to check FortiOS network settings

- If you're having problems connecting to the management interface, is your protocol enabled on the interface for administrative access?
- Does the interface have an IP address?

### How to check CPU and memory resources

- Is the FortiGate's CPU running at almost 100 percent usage?
- Is your FortiGate running low on memory?

### How to check modem status

- Is the modem connected?
- Are there PPP issues?

### How to run ping and traceroute

- Is the FortiGate experiencing complete packet loss?

[How to check the logs](#)

- Do you need to identify a problem?

[How to verify the contents of the routing table \(in NAT mode\)](#)

- Are there routes in the routing table for default and static routes?
- Do all connected subnets have a route in the routing table?
- Does a route have a higher priority than it should?

[How to verify the correct route is being used](#)

- Is the traffic routed correctly?

[How to verify the correct firewall policy is being used](#)

- Is the correct firewall policy applied to the expected traffic?

[How to check the bridging information in transparent mode](#)

- Are you having problems in transparent mode?

[How to check the number of sessions that UTM proxy uses](#)

- Have you reached the maximum number of sessions for a protocol?
- Are new sessions failing to start for a certain protocol?

[How to examine the firewall session list](#)

- Are there active firewall sessions?

[How to check wireless information](#)

- Is the wireless network working properly?

[How to verify connectivity to FortiGuard](#)

- Is the FortiGate communicating properly with FortiGuard?

[How to perform a sniffer trace \(CLI and packet capture\)](#)

- Is traffic entering the FortiGate? Does the traffic arrive on the expected interface?
- Is the ARP resolution correct for the next-hop destination?
- Is the traffic exiting the FortiGate to the destination as expected?
- Is the FortiGate sending traffic back to the originator?

[How to debug the packet flow](#)

- Is traffic entering or leaving the FortiGate as expected?

## How to check hardware connections

If there's no traffic flowing from the FortiGate, you may have a hardware problem.

To check hardware connections:

- Ensure network cables are plugged into the interfaces.
- Verify that the LED connection lights for the network cables are the right color (usually green).

- If the cable or its connector are damaged, change the cable. You should also change the cable if you're not sure about the type or quality of the cable, such as straight through or crossover, or if you see exposed wires at the connector.
- Connect the FortiGate to different hardware.
- Ensure the link status is set to **Up** for the interface (see **Network > Interfaces**). The link status is based on the physical connection and can't be set in FortiOS.

If any of these solve the problem, it was a hardware connection problem. You should still perform some basic software connectivity tests to ensure complete connectivity. The interface might also be disabled, or its **Administrative Status** is set to **Down**.

#### To enable an interface - GUI

1. Go to **Network > Interfaces**.
2. Select and edit the interface to enable, such as **port1**.
3. Find **Administrative Status** at the bottom of the screen, and select **Up**.
4. Select **Apply**.

#### To enable an interface - CLI

```
config system interface
 edit port1
 set status up
 next
end
```

## How to check FortiOS network settings

You can manage FortiOS network settings in the GUI and the CLI. The following information includes troubleshooting and best practice information. The network settings include:

- [Interface settings](#)
- [DNS settings](#)
- [DHCP server settings](#)

### Interface settings

If you can access the FortiGate with the management cable only, the first step is to display the interface settings. To display the settings for the internal interface, use the following CLI command:

```
FGT# show system interface <interface_name>
```

For a complete listing of all the possible interface settings, use the following CLI command:

```
config system interface
 edit <interface_name>
 get
end
```

Check the interface settings to ensure that they aren't preventing traffic. Check the following items (only the GUI terms are shown, CLI terms may vary):

Setting	Description
<b>Link Status</b>	<b>Down</b> until a valid cable is plugged into this interface, then it will be <b>Up</b> .  The Link Status is shown physically by the connection LED for the interface. If the LED is green, the connection is good. If Link Status is <b>Down</b> , the interface doesn't work. Link Status is also displayed on the <b>Network &gt; Interfaces</b> screen, by default.
<b>Addressing mode</b>	Don't use <b>DHCP</b> if you don't have a DHCP server. You won't be able to log in to an interface in DHCP mode as it won't have an IP address
<b>IP/Network Mask</b>	An interface needs an IP address to be able to connect to other devices. Ensure there is a valid IP address in this field. The one exception is if <b>DHCP</b> is enabled for this interface to get its IP address from an external DHCP server.
<b>IPv6 address</b>	The same protocol must be used by both ends to complete the connection. Ensure both this interface and the remote connection are both using IPv4 or both using IPv6 addressing.
<b>Administrative access</b>	If no protocols are selected, you will have to use the local management cable to connect to the unit. If you're using IPv6, configure the IPv6 administrative access protocols.
<b>Administrative status</b>	Set to <b>Up</b> or the interface won't work.

## DNS settings

You can trace many networking problems back to DNS issues. Check the following items:

- Are there values for both primary and secondary entries?
- Is the local domain name correct?
- Are you using IPv6 addressing? If so, are the IPv6 DNS settings correct?
- Are you using Dynamic DNS (DDNS)? If so, is it using the correct server, credentials, and interface?
- Can you contact both DNS servers to verify the servers are operational?
- If an interface addressing mode is set to DHCP and is set to override the internal DNS, is that interface receiving a valid DNS entry from the DHCP server? Is it a reasonable address and can it be contacted to verify it's operational?
- Are there any DENY security policies that need to allow DNS?
- Can any internal device perform a successful traceroute to a location using the FQDN?

## DHCP server settings

DHCP servers are common on internal and wireless networks. If the DHCP server isn't configured correctly, it can cause problems. Check the following items:

- Is the DHCP server entry set to **Relay**? If so, verify there is another DHCP server to which requests can be relayed. Otherwise, it should be set to **Server**.
- Is the DHCP server enabled?

- Does the DHCP server use a valid IP address range? Are other devices using the addresses? If one or more devices are using IP addresses in this range, you can use the IP reservation feature to ensure the DHCP server doesn't use these addresses.
- Is there a gateway entry? If not, add a gateway entry to ensure that the server's clients have a default route.
- Is the system DNS setting being used? A best practice is to avoid confusion by using the system DNS whenever possible. However, you can specify up to three custom DNS servers, and you should use all three entries for redundancy.

There are some situations, such as a new wireless interface, or during the initial FortiGate configuration, where interfaces override the system DNS entries. When this happens, it often shows up as intermittent Internet connectivity. To fix the problem, go to **Network > DNS** and enable **Use FortiGuard Servers**.

## How to check CPU and memory resources

System resources are shared and a number of processes run simultaneously on the FortiGate unit.

The **Resource** widgets for **CPU** and **Memory** on the **Dashboard** provide a quick way to monitor usage.

To use the CLI to check the system resources on your FortiGate unit, run the following command:

```
FGT# get system performance status
```

This command provides a quick and easy snapshot of the FortiGate.

The first line of output shows the CPU usage by category. A FortiGate that is doing nothing looks like the following example:

```
CPU states: 0% user 0% system 0% nice 100% idle
```

However, if your network is running slowly, you might see something like the following example:

```
CPU states: 1% user 98% system 0% nice 1% idle
```

This line shows that all of the CPU is used up by system processes. Normally this shouldn't happen since it shows that the FortiGate is overloaded for some reason. If you see this overloading, you should investigate further because it's possible that a process, such as `scanunitid`, is using all of the resources to scan traffic. In this case, you must reduce the amount of traffic that's being scanned by blocking unwanted protocols, configuring more security policies to limit scanning to certain protocols, or similar actions. It's also possible that a hacker has gained access to your network and is overloading it with malicious activity, such as running a spam server or using zombie PCs to attack other networks on the Internet. You can use the `get system performance top` CLI command to get more information about the CPU. This command shows you all of the top processes that are running on the FortiGate (the names are on the left) and their CPU usage. If a process is using most of the CPU cycles, investigate it to determine whether the activity is normal.

The second line of output from the `get system performance status` command shows the memory usage. Memory usage shouldn't exceed 90%. If memory is too full, some processes won't be able to function properly. For example, if the system is running low on memory, antivirus scanning enters into failopen mode where it drops connections or bypasses the antivirus system.

The other lines of output, such as average network usage, average session setup rate, viruses caught, and IPS attacks blocked, can also help you determine why system resource usage is high. For example, if network usage

is high, it results in high traffic processing on the FortiGate, or if the session setup rate is very low (or zero) the proxy may be overloaded and unable to do its job.

## How to troubleshoot high memory usage

As with any system, a FortiGate has limited hardware resources, such as memory, and all processes running on the FortiGate share the memory. Each process uses more or less memory, depending on its workload. For example, a process usually uses more memory in high traffic situations. If some processes use all of the available memory, other processes won't be able to run.

When high memory usage occurs, the services may freeze up, connections may be lost, or new connections may be refused.

If you see high memory usage in the **Memory** widget, the FortiGate may be handling high traffic volumes. Alternatively, the FortiGate may have connection pool limits that are affecting a single proxy. If the FortiGate receives a large volume of traffic on a specific proxy, the unit may exceed the connection pool limit. If the number of free connections within a proxy connection pool reaches zero, issues may occur.

Use the following CLI command, which uses the antivirus failopen feature:

```
config system global
 set av-failopen idledrop
end
```

If you set `av-failopen` to `idledrop`, the FortiGate drops connections based on the clients that have the most open connections. This helps you determine the behavior of the FortiGate antivirus system if it becomes overloaded in high traffic.

Use the following CLI command, which shows information about current memory usage:

```
diagnose hardware sysinfo memory
```

### Sample output:

```
total: used: free: shared: buffers: cached: shm:
Mem: 2074185728 756936704 1317249024 0 20701184 194555904 161046528
Swap: 0 0 0
MemTotal: 2025572 kB
MemFree: 1286376 kB
MemShared: 0 kB
Buffers: 20216 kB
Cached: 189996 kB
SwapCached: 0 kB
Active: 56644 kB
Inactive: 153648 kB
HighTotal: 0 kB
HighFree: 0 kB
LowTotal: 2025572 kB
LowFree: 1286376 kB
SwapTotal: 0 kB
SwapFree: 0 kB
```

## How to troubleshoot high CPU usage

If you deploy too many FortiOS features at the same time, you can overextend the CPU resources on a FortiGate. When this occurs, the FortiGate experiences connection-related problems.

Some examples of CPU intensive features are:

- VPN high-level encryption
- Intensive scanning of all traffic
- Logging all traffic and packets
- Dashboard widgets that frequently perform data updates

#### 1. Determine the current level of CPU usage.

There are two ways to do this. The simplest is to look at the **CPU** widget on the **Dashboard**. The real-time CPU usage is displayed for different timeframes. The second method provides precise usage values both for overall usage and for specific processes. To use it, run the `diagnose sys top` command in the CLI.

#### Sample output:

```
Run Time: 86 days, 0 hours and 10 minutes
OU, ON, OS, 100I, OWA, OHI, OSI, OST; 3040T, 2437F
bcm.user 93 S < 3.1 0.4
httpsd 18922 S 1.5 0.5
httpsd 19150 S 0.3 0.5
newcli 20195 R 0.1 0.1
cmdbsvr 115 S 0.0 0.8
pyfcgid 20107 S 0.0 0.6
forticron 146 S 0.0 0.5
httpsd 139 S 0.0 0.5
cw_acd 166 S 0.0 0.5
miglogd 136 S 0.0 0.5
pyfcgid 20110 S 0.0 0.4
pyfcgid 20111 S 0.0 0.4
pyfcgid 20109 S 0.0 0.4
httpsd 20192 S 0.0 0.4
miglogd 174 S 0.0 0.4
miglogd 175 S 0.0 0.4
fgfmd 165 S 0.0 0.3
newcli 20191 S 0.0 0.3
initXXXXXXXXXXXX 1 S 0.0 0.3
httpsd 184 s 0.0 0.3
```

Where the codes on the second output line mean the following:

- **U** is the percentage of user space applications that are currently using the CPU.
- **N** is the percentage of time that the CPU spent on low priority processes since the last shutdown.
- **S** is the percentage of system processes (or kernel processes) that are using the CPU.
- **I** is the percentage of idle CPU resources.
- **WA** is the percentage of time that the CPU spent waiting on IO peripherals since the last shutdown.
- **HI** is the percentage of time that the CPU spent handling hardware interrupt routines since the last shutdown.
- **SI** is the percentage of time that the CPU spent handling software interrupt routines since the last shutdown.
- **ST**, or steal time, is the percentage of time that a virtual CPU waits for the physical CPU when the hypervisor is servicing another virtual processor.
- **T** is the total FortiOS system memory, in MB.
- **F** is free memory, in MB.

Each additional line of the command output displays information for specific processes running on the FortiGate unit. For example, the third line of the output is:

```
newcli 20195 R 0.1 0.1
```

Where:

- `newcli` is the process name. Other process names can include `ipsengine`, `sshd`, `cmdbsrv`, `httpsd`, `scanunitd`, and `miglogd`. Duplicate process names indicate that separate instances of that process are running.
- `20195` is the process ID, which can be any number.
- `R` is the current state of the process. The process state can be:
  - `R` - running
  - `S` - sleep
  - `Z` - zombie
  - `D` - disk sleep
- `0.1` is the percentage of CPU capacity that the process is using. CPU usage can range from 0.0 for a process that is sleeping to higher values for a process that's taking a lot of CPU time.
- `0.1` is the amount of memory that the process is using. Memory usage can range from 0.1 to 5.5 and higher.

When `diagnose sys top` is running, enter the following single-key commands :

- Press `q` to quit and return to the normal CLI prompt.
- Press `p` to sort the processes by the amount of CPU resources that the processes are using.
- Press `m` to sort the processes by the amount of memory that the processes are using.

The processes listed are the top processes that are running, and not all of the processes. For example, if 20 processes are listed, they are the top 20 processes, sorted by either CPU or memory usage. You can configure the number of processes displayed, using the following CLI command:

```
diagnose sys top <integer_seconds> <integer_maximum_lines>
```

Where:

- `<integer_seconds>` is the delay in seconds (default is 5)
- `<integer_maximum_lines>` is the maximum number of lines (or processes) to list (default is 20).

## 2. Determine what features are using most of the CPU resources.

There is a command in the CLI that shows the top few processes that are currently running and use the most CPU resources. The `get system performance top` CLI command shows a table of information. The second column from the right shows CPU usage by percentage. If the top few entries are using most of the CPU, note which processes they are and try and reduce their CPU load.

Some examples of processes you'll see include:

- `ipsengine` — the IPS engine that scans traffic for intrusions
- `scanunitd` — antivirus scanner
- `httpsd` — secure HTTP
- `iked` — internet key exchange (IKE) in use with IPsec VPN tunnels
- `newcli` — active whenever you're accessing the CLI

- `sshd` — there are active secure socket connections
- `cmdbsrv` — the command database server application

Go to the features that are at the top of the list and look for evidence of them overusing the CPU. Generally, the monitor for a feature is a good place to start.

### 3. Check for unnecessary CPU “wasters”.

These are some best practices that will reduce your CPU usage, even if the FortiGate isn't experiencing high CPU usage.

- Use hardware acceleration wherever possible to offload tasks from the CPU. Offloading tasks, such as encryption, frees up the CPU for other tasks.
- Avoid the use of GUI widgets that require computing cycles, such as the Top Sessions widget. These widgets constantly poll the system for information, which uses CPU and other resources.
- Schedule antivirus, IPS, and firmware updates during off peak hours. These updates don't usually these don't consume CPU resources but they can disrupt normal operation.
- Check the log levels and which events are being logged. This is the severity of the messages that are recorded. Consider going up one level to reduce the amount of logging. Also, if there are events you don't need to monitor, remove them from the list.
- Log to FortiCloud instead of logging to memory or disk. Logging to memory quickly uses up resources and logging to the local disk impacts overall performance and reduces the lifetime of the unit. Fortinet recommends that you log to FortiCloud because it doesn't use much CPU.
- If the disk is almost full, transfer the logs or data off the disk to free up space. When a disk is almost full it consumes a lot of resources to find the free space and organize the files.
- If the FortiGate has packet logging enabled, consider disabling it. When packet logging is enabled, it records every packet that comes through that policy.
- Halt all sniffers and traces.
- Ensure that the FortiGate isn't scanning traffic twice. If traffic enters the FortiGate on one interface, goes out another, and then comes back in again, that traffic doesn't need to be rescanned. Doing so is a waste of resources. However, ensure that traffic is being scanned once.
- Reduce the session timers to close unused sessions faster. Enter the following CLI commands, which reduce the default values. These values reduce the values from defaults. Note tht, by default, the system adds 10 seconds to `tcp-timewait`.

```
config system global
 set tcp-halfclose-timer 30
 set tcp-halfopen-timer 30
 set tcp-timewait-timer 0
 set udp-idle-timer 60
end
```

- In **System > Feature Visibility**, only enable features that you need.

### 4. When CPU usage is under control, use SNMP to monitor CPU usage. Alternatively, use logging to record CPU and memory usage every 5 minutes.

Once things are back to normal, you should set up a warning system that sends you alerts when CPU resources are used excessively. A common method to do this is using SNMP. SNMP monitors many values in FortiOS and allows you to set high water marks that generate events. You run an application on your computer to watch for and record these events. Go to **System > SNMP** to enable and configure an SNMP community. If this method is too complicated, you can use the **System Resources** widget to record CPU usage. However, this method only records problems as they happen and won't send you alerts for problems.

## How to check modem status

If the modem doesn't work properly, or a FortiGate doesn't detect the modem, you can use the following diagnostic command to help you troubleshoot issues with the modem:

```
diagnose sys modem {cmd | com | detect | history | external-modem | query| reset}
```

You should always run the following diagnose command after you insert the USB modem into the FortiGate:

```
diagnose sys modem detect
```

You can view the modem configuration, using the `get system modem` command. You can also view the modem's vendor and the custom product identification number from the information output that the `get system modem` command shows.

If there are connectivity issues, use the following to help you resolve them:

- `diagnose debug enable` – activates the debug on the console
- `diagnose debug application modemd` – dumps communication between the modem and the unit.
- `diagnose debug application ppp` – dumps the PPP negotiating messages.
- `execute modem dial` – displays modem debug output.

The modem diagnose output shouldn't contain errors on the way to initializing. You should also verify the number that is used to dial into your ISP.

## How to run ping and traceroute

Ping and traceroute are useful tools in network troubleshooting. Alone, either one can determine network connectivity between two points. However, ping can be used to generate simple network traffic that you can view using diagnose commands on the FortiGate. This combination can be very powerful when you're trying to locate network problems.

In addition to their normal uses, ping and traceroute can tell you if your computer or network device has access to a domain name server (DNS). While both tools can use IP addresses alone, they can also use domain names for devices. This is an added troubleshooting feature that can be useful in determining why particular services, such as email or web browsing, may not work properly.

If ping doesn't work, it may be disabled on at least one of the interface settings, and security policies for that interface.

Both ping and traceroute require particular ports to be open on firewalls, or else they can't function. Since you typically use these tools to troubleshoot, you can allow them in the security policies and on interfaces only when you need them. Otherwise, keep the ports disabled for added security.

### Ping

The ping command sends a very small packet to a destination, and waits for a response. The response has a timer that expires when the destination is unreachable.

Ping is part of Layer 3 on the OSI Networking Model. Ping sends Internet Control Message Protocol (ICMP) "echo request" packets to the destination, and listens for "echo response" packets in reply. However, many public networks block ICMP packets because ping can be used in a denial of service (DoS) attack (such as Ping of Death

or a smurf attack), or by an attacker to find active locations on the network. By default, FortiGate units have ping enabled while broadcast-forward is disabled on the external interface.

### What ping can tell you

Beyond the basic connectivity information, ping can tell you the amount of packet loss (if any), how long it takes the packet to make the round trip, and the variation in that time from packet to packet.

If there is some packet loss detected, you should investigate the following:

- Possible ECMP, split horizon, or network loops.
- Cabling, to ensure no loose connections.
- Verify which security policy was used (use the packet count column on the **Policy & Objects > IPv4 Policy** or **Policy & Objects > IPv6 Policy** page).

If there is total packet loss, you should investigate the following:

- **Hardware:** ensure cabling is correct, and all equipment between the two locations is accounted for.
- **Addresses and routes:** ensure all IP addresses and routing information along the route is configured as expected.
- **Firewalls:** ensure all firewalls, including FortiGate security policies allow PING to pass through.

### How to use ping

Ping syntax is the same for nearly every type of system on a network.

#### To ping from a FortiGate

1. Connect to the CLI either through telnet or through the CLI widget on the **Dashboard**.
2. Enter `execute ping 10.11.101.101` to send 5 ping packets to the destination IP address. There are no options for this command.

#### Sample output:

```
Head_Office_620b # execute ping 10.11.101.101
PING 10.11.101.101 (10.11.101.101): 56 data bytes
64 bytes from 10.11.101.101: icmp_seq=0 ttl=255 time=0.3 ms
64 bytes from 10.11.101.101: icmp_seq=1 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=2 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=3 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=4 ttl=255 time=0.2 ms

--- 10.11.101.101 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.2/0.2/0.3 ms
```

#### To ping from an Microsoft Windows PC

1. Open a command window.
2. Enter `ping 10.11.101.100` to ping the default internal interface of the FortiGate with four packets.

Other options include:

- `-t` to send packets until you press "Ctrl+C"
- `-a` to resolve addresses to domain names where possible
- `-n x` to send X ping packets and stop

**Sample output:**

```
C:\>ping 10.11.101.101

Pinging 10.11.101.101 with 32 bytes of data:
Reply from 10.11.101.101: bytes=32 time=10ms TTL=255
Reply from 10.11.101.101: bytes=32 time<1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255

Ping statistics for 10.11.101.101:
 Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
 Approximate round trip times in milli-seconds:
 Minimum = 0ms, Maximum = 10ms, Average = 3ms
```

**To ping from a Linux PC**

1. Go to a shell prompt.
2. Enter "ping 10.11.101.101".

**Traceroute**

Where ping will only tell you if it reached its destination and returned successfully, traceroute shows each step of the journey to its destination and how long each step takes. If ping finds an outage between two points, you can use traceroute to locate exactly where the problem is.

**What's traceroute**

Traceroute works by sending ICMP packets to test each hop along the route. It sends three packets, and then increases the time to live (TTL) setting by one each time. This effectively allows the packets to go one hop farther along the route. This is the reason why most traceroute commands display their maximum hop count before they start tracing the route, which is the maximum number of steps it takes before it declares the destination unreachable. Also, the TTL setting may result in steps along the route timing out due to slow responses. There are many possible reasons for this to occur.

By default, traceroute uses UDP datagrams with destination ports numbered from 33434 to 33534. The traceroute utility may also offer the option to select use of ICMP echo request (type 8) instead, which the Windows tracert utility uses. If you must, allow both protocols inbound through the FortiGate security policies (UDP with ports from 33434 to 33534 and ICMP type 8).

You can also use the packet count column of the **Policy & Objects > IPv4 Policy** (or **Policy & Objects > IPv6 Policy**, if applicable) page to track traceroute packets. This allows you to verify the connection and confirm which security policy the traceroute packets are using.

**What traceroute can tell you**

Ping and traceroute have similar functions, which is to verify connectivity between two points. The big difference is that traceroute shows you each step of the way, where ping doesn't. Also, ping and traceroute use different protocols and ports, so one may succeed where the other fails.

You can verify your DNS connection using traceroute. If you enter an FQDN instead of an IP address for the traceroute, DNS tries to resolve that domain name. If the name isn't resolved, you have DNS issues.

## How to use traceroute

The traceroute command varies slightly between operating systems. Note that in MicroSoft Windows, the command name is shortened to “tracert”. Also, your output lists different domain names and IP addresses along your route.

### To use traceroute on an MicroSoft Windows PC

1. Open a command window.
2. Enter “tracert fortinet.com” to trace the route from the PC to the Fortinet web site.

#### Sample output:

```
C:\>tracert fortinet.com

Tracing route to fortinet.com [208.70.202.225]
over a maximum of 30 hops:
 1 <1 ms <1 ms <1 ms 172.20.120.2
 2 66 ms 24 ms 31 ms 209-87-254-xxx.storm.ca [209.87.254.221]
 3 52 ms 22 ms 18 ms core-2-g0-0-1104.storm.ca [209.87.239.129]
 4 43 ms 36 ms 27 ms core-3-g0-0-1185.storm.ca [209.87.239.222]
 5 46 ms 21 ms 16 ms te3-x.1156.mpd01.cogentco.com [38.104.158.69]
 6 25 ms 45 ms 53 ms te8-7.mpd01.cogentco.com [154.54.27.249]
 7 89 ms 70 ms 36 ms te3-x.mpd01.cogentco.com [154.54.6.206]
 8 55 ms 77 ms 58 ms sl-st30-chi-.sprintlink.net [144.232.9.69]
 9 53 ms 58 ms 46 ms sl-0-3-3-x.sprintlink.net [144.232.19.181]
10 82 ms 90 ms 75 ms sl-x-12-0-1.sprintlink.net [144.232.20.61]
11 122 ms 123 ms 132 ms sl-0-x-0-3.sprintlink.net [144.232.18.150]
12 129 ms 119 ms 139 ms 144.232.20.7
13 172 ms 164 ms 243 ms sl-321313-0.sprintlink.net [144.223.243.58]
14 99 ms 94 ms 93 ms 203.78.181.18
15 108 ms 102 ms 89 ms 203.78.176.2
16 98 ms 95 ms 97 ms 208.70.202.225

Trace complete.
```

The first column on the left shows the hop count, which can't exceed 30 hops. When that number is reached, the traceroute ends.

The second, third, and fourth columns display how much time each of the three packets takes to reach this stage of the route. These values are in milliseconds and normally vary quite a bit. Typically a value of <1ms indicates a local connection.

The fifth column (farthest to the right) shows the domain name of the device and its IP address, or possibly only the IP address.

### To perform a traceroute on a Linux PC

1. Go to a command line prompt.
2. Enter “traceroute fortinet.com”.

The Linux traceroute output is very similar to the MicroSoft Windows tracert output.

### To trace a route from a FortiGate to a destination IP address - CLI

```
execute traceroute www.fortinet.com
traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
```

```

1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms

```

## How to check the logs

You might forget this step in troubleshooting, but it's an important one. Logging records the traffic that passes through the FortiGate to your network and what action the FortiGate takes when it scans the traffic. This information record is called a log message.

When you first configure FortiOS, log as much information as you can. If the logs that the FortiGate generates are too large, you can turn off or scale back the logging for features that you're not using.

As with most troubleshooting steps, before you can determine if the logs indicate a problem, you need to know what logs result from normal operation. Without a baseline it's difficult to troubleshoot.

When you troubleshoot with log files:

- Compare current logs to a recorded baseline of normal operation.
- If you need to increase the level of logging (for example, from Warning to Information) to obtain more information.

When you increase logging levels, ensure that you configure email alerts and select both disk usage and log quota. This ensures that you'll be notified if the increase in logging causes problems. Configure log settings by going to **Log & Report > Log Settings**.

Determine the activities that generate the most log entries:

- Check all logs to ensure important information isn't overlooked.
- Filter or order log entries based on different fields, such as level, service, or IP address, to look for patterns that may indicate a specific problem, such as frequent blocked connections on a specific port for all IP addresses.

Logs help identify and locate any problems, but they won't solve the problems. The purpose of logs is to speed up your problem solving and save you time and effort.

## How to verify the contents of the routing table (in NAT mode)

When a FortiGate has limited or no connectivity, a good place to look for information is the routing table.

The routing table is where all the currently used routes are stored for both static and dynamic protocols. If a route is in the routing table, it saves time and resources that you would spend performing a lookup. If the routing table is full and a new route needs to be added, the oldest, least-used route is removed and the new route is added. This ensures that the most recently used routes stay in the table. If your FortiGate is in transparent mode, you can't perform this step.

If the FortiGate is running in NAT mode, verify that all desired routes are in the routing table, including local subnets, default routes, specific static routes, and dynamic routing protocols.

To check the routing table in the FortiGate GUI, use the Routing Monitor by going to **Monitor > Routing Monitor**.

In the CLI, use the command `get router info routing-table all`.

### Sample output:

```
FGT# get router info routing-table all

Codes:
 K - kernel, C - connected, S - static, R - RIP, B - BGP
 O - OSPF, IA - OSPF inter area
 N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
 E1 - OSPF external type 1, E2 - OSPF external type 2
 i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
 * - candidate default

S* 0.0.0.0/0 [10/0] via 172.20.120.2, wan1
C 10.31.101.0/24 is directly connected, internal
C 172.20.120.0/24 is directly connected, wan1
```

## How to verify the correct route is being used

If you have more than one default route and want to make sure that traffic is flowing as expected and through the right route, you can run a trace route from a machine in the local area network (LAN). This shows you the first hop that the traffic goes through.

### Sample output:

```
C:\>tracert www.fortinet.com

Tracing route to www.fortinet.com [66.171.121.34]
over a maximum of 30 hops:

 1 <1 ms <1 ms <1 ms 10.10.1.99
 2 1 ms <1 ms <1 ms 172.20.120.2
 3 3 ms 3 ms 3 ms static-209-87-254-221.storm.ca [209.87.254.221]
 4 3 ms 3 ms 3 ms core-2-g0-2.storm.ca [209.87.239.129]
 5 13 ms 13 ms 13 ms core-3-bdi1739.storm.ca [209.87.239.199]
 6 12 ms 19 ms 11 ms v502.core1.tor1.he.net [216.66.41.113]
 7 22 ms 22 ms 21 ms 100ge1-2.core1.nyc4.he.net [184.105.80.9]
 8 84 ms 84 ms 84 ms ny-paix-gni.twgate.net [198.32.118.41]
 9 82 ms 84 ms 82 ms 217-228-160-203.TWGATE-IP.twgate.net [203.160.22
 8.217]
10 82 ms 81 ms 82 ms 229-228-160-203.TWGATE-IP.twgate.net [203.160.22
 8.229]
11 82 ms 82 ms 82 ms 203.78.181.2
12 84 ms 83 ms 83 ms 203.78.186.70
13 84 ms * 85 ms 66.171.127.177
14 84 ms 84 ms 84 ms fortinet.com [66.171.121.34]
15 84 ms 84 ms 83 ms fortinet.com [66.171.121.34]

Trace complete.
```

In this scenario, the first hop contains the IP address `10.10.1.99`, which is the internal interface of the FortiGate. The second hop contains the IP address `172.20.120.2`, to which the `wan1` interface of the FortiGate is connected, so we can conclude that the route through `wan1` interface is being used for this traffic.

You can also see the route taken for each session by debugging the packet flow in the CLI. For more information, see [How to debug the packet flow](#).

## How to verify the correct firewall policy is being used

If you have more than one firewall policy, use the count column to check which policy is being used, the count must show traffic increasing. To do so, go to the **Policy & Objects > IPv4 Policy** or **Policy & Objects > IPv6 Policy** page.

Also, debugging the packet flow in the CLI shows the policy ID that's allowing the traffic. For more information on debugging the packet flow, see [How to debug the packet flow](#).

## How to check the bridging information in transparent mode

When the FortiGate is set to transparent mode, it acts like a bridge and sends all incoming traffic out on the other interfaces. The bridge is between interfaces on the FortiGate.

Each bridge that's listed is a link between interfaces. Where traffic is flowing between interfaces, you can expect to find bridges listed. If you're having connectivity issues, and there are no bridges listed, that is a likely cause. Check for the MAC address of the interface or device in question.

### How to check the bridging information

To list the existing bridge instances on the FortiGate, use the following command:

```
diagnose netlink brctl list
```

#### Sample output:

```
#diagnose netlink brctl list
list bridge information
1. root.b fdb: size=256 used=6 num=7 depth=2 simple=no
Total 1 bridges
```

### How to display forwarding domain information

You can use forwarding domains, or collision domains, in routing to limit where packets are forwarded on the network. Layer 2 broadcasts are limited to the same group. By default, all interfaces are in group 0. For example, if the FortiGate has 12 interfaces, only two may be in the same forwarding domain, which limits the packets that are broadcast to those two interfaces. This reduces traffic on the rest of the network.

Collision domains prevent the forwarding of ARP packets to all VLANs on an interface. Without collision domains, duplicate MAC addresses on VLANs may cause ARP packets to be duplicated. Duplicate ARP packets can cause some switches to reset. It's important to know what interfaces are part of which forwarding domains because this determines which interfaces can communicate with each other.

To manually configure forwarding domains in transparent mode, use the following CLI command:

```
config system interface
 edit <interface_name>
 set forward-domain <integer>
 end
```

To display the information for forward domains, use the following command:

```
diagnose netlink brctl domain <name> <id>
```

where <name> is the name of the forwarding domain to display and <id> is the domain ID.

### Sample output

```
diagnose netlink brctl domain ione 101
show bridge root.b ione forward domain.
id=101 dev=trunk_1 6
```

To list the existing bridge MAC table, use the following command:

```
diagnose netlink brctl name host <name>
```

### Sample output

```
show bridge control interface root.b host.
fdb: size=256, used=6, num=7, depth=2, simple=no
Bridge root.b host table
```

port no	device	devname	mac addr	tvl	attributes
2	7	wan2	02:09:0f:78:69:00	0	Local Static
5	6	vlan_1	02:09:0f:78:69:01	0	Local Static
3	8	dmz	02:09:0f:78:69:01	0	Local Static
4	9	internal	02:09:0f:78:69:02	0	Local Static
3	8	dmz	00:80:c8:39:87:5a	194	
4	9	internal	02:09:0f:78:67:68	8	
1	3	wan1	00:09:0f:78:69:fe	0	Local Static

To list the existing bridge port list, use the following command:

```
diagnose netlink brctl name port <name>
```

### Sample output:

```
show bridge root.b data port.
trunk_1 peer_dev=0
internal peer_dev=0
dmz peer_dev=0
wan2 peer_dev=0
wan1 peer_dev=0
```

## How to check the number of sessions that UTM proxy uses

Each FortiGate model has a limit to the maximum number of sessions that the UTM proxy supports. The UTM proxy handles all the traffic for the following protocols: HTTP, SMTP, POP3, IMAP, FTP, and NNTP. If the proxy

for a protocol fills up its session table, the FortiGate enters conserve mode, where it behaves differently, until entries and memory free up again.

## Conserve or failopen mode

Once you reach the limit, depending on the conserve mode configuration, no new sessions are created until old ones end. You can configure the behavior of the FortiGate when memory is running low or the proxy connection limit has been reached. There are two related commands for this in the CLI:

```
config system global
 set av-failopen-session {enable | disable}
 set av-failopen {idledrop | off | one-shot | pass}
end
```

To set the behavior for these conditions, you must enable `av-failopen-session`. When it's enabled, and a proxy for a protocol runs out of room in its session table, that protocol goes into failopen mode and behaves as defined in the `av-failopen` command.

`av-failopen` determines the behavior of the proxy until entries are free in the session table again for that proxy.

- **idledrop** — This option removes idle sessions from the session table, starting with the clients that have the most sessions currently open. This method assumes that idle sessions aren't being used and it won't cause problems to close these sessions. This is usually true, but some applications may be unable to open a session. If this occurs, try another method to check if this is really the problem. This is a secure option as no unscanned traffic is allowed to pass.
- **off** — This option turns off accepting any new AV sessions, but continues to process any existing AV sessions that are currently active. All the protocols listed (HTTP, SMTP, POP3, IMAP, FTP, and NNTP) are scanned by FortiGate Antivirus. If AV scanning is enabled, `av-failopen off` is selected, and the proxy session table fills up, which means that no new sessions of that type are accepted. For example, if the POP3 session table is full, and email AV scanning is enabled, no additional POP3 connections are allowed until the session table gets some free space. This is a secure option because no unscanned traffic is allowed to pass.
- **one-shot** — When memory is low, bypass the antivirus system. The term `one-shot` comes from the fact that once you're in `one-shot av-failopen` mode, you must set `av-failopen` to either `pass` or `off` to restart AV scanning. This is a very unsecure option because it allows all traffic without AV scanning, and it never reverts to normal without manual assistance.
- **pass** — When memory is low, bypass the antivirus system. The difference between `pass` and `one-shot` options is that when memory is freed up, the system automatically starts AV scanning. This is an unsecure option because it allows traffic to pass without AV scanning. However, it's better than `one-shot` because it automatically restarts AV scanning, when possible.

If the proxy session table is full for one or more protocols and your FortiGate enters into conserve or failopen mode, it appears as though the FortiGate has lost connection, network services are intermittent or don't exist, and yet other services work normally for a while until their sessions end and they join the queue of session-starved applications.

## How to examine the firewall session list

The firewall session list displays all sessions that the FortiGate has open. You can see if there are strange patterns, such as no sessions apart from the internal network, or all sessions are only to one IP address.

When you examine the firewall session list in the CLI, you can use filters to reduce the output. In the GUI, the filters belong to the interface.

### To examine the firewall session list - GUI

Go to **FortiView > All Sessions**.

### To examine the firewall session list - CLI

When you examine the firewall session list, there may be too many sessions to display. In this case, it's necessary to limit or filter the sessions displayed by source or destination address, or NAT'd address or port. If you want to filter by more than one of these, you need to enter a separate line for each value.

The following example shows filtering the session list based on a source address of 10.11.101.112:

```
FGT# diagnose sys session filter src 10.11.101.112
FGT# diagnose sys session list
```

The following example shows filtering the session list based on a destination address of 172.20.120.222:

```
FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session list
```

### To clear all sessions corresponding to a filter - CLI

```
FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session clear
```

## Check source NAT information

When you troubleshoot connections, remember NAT. NAT is especially important if you're troubleshooting from the remote end of the connection outside the firewall. On the **FortiView > All Sessions** list, pay attention to **NAT Source**, and **NAT Source Port**. These columns display the IP and port values after NAT has been applied.

Checking the NAT values can help you ensure that they are the values you expect, and that the remote end of the sessions can see the expected IP address and port number.

When you display the session list in the CLI, you can match the NAT'd source address (`nsrc`) and port (`nport`). This can be useful if multiple internal IP addresses are NAT'd to a common external-facing source IP address.

```
FGT# diagnose sys session filter nsrc 172.20.120.122
FGT# diagnose sys session filter nport 8888
FGT# diagnose sys session list
```

## How to check wireless information

Wireless connections, stations, and interfaces have different issues than other physical interfaces.

### Troubleshooting station connection issue

To check whether a station entry is created on access control, use the following command:

```
FG600B3909600253 # diagnose wireless-controller wlac -d sta
* vf=0 wtp=70 rId=2 wlan=open ip=0.0.0.0 mac=00:09:0f:db:c4:03 rssi=0 idle=148 bw=0 use=2
vf=0 wtp=70 rId=2 wlan=open ip=172.30.32.122 mac=00:25:9c:e0:47:88 rssi=-40 idle=0 bw=9
use=2
```

## Enable diagnostics for a particular station

This example uses the station MAC address to find where it's failing:

```
FG600B3909600253 # diagnose wireless-controller wlacl sta_filter 00:25:9c:e0:47:88 1
Set filter sta 00:25:9c:e0:47:88 level 1
FG600B3909600253 # 71419.245 <ih> IEEE 802.11 mgmt::disassoc <== 00:25:9c:e0:47:88 vap
open rId 1 wId 0 00:09:0f:db:c4:03
71419.246 <dc> STA del 00:25:9c:e0:47:88 vap open rId 1 wId 0
71419.246 <cc> STA_CFG_REQ(34) sta 00:25:9c:e0:47:88 del ==> ws (0-192.168.35.1:5246) rId
1 wId 0
71419.246 <cc> STA del 00:25:9c:e0:47:88 vap open ws (0-192.168.35.1:5246) rId 1 wId 0
00:09:0f:db:c4:03 sec open reason I2C_STA_DEL
71419.247 <cc> STA_CFG_RESP(34) 00:25:9c:e0:47:88 <== ws (0-192.168.35.1:5246) rc 0
(Success).
```

## How to verify connectivity to FortiGuard

You can verify connectivity to FortiGuard in the **Licenses** widget on the **Dashboard**. When your FortiGate is connected to FortiGuard, a green check mark appears for available FortiGuard services.

To verify connectivity to FortiGuard using the CLI, enter the commands `execute ping service.fortiguard.net` and `execute ping update.fortiguard.net`.

### Sample output:

```
FG100D# execute ping service.fortiguard.net
PING guard.fortinet.net (208.91.112.196): 56 data bytes
64 bytes from 208.91.112.196: icmp_seq=0 ttl=51 time=61.0 ms
64 bytes from 208.91.112.196: icmp_seq=1 ttl=51 time=60.0 ms
64 bytes from 208.91.112.196: icmp_seq=2 ttl=51 time=59.6 ms
64 bytes from 208.91.112.196: icmp_seq=3 ttl=51 time=58.9 ms
64 bytes from 208.91.112.196: icmp_seq=4 ttl=51 time=59.2 ms

--- guard.fortinet.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 58.9/59.7/61.0 ms

FG100D# execute ping update.fortiguard.net
PING fds1.fortinet.com (208.91.112.68): 56 data bytes
64 bytes from 208.91.112.68: icmp_seq=0 ttl=53 time=62.0 ms
64 bytes from 208.91.112.68: icmp_seq=1 ttl=53 time=61.8 ms
64 bytes from 208.91.112.68: icmp_seq=2 ttl=53 time=61.3 ms
64 bytes from 208.91.112.68: icmp_seq=3 ttl=53 time=61.9 ms
64 bytes from 208.91.112.68: icmp_seq=4 ttl=53 time=61.8 ms
```

## How to perform a sniffer trace (CLI and packet capture)

When you troubleshoot networks and routing in particular, it helps to look inside the headers of packets to determine if they're traveling along the route that you expect them to take. Packet sniffing can also be called a network tap, packet capture, or logic analyzing.

If your FortiGate has NP2, NP4, or NP6 interfaces that are offloading traffic, this will change the sniffer trace. Before performing a trace on any NP2, NP4, or NP6 interfaces, you should disable offloading on those interfaces.

## How do you sniff packets

Before you start sniffing packets on the CLI, you should prepare to capture the output to a file. A large amount of data may scroll by and you won't be able to see it without first saving it to a file. One method is to use a terminal program like puTTY to connect to the FortiGate CLI. Once the packet sniffing count is reached, you can end the session and analyze the output in the file.

The general form of the internal FortiOS packet sniffer command is:

```
diagnose sniffer packet <interface_name> <'filter'> <verbose> <count> <tsformat>
```

To stop the sniffer, type CTRL+C.

<b>&lt;interface_name&gt;</b>	The name of the interface to sniff, such as "port1" or "internal". This can also be "any" to sniff all interfaces.
<b>&lt;'filter'&gt;</b>	What to look for in the information the sniffer reads. "none" indicates no filtering, and all packets are displayed as the other arguments indicate.  The filter must be inside single quotes (').
<b>&lt;verbose&gt;</b>	The level of verbosity as one of:  <ol style="list-style-type: none"> <li><b>1</b> - print header of packets</li> <li><b>2</b> - print header and data from IP of packets</li> <li><b>3</b> - print header and data from Ethernet of packets</li> <li><b>4</b> - print header of packets with interface name</li> </ol>
<b>&lt;count&gt;</b>	The number of packets the sniffer reads before stopping. If you don't put a number here, the sniffer will run until you stop it with <CTRL+C>.
<b>&lt;tsformat&gt;</b>	The format of timestamp. <ul style="list-style-type: none"> <li>• a: absolute UTC time, yyyy-mm-dd hh:mm:ss.ms</li> <li>• l: absolute LOCAL time, yyyy-mm-dd hh:mm:ss.ms</li> <li>• otherwise: relative to the start of sniffing, ss.ms</li> </ul>

For a simple sniffing example, enter the CLI command `diagnose sniffer packet port1 none 1 3`. This displays the next three packets on the port1 interface using no filtering, and verbose level 1. At this verbosity level, you can see the source IP and port, the destination IP and port, action (such as ack), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets and that 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diagnose sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]

0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757

0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808

0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

For a more advanced example of packet sniffing, the following commands will report packets on any interface that are traveling between a computer with the host name of "PC1" and a computer with the host name of "PC2". With verbosity 4 and above, the sniffer trace displays the interface names where traffic enters or leaves the FortiGate unit. Remember to stop the sniffer, type `CTRL+C`.

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2>" 4
```

or

```
FGT# diagnose sniffer packet any "(host <PC1> or host <PC2>) and icmp" 4
```

The following CLI command for a sniffer includes the ARP protocol in the filter which may be useful to troubleshoot a failure in the ARP resolution (for example, PC2 may be down and not responding to the FortiGate ARP requests).

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2> or arp" 4
```

## How do you use packet capture

To use packet capture, the FortiGate must have a disk. You can enable the `capture-packet` in the firewall policy, using the following CLI commands:

```
config firewall policy
 edit <id>
 set capture-packet enable
 end
```

To configure packet capture filters, go to **Network > Packet Capture**.

When you add a packet capture filter, enter the following information and select **OK**.

<b>Interface</b>	Select the interface to sniff from the drop-down menu.  You must select one interface. You can't change the interface without deleting the filter and creating a new one, unlike the other fields.
<b>Max Packets to Save</b>	Enter the number of packets to capture before the filter stops.  This number can't be zero. You can halt the capturing before this number is reached.
<b>Enable Filters</b>	Select this option to specify filter fields
<b>Host(s)</b>	Enter the IP address of one or more hosts  Separate multiple hosts with commas. To enter a range, use a dash without spaces, for example 172.16.1.5-172.16.1.15, or enter a subnet.
<b>Port(s)</b>	Enter one or more ports to capture on the selected interface.  Separate multiple ports with commas. To enter a range, use a dash without spaces, for example 88-90

<b>VLAN(s)</b>	Enter one or more VLANs (if any).  Separate multiple VLANs with commas.
<b>Protocol</b>	Enter one or more protocols. Separate multiple protocols with commas. To enter a range, use a dash without spaces, for example 1-6, 17, 21-25.
<b>Include IPv6 Packets</b>	Select this option if you're troubleshooting IPv6 networking, or if your network uses IPv6. Otherwise, leave it disabled.
<b>Include Non-IP Packets</b>	The protocols in the list are all IP based except for ICMP (ping). To capture non-IP based packets, select this feature. Examples of non-IP packets include IPsec, IGMP, ARP, and ICMP.

If you select a filter, you have the option to start and stop packet capture in the edit window, or download the captured packets. You can also see the filter status and the number of packets captured.

You can select the filter and start capturing packets. When the filter is running, the number of captured packets increases until it reaches the **Max Packet Count** or you stop it. When the filter is running, you can't download the output file.

When the packet capture is complete, you can download the \*.pcap file. You must use a third party application, such as Wireshark, to read \*.pcap files. This tool provides you with extensive analytics and the full contents of the packets that were captured.

To start, stop, or resume packet capture, use the symbols on the screen. These symbols are the same as those used for audio or video playback. Hover over the symbol to reveal explanatory text. Similarly, to download the \*.pcap file, use the download symbol on the screen.

For more information on troubleshooting with packet capture and packet sniffing, see ["Packet sniffing and packet capture" on page 3279](#).

## How to debug the packet flow

Traffic should come in and leave the FortiGate. If you determine that network traffic isn't entering and leaving the FortiGate as expected, debug the packet flow.

You can only perform debugging using CLI commands. Debugging the packet flow requires that you enter a number of debug commands as each one configures part of the debug action, with the final command starting the debug.

If your FortiGate has FortiASIC NP4 or NP6 interface pairs that are offloading traffic, this changes the packet flow. Before you perform the debug on any NP4 or NP6 interfaces, you should disable offloading on those interfaces. Enter `diagnose npu <interface pair> fastpath disable`, where `<interface pair>` can be `np4`, `np6`, `np4lite`, or `np6lite`.

The following configuration assumes that PC1 is connected to the internal interface of the FortiGate and has an IP address of 10.11.101.200. PC1 is the host name of the computer.

To debug the packet flow in the CLI, enter the following commands:

```
FGT# diagnose debug disable
```

```
FGT# diagnose debug flow filter add <PC1>
FGT# diagnose debug flow show console enable
FGT# diagnose debug flow show function-name enable
FGT# diagnose debug flow trace start 100
FGT# diagnose debug enable
```

The `start 100` argument in the above list of commands limits the output to 100 packets from the flow. This is useful to look at the flow without flooding your log or displaying too much information.

To stop all other debug activities, enter the command:

```
FGT# diagnose debug flow trace stop
```

The following is an example of debug flow output for traffic that has no matching security policy, and is in turn blocked by the FortiGate unit. The denied message indicates that the traffic was blocked.

```
id=20085 trace_id=319 func=resolve_ip_tuple_fast line=2825 msg="vd-root received a packet
(proto=6, 192.168.129.136:2854->192.168.96.153:1863) from port3."

id=20085 trace_id=319 func=fw_forward_handler line=248 msg=" Denied by forward policy
check"
```

## Troubleshooting resources

Fortinet provides customers with resources of valuable information about FortiOS technical issues, including:

### Technical documentation

Installation, Administration, and Quick Start Guides, as well as other technical documents, are available online at the [Fortinet Document Library](https://docs.fortinet.com): <https://docs.fortinet.com>

### Fortinet video library

The [Fortinet Video Library](https://video.fortinet.com) hosts a collection of video which provide valuable information about Fortinet products. <https://video.fortinet.com>

### Release notes

Issues that arise after the technical documentation is published will often be listed in the Release Notes. To find these, go to the [Fortinet Document Library](https://docs.fortinet.com).

### Knowledge base

The [Fortinet Knowledge Base](https://kb.fortinet.com) provides access to a variety of articles, white papers, and other documentation that provides technical insight into a range of Fortinet products. The Knowledge Base is available online at:

<http://kb.fortinet.com>

## Fortinet technical discussion forums

An online technical forum allows administrators to contribute to discussions about issues that relate to their Fortinet products. Searching the forum can help an administrator identify if an issue has been experienced by another user. You can access the support forums at: <https://forum.fortinet.com/>

## Fortinet training services online campus

The [Fortinet Training Services Online Campus](https://www.fortinet.com/training.html) hosts a collection of tutorials and training materials which you can use to increase your knowledge of the Fortinet products. <https://www.fortinet.com/training.html>

## Fortinet customer support

You defined your problem, researched a solution, put together a plan to find the solution, and executed that plan. At this point, if the problem hasn't been solved, it's time to contact [Fortinet Customer Service & Support](#) for assistance. Prepare yourself by reading [How to work with Fortinet Support](#) on Fortinet's Cookbook site.

<https://support.fortinet.com>

# Chapter 32 - Virtual Domains

## Virtual domains

This guide explains how to set up and use Virtual Domains (VDOMs) with a FortiGate. It contains the following sections:

- [Virtual Domains Overview](#): information about the basic concepts and rules for using VDOMs.
- [VDOMs in NAT mode](#): detailed explanations and examples for configuring VDOM features for a FortiGate in NAT mode.
- [VDOMs in transparent mode](#): detailed explanations and examples for configuring VDOM features for a FortiGate in Transparent mode.
- [Inter-VDOM routing](#): concepts and scenarios for inter-VDOM routing.
- [Troubleshooting Virtual Domains](#): diagnostic and troubleshooting information for some potential VDOM issues.

Before you begin using this guide, take a moment to note the following:

- By default, most FortiGate units support 10 VDOMs. Many FortiGate models support purchasing a license key to increase the maximum number.
- This guide uses a FortiGate unit with interfaces named port1 through port4 for examples and procedures. The interface names on some models will vary. Where possible aliases for these ports are indicated to show their intended purpose and to help you determine which ports to use if your ports are labelled differently.
- Administrators are assumed to be super\_admin administrators unless otherwise specified. Some restrictions will apply to other administrators.

## What's new in FortiOS 5.6

The following new features have been added for Virtual Domains (VDOMs) in FortiOS 5.6:

### VDOMs (5.6.3)

This section describes new VDOM features added to FortiOS 5.6.3.

### Rewrite Global Resources Page and VDOM edit page (444478)

The previous Global Resources and VDOM edit pages were outdated. These pages have been redesigned and updated to use modern styling.

- Updated api/v2/monitor/system/vdom-resources to include VDOM resource usage
- Created new endpoint api/v2/monitor/system/global-resources for retrieving global resource usage across VDOMs
- Rewrote VDOM create/edit page in Angular
- Rewrote Global Resources page in Angular

## VDOMs (5.6)

This section describes new VDOM features added to FortiOS 5.6

### Dashboard changes

The option to enable VDOMs is no longer part of the **System Information** widget. To enable VDOMs, you must now go to **System > Settings**.

### Firewall Service Cache improvement

The Firewall Service Cache will now have separate caches for each VDOM, to improve the speed of cache searches.

## Virtual Domains Overview

Virtual domains (VDOMs) are a method of dividing a FortiGate device into two or more virtual instances that function as multiple independent devices. VDOMs can provide separate firewall policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network or organization.

This chapter will cover the basics of VDOMs, how they change your FortiGate device, and how to work with VDOMs.

This section includes:

- [Benefits of VDOMs](#)
- [Enabling and accessing VDOMs](#)
- [Configuring VDOMs](#)

Multiple VDOM support isn't available when Security Fabric is enabled.

---

### Benefits of VDOMs

VDOMs provide the following benefits:

- [Easier administration](#)
- [Continued security](#)
- [Savings in physical space and power](#)
- [Improving transparent mode configuration](#)
- [More flexible MSSP configurations](#)

#### Easier administration

VDOMs provide separate security domains that allow separate zones, user authentication, firewall policies, routing, and VPN configurations. VDOMs separate security domains and simplify administration of complex configurations—you do not have to manage as many settings at one time.

By default, each FortiGate unit has a VDOM named root. This VDOM includes all of the unit's physical interfaces, modem, VLAN subinterfaces, zones, firewall policies, routing settings, and VPN settings.

Also, you can optionally assign an administrator account restricted to one VDOM. If the VDOM is created to serve an organization, this feature enables the organization to manage its own configuration.

In order to connect to a VDOM, an admin must log in using an interface belonging to that VDOM. This allows for proper authentication and restricts that admin's access to a single VDOM.

Each physical FortiGate unit requires a FortiGuard license to access security updates. VDOMs do not require any additional FortiGuard licenses, or updating — all the security updates for all the VDOMs are performed once per update at the global level. Combined this can be a potentially large money and time saving feature in your network.

Management systems such as SNMP, logging, alert email, FDN-based updates, and NTP-based time setting use addresses and routing in the management VDOM to communicate with the network. They can connect only to network resources that communicate with the management VDOM. Using a separate VDOM for management traffic enables easier management of the FortiGate unit global settings, and VDOM administrators can also manage their VDOMs more easily.

### Continued security

When a packet enters a VDOM, it is confined to that VDOM and is subject to any firewall policies for connections between VLAN subinterfaces or zones in that VDOM, just like those interfaces on a FortiGate unit without VDOMs enabled.

To travel between VDOMs, a packet must first pass through a firewall policy on a physical interface. The packet then arrives at another VDOM on that same FortiGate unit, but on a different interface, where it must pass through another firewall before entering. It doesn't matter if the interface is physical or virtual — inter-VDOM packets still require the same security measures as when passing through physical interfaces.

VDOMs provide an additional level of security because regular administrator accounts are specific to one VDOM — an administrator restricted to one VDOM cannot change information on other VDOMs. Any configuration changes and potential errors will apply only to that VDOM and limit any potential down time. Using this concept, you can farther split settings so that the management domain is only accessible by the `super_admin` and does not share any settings with the other VDOMs.

### Savings in physical space and power

To increase the number of physical FortiGate units, you need more rack space, cables, and power to install the new units. You also need to change your network configuration to accommodate the new physical units. In the future, if you need fewer physical units you are left with expensive hardware that is idle.

Increasing VDOMs involves no additional hardware, no additional cabling, and very few changes to existing networking configurations. VDOMs save physical space and power. You are limited only by the size of the VDOM license you buy and the physical resources on the FortiGate unit.

For example, if you are using one FortiGate 620B unit with 10 VDOMs instead of 10 physical units, over a year you will save an estimated 18,000 kWh. You could potentially save ten times that amount with a 100 VDOM license.

By default, most FortiGate units support 10 VDOMs. Many FortiGate models support purchasing a license key to increase the maximum number.

### Improving transparent mode configuration

When VDOMs are not enabled and you put your FortiGate unit into transparent mode, all the interfaces on your unit become broadcast interfaces. The problem with this is that there are no interfaces free to do anything else.

With multiple VDOMs you can have one of them configured in transparent mode, and the rest in NAT mode. In this configuration, you have an available transparent mode FortiGate unit you can drop into your network for troubleshooting, and you also have the standard NAT for networking.

### More flexible MSSP configurations

If you are a managed security and service provider (MSSP), VDOMs are fundamental to your business. As a service provider you have multiple customers, each with their own needs and service plans. VDOMs allow you to

have a separate configuration for each customer, or group of customers; with up to 500 VDOMs configured per FortiGate unit on high end models.

Not only does this provide the exact level of service needed by each customer, but administration of the FortiGate unit is easier as well - you can provide uninterrupted service generally with immediate changes as required. Most importantly, it allows you to only use the resources that each customer needs. Inter-VDOM links allow you to customize the level of interaction you need between each of your customers and your administrators.

## Enabling and accessing VDOMs

While VDOMs are essentially the same as your regular FortiGate unit for menu configuration, CLI command structure, and general task flow, there are some small differences.

After first enabling VDOMs on your FortiGate unit, you should take the time to familiarize yourself with the interface. This section will help walk you through virtual domains.

This section includes:

- [Enabling VDOMs](#)
- [Viewing the VDOM list](#)
- [Global and per-VDOM settings](#)
- [Resource settings](#)
- [VDOM Licensing](#)
- [Logging in to VDOMs](#)

### Enabling VDOMs

Using the default admin administration account, you can enable or disable VDOM operation on the FortiGate unit.

#### To enable VDOM configuration - GUI:

1. Log in with a super\_admin account.
2. Go to **System > Settings**.
3. Under **Operations Settings**, enable **Virtual Domains**.

The FortiGate unit logs off all sessions. You can now log in again as admin.

#### To enable VDOM configuration - CLI:

```
config system global
 set vdom-admin enable
end
```

### Changes to the GUI and CLI

When Virtual Domains are enabled, your FortiGate unit will change. The changes will be visible in both the GUI and CLI, just the GUI, or just the CLI.

When enabling VDOMs, the GUI and the CLI are changed as follows:

- Global and per-VDOM configurations are separated. This is indicated in the Online Help by Global and VDOM icons.
- Only admin accounts using the super\_admin profiles can view or configure global options

- Admin accounts using the super\_admin profile can configure all VDOM configurations.
- All other administrator accounts can configure only the VDOM to which they are assigned.

The following changes are specific to the GUI:

- In the Global view, the System section of the left-hand menu is renamed to Global, and includes a VDOM sub-menu.
- The Log Config menu is moved from Log & Report into the new Global section.
- For admin accounts using the super\_admin profile, a new section called Virtual Domains is added at the bottom of the left-hand menu. It lists all the individual VDOMs as expandable menus, with all VDOM specific options in that menu, which allows you to easily select which VDOM to configure, including the root VDOM.

In the CLI, admin accounts using the super\_admin profile must specify either the global or a VDOM-specific shell before entering commands:

- To change FortiGate unit system settings, from the top level you must first enter the following CLI before entering commands:

```
config global
```

- To change VDOM settings, from the top level you must first enter the following CLI before entering commands for that VDOM:

```
config vdom
edit <vdom_name>
```

Settings configured outside of a VDOM are called global settings. These settings affect the entire FortiGate unit and include areas such as interfaces, HA, maintenance, some antivirus settings, and some logging settings. In general, any unit settings that should only be changed by the top level administrator are global settings.

Settings configured within a VDOM are called VDOM settings. These settings affect only that specific VDOM and include areas such as operating mode, routing, firewall, VPN, some antivirus, some logging, and reporting.

## Viewing the VDOM list

The VDOM list shows all virtual domains, their status, and which VDOM is the management VDOM. It is accessible if you are logged in on an administrator account with the super\_admin profile such as the “admin” administrator account.

In the VDOM list you can create or delete VDOMs, edit VDOMs, change the management VDOM, and enable or disable VDOMs.

You can access the VDOM list when viewing by going to **Global > System > VDOM**.

The root domain cannot be disabled, even if it is not the management VDOM.

---

## Global and per-VDOM settings

Settings configured outside of a VDOM are called global settings. These settings affect the entire FortiGate unit and include areas such as interfaces, HA, maintenance, some antivirus, and some logging. In general, any unit settings that should only be changed by the top level administrator are global settings.

Settings configured within a VDOM are called VDOM settings. These settings affect only that specific VDOM and include areas such as operating mode, routing, firewall, VPN, some antivirus, some logging settings, and reporting.

When Virtual Domains are not enabled, the entire FortiGate unit is effectively a single VDOM. Per-VDOM limits apply. For some resource types, the global limit cannot be reached with only one VDOM.

## Resource settings

Your FortiGate unit has a limited amount of hardware resources such as memory, disk storage, CPU operations. When Virtual Domains are disabled, this limit is not a major concern because all sessions, users, and other processes share all the resources equally.

When using Virtual Domains, hardware resources can be divided differently between Virtual Domains as they are needed. Minimum levels of resources can be specified for each VDOM, so that no Virtual Domain will suffer a complete lack of resources.

For example, if one VDOM has only a web server and logging server connected, and a second VDOM has an internal network of 20 users, these two VDOMs will require different levels of resources. The first VDOM will require many sessions but no user accounts. This compares to the second VDOM where user accounts and management resources are required, but fewer sessions.

Using the global and per-VDOM resource settings, you can customize the resources allocated to each VDOM to ensure the proper level of service is maintained on each VDOM.

## Global resource settings

Global Resources apply to the whole FortiGate unit. They represent all of the hardware capabilities of your unit. By default the values are set to their maximum values. These values vary by your model due to each model having differing hardware capabilities.

It can be useful to change the maximum values for some resources to ensure there is enough memory available for other resources that may be more important to your configuration.

To use the earlier example, if your FortiGate unit is protecting a number of web servers and other publicly accessible servers you would want to maximize the available sessions and proxies while minimizing other settings that are unused such as user settings, VPNs, and dial-up tunnels.

Global Resources are only configurable at the global level, and only the admin account has access to these settings. To view the resource list, go to **Global > System > Global Resources**. You can also use the following CLI command:

```
config global
 config system resource-limits
 get
```

Note that global resources, such as the log disk quota resource, will only be visible if your FortiGate unit hardware supports those resources, such as having a hard disk to support the log disk resource.

---

For explicit proxies, when configuring limits on the number of concurrent users, you need to allow for the number of users based on their authentication method. Otherwise you may run out of user resources prematurely.

Each session-based authenticated user is counted as a single user using their authentication membership (RADIUS, LDAP, FSAE, local database etc.) to match users in other sessions. So one authenticated user in multiple sessions is still one user.

For all other situations, the source IP address is used to determine a user. All sessions from a single source address are assumed to be from the same user.

---

### Per-VDOM resource settings

While Global resources apply to resources shared by the whole FortiGate unit, per-VDOM resources are specific to only one Virtual Domain.

By default all the per-VDOM resource settings are set to no limits. This means that any single VDOM can use up all the resources of the entire FortiGate unit if it needs to do so. This would starve the other VDOMs for resources to the point where they would be unable to function. For this reason, it is recommended that you set some maximums on resources that are most vital to your customers.

Each Virtual Domain has its own resource settings. These settings include both maximum, and minimum levels. The maximum level is the highest amount of that resource that this VDOM can use if it is available on the FortiGate unit. Minimum levels are a guaranteed level that this minimum level of the resource will always be available no matter what the other VDOMs may be using.

For example, consider a FortiGate unit that has ten VDOMs configured. vdom1 has a maximum of 5000 sessions and a minimum of 1000 sessions. If the FortiGate unit has a global maximum of 20,000 sessions, it is possible that vdom1 will not be able to reach its 5000 session upper limit. However, at all times vdom1 is guaranteed to have 1000 sessions available that it can use. On the other hand, if the remaining nine VDOMs use only 1000 sessions each, vdom1 will be able to reach its maximum of 5000.

#### To view per-VDOM resource settings - GUI:

1. Select **Global > System > VDOM**.
2. Select the `root` VDOM, and select **Edit**.
3. Adjust the settings in the **Resource Usage** section of the page.
4. Select **OK**.

#### To view per-VDOM resource settings - CLI:

```
config global
 config system vdom-property
 edit root
 get
```

### VDOM Licensing

For select FortiGate models in the 1U category and higher, you can purchase a license key to increase the maximum number of VDOMs. Most Enterprise and Large Enterprise (2U) models can support up to 500 VDOMs. Chassis-based models can support over 500 VDOMs. For specific information, see the product data sheet.

Configuring 500 or more VDOMs will result in reduced system performance. See [Troubleshooting Virtual Domains](#).

Your FortiGate unit has limited resources that are divided among all configured VDOMs. These resources include system memory and CPU. Running security features on many VDOMs at once can limit resources available for basic processing. If you require many VDOMs, all with active security features, it is recommended to upgrade to a more powerful FortiGate unit.

It is important to backup your configuration before upgrading the VDOM license on your FortiGate unit or units, especially with FortiGate units in HA mode.

### To obtain a VDOM license key

1. Log in with a super\_admin account.
2. Go to the **Dashboard**.
3. Record your FortiGate unit serial number as shown in **System Information** widget.
4. In the **License Information** widget, locate **Virtual Domain** and select **Purchase More**.

If you do not see the **Purchase More** option on the System Dashboard, your FortiGate model does not support more than 10 VDOMs.

5. You will be taken to the Fortinet customer support website where you can log in and purchase a license key for 25, 50, 100, 250, 500, or more VDOMs.
6. When you receive your license key, go to the Dashboard and select **Upload License** under **License Information, Virtual Domains**.
7. In the **Input License Key** field, enter the 32-character license key you received from Fortinet customer support.
8. Select **Apply**.

To verify the new VDOM license, in global configuration go to **System > Dashboard**. Under **License Information, Virtual Domains** the maximum number of VDOMs allowed is shown.

VDOMs created on a registered FortiGate unit are recognized as real devices by any connected FortiAnalyzer unit. The FortiAnalyzer unit includes VDOMs in its total number of registered devices. For example, if three FortiGate units are registered on the FortiAnalyzer unit and they contain a total of four VDOMs, the total number of registered FortiGate units on the FortiAnalyzer unit is seven. For more information, see the [FortiAnalyzer Administration Guide](#).

### Logging in to VDOMs

Management services communicate using the management VDOM, which is the root VDOM by default.

Management traffic requires an interface that has access to the Internet. If there is no interface assigned to the VDOM containing the management traffic, services including updates will not function.

### Accessing a VDOM if you are the FortiGate's Administrator - GUI:

1. Log in with a `super_admin` account.
2. In the **Virtual Domains** menu on the left-hand side, select the VDOM to configure. The menu will expand to show the various pages and settings for that VDOM.
3. When you have finished configuring the VDOM, you can
  - open the **Global** menu to return to global configuration
  - log out

### Accessing a VDOM if you are the FortiGate's Administrator - CLI:

With the `super_admin`, logging into the CLI involves also logging into the specific VDOM. If you need a reminder, use `edit ?` to see a list of existing VDOMs before you editing a VDOM.

If you misspell a VDOM you are trying to switch to, you will create a new VDOM by that name. Any changes you make will be part of the new VDOM, and not the intended VDOM. If you are having problems where your changes aren't visible, back up to the top level and use `edit ?` to see a list of VDOMs to ensure this has not happened. If it has happened, see [Enabling and accessing VDOMs](#).

```
config vdom
edit ?
edit <chosen_vdom>
..
<enter vdom related commands>
..
end
exit
```

### Accessing a VDOM if you are the VDOM's Administrator - GUI:

1. Connect to the FortiGate unit using an interface that belongs to the VDOM to be configured.
2. Log in using an administrator account that has access to the VDOM. The main GUI page opens. The interface is largely the same as if the device has VDOMs disabled. From here you can access VDOM-specific settings.

### Accessing a VDOM if you are the VDOM's Administrator - CLI:

A non-`super_admin` account has access to only one VDOM and must log in through an interface that belongs to the same VDOM, but the process is the same as logging into a non-VDOM unit.

```
Login: regular_admin
Password: <password>
..
<enter vdom related commands>
..
exit
```

## Configuring VDOMs

Only a super admin administrator account such as the default **admin** account can create, disable, or delete VDOMs. That account can create additional administrators for each VDOM.

This section includes:

- [Creating a VDOM](#)
- [Disabling a VDOM](#)
- [Deleting a VDOM](#)
- [Administrators in VDOMs](#)
- [Changing the management VDOM](#)

### Creating a VDOM

Once you have enabled VDOMs on your FortiGate unit, you can create additional VDOMs beyond the default root Virtual Domain.

By default, new VDOMs are set to NAT mode. If you want a Virtual Domain to be in transparent mode, you must manually change it.

You can name new VDOM as you like with the following restrictions:

- only letters, numbers, “-”, and “\_” are allowed
- no more than 11 characters are allowed
- no spaces are allowed
- VDOMs cannot have the same names as interfaces, zones, switch interfaces, or other VDOMs.

When creating large numbers of VDOMs you should not enable advanced features such as proxies, web filtering, and antivirus due to limited FortiGate unit resources. Also when creating large numbers of VDOMs, you may experience reduced performance for the same reason.

---

#### To create a VDOM - GUI:

1. Log in with a super\_admin account.
2. Select **Global > System > VDOM**.
3. Select **Create New**.
4. Enter a unique name for your new VDOM.
5. Enter a short and descriptive comment to identify this VDOM.
6. Select **OK**.

Repeat Steps 3 through 6 to add additional VDOMs.

#### To create a VDOM - CLI:

```
config vdom
 edit <new_vdom_name>
end
```

If you want to edit an existing Virtual Domain in the CLI, and mistype the name a new Virtual Domain will be created with this new misspelled name. If you notice expected configuration changes are not visible, this may be the reason. You should periodically check your VDOM list to ensure there are none of these misspelled VDOMs present.

## Disabling a VDOM

The status of a VDOM can be Enabled or Disabled.

Active status VDOMs can be configured. Active is the default status when a VDOM is created. The management VDOM must be an Active VDOM.

Disabled status VDOMs are considered “offline”. The configuration remains, but you cannot use the VDOM, and only the super\_admin administrator can view it. You cannot delete a disabled VDOM without first enabling it, and removing references to it like usual—there is no **Delete** icon for disabled status VDOMs. You can assign interfaces to a disabled VDOM.

The following procedures show how to disable a VDOM called “test-vdom”.

### To disable a VDOM - GUI:

1. Go to **Global > System > VDOM**.
2. Open the VDOM for editing.
3. Ensure **Enable** is not selected and then select **OK**.  
The VDOM's Enable icon in the VDOM list is a grey X.

### To disable a VDOM - CLI:

```
config vdom
 edit test-vdom
 config system settings
 set status disable
 end
end
```

### To enable a VDOM - GUI:

1. Go to **Global > System > VDOM**.
2. Open the VDOM for editing.
3. Ensure **Enable** is selected and then select **OK**.  
The VDOM's Enable icon in the VDOM list is a green checkmark.

### To enable a VDOM - CLI:

```
config vdom
 edit test-vdom
 config system settings
 set status enable
 end
end
```

## Deleting a VDOM

Deleting a VDOM removes it from the FortiGate unit configuration.

Before you can delete a VDOM, all references to it must be removed, including any per-VDOM objects. If there are any references to the VDOM remaining, you will see an error message and not be able to delete the VDOM.

A disabled VDOM cannot be deleted. You can also not delete the root VDOM or the management VDOM.

Before deleting a VDOM, a good practice is to reset any interface referencing that VDOM to its default configuration, with “root” selected as the Virtual Domain.

---

The following procedures show how to delete the `test-vm` VDOM.

#### To delete a VDOM - GUI:

1. Go to **Global > System > VDOM**.
2. Select the check box for the VDOM and then select the **Delete** icon.

If the **Delete** icon is not active, there are still references to the VDOM that must first be removed. The **Delete** icon is available when all the references to this VDOM are removed.

3. Confirm the deletion.

#### To delete a VDOM - CLI:

```
config vdom
 delete test-vm
end
```

### Removing references to a VDOM

When you are going to delete a VDOM, all references to that VDOM must first be removed. It can be difficult to find all the references to the VDOM. This section provides a list of common objects that must be removed before a VDOM can be deleted, and a CLI command to help list the dependencies.

Interfaces are an important part of VDOMs. If you can move all the interfaces out of a VDOM, generally you will be able to delete that VDOM.

#### Common objects that refer to VDOMs

When you are getting ready to delete a VDOM check for, and remove the following objects that refer to that VDOM or its components:

- Routing - both static and dynamic routes
- Firewall addresses, policies, groups, or other settings
- Security Features/Profiles
- VPN configuration
- Users or user groups
- Logging
- DHCP servers
- Network interfaces, zones, custom DNS servers
- VDOM Administrators

## Administrators in VDOMs

When VDOMs are enabled, permissions change for administrators. Administrators are now divided into per-VDOM administrators, and `super_admin` administrators. Only `super_admin` administrator accounts can create other administrator accounts and assign them to a VDOM.

### Administrator VDOM permissions

Different types of administrator accounts have different permissions within VDOMs. For example, if you are using a `super_admin` profile account, you can perform all tasks. However, if you are using a regular admin account, the tasks available to you depend on whether you have read only or read/write permissions. The following table shows what tasks can be performed by which administrators.

#### Administrator VDOM permissions

Tasks	Regular administrator account		Super_admin profile administrator account
	Read only permission	Read/write permission	
View global settings	yes	yes	yes
Configure global settings	no	no	yes
Create or delete VDOMs	no	no	yes
Configure multiple VDOMs	no	no	yes
Assign interfaces to a VDOM	no	no	yes
Revision Control Backup and Restore	no	no	yes
Create VLANs	no	yes - for 1 VDOM	yes - for all VDOMs
Assign an administrator to a VDOM	no	no	yes
Create additional admin accounts	no	yes - for 1 VDOM	yes - for all VDOMs
Create and edit protection profiles	no	yes - for 1 VDOM	yes - for all VDOMs

The only difference in admin accounts when VDOMs are enabled is selecting which VDOM the admin account belongs to. Otherwise, by default the administration accounts are the same as when VDOMs are disabled and closely resemble the `super_admin` account in their privileges.

## Creating administrators for VDOMs

Using the admin administrator account, you can create additional administrator accounts and assign them to VDOMs.

The newly-created administrator can access the FortiGate unit only through network interfaces that belong to their assigned VDOM or through the console interface. The network interface must be configured to allow management access, such as HTTPS and SSH. Without these in place, the new administrator will not be able to access the FortiGate unit and will have to contact the super\_admin administrator for access.

The following procedure creates a new Local administrator account called `admin_sales` with a password of `fortinet` in the `sales` VDOM using the `admin_prof` default profile.

### To create an administrator for a VDOM - GUI:

1. Log in with a super\_admin account.
2. Go to **System > Administrators**.
3. Select **Create New**.
4. Select **Regular** for Type, as you are creating a Local administrator account.
5. Enter the necessary information about the administrator: email, password, etc.
6. If this admin will be accessing the VDOM from a particular IP address or subnet, enable **Restrict this Admin Login from Trusted Hosts Only** and enter the IP in **Trusted Host #1**.
7. Select `prof_admin` for the **Admin Profile**.
8. Select `sales` from the list of **Virtual Domains**.
9. Select **OK**.

### To create administrators for VDOMs - CLI:

```
config global
 config system admin
 edit <new_admin_name>
 set vdom <vdom_for_this_account>
 set password <pwd>
 set accprofile <an_admin_profile>
 ...
 end
```

## Virtual Domain administrator dashboard display

When administrators logs into their virtual domain, they see a different dashboard than the global administrator will see. The VDOM dashboard displays information only relevant to that VDOM — no global or other VDOM information is displayed.

**VDOM dashboard information**

Information	per-VDOM	Global
<b>System Information</b>	read-only	yes
<b>License Information</b>	no	yes
<b>CLI console</b>	yes	yes
<b>Unit Operation</b>	read-only	yes
<b>Alert Message Console</b>	no	yes
<b>Top Sessions</b>	limited to VDOM sessions	yes
<b>Traffic</b>	limited to VDOM interfaces	yes
<b>Statistics</b>	yes	yes

**Changing the management VDOM**

The management virtual domain is the virtual domain where all the management traffic for the FortiGate unit originates. This management traffic needs access to remote servers, such as FortiGuard services and NTP, to perform its duties. It needs access to the Internet to send and receive this traffic.

Management traffic includes, but is not limited to

- DNS lookups
- logging to FortiAnalyzer or syslog
- FortiGuard service
- sending alert emails
- Network time protocol traffic (NTP)
- Sending SNMP traps
- Quarantining suspicious files and email.

By default the management VDOM is the root domain. When other VDOMs are configured on your FortiGate unit, management traffic can be moved to one of these other VDOMs.

Reasons to move the management VDOM include selecting a non-root VDOM to be your administration VDOM, or the root VDOM not having an interface with a connection to the Internet.

You cannot change the management VDOM if any administrators are using RADIUS authentication.

The following procedure will change the management VDOM from the default `root` to a VDOM named `mgmt_vdom`. It is assumed that `mgmt_vdom` has already been created and has an interface that can access the Internet.

**To change the management VDOM - GUI:**

1. Select **Global > System > VDOM**.
2. Select the checkbox next to the required VDOM.
3. Select **Switch Management**.

The current management VDOM is shown in square brackets, “[root]” for example.

**To change the management VDOM - CLI:**

```
config global
 config system global
 set management-vdom mgmt_vdom
 end
```

Management traffic will now originate from mgmt\_vdom.

## VDOMs in NAT mode

A new VDOM uses network address translation (NAT) mode by default. In this mode, you install the VDOM as a gateway or router between two networks. In most cases, the VDOM is between a private network and the Internet.

VDOMs on the same FortiGate to use either NAT or transparent mode, regardless of the operation mode of other VDOMs on that FortiGate. For more information about Transparent mode, see ["VDOMs in transparent mode" on page 3353](#).

This chapter contains the following sections:

- [Using a VDOM in NAT mode](#)
- [Example configuration: VDOM in NAT mode](#)

### Using a VDOM in NAT mode

When using a VDOM in NAT mode,

- [Using a VDOM in NAT mode](#)
- [Configuring interfaces](#)
- [Configuring VDOM routing](#)
- [Configuring security policies](#)
- [Changing the inspection mode](#)
- [Configuring security profiles](#)
- [Configuring VPNs for a VDOM](#)
- [Certificate management](#)

#### Configuring interfaces

A VDOM must contain at least two interfaces to be useful. These can be physical interfaces or VLAN interfaces. By default, all physical interfaces are in the root VDOM. When you create a new VLAN, it is in the root VDOM by default.

When there are VDOMs on the FortiGate unit in both NAT and Transparent operation modes, some interface fields will be displayed as “-” on **Network > Interfaces**. Only someone with a super\_admin account can view all the VDOMs.

When moving an interface to a different VDOM, firewall IP pools and virtual IPs for this interface are deleted. You should manually delete any routes that refer to this interface. Once the interface has been moved to the new VDOM, you can add these services to the interface again.

---

When configuring VDOMs on FortiGate units with accelerated interfaces you must assign both interfaces in the pair to the same VDOM for those interfaces to retain their acceleration. Otherwise they will become normal interfaces.

---

This section includes the following topics:

- [Adding a VLAN to a NAT VDOM](#)
- [Moving an interface to a VDOM](#)
- [Deleting an interface](#)
- [Adding a zone to a VDOM](#)

### Adding a VLAN to a NAT VDOM

The following example shows one way that multiple companies can maintain their security when they are using one FortiGate unit with VLANs that share interfaces on the unit.

This procedure will add a VLAN interface called `client1-v100` with a VLAN ID of 100 to an existing VDOM called `client1` using the physical interface called `port2`.

The physical interface does not need to belong to the VDOM that the VLAN belongs to.

#### To add a VLAN subinterface to a VDOM - GUI:

1. Go to **Global > Network > Interfaces**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

<b>Name</b>	client1-v100
<b>Interface</b>	port2
<b>VLAN ID</b>	100
<b>Virtual Domain</b>	Client1
<b>Addressing mode</b>	Manual
<b>IP/Netmask</b>	172.20.120.110/255.255.255.0
<b>Administrative Access</b>	HTTPS, SSH

You will see an expand arrow added to the port2 interface. When the arrow is expanded, the interface shows the `client1-v100` VLAN subinterface.

#### To add a VLAN subinterface to a VDOM - CLI:

```
config global
 config system interface
 edit client1-v100
 set type vlan
 set vlanid 100
 set vdom Client1
 set interface port2
 set ip 172.20.120.110 255.255.255.0
 set allowaccess https ssh
```

end

### Moving an interface to a VDOM

Interfaces belong to the root VDOM by default. Moving an interface is the same procedure no matter if its moving from the root VDOM or a any other VDOM.

If you have an accelerated pair of physical interfaces both interfaces must be in the same VDOM or you will lose their acceleration.

The following procedure will move the port3 interface to the Client2 VDOM. This is a common action when configuring a VDOM. It is assumed that the Client2 VDOM has already been created. It is also assumed that your FortiGate unit has a port3 interface. If you are using a different model, your physical interfaces may not be named `port2`, `external` or `port3`.

#### To move an existing interface to a different VDOM - GUI:

1. Go to **Global > Network > Interfaces**.
2. Select **Edit** for the port3 interface.
3. Select `Client2` as the new **Virtual Domain**.
4. Select **OK**.

#### To move an existing interface to a different VDOM - CLI:

```
config global
 config system interface
 edit port3
 set vdom Client2
 end
```

### Deleting an interface

Before you can delete a virtual interface, or move an interface from one VDOM to another, all references to that interface must be removed. For a list of objects that can refer to an interface see [Virtual Domains Overview](#).

The easiest way to be sure an interface can be deleted is when the Delete icon is no longer greyed out. If it remains greyed out when an interface is selected, that interface still has objects referring to it, or it is a physical interface that cannot be deleted.

#### To delete a virtual interface - GUI:

1. Ensure all objects referring to this interface have been removed.
2. Select **Global > Network > Interfaces**.
3. Select the interface to delete.
4. Select the delete icon.

### Adding a zone to a VDOM

Grouping interfaces and VLAN subinterfaces into zones simplifies policy creation. You can configure policies for connections to and from a zone, but not between interfaces in a zone.

Zones are VDOM-specific. A zone cannot be moved to a different VDOM. Any interfaces in a zone cannot be used in another zone. To move a zone to a new VDOM requires deleting the current zone and re-creating a zone in the new VDOM.

The following procedure will create a zone called `accounting` in the `client2` VDOM. It will not allow intra-zone traffic, and both `port3` and `port2` interfaces belong to this zone. This is a method of grouping and isolating traffic over particular interfaces—it is useful for added security and control within a larger network.

#### To add a zone to a VDOM - GUI:

1. In **Virtual Domains**, select the `client2` VDOM.
2. Go to **Network > Interfaces**.
3. Select **Create New > Zone**.
4. Enter the following information and select **OK**:

<b>Zone Name</b>	accounting
<b>Block intra-zone traffic</b>	Select
<b>Interface Members</b>	port3, port2

#### To add a zone to a VDOM - CLI:

```
config vdom
 edit client2
 config system zone
 edit accounting
 set interface port3 port2
 set intrazone deny
 end
 end
 end
```

## Configuring VDOM routing

Routing is VDOM-specific. Each VDOM should have a default static route configured as a minimum. Within a VDOM, routing is the same as routing on your FortiGate unit without VDOMs enabled.

When configuring dynamic routing on a VDOM, other VDOMs on the FortiGate unit can be neighbors. The following topics give a brief introduction to the routing protocols, and show specific examples of how to configure dynamic routing for VDOMs. Figures are included to show the FortiGate unit configuration after the successful completion of the routing example.

### Default static route for a VDOM

The routing you define applies only to network traffic entering non-ssl interfaces belonging to this VDOM. Set the administrative distance high enough, typically 20, so that automatically configured routes will be preferred to the default.

In the following procedure, it is assumed that a VDOM called “Client2” exists. The procedure will create a default static route for this VDOM. The route has a destination IP of 0.0.0.0, on the `port3` interface. It has a gateway of 10.10.10.1, and an administrative distance of 20.

The values used in this procedure are very standard, and this procedure should be part of configuring all VDOMs.

**To add a default static route for a VDOM - GUI:**

1. In **Virtual Domains**, select the client2 VDOM.
2. Go to **Network > Static Routes**.
3. Select **Create New**.
4. Enter the following information and select **OK**:

<b>Destination IP/Mask</b>	0.0.0.0/0.0.0.0
<b>Device</b>	port2
<b>Gateway</b>	10.10.10.1
<b>Distance</b>	20

**To add a default static route for a VDOM - CLI:**

```
config vdom
 edit client2
 config router static
 edit 4
 set device port2
 set dst 0.0.0.0 0.0.0.0
 set gateway 10.10.10.1
 set distance 20
 end
 end
 end
```

**Dynamic Routing in VDOMs**

Dynamic routing is VDOM-specific, like all other routing. Dynamic routing configuration is the same with VDOMs as with your FortiGate unit without VDOMs enabled, once you are at the routing menu. If you have multiple VDOMs configured, the dynamic routing configuration between them can become quite complex.

VDOMs provide some interesting changes to dynamic routing. Each VDOM can be a neighbor to the other VDOMs. This is useful in simulating a dynamic routing area or AS or network using only your FortiGate unit.

You can separate different types of routing to different VDOMs if required. This allows for easier troubleshooting. This is very useful if your FortiGate unit is on the border of a number of different routing domains.

For more information on dynamic routing in FortiOS, see the Advanced Routing handbook.

Inter-VDOM links must have IP addresses assigned to them if they are part of a dynamic routing configuration. Inter-VDOM links may or may not have IP addresses assigned to them. Without IP addresses, you need to be careful how you configure routing. While the default static route can be assigned an address of 0.0.0.0 and rely instead on the interface, dynamic routing almost always requires an IP address.

**RIP**

The RIP dynamic routing protocol uses hop count to determine the best route, with a hop count of 1 being directly attached to the interface and a hop count of 16 being unreachable. For example if two VDOMs on the same FortiGate unit are RIP neighbors, they have a hop count of 1.

## OSPF

OSPF communicates the status of its network links to adjacent neighbor routers instead of the complete routing table. When compared to RIP, OSPF is more suitable for large networks, it is not limited by hop count, and is more complex to configure. For smaller OSPF configurations its easiest to just use the backbone area, instead of multiple areas.

## BGP

BGP is an Internet gateway protocol (IGP) used to connect autonomous systems (ASes) and is used by Internet service providers (ISPs). BGP stores the full path, or path vector, to a destination and its attributes which aid in proper routing.

## Configuring security policies

Security policies are VDOM-specific. This means that all firewall settings for a VDOM, such as firewall addresses and security policies, are configured within the VDOM.

In VDOMs, all firewall related objects are configured per-VDOM including addresses, service groups, security profiles, schedules, traffic shaping, and so on. If you want firewall addresses, you will have to create them on each VDOM separately. If you have many addresses, and VDOMs this can be tedious and time consuming. Consider using a FortiManager unit to manage your VDOM configuration — it can get firewall objects from a configured VDOM or FortiGate unit, and push those objects to many other VDOMs or FortiGate units.

You can customize the **Policy** display by including some or all columns, and customize the column order onscreen. Due to this feature, security policy screenshots may not appear the same as on your screen.

---

## Configuring a security policy for a VDOM

Your security policies can involve only the interfaces, zones, and firewall addresses that are part of the current VDOM, and they are only visible when you are viewing the current VDOM. The security policies of this VDOM filter the network traffic on the interfaces and VLAN subinterfaces in this VDOM.

A firewall service group can be configured to group multiple services into one service group. When a descriptive name is used, service groups make it easier for an administrator to quickly determine what services are allowed by a security policy.

In the following procedure, it is assumed that a VDOM called `Client2` exists. The procedure will configure an outgoing security policy. The security policy will allow all HTTPS, SSH, and DNS traffic for the `SalesLocal` address group on `VLAN_200` going to all addresses on port3. This traffic will be scanned and logged.

### To configure a security policy for a VDOM - GUI:

1. In **Virtual Domains**, select the `client2` VDOM.
2. Go to **Policy & Objects > IPv4 Policy**.
3. Select **Create New**.
4. Enter the following information and select **OK**:

<b>Name</b>	Client2-outgoing
<b>Incoming Interface</b>	VLAN_200
<b>Outgoing Interface</b>	port3
<b>Source Address</b>	SalesLocal
<b>Destination Address</b>	any
<b>Schedule</b>	always
<b>Service</b>	HTTPS, SSH, DNS
<b>Action</b>	ACCEPT
<b>Log Allowed Traffic</b>	enable

### To configure a security policy for a VDOM - CLI:

```

config vdom
 edit Client2
 config firewall policy
 edit 12
 set srcintf VLAN_200
 set srcaddr SalesLocal
 set dstintf port3(dmz)
 set dstaddr any
 set schedule always
 set service HTTPS SSH
 set action accept
 set status enable
 set logtraffic enable
 end
 end
 end

```

## Changing the inspection mode

If you wish to change the inspection mode for a VDOM, go to **System > VDOM** and edit the VDOM you want to configure. Set **Inspection Mode** to either **Proxy** or **Flow-based**.

VDOMs on the same FortiGate can use different inspection modes.

## Configuring security profiles

In NAT VDOMs, security profiles are exactly like regular FortiGate unit operation with one exception. In VDOMs, there are no default security profiles.

If you want security profiles in VDOMs, you must create them yourself. If you have many security profiles to create in each VDOM, you should consider using a FortiManager unit. It can get existing profiles from a VDOM or FortiGate unit, and push those profiles down to multiple other VDOMs or FortiGate units.

When VDOMs are enabled, you only need one FortiGuard license for the physical unit, and download FortiGuard updates once for the physical unit. This can result in a large time and money savings over multiple physical units if you have many VDOMs.

## Configuring VPNs for a VDOM

Virtual Private Networking (VPN) settings are VDOM-specific, and must be configured within each VDOM. Configurations for IPsec Tunnel, IPsec Interface, PPTP and SSL are VDOM-specific.

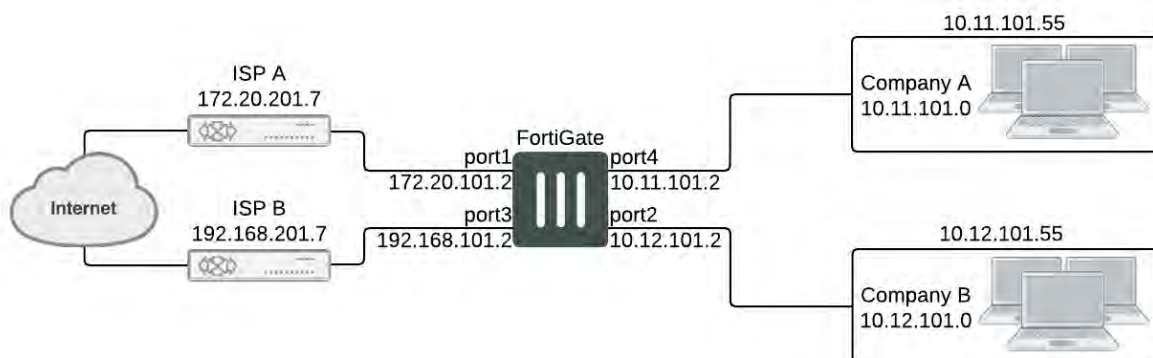

## Certificate management

Certificates can be uploaded to the FortiGate certificate store as either global or per-VDOM. Any certificates uploaded to the global certificate store will be available to all VDOMs on the FortiGate. A certificate uploaded to a VDOM-specific certificate store are only available for that VDOM.

The following factory default certificates are unique to each VDOM and are automatically generated when a new VDOM is added:

- Fortinet\_CA\_SSL
- Fortinet\_SSL
- PositiveSSL\_CA
- Fortinet\_Wifi
- Fortinet\_Factory

## Example configuration: VDOM in NAT mode

Company A and Company B each have their own internal networks and their own ISPs. They share a FortiGate unit that is configured with two separate VDOMs, with each VDOM running in NAT mode enabling separate configuration of network protection profiles. Each ISP is connected to a different interface on the FortiGate unit.

This network example was chosen to illustrate one of the most typical VDOM configurations.

This example has the following sections:

- [Network topology and assumptions](#)
- [General configuration steps](#)
- [Creating the VDOMs](#)
- [Configuring the FortiGate interfaces](#)
- [Configuring the vdomA VDOM](#)

- [Configuring the vdomB VDOM](#)
- [Testing the configuration](#)

## Network topology and assumptions

Both companies have their own ISPs and their own internal interface, external interface, and VDOM on the FortiGate unit.

For easier configuration, the following IP addressing is used:

- all IP addresses on the FortiGate unit end in “.2” such as 10.11.101.2.
- all IP addresses for ISPs end in “.7”, such as 172.20.201.7.
- all internal networks are 10.\*.\* networks, and sample internal addresses end in “.55”.

The IP address matrix for this example is as follows.

Address	Company A	Company B
<b>ISP</b>	172.20.201.7	192.168.201.7
<b>Internal network</b>	10.11.101.0	10.012.101.0
<b>FortiGate / VDOM</b>	172.20.201.2 (port1)	192.168.201.2 (port3)
	10.11.101.2 (port4)	10.012.101.2 (port2)

The Company A internal network is on the 10.11.101.0/255.255.255.0 subnet. The Company B internal network is on the 10.12.101.0/255.255.255.0 subnet.

There are no switches or routers required for this configuration.

There are no VLANs in this network topology.

The interfaces used in this example are port1 through port4. Different FortiGate models may have different interface labels. port1 and port3 are used as external interfaces. port2 and port4 are internal interfaces.

The administrator is a super\_admin account. If you are using a non-super\_admin account, refer to "Global and per-VDOM settings" to see which parts a non-super\_admin account can also configure.

When configuring security policies in the CLI always choose a policy number that is higher than any existing policy numbers, select `services` before `profile-status`, and `profile-status` before `profile`. If these commands are not entered in that order, they may not be available to enter.

## General configuration steps

For best results in this configuration, follow the procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. [Creating the VDOMs](#)
2. [Configuring the FortiGate interfaces](#)
3. [Configuring the vdomA VDOM](#), and [Configuring the vdomB VDOM](#)
4. [Testing the configuration](#)

## Creating the VDOMs

In this example, two new VDOMs are created — vdomA for Company A and vdomB for Company B. These VDOMs will keep the traffic for these two companies separate while enabling each company to access its own ISP.

### To create two VDOMs - GUI:

1. Log in with a super\_admin account.
2. Go to **Global > System > VDOM**, and select **Create New**.
3. Enter vdomA and select **OK**.
4. Select **OK** again to return to the VDOM list.
5. Select **Create New**.
6. Enter vdomB and select **OK**.

### To create two VDOMs - CLI:

```
config vdom
 edit vdomA
 next
 edit vdomB
end
```

## Configuring the FortiGate interfaces

This section configures the interfaces that connect to the companies' internal networks, and to the companies' ISPs.

All interfaces on the FortiGate unit will be configured with an IP address ending in “.2” such as 10.11.101.2. This will simplify network administration both for the companies, and for the FortiGate unit global administrator. Also the internal addresses for each company differ in the second octet of their IP address - Company A is 10.11.\*, and Company B is 10.12.\*.

This section includes the following topics:

- [Configuring the vdomA interfaces](#)
- [Configuring the vdomB interfaces](#)

If you cannot change the VDOM of a network interface it is because something is referring to that interface that needs to be deleted. Once all the references are deleted the interface will be available to switch to a different VDOM. For example a common reference to the external interface is the default static route entry. See [Example configuration: VDOM in NAT mode](#).

### Configuring the vdomA interfaces

The vdomA VDOM includes two FortiGate unit interfaces: port1 and external.

The port4 interface connects the Company A internal network to the FortiGate unit, and shares the internal network subnet of 10.11.101.0/255.255.255.0.

The external interface connects the FortiGate unit to ISP A and the Internet. It shares the ISP A subnet of 172.20.201.0/255.255.255.0.

**To configure the vdomA interfaces - GUI:**

1. Go to **Global > Network > Interfaces**.
2. Select **Edit** on the port1 interface.
3. Enter the following information and select **OK**:

<b>Virtual Domain</b>	vdomA
<b>Addressing mode</b>	Manual
<b>IP/Netmask</b>	172.20.201.2/255.255.255.0

4. Select **Edit** on the port4 interface.
5. Enter the following information and select **OK**:

<b>Virtual Domain</b>	vdomA
<b>Addressing mode</b>	Manual
<b>IP/Netmask</b>	10.11.101.2/255.255.255.0

**To configure the vdomA interfaces - CLI:**

```

config global
 config system interface
 edit port1
 set vdom vdomA
 set mode static
 set ip 172.20.201.2 255.255.255.0
 next
 edit port4
 set vdom ABCDomain
 set mode static
 set ip 10.11.101.2 255.255.255.0
 end
 end

```

**Configuring the vdomB interfaces**

The vdomB VDOM uses two FortiGate unit interfaces: port2 and port3.

The port2 interface connects the Company B internal network to the FortiGate unit, and shares the internal network subnet of 10.12.101.0/255.255.255.0.

The port3 interface connects the FortiGate unit to ISP B and the Internet. It shares the ISP B subnet of 192.168.201.0/255.255.255.0.

**To configure the vdomB interfaces - GUI:**

1. Go to **Global > Network > Interfaces**.
2. Select **Edit** on the port3 interface.
3. Enter the following information and select **OK**:

<b>Virtual domain</b>	vdomB
<b>Addressing mode</b>	Manual
<b>IP/Netmask</b>	192.168.201.2/255.255.255.0

4. Select **Edit** on the port2 interface.
5. Enter the following information and select **OK**:

<b>Virtual domain</b>	vdomB
<b>Addressing mode</b>	Manual
<b>IP/Netmask</b>	10.12.101.2/255.255.255.0

### To configure the vdomB interfaces - CLI:

```
config global
 config system interface
 edit port3
 set vdom vdomB
 set mode static
 set ip 192.168.201.2 255.255.255.0
 next
 edit port2
 set vdom vdomB
 set mode static
 set ip 10.12.101.2 255.255.255.0
 end
```

## Configuring the vdomA VDOM

With the VDOMs created and the ISPs connected, the next step is to configure the vdomA VDOM.

Configuring the vdomA includes the following:

- [Adding vdomA firewall addresses](#)
- [Adding the vdomA security policy](#)
- [Adding the vdomA default route](#)

### Adding vdomA firewall addresses

You need to define the addresses used by Company A's internal network for use in security policies. This internal network is the 10.11.101.0/255.255.255.0 subnet.

The FortiGate unit provides one default address, "all", that you can use when a security policy applies to all addresses as the source or destination of a packet.

### To add the vdomA firewall addresses - GUI:

1. In **Virtual Domains**, select **vdomA**.
2. Go to **Policy & Objects > Addresses**.
3. Select **Create New**.
4. Enter the following information and select **OK**:

<b>Address Name</b>	Ainternal
<b>Type</b>	Subnet / IP Range
<b>Subnet / IP Range</b>	10.11.101.0/255.255.255.0
<b>Interface</b>	port4

#### To add the ABCDomain VDOM firewall addresses - CLI:

```
config vdom
 edit vdomA
 config firewall address
 edit Ainternal
 set type ipmask
 set subnet 10.11.101.0 255.255.255.0
 end
 end
 end
```

#### Adding the vdomA security policy

You need to add the `vdomA` security policy to allow traffic from the internal network to reach the external network, and from the external network to internal as well. You need two policies for this domain.

#### To add the vdomA security policy - GUI:

1. In **Virtual Domains**, select **vdomA**.
2. Go to **Policy & Objects > IPv4 Policy**.
3. Select **Create New**.
4. Enter the following information and select **OK**:

<b>Name</b>	VDOMA-internal-to-external
<b>Incoming Interface</b>	port4
<b>Outgoing Interface</b>	port1
<b>Source Address</b>	Ainternal
<b>Destination Address</b>	all
<b>Schedule</b>	Always
<b>Service</b>	ALL
<b>Action</b>	ACCEPT

5. Select **Create New**.
6. Enter the following information and select **OK**:

<b>Name</b>	VDOMA-external-to-internal
-------------	----------------------------

<b>Incoming Interface</b>	port1
<b>Outgoing Interface</b>	port4
<b>Source Address</b>	all
<b>Destination Address</b>	Ainternal
<b>Schedule</b>	Always
<b>Service</b>	ALL
<b>Action</b>	ACCEPT

### To add the vdomA security policy - CLI:

```
config vdom
 edit vdomA
 config firewall policy
 edit 1
 set srcintf port4
 set srcaddr Ainternal
 set dstintf port1
 set dstaddr all
 set schedule always
 set service ALL
 set action accept
 set status enable
 next
 edit 2
 set srcintf port1
 set srcaddr all
 set dstintf port4
 set dstaddr Ainternal
 set schedule always
 set service ALL
 set action accept
 set status enable
 end
 end
 end
```

### Adding the vdomA default route

You also need to define a default route to direct packets from the Company A internal network to ISP A. Every VDOM needs a default static route, as a minimum, to handle traffic addressed to external networks such as the Internet.

The administrative distance should be set slightly higher than other routes. Lower admin distances will get checked first, and this default route will only be used as a last resort.

### To add a default route to the vdomA - GUI:

1. For **Virtual Domains**, select **vdomA**
2. Go to **Network > Static Routes**.
3. Select **Create New**.
4. Enter the following information and select **OK**:

<b>Destination IP/Mask</b>	0.0.0.0/0.0.0.0
<b>Device</b>	port1
<b>Gateway</b>	172.20.201.7
<b>Distance</b>	20

#### To add a default route to the vdomA - CLI:

```
config vdom
 edit vdomA
 config router static
 edit 1
 set device port1
 set gateway 172.20.201.7
 end
 end
 end
```

### Configuring the vdomB VDOM

In this example, the vdomB VDOM is used for Company B. Firewall and routing settings are specific to a single VDOM.

vdomB includes the FortiGate port2 interface to connect to the Company B internal network, and the FortiGate port3 interface to connect to ISP B. Security policies are needed to allow traffic from port2 to external and from external to port2 interfaces.

This section includes the following topics:

- [Adding the vdomB firewall address](#)
- [Adding the vdomB security policy](#)
- [Adding a default route to the vdomB VDOM](#)

#### Adding the vdomB firewall address

You need to define addresses for use in security policies. In this example, the vdomB VDOM needs an address for the port2 interface and the “all” address.

#### To add the vdomB firewall address - GUI:

1. In **Virtual Domains**, select **vdomB**.
2. Go to **Policy & Objects > Addresses**.
3. Select **Create New**.
4. Enter the following information and select **OK**:

<b>Address Name</b>	Binternal
<b>Type</b>	Subnet / IP Range
<b>Subnet / IP Range</b>	10.12.101.0/255.255.255.0
<b>Interface</b>	port2

**To add the vdomB firewall address - CLI:**

```

config vdom
 edit vdomB
 config firewall address
 edit Binternal
 set type ipmask
 set subnet 10.12.101.0 255.255.255.0
 end
 end
 end
end

```

**Adding the vdomB security policy**

You also need a security policy for the Company B domain. In this example, the security policy allows all traffic.

**To add the vdomB security policy - GUI:**

1. Log in with a super\_admin account.
2. In **Virtual Domains**, select vdomB.
3. Go to **Policy & Objects > IPv4 Policy**
4. Select **Create New**.
5. Enter the following information and select **OK**:

<b>Name</b>	VDOMB-internal-to-external
<b>Incoming Interface</b>	port2
<b>Outgoing Interface</b>	port3
<b>Source Address</b>	Binternal
<b>Destination Address</b>	all
<b>Schedule</b>	Always
<b>Service</b>	ALL
<b>Action</b>	ACCEPT

6. Select **Create New**.
7. Enter the following information and select **OK**:

<b>Name</b>	VDOMB-external-to-internal
<b>Incoming Interface</b>	port3
<b>Outgoing Interface</b>	port2
<b>Source Address</b>	all
<b>Destination Address</b>	Binternal
<b>Schedule</b>	Always

<b>Service</b>	ALL
<b>Action</b>	ACCEPT

### To add the vdomB security policy - CLI:

```
config vdom
 edit vdomB
 config firewall policy
 edit 1
 set srcintf port2
 set dstintf port3
 set srcaddr Binternal
 set dstaddr all
 set schedule always
 set service ALL
 set action accept
 set status enable
 edit 1
 set srcintf port3
 set dstintf port2
 set srcaddr all
 set dstaddr Binternal
 set schedule always
 set service ALL
 set action accept
 set status enable
 end
 end
 end
```

### Adding a default route to the vdomB VDOM

You need to define a default route to direct packets to ISP B.

### To add a default route to the vdomB VDOM - GUI:

1. Log in as the super\_admin administrator.
2. In **Virtual Domains**, select vdomB.
3. Go to **Network > Static Routes**.
4. Select **Create New**.
5. Enter the following information and select **OK**:

<b>Destination IP/Mask</b>	0.0.0.0/0.0.0.0
<b>Device</b>	port3
<b>Gateway</b>	192.168.201.7
<b>Distance</b>	20

### To add a default route to the vdomB VDOM - CLI:

```
config vdom
 edit vdomB
```

```
config router static
edit 1
set dst 0.0.0.0/0
set device external
set gateway 192.168.201.7
end
end
```

## Testing the configuration

Once you have completed configuration for both company VDMs, you can use diagnostic commands, such as `tracert` in Windows, to test traffic routed through the FortiGate unit. Alternately, you can use the `traceroute` command on a Linux system with similar output.

Possible errors during the traceroute test are:

- “\* \* \* Request timed out” - the trace was not able to make the next connection towards the destination fast enough
- “Destination host unreachable” - after a number of timed-out responses the trace will give up

Possible reasons for these errors are bad connections or configuration errors.

For additional troubleshooting, see [Troubleshooting Virtual Domains](#).

## Testing traffic from the internal network to the ISP

In this example, a route is traced from the Company A internal network to ISP A. The test was run on a Windows PC with an IP address of 10.11.101.55.

The output here indicates three hops between the source and destination, the IP address of each hop, and that the trace was successful.

From the Company A internal network, access a command prompt and enter this command:

```
C:\>tracert 172.20.201.7
Tracing route to 172.20.201.7 over a maximum of 30 hops:
 1 <10 ms <10 ms <10 ms 10.11.101.2
 2 <10 ms <10 ms <10 ms 172.20.201.2
 3 <10 ms <10 ms <10 ms 172.20.201.7
Trace complete.
```

## VDOMs in transparent mode

A VDOM in Transparent mode is installed between the internal network and the router. In this mode, the VDOM does not make any changes to IP addresses and only applies security scanning to traffic. When a VDOM is added to a network in Transparent mode, no network changes are required, except to provide the VDOM with a management IP address.

Each VDOM on a FortiGate can be configured for NAT mode or Transparent mode, regardless of the operation mode of other VDOMs on the FortiGate. For more information about NAT mode, see ["VDOMs in NAT mode" on page 3335](#).

This chapter includes the following sections:

- [Transparent Mode Overview](#)
- [Using a VDOM in Transparent mode](#)
- [VDOMs in transparent mode](#)

### Transparent Mode Overview

In transparent mode, a VDOM becomes a layer-2 IP forwarding bridge. This means that Ethernet frames are forwarded based on destination MAC address, and no other routing is performed. All incoming traffic that is accepted by the firewall, is broadcast out on all interfaces.

In transparent mode the VDOM is a forwarding bridge, not a switch. A switch can develop a port table and associated MAC addresses, so that it can bridge two ports to deliver the traffic instead of broadcasting to all ports. In transparent mode, the VDOM does not follow this switch behavior, but instead is the forwarding bridge that broadcasts all packets out over all interfaces, subject to security policies.

### Differences between NAT and Transparent mode

The differences between NAT mode and Transparent mode include:

#### Differences between NAT and Transparent modes

Features	NAT mode	Transparent mode
Specific Management IP address required	No	Yes
Perform Network Address Translation (NAT)	Yes	Yes
Stateful packet inspection	Yes	Yes
Layer-2 forwarding	Yes	Yes
Layer-3 routing	Yes	No

Features	NAT mode	Transparent mode
Unicast Routing / Policy Based routing	Yes	No
DHCP server	Yes	No
IPsec VPN	Yes	Yes
PPTP/L2TP VPN	Yes	No
SSL VPN	Yes	No
Security features	Yes	Yes
VLAN support	Yes	Yes - limited to VLAN trunks.
Ping servers (dead gateway detection)	Yes	No

To provide administrative access to a FortiGate unit or VDOM in Transparent mode, you must define a management IP address and a gateway. This step is not required in NAT mode where you can access the FortiGate unit through the assigned IP address of any interface where administrative access is permitted.

If you incorrectly set the Transparent mode management IP address for your FortiGate unit, you will be unable to access your unit through the GUI. In this situation, you will need to connect to the FortiGate unit using the console cable and change the settings so you can access the unit. Alternately, if your unit has an LCD panel, you can change the operation mode and interface information through the LCD panel.

## Operation mode differences in VDOMs

A VDOM, such as root, can have a maximum of 255 interfaces in Network Address Translation (NAT) mode or Transparent mode. This includes VLANs, other virtual interfaces, and physical interfaces. To have more than a total of 255 interfaces configured, you need multiple VDOMs with multiple interfaces on each.

In Transparent mode without VDOMs enabled, all interfaces on the FortiGate unit act as a bridge — all traffic coming in on one interface is sent back out on all the other interfaces. This effectively turns the FortiGate unit into a two interface unit no matter how many physical interfaces it has. When VDOMs are enabled, this allows you to determine how many interfaces to assign to a VDOM running in Transparent mode. If there are reasons for assigning more than two interfaces based on your network topology, you are able to. However, the benefit of VDOMs in this case is that you have the functionality of Transparent mode, but you can use interfaces for NAT traffic as well.

You can add more VDOMs to separate groups of VLAN subinterfaces. When using a FortiGate unit to serve multiple organizations, this configuration simplifies administration because you see only the security policies and settings for the VDOM you are configuring.

One essential application of VDOMs is to prevent problems caused when a FortiGate unit is connected to a layer-2 switch that has a global MAC table. FortiGate units normally forward ARP requests to all interfaces, including VLAN subinterfaces. It is then possible for the switch to receive duplicate ARP packets on different VLANs. Some layer-2 switches reset when this happens. As ARP requests are only forwarded to interfaces in the same VDOM, you can solve this problem by creating a VDOM for each VLAN.

For more information about Transparent mode, see the Transparent Mode & Internal Segmentation Firewall (ISFW) handbook.

## Using a VDOM in Transparent mode

The essential steps to configure a VDOM in Transparent mode are:

- [Switching to Transparent mode](#)
- [Adding VLAN subinterfaces](#)
- [Creating security policies](#)

You can also configure the security profiles that manage antivirus scanning, web filtering and spam filtering.

In Transparent mode, you can access the GUI by connecting to an interface configured for administrative access and using HTTPS to access the management IP address. In the following examples, administrative access is enabled by default on the internal interface and the default management IP address is 10.11.0.1.

### Switching to Transparent mode

A VDOM is in NAT mode by default when it is created. You must switch it to Transparent mode, and add a management IP address so you can access the VDOM from your management computer.

Before applying the change to Transparent mode, ensure the VDOM has administrative access on the selected interface, and that the selected management IP address is reachable on your network.

Switching the VDOM to Transparent mode cannot be done through the GUI. It must be done through the CLI only.

#### To switch the VDOM to Transparent mode - CLI:

```
config vdom
 edit <name>
 config system settings
 set opmode transparent
 set mangeip 10.11.0.99 255.255.255.0
 end
 end
```

### Adding VLAN subinterfaces

There are a few differences when adding VLANs in Transparent mode compared to NAT mode.

In Transparent mode, VLAN traffic is trunked across the VDOM. That means VLAN traffic cannot be routed, changed, or inspected. For this reason when you assign a VLAN to a Transparent mode VDOM, you will see the **Addressing Mode** section of the interface configuration disappear in from the GUI. It is because with no routing, inspection, or any activities able to be performed on VLAN traffic the VDOM simply re-broadcasts the VLAN traffic. This requires no addressing.

Also any routing related features such as dynamic routing or Virtual Router Redundancy Protocol (VRRP) are not available in Transparent mode for any interfaces.

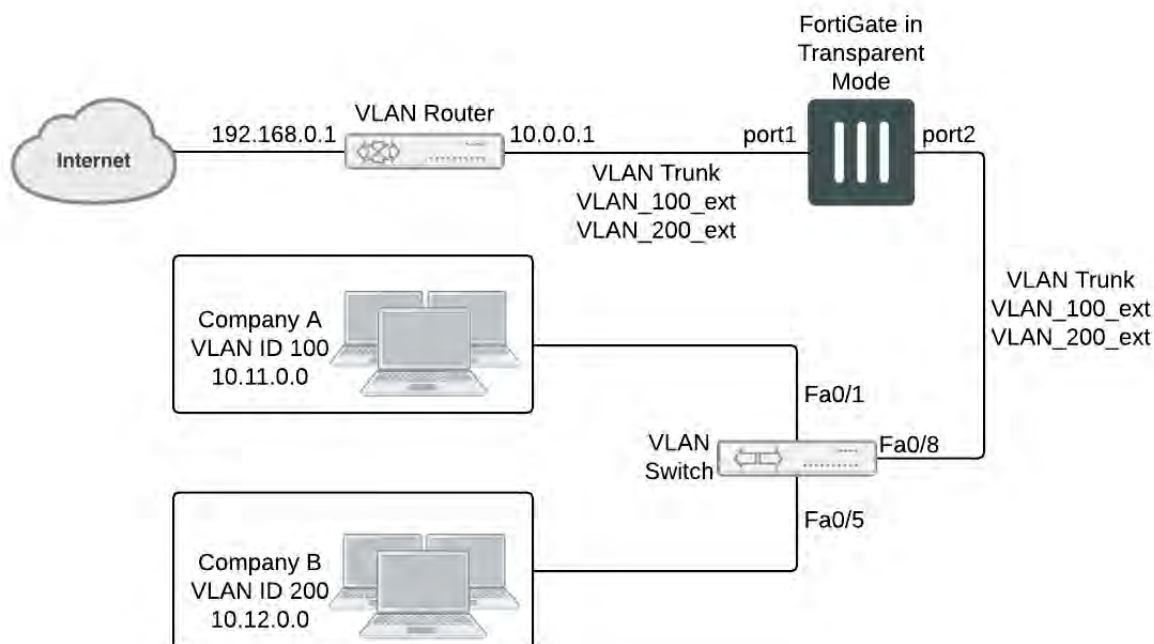

## Creating security policies

Security policies permit communication between the FortiGate unit's network interfaces based on source and destination IP addresses. Typically you will also limit communication to desired times and services for additional security.

In Transparent mode, the FortiGate unit performs antivirus and antispam scanning on each packet as it passes through the unit. You need security policies to permit packets to pass from the VLAN interface where they enter the unit to the VLAN interface where they exit the unit. If there are no security policies configured, no packets will be allowed to pass from one interface to another.

For more information, see the Firewall handbook.

## Example configuration: VDOM in Transparent mode

In this example, the FortiGate unit provides network protection to two organizations — Company A and Company B. Each company has different policies for incoming and outgoing traffic, requiring three different security policies and protection profiles.

VDMs are not required for this configuration, but by using VDMs the profiles and policies can be more easily managed on a per-VDM basis either by one central administrator or separate administrators for each company. Also future expansion is simply a matter of adding additional VDMs, whilst not disrupting the existing VDMs.

For this example, firewalls are only included to deal with web traffic. This is to provide an example without making configuration unnecessarily complicated.

This example includes the following sections:

- [Network topology and assumptions](#)
- [General configuration steps](#)
- [Configuring common items](#)
- [Creating virtual domains](#)
- [Configuring the Company\\_A VDOM](#)
- [Configuring the Company\\_B VDOM](#)
- [Configuring the VLAN switch and router](#)
- [Testing the configuration](#)

## Network topology and assumptions

Each organization's internal network consists of a different range of IP addresses:

- 10.11.0.0/255.255.0.0 for Company A.
- 10.12.0.0/255.255.0.0 for Company B.

For the procedures in this section, it is assumed that you have enabled VDOM configuration on your FortiGate unit. For more information, see [Virtual Domains Overview](#).

The VDOM names are similar to the company names for easy recognition. The root VDOM cannot be renamed and is not used in this example.

Interfaces used in this example are port1 and port2. Some FortiGate models may not have interfaces with these names. port1 is an external interface. port2 is an internal interface.

## General configuration steps

The following steps summarize the configuration for this example. For best results, follow the procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. [Configuring common items](#)
2. [Creating virtual domains](#)
3. [Configuring the Company\\_A VDOM](#)
4. [Configuring the Company\\_B VDOM](#)
5. [Configuring the VLAN switch and router](#)
6. [Testing the configuration](#)

## Configuring common items

Both VDOMs require you configure security profiles. These will be configured the same way, but need to be configured in both VDOMs.

The relaxed profile allows users to surf websites they are not allowed to visit during normal business hours. Also a quota is in place to restrict users to one hour of access to these websites to ensure employees do not take long and unproductive lunches.

### To create a strict web filtering profile - GUI:

1. Go to the proper VDOM, and select **Security Profiles > Web Filter**.
2. Select **Create New**.
3. Enter `strict` for the **Name**.

4. Expand FortiGuard Web Filtering, and select block for all Categories except Business Oriented, and Other.
5. Block all Classifications except Cached Content, and Image Search.
6. Ensure **FortiGuard Quota** for all Categories and Classifications is Disabled.
7. Select **OK**.

#### To create a strict web filtering profile - CLI:

```
config vdom
 edit <vdom_name>
 config webfilter profile
 edit strict
 config ftgd-wf
 set allow g07 g08 g21 g22 c01 c03
 set deny g01 g02 g03 g04 g05 g06 c02 c04 c05 c06 c07
 end
 set web-ftgd-err-log enable
 end
 end
 end
```

#### To create a relaxed web filtering profile - GUI:

1. Go to the proper VDOM, and select **Security Profiles > Web Filter**.
2. Select **Create New**.
3. Enter `relaxed` for the **Name**.
4. Expand FortiGuard Web Filtering, and select block for Potentially Security Violating Category, and Spam URL Classification.
5. Enable FortiGuard Quotas to allow 1 hour for all allowed Categories and Classifications.

## Creating virtual domains

The FortiGate unit supports 10 virtual domains. Root is the default VDOM. It cannot be deleted or renamed. The root VDOM is not used in this example. New VDOMs are created for Company A and Company B

#### To create the virtual domains - GUI:

1. With VDOMs enabled, select **Global > System > VDOM**.
2. Select **Create New**.
3. Enter `Company_A` for Name, and select **OK**.
4. Select **Create New**.
5. Enter `Company_B` for Name, and select **OK**.

#### To create the virtual domains - CLI:

```
config system vdom
 edit Company_A
 next
 edit Company_B
end
```

## Configuring the Company\_A VDOM

This section describes how to add VLAN subinterfaces and configure security policies for the Company\_A VDOM.

This section includes the following topics:

- [Adding VLAN subinterfaces](#)
- [Creating the Lunch schedule](#)
- [Configuring Company\\_A firewall addresses](#)
- [Creating Company\\_A security policies](#)

### Adding VLAN subinterfaces

You need to create a VLAN subinterface on the port2 interface and another one on the port1 interface, both with the same VLAN ID.

#### To add VLAN subinterfaces - GUI:

1. Go to **Global > Network > Interfaces**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

<b>Name</b>	VLAN_100_int
<b>Interface</b>	port2
<b>VLAN ID</b>	100
<b>Virtual Domain</b>	Company_A

4. Select **Create New**.
5. Enter the following information and select **OK**:

<b>Name</b>	VLAN_100_ext
<b>Interface</b>	port1
<b>VLAN ID</b>	100
<b>Virtual Domain</b>	Company_A

#### To add the VLAN subinterfaces - CLI:

```
config system interface
edit VLAN_100_int
set interface port2
set vlanid 100
set vdom Company_A
next
edit VLAN_100_ext
set interface port1
set vlanid 100
set vdom Company_A
end
```

## Creating the Lunch schedule

Both organizations have the same lunch schedule, but only Company A has relaxed its security policy to allow employees more freedom in accessing the Internet during lunch. Lunch schedule will be Monday to Friday from 11:45am to 2:00pm (14:00).

### To create a recurring schedule for lunchtime - GUI:

1. In Company\_A VDOM, go to **Policy & Objects > Schedules**.
2. Select **Create New**.
3. Enter **Lunch** as the name for the schedule.
4. Select **Mon, Tues, Wed, Thu, and Fri**.
5. Set the **Start** time as **11:45** and set the **Stop** time as **14:00**.
6. Select **OK**.

### To create a recurring schedule for lunchtime - CLI:

```
config vdom
 edit Company_A
 config firewall schedule recurring
 edit Lunch
 set day monday tuesday wednesday thursday friday
 set start 11:45
 set end 14:00
 end
 end
```

## Configuring Company\_A firewall addresses

For Company A, its networks are all on the 10.11.0.0 network, so restricting addresses to that domain provides added security.

### To configure Company\_A firewall addresses - GUI:

1. In the Company\_A VDOM, go to **Policy & Objects > Addresses**.
2. Select **Create New**.
3. Enter **CompanyA** in the **Address Name** field.
4. Type **10.11.0.0/255.255.0.0** in the **Subnet / IP Range** field.
5. Select **OK**.

### To configure vdomA firewall addresses - CLI:

```
config firewall address
 edit CompanyA
 set type ipmask
 set subnet 10.11.0.0 255.255.0.0
 end
```

## Creating Company\_A security policies

A security policy can include varying levels of security feature protection. This example only deals with web filtering. The following security policies use the custom security `strict` and `relaxed` profiles configured earlier.

For these security policies, we assume that all protocols will be on their standard ports, such as port 80 for http traffic. If the ports are changed, such as using port 8080 for http traffic, you will have to create custom services for protocols with non-standard ports, and assign them different names.

The firewalls configured in this section are:

- internal to external — always allow all, security features - web filtering: strict
- internal to external — Lunch allow all, security features - web filtering:relaxed

Security policies allow packets to travel between the internal VLAN\_100 interface to the external interface subject to the restrictions of the protection profile. Entering the policies in this order means the last one configured is at the top of the policy list, and will be checked first. This is important because the policies are arranged so if one does not apply the next is checked until the end of the list.

### To configure Company\_A security policies - GUI:

1. Go to **Policy & Objects > IPv4 Policy**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

<b>Name</b>	CompanyA-lunch
<b>Incoming Interface</b>	VLAN_100_int
<b>Outgoing Interface</b>	VLAN_100_ext
<b>Source Address</b>	CompanyA
<b>Destination Address</b>	all
<b>Schedule</b>	Lunch
<b>Service</b>	all
<b>Action</b>	ACCEPT
<b>Security Features</b>	enable
<b>Web Filtering</b>	relaxed

This policy provides relaxed protection during lunch hours — going from strict down to scan for protocol options and web filtering. AntiVirus and Email Filtering remain at strict for security — relaxing them would not provide employees additional access to the Internet and it would make the company vulnerable.

1. Select **Create New**.
2. Enter the following information and select **OK**:

<b>Name</b>	CompanyA-strict
<b>Incoming Interface</b>	VLAN_100_int
<b>Outgoing Interface</b>	VLAN_100_ext

<b>Source Address</b>	CompanyA
<b>Destination Address</b>	all
<b>Schedule</b>	always
<b>Service</b>	all
<b>Action</b>	ACCEPT
<b>Security Features</b>	enable
<b>Web Filtering</b>	strict

This policy enforces strict scanning at all times, while allowing all traffic. It ensures company policies are met for network security.

4. Verify that the policy list arranged **By Sequence** to make sure the CompanyA-lunch policy is located above the CompanyA-strict policy. If necessary, rearrange the policies so that the appropriate policy is applied to outgoing traffic.

#### To configure Company\_A security policies - CLI:

```
config vdom
 edit Company_A
 config firewall policy
 edit 1
 set name "CompanyA-lunch"
 set srcintf VLAN_100_int
 set dstintf VLAN_100_ext
 set srcaddr all
 set dstaddr all
 set action accept
 set schedule Lunch
 set webfiltering relaxed
 next
 edit 2
 set name "CompanyA-strict"
 set srcintf VLAN_100_int
 set dstintf VLAN_100_ext
 set srcaddr all
 set dstaddr all
 set action accept
 set schedule always
 set webfiltering strict
 end
 end
 end
```

### Configuring the Company\_B VDOM

This section describes how to add VLAN subinterfaces and configure security policies for the Company B VDOM.

This section includes the following topics:

- [Adding VLAN subinterfaces](#)
- [Creating Company\\_B service groups](#)

- [Configuring Company\\_B firewall addresses](#)
- [Configuring Company\\_B security policies](#)

### Adding VLAN subinterfaces

You need to create a VLAN subinterface on the internal interface and another one on the external interface, both with the same VLAN ID.

#### To add VLAN subinterfaces - GUI:

1. Go to **Network > Interfaces**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

<b>Name</b>	VLAN_200_int
<b>Interface</b>	port2
<b>VLAN ID</b>	200
<b>Virtual Domain</b>	Company_B

4. Select **Create New**.
5. Enter the following information and select **OK**:

<b>Name</b>	VLAN_200_ext
<b>Interface</b>	port1
<b>VLAN ID</b>	200
<b>Virtual Domain</b>	Company_B

#### To add the VLAN subinterfaces - CLI:

```
config system interface
 edit VLAN_200_int
 set interface internal
 set vlanid 200
 set vdom Company_B
 next
 edit VLAN_200_ext
 set interface external
 set vlanid 200
 set vdom Company_B
 end
```

### Creating Company\_B service groups

Company\_B does not want its employees to use any online chat software except NetMeeting, which the company uses for net conferencing. To simplify the creation of a security policy for this purpose, you create a service group that contains all of the services you want to restrict. A security policy can manage only one service or one group.

**To create a chat service group - GUI:**

1. Go to **Policy & Objects > Services** and select **Create New > Service Group**.
2. Enter `Chat` in the **Group Name** field.
3. For each of IRC, AOL, SIP-MSNmessenger and TALK, select the service in the **Available Services** list and select the right arrow to add it to the **Members** list.

If a particular service does not appear in the **Available Services** list, see the list in **Policy & Objects > Services**. Some services do not appear by default unless edited.

4. Select **OK**.

**To create a games and chat service group - CLI:**

```
config firewall service group
edit Chat
set member IRC SIP-MSNmessenger AOL TALK
end
```

**Configuring Company\_B firewall addresses**

Company B's network is all in the 10.12.0.0 network. Security can be improved by only allowing traffic from IP addresses on that network.

**To configure Company\_B firewall address - GUI:**

1. In the Company\_B VDOM, go to **Policy & Objects > Addresses**.
2. Select **Create New**.
3. Enter `new` in the **Address Name** field.
4. Type `10.12.0.0/255.255.0.0` in the **Subnet / IP Range** field.
5. Select **OK**.

**To configure Company\_B firewall addresses - CLI:**

```
config vdom
edit Company_B
config firewall address
edit all
set type ipmask
set subnet 10.12.0.0 255.255.0.0
end
```

**Configuring Company\_B security policies**

Security policies allow packets to travel between the internal and external VLAN\_200 interfaces subject to the restrictions of the protection profile.

**To configure Company\_B security policies - GUI:**

1. Go to **Policy & Objects > IPv4 Policy**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

<b>Name</b>	CompanyB-deny-games-chat
<b>Incoming Interface</b>	VLAN_200_int
<b>Outgoing Interface</b>	VLAN_200_ext
<b>Source Address</b>	all
<b>Destination Address</b>	all
<b>Schedule</b>	BusinessDay
<b>Service</b>	games-chat
<b>Action</b>	DENY

This policy prevents the use of network games or chat programs (except NetMeeting) during business hours.

4. Enter the following information and select **OK**:

<b>Name</b>	CompanyB-lunch
<b>Incoming Interface</b>	VLAN_200_int
<b>Outgoing Interface</b>	VLAN_200_ext
<b>Source Address</b>	all
<b>Destination Address</b>	all
<b>Schedule</b>	Lunch
<b>Service</b>	HTTP, DNS
<b>Action</b>	ACCEPT
<b>Security Features</b>	enable
<b>Web Filter</b>	relaxed

This policy relaxes the web category filtering during lunch hour.

5. Select **Create New**.

6. Enter the following information and select **OK**:

<b>Name</b>	CompanyB-strict
<b>Incoming Interface</b>	VLAN_200_int
<b>Outgoing Interface</b>	VLAN_200_ext
<b>Source Address</b>	all

<b>Destination Address</b>	all
<b>Schedule</b>	BusinessDay
<b>Service</b>	HTTP, DNS
<b>Action</b>	ACCEPT
<b>Security Profiles</b>	enabled
<b>Web Filter</b>	strict

This policy provides rather strict web category filtering during business hours.

7. Select **Create New**.

8. Enter the following information and select **OK**:

<b>Name</b>	CompanyB-after-hours
<b>Incoming Interface</b>	VLAN_200_int
<b>Outgoing Interface</b>	VLAN_200_ext
<b>Source Address</b>	all
<b>Destination Address</b>	all
<b>Schedule</b>	always
<b>Service</b>	ALL
<b>Action</b>	ACCEPT
<b>Security Profiles</b>	enabled
<b>Web Filter</b>	relaxed

Because it is last in the list, this policy applies to the times and services not covered in preceding policies. This means that outside of regular business hours, the Relaxed protection profile applies to email and web browsing, and online chat and games are permitted. Company B needs this policy because its employees sometimes work overtime. The other companies in this example maintain fixed hours and do not want any after-hours Internet access.

### To configure Company\_B security policies - CLI:

```
config firewall policy
 edit 1
 set name "CompanyB-deny-games-chat"
 set srcintf VLAN_200_int
 set srcaddr all
 set dstintf VLAN_200_ext
 set dstaddr all
 set schedule BusinessDay
 set service Games
 set action deny
```

```

next
edit 2
 set name "CompanyB-lunch"
 set srcintf VLAN_200_int
 set srcaddr all
 set dstintf VLAN_200_ext
 set dstaddr all
 set action accept
 set schedule Lunch
 set service HTTP
 set profile_status enable
 set profile Relaxed
next
edit 3
 set name "CompanyB-strict"
 set srcintf VLAN_200_int
 set srcaddr all
 set dstintf VLAN_200_ext
 set dstaddr all
 set action accept
 set schedule BusinessDay
 set service HTTP
 set profile_status enable
 set profile BusinessOnly
next
edit 4
 set name "CompanyB-after-hours"
 set srcintf VLAN_200_int
 set srcaddr all
 set dstintf VLAN_200_ext
 set dstaddr all
 set action accept
 set schedule always
 set service ALL
 set profile_status enable
 set profile Relaxed
end

```

## Configuring the VLAN switch and router

The Cisco switch is the first VLAN device internal passes through, and the Cisco router is the last device before the Internet or ISP.

This section includes the following topics:

- [Configuring the Cisco switch](#)
- [Configuring the Cisco router](#)

### Configuring the Cisco switch

On the Cisco Catalyst 2900 ethernet switch, you need to define the VLANs 100, 200 and 300 in the VLAN database, and then add configuration files to define the VLAN subinterfaces and the 802.1Q trunk interface.

Add this file to Cisco VLAN switch:

```

!
interface FastEthernet0/1
switchport access vlan 100

```

```
!
interface FastEthernet0/5
switchport access vlan 300
!
interface FastEthernet0/6
switchport trunk encapsulation dot1q
switchport mode trunk
!
```

Switch 1 has the following configuration:

<b>Port 0/1</b>	VLAN ID 100
<b>Port 0/3</b>	VLAN ID 200
<b>Port 0/6</b>	802.1Q trunk

### Configuring the Cisco router

The configuration for the Cisco router in this example is the same as in the basic example, except we add VLAN\_300. Each of the three companies has its own subnet assigned to it.

The IP addresses assigned to each VLAN on the router are the gateway addresses for the VLANs. For example, devices on VLAN\_100 would have their gateway set to 10.11.0.1/255.255.0.0.

```
!
interface FastEthernet0/0
switchport trunk encapsulation dot1q
switchport mode trunk
!
interface FastEthernet0/0.1
encapsulation dot1Q 100
ip address 10.11.0.1 255.255.0.0
!
interface FastEthernet0/0.3
encapsulation dot1Q 200
ip address 10.12.0.1 255.255.0.0
!
```

The router has the following configuration:

<b>Port 0/0.1</b>	VLAN ID 100
<b>Port 0/0.3</b>	VLAN ID 200
<b>Port 0/0</b>	802.1Q trunk

### Testing the configuration

Use diagnostic commands, such as `tracert`, to test traffic routed through the network.

You should test traffic between the internal VLANs as well as from the internal VLANs to the Internet to ensure connectivity.

For additional troubleshooting, see [Troubleshooting Virtual Domains](#).

This section includes the following topics:

- [Testing traffic from VLAN\\_100 to the Internet](#)
- [Testing traffic from VLAN\\_100 to VLAN\\_200](#)

### Testing traffic from VLAN\_100 to the Internet

In this example, a route is traced from VLANs to a host on the Internet. The route target is `www.example.com`.

From a host on VLAN\_100, access a command prompt and enter this command:

```
C:\>tracert www.example.com
Tracing route to www.example.com [208.77.188.166]
over a maximum of 30 hops:
 1 <10 ms <10 ms <10 ms 10.100.0.1
 ...
 14 172 ms 141 ms 140 ms 208.77.188.166
Trace complete.
```

The number of steps between the first and the last hop, as well as their IP addresses, will vary depending on your location and ISP. However, all successful tracerts to `www.example.com` will start and end with these lines.

Repeat the tracert for VLAN\_200.

The tracert for each VLAN will include the gateway for that VLAN as the first step. Otherwise, the tracert should be the same for each VLAN.

### Testing traffic from VLAN\_100 to VLAN\_200

In this example, a route is traced between two internal networks. The route target is a host on VLAN\_200. The Windows traceroute command `tracert` is used.

From VLAN\_100, access a Windows command prompt and enter this command:

```
C:\>tracert 10.12.0.2
Tracing route to 10.12.0.2 over a maximum of 30 hops:
 1 <10 ms <10 ms <10 ms 10.100.0.1
 2 <10 ms <10 ms <10 ms 10.12.0.2
Trace complete.
```

You can repeat this for different routes in the topology. In each case the IP addresses will be the gateway for the starting VLAN, and the end point at the ending VLAN.

## Inter-VDOM routing

Inter-VDOM routing changes this allows VDOMs to communicate internally without using additional physical interfaces, using VDOM links. VDOM links are virtual interfaces that connect VDOMs. A VDOM link contains a pair of interfaces with each one connected to a VDOM, and forming either end of the inter-VDOM connection.

This chapter contains the following sections:

- [Benefits of inter-VDOM routing](#)
- [Configuring VDOM links](#)
- [Inter-VDOM configurations](#)
- [Dynamic routing over inter-VDOM links](#)
- [HA virtual clusters and VDOM links](#)
- [Example configuration: Inter-VDOM routing](#)

### Benefits of inter-VDOM routing

Inter-VDOM routing has a number of advantages over independent VDOM routing. These benefits include:

- [Freed-up physical interfaces](#)
- [More speed than physical interfaces](#)
- [Continued support for secure firewall policies](#)
- [Configuration flexibility](#)

#### Freed-up physical interfaces

Tying up physical interfaces on the FortiGate unit presents a problem. With a limited number of interfaces available, configuration options for the old style of communication between VDOMs are very limited. VLANs can be an answer to this, but they have some limitations.

For example, the FortiGate-800 has 8 physical ethernet ports. If they are assigned 2 per VDOM (one each for external and internal traffic) there can only be 4 VDOMs at most configured, not the 10 VDOMs the license will allow. Adding even one additional interface per VDOM to be used to communicate between VDOMs leaves only 2 VDOMs for that configuration, since it would required 9 interfaces for 3 VDOMs. Even using one physical interface for both external traffic and inter-VDOM communication would severely lower the available bandwidth for external traffic on that interface.

With the introduction of inter-VDOM routing, traffic can travel between VDOMs internally, freeing up physical interfaces for external traffic. Using the above example we can use the 4 VDOM configuration and all the interfaces will have their full bandwidth.

#### More speed than physical interfaces

Internal interfaces are faster than physical interfaces. Their speed depends on the FortiGate unit CPU and its load. That means that an inter-VDOM link interface will be faster than a outbound physical interface connected to another inbound physical interface.

However, while one virtual interface with normal traffic would be considerably faster than on a physical interface, the more traffic and more internal interfaces you configure, the slower they will become until they are slower than

the physical interfaces. CPU load can come from other sources such as AV or content scanning. This produces the same effect—internal interfaces such as inter-VDOM links will be slower.

### Continued support for secure firewall policies

VDOMs help to separate traffic based on your needs. This is an important step in satisfying regulations that require proof of secure data handling. This is especially important to health, law, accounting, and other businesses that handle sensitive data every day.

By keeping things separate, traffic has to leave the FortiGate unit and re-enter to change VDOMs. This forces traffic to go through the firewall when leaving and enter through another firewall, keeping traffic secure.

With inter-VDOM routing, the need for the physical interfaces is greatly reduced. However, firewall policies still need to be in place for traffic to pass through any interface, physical or virtual, and thus provide the same level of security both internally and externally. Configuration of firewall policies is the same for inter-VDOM links as for any other interface, and your data will continue to have the high level of security.

### Configuration flexibility

A typical VDOM uses at least two interfaces, typically physical interfaces, one for internal and one for external traffic. Depending on the configuration, more interfaces may be required. This means that the maximum number of VDOMs configurable on a FortiGate unit using physical interfaces is the number of interfaces available divided by two. VLANs can increase the number by providing multiple virtual interfaces over a single physical interface, but VLANs have some limitations. Using physical interfaces for inter-VDOM communication therefore limits the number of possible configurations on your FortiGate unit.

To overcome this limitation, inter-VDOM links can be created within the FortiGate unit. Using virtual interfaces, inter-VDOM links free up the physical interfaces for external traffic. Using VDOM links on a FortiGate unit with 8 physical interfaces, you can have 4 VDOMs communicating with each other (meshed configuration) and continue to have 2 physical interfaces each for internal and external connections. This configuration would have required 20 physical interfaces without inter-VDOM routing. With inter-VDOM routing it only requires 8 physical interfaces, with the other 12 interfaces being internal VDOM links.

Inter-VDOM routing allows you to make use of standalone VDOMs, Management VDOMs, and Meshed VDOMs without being limited by the number of physical interfaces on your FortiGate unit. For more information about these types of VDOMs, see ["Inter-VDOM configurations" on page 3371](#).

## Inter-VDOM configurations

By using fewer physical interfaces to inter-connect VDOMs, inter-VDOM links provide you with more configuration options.

None of these configurations use VLANs to reduce the number of physical interfaces. It is generally assumed that an internal or client network will have its own internal interface and an external interface to connect to its ISP and the Internet.

These inter-VDOM configurations can use any FortiGate model with possible limitations based on the number of physical interfaces. VLANs can be used to work around these limitations.

There are four different types of inter-VDOM configurations:

- [Standalone VDOM](#)
- [Independent VDOMs](#)

- Management VDOM
- Meshed VDOM

### Standalone VDOM

The standalone VDOM configuration uses a single VDOM on your FortiGate unit — the root VDOM that all FortiGate units have by default. This is the VDOM configuration you are likely familiar with. It is the default configuration for FortiGate units before you create additional VDOMs.

The configuration shown above has no VDOM inter-connections and requires no special configurations or settings.

The standalone VDOM configuration can be used for simple network configurations that only have one department or one company administering the connections, firewalls and other VDOM-dependent settings.

However, with this configuration, keeping client networks separate requires many interfaces, considerable firewall design and maintenance, and can quickly become time consuming and complex. Also, configuration errors for one client network can easily affect other client networks, causing unnecessary network downtime.

### Independent VDOMs

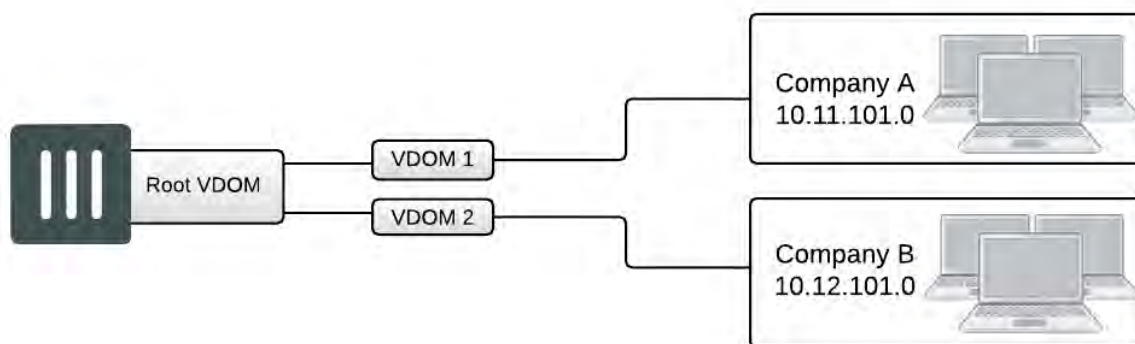

The independent VDOMs configuration uses multiple VDOMs that are completely separate from each other. This is another common VDOM configuration.

This configuration has no communication between VDOMs and apart from initially setting up each VDOM, it requires no special configurations or settings. Any communication between VDOMs is treated as if communication is between separate physical devices.

The independent inter-VDOM configuration can be used where more than one department or one company is sharing the FortiGate unit. Each can administer the connections, firewalls and other VDOM-dependent settings for only its own VDOM. To each company or department, it appears as if it has its own FortiGate unit. This configuration reduces the amount of firewall configuration and maintenance required by dividing up the work.

However, this configuration lacks a management VDOM for VDOMs 1, 2, and 3. This is illustrated in Figure 50. This management VDOM would enable an extra level of control for the FortiGate unit administrator, while still allowing each company or department to administer its own VDOM.

### Management VDOM

In the management VDOM configuration, the root VDOM is the management VDOM. The other VDOMs are connected to the management VDOM with inter-VDOM links. There are no other inter-VDOM connections.

The inter-VDOM links connect the management VDOM to the other VDOMs. This does not require any physical interfaces, and the bandwidth of inter-VDOM links can be faster than physical interfaces, depending on the CPU workload.

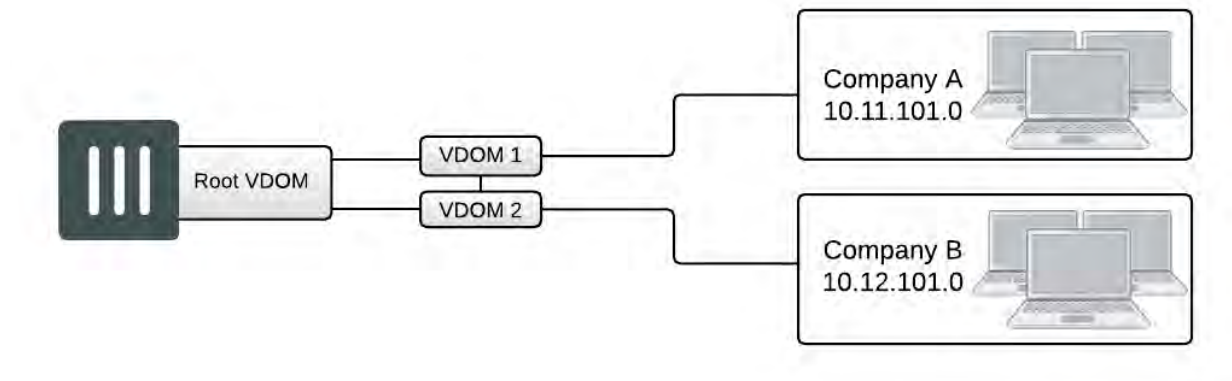

Only the management VDOM is connected to the Internet. The other VDOMs are connected to internal networks. All external traffic is routed through the management VDOM using inter-VDOM links and firewall policies between the management VDOM and each VDOM. This ensures the management VDOM has full control over access to the Internet, including what types of traffic are allowed in both directions. There is no communication directly between the non-root VDOMs. Security is greatly increased with only one point of entry and exit. Only the management VDOM needs to be fully managed to ensure network security in this case. Each client network can manage its own configuration without compromising security or bringing down another client network.

The management VDOM configuration is ideally suited for a service provider business. The service provider administers the management VDOM with the other VDOMs as customers. These customers do not require a dedicated IT person to manage their network. The service provider controls the traffic and can prevent the customers from using banned services and prevent Internet connections from initiating those same banned services. One example of a banned service might be Instant Messaging (IM) at a company concerned about intellectual property. Another example could be to limit bandwidth used by file-sharing applications without

banning that application completely. Firewall policies control the traffic between the customer VDOM and the management VDOM and can be customized for each customer.

The management VDOM configuration is limited in that the customer VDOMs have no inter-connections. In many situations this limitation is ideal because it maintains proper security. However, some configurations may require customers to communicate with each other, which would be easier if the customer VDOMs were inter-connected.

## Meshed VDOM

The meshed VDOMs configuration, including partial and full mesh, has VDOMs inter-connected with other VDOMs. There is no special feature to accomplish this—they are just complex VDOM configurations.

Partial mesh means only some VDOMs are inter-connected. In a full mesh configuration, all VDOMs are inter-connected to all other VDOMs. This can be useful when you want to provide full access between VDOMs but handle traffic differently depending on which VDOM it originates from or is going to.

With full access between all VDOMs being possible, it is extra important to ensure proper security. You can achieve this level of security by establishing extensive firewall policies and ensuring secure account access for all administrators and users.

Meshed VDOM configurations can become complex very quickly, with full mesh VDOMs being the most complex. Ensure this is the proper solution for your situation before using this configuration. Generally, these configurations are seen as theoretical and are rarely deployed in the field.

## Configuring VDOM links

Once VDOMs are configured on your FortiGate unit, configuring inter-VDOM routing and VDOM-links is very much like creating a VLAN interface. VDOM-links are managed through the GUI or CLI. In the GUI, VDOM link interfaces are managed in the network interface list.

This section includes the following topics:

- [Creating VDOM links](#)
- [IP addresses and inter-VDOM links](#)
- [Deleting VDOM links](#)
- [NAT to Transparent VDOM links](#)

## Creating VDOM links

VDOM links connect VDOMs together to allow traffic to pass between VDOMs as per firewall policies. Inter-VDOM links are virtual interfaces that are very similar to VPN tunnel interfaces except inter-VDOM links do not require IP addresses.

To create a VDOM link, you first create the point-to-point interface, and then bind the two interface objects associated with it to the virtual domains.

In creating the point-to-point interface, you also create two additional interface objects by default. They are called `vlink10` and `vlink11` - the interface name you chose with a 1 or a 0 to designate the two ends of the link.

Once the interface objects are bound, they are treated like normal FortiGate interfaces and need to be configured just like regular interfaces.

The assumptions for this example are as follows:

- Your FortiGate unit has VDOMs enabled and you have 2 VDOMs called `customer1` and `customer2` already configured. For more information on configuring VDOMs see [Configuring VDOMs](#).
- You are using a `super_admin` account.

### To configure an inter-VDOM link - GUI:

1. Go to **Global > Network > Interfaces**.
2. Select **Create New > VDOM link**, enter the following information, and select **OK**.

<b>Name</b>	vlink1
	(The name can be up to 11 characters long. Valid characters are letters, numbers, "-", and "_". No spaces are allowed.)
<b>Interface #0</b>	
<b>Virtual Domain</b>	customer1
<b>IP/Netmask</b>	10.11.12.13/255.255.255.0
<b>Administrative Access</b>	HTTPS, SSL
<b>Interface #1</b>	
<b>Virtual Domain</b>	customer2
<b>IP/Netmask</b>	172.120.100.13/255.255.255.0
<b>Administrative Access</b>	HTTPS, SSL

### To configure an inter-VDOM link - CLI:

```
config global
 config system vdom-link
 edit vlink1
 end
 config system interface
 edit vlink10
 set vdom customer1
```

```
next
edit vlink11
 set vdom customer2
end
```

Once you have created and bound the interface ends to VDOMs, configure the appropriate firewall policies and other settings that you require. To confirm the inter-VDOM link was created, find the VDOM link pair and use the expand arrow to view the two VDOM link interfaces. You can select edit to change any information.

## IP addresses and inter-VDOM links

Besides being virtual interfaces, here is one main difference between inter-VDOM links and regular interfaces—default inter-VDOM links do not require IP addresses. IP addresses are not required by default because an inter-VDOM link is an internal connection that can be referred to by the interface name in firewall policies, and other system references. This introduces three possible situations with inter-VDOM links that are:

- **unnumbered** - an inter-VDOM link with no IP addresses for either end of the tunnel
- **half numbered** - an inter-VDOM link with one IP address for one end and none for the other end
- **full numbered** - an inter-VDOM link with two IP addresses, one for each end.

Not using an IP address in the configuration can speed up and simplify configuration for you. Also you will not use up all the IP addresses in your subnets if you have many inter-VDOM links.

Half or full numbered interfaces are required if you are doing NAT, either SNAT or DNAT as you need an IP number on both ends to translate between.

You can use unnumbered interfaces in static routing, by naming the interface and using 0.0.0.0 for the gateway. Running traceroute will not show the interface in the list of hops. However you can see the interface when you are sniffing packets, which is useful for troubleshooting.

## Deleting VDOM links

When you delete the VDOM link, the two link objects associated with it will also be deleted. You cannot delete the objects by themselves. The example uses a VDOM routing connection called “vlink1”. Removing vlink1 will also remove its two link objects vlink10 and vlink11.

Before deleting the VDOM link, ensure all policies, firewalls, and other configurations that include the VDOM link are deleted, removed, or changed to no longer include the VDOM link.

### To remove a VDOM link - GUI:

1. Go to **Global > Network > Interfaces**.
2. Select **Delete** for the VDOM link **vlink1**.

### To remove a VDOM link - CLI:

```
config global
 config system vdom-link
 delete vlink1
 end
```

## NAT to Transparent VDOM links

Inter-VDOM links can be created between VDOMs in NAT mode and VDOMs in Transparent mode, but it must be done through the CLI, as the VDOM link type must be changed from the default PPP to Ethernet for the two VDOMs to communicate. The below example assumes one vdom is in NAT mode and one is Transparent.

An IP address must be assigned to the NAT VDOM's interface, but no IP address should be assigned to the Transparent VDOM's interface.

### To configure a NAT to Transparent VDOM link - CLI:

```
config global
 config system vdom-link
 edit vlink1
 set type ethernet
 end
 config system interface
 edit vlink10
 set vdom (interface 1 name)
 set ip (interface 1 ip)
 next
 edit vlink11
 set vdom (interface 2 name)
 end
```

Ethernet-type is not recommended for standard NAT to NAT inter-VDOM links, as the default PPP-type link does not require the VDOM links to have addresses, while Ethernet-type does. VDOM link addresses are explained in [IP addresses and inter-VDOM links](#).

## Dynamic routing over inter-VDOM links

BGP is supported over inter-VDOM links. Unless otherwise indicated, routing works as expected over inter-VDOM links.

If an inter-VDOM link has no assigned IP addresses to it, it may be difficult to use that interface in dynamic routing configurations. For example BGP requires an IP address to define any BGP router added to the network.

In OSPF, you can configure a router using a router ID and not its IP address. In fact, having no IP address avoids possible confusing between which value is the router ID and which is the IP address. However for that router to become adjacent with another OSPF router it will have to share the same subnet, which is technically impossible without an IP address. For this reason, while you can configure an OSPF router using an IP-less inter-VDOM link, it will likely be of limited value to you.

In RIP the metric used is hop count. If the inter-VDOM link can reach other nodes on the network, such as through a default route, then it may be possible to configure a RIP router on an inter-VDOM link. However, once again it may be of limited value due to limitations.

As stated earlier, BGP requires an IP address to define a router — an IP-less inter-VDOM link will not work with BGP.

In Multicast, you can configure an interface without using an IP address. However that interface will be unable to become an RP candidate. This limits the roles available to such an interface.

## HA virtual clusters and VDOM links

FortiGate HA is implemented by configuring two or more FortiGate units to operate as an HA cluster. To the network, the HA cluster appears to function as a single FortiGate unit, processing network traffic and providing normal security services such as firewall, VPN, IPS, virus scanning, web filtering, and spam filtering.

Virtual clustering extends HA features to provide failover protection and load balancing for a FortiGate unit operating with virtual domains. A virtual cluster consists of a cluster of two FortiGate units operating with virtual domains. Traffic on different virtual domains can be load balanced between the cluster units.

With virtual clusters (vclusters) configured, inter-VDOM links must be entirely within one vcluster. You cannot create links between vclusters, and you cannot move a VDOM that is linked into another virtual cluster. If your FortiGate units are operating in HA mode, with multiple vclusters when you create the vdom-link, the CLI command `config system vdom-link` includes an option to set which vcluster the link will be in.

### What is virtual clustering?

Virtual clustering is an extension of the FGCP for FortiGate units operating with multiple VDOMs enabled. Virtual clustering operates in active-passive mode to provide failover protection between two instances of a VDOM operating on two different cluster units. You can also operate virtual clustering in active-active mode to use HA load balancing to load balance sessions between cluster units. Alternatively, by distributing VDOM processing between the two cluster units you can also configure virtual clustering to provide load balancing by distributing sessions for different VDOMs to each cluster unit.

### Virtual clustering and failover protection

Virtual clustering operates on a cluster of two (and only two) FortiGate units with VDOMs enabled. Each VDOM creates a cluster between instances of the VDOMs on the two FortiGate units in the virtual cluster. All traffic to and from the VDOM stays within the VDOM and is processed by the VDOM. One cluster unit is the primary unit for each VDOM and one cluster unit is the subordinate unit for each VDOM. The primary unit processes all traffic for the VDOM. The subordinate unit does not process traffic for the VDOM. If a cluster unit fails, all traffic fails over to the cluster unit that is still operating.

### Virtual clustering and heartbeat interfaces

The HA heartbeat provides the same HA services in a virtual clustering configuration as in a standard HA configuration. One set of HA heartbeat interfaces provides HA heartbeat services for all of the VDOMs in the cluster. You do not have to add a heartbeat interface for each VDOM.

### Virtual clustering and HA override

For a virtual cluster configuration, override is enabled by default for both virtual clusters when you:

- Enable VDOM portioning from the GUI by moving virtual domains to virtual cluster 2
- Enter `set vcluster2 enable` from the CLI `config system ha` command to enable virtual cluster 2.

Usually you would enable virtual cluster 2 and expect one cluster unit to be the primary unit for virtual cluster 1 and the other cluster unit to be the primary unit for virtual cluster 2. For this distribution to occur override must be enabled for both virtual clusters. Otherwise you will need to restart the cluster to force it to renegotiate.

### Virtual clustering and load balancing or VDOM partitioning

There are two ways to configure load balancing for virtual clustering. The first is to set the HA mode to active-active. The second is to configure VDOM partitioning. For virtual clustering, setting the HA Mode to active-active has the same result as active-active HA for a cluster without virtual domains. The primary unit receives all sessions and load balances them among the cluster units according to the load balancing schedule. All cluster units process traffic for all virtual domains.

Note: If override is enabled the cluster may renegotiate too often. You can choose to disable override at any time. If you decide to disable override, for best results, you should disable it for both cluster units.

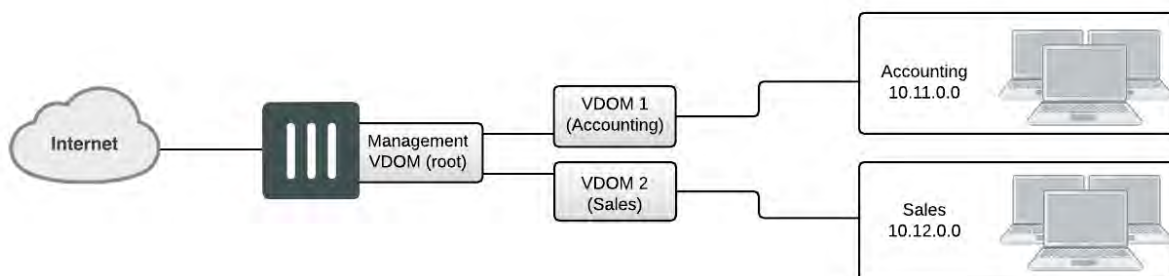

In a VDOM partitioning virtual clustering configuration, the HA mode is set to active-passive. Even though virtual clustering operates in active-passive mode you can configure a form of load balancing by using VDOM partitioning to distribute traffic between both cluster units. To configure VDOM partitioning you set one cluster unit as the primary unit for some virtual domains and you set the other cluster unit as the primary unit for other virtual domains. All traffic for a virtual domain is processed by the primary unit for that virtual domain. You can control the distribution of traffic between the cluster units by adjusting which cluster unit is the primary unit for each virtual domain.

For example, you could have 4 VDOMs, two of which have a high traffic volume and two of which have a low traffic volume. You can configure each cluster unit to be the primary unit for one of the high volume VDOMs and one of the low volume VDOMs. As a result each cluster unit will be processing traffic for a high volume VDOM and a low volume VDOM, resulting in an even distribution of traffic between the cluster units. You can adjust the distribution at any time. For example, if a low volume VDOM becomes a high volume VDOM you can move it from one cluster unit to another until the best balance is achieved. From the GUI you configure VDOM partitioning by setting the HA mode to active-passive and distributing virtual domains between Virtual Cluster 1 and Virtual Cluster 2. You can also configure different device priorities, port monitoring, and remote link failover, for Virtual Cluster 1 and Virtual Cluster 2.

From the CLI you configure VDOM partitioning by setting the HA mode to a-p. Then you configure device priority, port monitoring, and remote link failover and specify the VDOMs to include in virtual cluster 1. You do the same for virtual cluster 2 by entering the config secondary-vcluster command.

Failover protection does not change. If one cluster unit fails, all sessions are processed by the remaining cluster unit. No traffic interruption occurs for the virtual domains for which the still functioning cluster unit was the primary unit. Traffic may be interrupted temporarily for virtual domains for which the failed unit was the primary unit while processing fails over to the still functioning cluster unit. If the failed cluster unit restarts and rejoins the virtual cluster, VDOM partitioning load balancing is restored.

### Example configuration: Inter-VDOM routing

This example shows how to configure a FortiGate unit to use inter-VDOM routing.

This section contains the follow topics:

- [Network topology and assumptions](#)
- [Creating the VDOMs](#)
- [Configuring the physical interfaces](#)
- [Configuring the VDOM links](#)
- [Configuring the firewall and Security Profile settings](#)
- [Testing the configuration](#)

## Network topology and assumptions

Two departments of a company, Accounting and Sales, are connected to one FortiGate 800 unit. To do its work, the Sales department receives a lot of email from advertising companies that would appear to be spam if the Accounting department received it. For this reason, each department has its own VDOM to keep firewall policies and other configurations separate. A management VDOM makes sense to ensure company policies are followed for traffic content.

The traffic between Accounting and Sales will be email and HTTPS only. It could use a VDOM link for a meshed configuration, but we will keep from getting too complex. With the configuration, inter-VDOM traffic will have a slightly longer path to follow than normal—from one department VDOM, through the management VDOM, and back to the other department VDOM. Since inter-VDOM links are faster than physical interfaces, this longer path should not be noticed.

Firewall policies will be in place. For added security, firewall policies will allow only valid office services such as email, web browsing, and FTP between either department and the Internet. Any additional services that are required can be added in the future.

The company uses a single ISP to connect to the Internet. The ISP uses DHCP to provide an IP address to the FortiGate unit. Both departments use the same ISP to reach the Internet.

Other assumptions for this example are as follows:

- Your FortiGate unit has interfaces labelled port1 through port4 and VDOMs are not enabled.
- You are using the super\_admin account.
- You have the FortiClient application installed.
- You are familiar with configuring interfaces, firewalls, and other common features on your FortiGate unit.

## General configuration steps

This example includes the following general steps. For best results, follow the steps in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. [Creating the VDOMs](#)
2. [Configuring the physical interfaces](#)
3. [Configuring the VDOM links](#)
4. [Configuring the firewall and Security Profile settings](#)
5. [Testing the configuration](#)

## Creating the VDOMs

This procedure enables VDOMs and creates the Sales and Accounting VDOMs.

**To create the VDOMs - GUI:**

1. Log in as the super\_admin administrator.
2. Go to the **Dashboard** and locate the **System Information** widget. Enable **Virtual Domain**.
3. Log in again.
4. Go to **Global > System > VDOM**.
5. Select **Create New**, enter `Accounting` for the VDOM Name, and select **OK**.
6. Select **Create New**, enter `Sales` for the VDOM Name, and select **OK**.

**To create the VDOMs - CLI:**

```

config system global
 set vdom enable
end
config system vdom
 edit Accounting
 next
 edit Sales
 next
end

```

**Configuring the physical interfaces**

Next, the physical interfaces must be configured. This example uses three interfaces on the FortiGate unit - port2 (internal), port3(dmz), and port1(external). port2 and port3 interfaces each have a department's network connected. port1 is for all traffic to or from the Internet and will use DHCP to configure its IP address, which is common with many ISPs.

**To configure the physical interfaces - GUI:**

1. Go to **Global > Network > Interfaces**.
2. Select **Edit** for the port2 interface, enter the following information, and select **OK**.

<b>Alias</b>	AccountingLocal
<b>Virtual Domain</b>	Accounting
<b>Addressing mode</b>	Manual
<b>IP/Netmask</b>	172.100.1.1/255.255.0.0
<b>Administrative Access</b>	HTTPS, PING, SSH
<b>Description</b>	This is the accounting department internal interface.

3. Select **Edit** for the port3 interface, enter the following information, and select **OK**.

<b>Alias</b>	SalesLocal
<b>Virtual Domain</b>	Sales
<b>Addressing mode</b>	Manual

<b>IP/Netmask</b>	192.168.1.1/255.255.0.0
<b>Administrative Access</b>	HTTPS, PING, SSH
<b>Description</b>	This is the sales department internal interface.

4. Select **Edit** for the port1 interface, enter the following information, and select **OK**.

<b>Alias</b>	ManagementExternal
<b>Virtual Domain</b>	root
<b>Addressing Mode</b>	DHCP
<b>Distance</b>	5
<b>Retrieve default gateway from server</b>	Enable
<b>Override internal DNS</b>	Enable
<b>Administrative Access</b>	HTTPS, SSH, SNMP
<b>Description</b>	This is the accounting department internal interface.

When the mode is set to DHCP or PPoE on an interface you can set the distance field. This is the administrative distance for any routes learned through the gateway for this interface. The gateway is added to the static route table with these values. A lower distance indicates a preferred route.

#### To configure the physical interfaces - CLI:

```
config global
config system interface
edit port2
set alias AccountingLocal
set vdom Accounting
set mode static
set ip 172.100.1.1 255.255.0.0
set allowaccess https ping ssh
set description "The accounting dept internal interface"
next
edit port3
set alias SalesLocal
set vdom Sales
set mode static
set ip 192.168.1.1 255.255.0.0
set allowaccess https ping ssh
set description "The sales dept. internal interface"
next
edit port1
set alias ManagementExternal
set vdom root
set mode DHCP
```

```

set distance 5
set gwdetect enable
set dns-server-override enable
set allowaccess https ssh snmp
set description "The systemwide management interface."
end

```

## Configuring the VDOM links

To complete the connection between each VDOM and the management VDOM, you need to add the two VDOM links; one pair is the Accounting - management link and the other is for Sales - management link.

When configuring inter-VDOM links, you do not have to assign IP addresses to the links unless you are using advanced features such as dynamic routing that require them. Not assigning IP addresses results in faster configuration, and more available IP addresses on your networks.

If you require them, or if you simply want to assign IP addresses for clarity can do so.

### To configure the Accounting and management VDOM link - GUI:

1. Go to **Global > Network > Interfaces**.
2. Select the expand arrow to select **Create New > VDOM link**.
3. Enter the following information, and select **OK**.

<b>Name</b>	AccountVlnk
<b>Interface #0</b>	
<b>Virtual Domain</b>	Accounting
<b>IP/Netmask</b>	0.0.0.0/0.0.0.0
<b>Administrative Access</b>	HTTPS, PING, SSH
<b>Description</b>	The Accounting VDOM side of the link.
<b>Interface #1</b>	
<b>Virtual Domain</b>	root
<b>IP/Netmask</b>	0.0.0.0/0.0.0.0
<b>Administrative Access</b>	HTTPS, PING, SSH
<b>Description</b>	The Management VDOM side of the link.

### To configure the Accounting and management VDOM link - CLI:

```

config global
 config system vdom-link
 edit AccountVlnk
 next
 end
 config system interface

```

```

edit AccountVlnk0
 set vdom Accounting
 set ip 0.0.0.0 0.0.0.0
 set allowaccess https ping ssh
 set description "Accounting side of the VDOM link"
next
edit AccountVlnk1
 set vdom root
 set ip 0.0.0.0 0.0.0.0
 set allowaccess https ping ssh
 set description "Management side of the VDOM link"
end

```

### To configure the Sales and management VDOM link - GUI:

1. Go to **Global > Network > Interfaces**.
2. Select the expand arrow and select **Create New > VDOM link**.
3. Enter the following information, and select **OK**.

Name	SalesVlnk
<b>Interface #0</b>	
<b>Virtual Domain</b>	Sales
<b>IP/Netmask</b>	0.0.0.0/0.0.0.0
<b>Administrative Access</b>	HTTPS, PING, SSH
<b>Description</b>	The Sales VDOM side of the link.
<b>Interface #1</b>	
<b>Virtual Domain</b>	root
<b>IP/Netmask</b>	0.0.0.0/0.0.0.0
<b>Administrative Access</b>	HTTPS, PING, SSH
<b>Description</b>	The Management VDOM side of the link.

### To configure the Sales and management VDOM link - CLI:

```

config global
 config system vdom-link
 edit SalesVlnk
 end
 config system interface
 edit SalesVlnk0
 set vdom Accounting
 set ip 0.0.0.0 0.0.0.0
 set allowaccess https ping ssh
 set description "Sales side of the VDOM link"
 next
 end
end

```

```
edit SalesVlnk1
 set vdom root
 set ip 0.0.0.0 0.0.0.0
 set allowaccess https ping ssh
 set description "Management side of the VDOM link"
end
end
```

## Configuring the firewall and Security Profile settings

With the VDOMs, physical interfaces, and VDOM links configured the firewall must now be configured to allow the proper traffic. Firewalls are configured per-VDOM, and firewall objects must be created for each VDOM separately.

For this example, the firewall group of services allowed between the internal networks and the Internet are the basic services for web browsing, file transfer, and email. These include: HTTP, HTTPS, SSL, FTP, DNS, NTP, POP3, and SMTP.

The only services allowed between Sales and Accounting are secure web browsing (HTTPS) and email (POP3 and SMTP).

The limited number of services ensures security between departments. The list of services can be expanded in the future if needed.

---

Security profile settings will block all non-essential business websites while logging all web traffic, scan and filter all web and email protocols, and block game and peer-to-peer applications using application control.

For added security, FortiClient is required on internal computers with AntiVirus scanning configured. This is enforced by **Endpoint NAC** in firewall policies.

Using firewall addresses makes the firewall policies easier to read. Also if any changes need to be made in the future, you can simply update the addresses without changing the firewall policies. The addresses required are:

- AccountingLocal - all traffic from the internal accounting network
- AccountingVlnk - all traffic from the VDOM link between accounting and management VDOMs
- SalesLocal - all traffic from the internal sales network
- SalesVlnk - all traffic from the VDOM link between sales and management VDOM.

The Accounting VDOM requires AccountingLocal, AccountingVlnk, and SalesLocal. The Sales VDOM requires SalesLocal, SalesVlnk, and AccountingLocal.

This section includes the following topics:

- [Configuring firewall service groups](#)
- [Configuring Security Profile settings for the Accounting VDOM](#)
- [Configuring firewall settings for the Accounting VDOM](#)
- [Configuring Security Profile settings for the Sales VDOM](#)
- [Configuring firewall settings for the Sales VDOM](#)
- [Configuring firewall settings between the Accounting and Sales VDOMs](#)

## Configuring firewall service groups

Service groups are an easy way to manage multiple services, especially if the same services are used on different networks.

The two service groups used here are intended for normal office traffic to the Internet, and for restricted traffic between departments. In both cases network traffic will be limited to the services listed to prevent any potential security risks or bandwidth-robbing applications.

These service groups can be changed as needed to either include additional valid services that are being used on the network, or to exclude services that are not required. Also, custom services can be created as needed for applications that are not listed.

### To configure two firewall service groups - GUI:

1. Open the **Accounting** VDOM.
2. Go to **Policy & Objects > Services** and select **Create New > Service Group**.
3. Select **Create New**, enter the following information, and select **OK**.

<b>Group Name</b>	OfficeServices
<b>Members</b>	HTTP, HTTPS, SSL, FTP, DNS, NTP, POP3, PING, SMTP

4. Select **Create New**, enter the following information, and select **OK**.

<b>Group Name</b>	AccountingSalesServices
<b>Members</b>	HTTPS, POP3, PING, SMTP

### To configure two firewall service groups - CLI:

```
config vdom
 edit Accounting
 config firewall service group
 edit OfficeServices
 set member HTTP HTTPS SSH FTP DNS NTP POP3 PING SMTP
 next
 edit AccountingSalesServices
 set member HTTPS POP3 PING SMTP
 end
 end
 end
```

## Configuring Security Profile settings for the Accounting VDOM

Security Profile settings include web filtering, antivirus, application control, and other features. This example just uses those three features to ensure that

- the business environment is free from viruses
- employees do not surf grossly inappropriate websites, and
- employees do not use games or peer-to-peer applications at work.

**To configure web filtering for the Accounting VDOM - GUI:**

1. Open the **Accounting** VDOM.
2. Go to **Security Profiles > Web Filter**.
3. Select **Create New**.
4. Enter `webStrict` for the **Name**.
5. Select the arrow to expand the **FortiGuard Web Filtering** section.
6. Block all **Categories** except Business Oriented, Other, and Unrated.
7. Block all **Classifications** except Image Search..
8. Log all **Categories** and **Classifications**.
9. Select **OK**.

**To configure AntiVirus for the Accounting VDOM - GUI:**

1. Open the **Accounting** VDOM.
2. Go to **Security Profiles > AntiVirus**.
3. Select **Create New**.
4. Enter `avStrict` for the **Name**.
5. Set **Detect Viruses** to **Block** and enable all **Inspected Protocols**.
6. Select **OK**.

**To configure application control for the Accounting VDOM - GUI:**

1. Open the **Accounting** VDOM.
2. Go to **Security Profiles > Application Control**.
3. Select **Create New** (+ button at top right of page).
4. Enter `appStrict` for **Name** and select **OK**.
5. Select **Create New**.
6. In **Filters**, set **Category** to **game**.
7. In **Applications/Settings**, enter the following, and select **OK**.

<b>Action</b>	Block
<b>Packet Logging</b>	Enable

8. Select **Create New**.
9. In **Filters**, set **Category** to **p2p**.
10. In **Applications/Settings**, enter the following, and select **OK**.

<b>Action</b>	Block
<b>Packet Logging</b>	Enable

11. Select **Apply**.

**To configure application control for the Accounting VDOM - CLI:**

```
config vdom
```

```

edit Accounting
 config application list
 edit appStrict
 config entries
 edit 1
 set category 2
 next
 edit 2
 set category 8
 end
 end
 end
 end
end

```

### Configuring firewall settings for the Accounting VDOM

This configuration includes two firewall addresses and two firewall policies for the Accounting VDOM - one for the internal network, and one for the VDOM link with the management VDOM (root).

For added security, all traffic allowed will be scanned. Only valid office traffic will be allowed using the service group `OfficeServices`.

Note the spelling of `AccountVlnk` which is due to the eleven character limit on VDOM link names.

#### To configure firewall addresses - GUI:

1. Open the **Accounting** VDOM.
2. Select **Policy & Objects > Addresses**.
3. Select **Create New**, enter the following information, and select **OK**.

<b>Address Name</b>	AccountingLocal
<b>Type</b>	Subnet/ IP Range
<b>Subnet / IP Range</b>	172.100.0.0
<b>Interface</b>	port1

4. Select **Create New**, enter the following information, and select **OK**.

<b>Address Name</b>	AccountManagement
<b>Type</b>	Subnet/ IP Range
<b>Subnet / IP Range</b>	10.0.1.0
<b>Interface</b>	AccountVlnk

#### To configure firewall addresses - CLI:

```

config vdom
 edit Accounting
 config firewall address
 edit AccountingLocal
 set type iprange
 set subnet 172.100.0.0
 end
 end
 end
end

```

```

 set associated-interface port1
 next
 edit AccountManagement
 set type iprange
 set subnet 10.0.1.0
 set associated-interface AccountVlnk
 end
end

```

### To configure the firewall policies from AccountingLocal to the Internet - GUI:

1. Open the **Accounting** VDOM.
2. Go to **Policy & Objects > IPv4 Policy**.
3. Select **Create New**, enter the following information, and then select **OK**.

<b>Name</b>	Accounting-Local-to-Management
<b>Incoming Interface</b>	port2
<b>Outgoing Interface</b>	AccountVlnk
<b>Source Address</b>	AccountingLocal
<b>Destination Address</b>	AccountManagement
<b>Schedule</b>	always
<b>Service</b>	OfficeServices
<b>Action</b>	ACCEPT
<b>Enable NAT</b>	enable
<b>Security Features</b>	enabled
<b>Web Filtering</b>	webStrict
<b>AntiVirus Filtering</b>	avStrict
<b>Application Control</b>	appStrict

4. Open the **root** VDOM.
5. Go to **Policy & Objects > IPv4 Policy**.
6. Select **Create New**, enter the following information, and then select **OK**.

<b>Name</b>	Accounting-VDOM-to-Internet
<b>Incoming Interface</b>	AccountVlnk
<b>Outgoing Interface</b>	ManagementExternal
<b>Source Address</b>	AccountManagement

<b>Destination Address</b>	all
<b>Schedule</b>	always
<b>Service</b>	OfficeServices
<b>Action</b>	ACCEPT
<b>Enable NAT</b>	enable
<b>Security Features</b>	enabled
<b>Web Filtering</b>	webStrict
<b>AntiVirus Filtering</b>	avStrict
<b>Application Control</b>	appStrict

**To configure the firewall policies from AccountingLocal to Internet - CLI:**

```

config vdom
 edit Accounting
 config firewall policy
 edit 1
 set name "Accounting-Local-to-Management"
 set srcintf port2
 set dstintf AccountVlnk
 set srcaddr AccountingLocal
 set dstaddr AccountManagement
 set action accept
 set schedule always
 set service OfficeServices
 set nat enable
 set av-profile avStrict
 set webfilter-profile webStrict
 set application-list appStrict
 end
 end
 end
config vdom
 edit root
 config firewall policy
 edit 2
 set name "Accounting-VDOM-to-Internet"
 set srcintf AccountVlnk
 set dstintf port1
 set srcaddr AccountManagement
 set dstaddr all
 set action accept
 set schedule always
 set service OfficeServices
 set nat enable
 set av-profile scan
 set webfilter-profile scan
 set application-list AppControlList
 end
 end
 end

```

**To configure the firewall policies from Internet to AccountingLocal - GUI:**

1. Open the **root** VDOM.
2. Go to **Policy & Objects > IPv4 Policy**.
3. Select **Create New**, enter the following information, and select **OK**.

<b>Name</b>	Internet-access-to-Accounting-VDOM
<b>Incoming Interface</b>	port1
<b>Outgoing Interface</b>	AccountVlnk
<b>Source Address</b>	all
<b>Destination Address</b>	AccountManagement
<b>Schedule</b>	always
<b>Service</b>	OfficeServices
<b>Action</b>	ACCEPT
<b>Enable NAT</b>	enable
<b>Security Features</b>	enabled
<b>Web Filtering</b>	webStrict
<b>AntiVirus Filtering</b>	avStrict
<b>Application Control</b>	appStrict

4. Open the **Accounting** VDOM.
5. Go to **Policy & Objects > IPv4 Policy**.
6. Select **Create New**, enter the following information, and select **OK**.

<b>Name</b>	Management-access-to-Accounting-local
<b>Incoming Interface</b>	AccountVlnk
<b>Outgoing Interface</b>	port2
<b>Source Address</b>	AccountManagement
<b>Destination Address</b>	AccountingLocal
<b>Schedule</b>	always
<b>Service</b>	OfficeServices
<b>Action</b>	ACCEPT
<b>Enable NAT</b>	enable

<b>Security Features</b>	enabled
<b>Web Filtering</b>	webStrict
<b>AntiVirus Filtering</b>	avStrict
<b>Application Control</b>	appStrict

### To configure the firewall policies from Internet to AccountingLocal - CLI:

```

config vdom
 edit root
 config firewall policy
 edit 3
 set name "Internet-access-to-Accounting-VDOM"
 set srcintf port1
 set dstintf AccountVlnk
 set srcaddr all
 set dstaddr AccountManagement
 set action accept
 set schedule always
 set service OfficeServices
 set nat enable
 set av-profile avStrict
 set webfilter-profile webStrict
 set application-list appstrict
 end
 end
 config vdom
 edit Accounting
 config firewall policy
 edit 4
 set name "Management-access-to-Accounting-local"
 set srcintf AccountVlnk
 set dstintf port2
 set srcaddr AccountManagement
 set dstaddr AccountingLocal
 set action accept
 set schedule always
 set service OfficeServices
 set nat enable
 set av-profile avStrict
 set webfilter-profile webStrict
 set application-list appstrict
 end
 end
 end
 end

```

### Configuring Security Profile settings for the Sales VDOM

Security profile settings include web filtering, antivirus, application control, and other features. This example just uses those three features to ensure that

- the business environment is free from viruses
- employees do not surf grossly inappropriate websites, and
- employees do not use games or peer-to-peer applications at work.

Note that Sales web traffic is different from Accounting, and web filtering is different to account for this.

**To configure web filtering for the Sales VDOM - GUI:**

1. Open the **Sales** VDOM.
2. Go to **Security Profiles > Web Filter**.
3. Select **Create New**.
4. Enter `webStrict` for the **Name**.
5. In **FortiGuard Categories**, select all of the categories except **Bandwidth Consuming**, **General Interest - Business** and **Unrated**.
6. In **Change Action for Selected Categories** select **Block**.
7. Select **Apply**.

**To configure web filtering for the Sales VDOM - CLI:**

```
config vdom
 edit Sales
 config webfilter profile
 edit webStrict
 config ftgd-wf
 set allow g07 g08 g21 g22 c01 c03
 set deny g01 g02 g03 g04 g05 g06 c02 c04 c05 c06 c07
 end
 set web-ftgd-err-log enable
 end
 end
 end
```

**To configure AntiVirus for the Sales VDOM - GUI:**

1. Open the **Sales** VDOM.
2. Go to **Security Profiles > AntiVirus**.
3. Select **Create New**.
4. Enter `avStrict` for the **Name**.
5. Set **Detect Viruses** to **Block** and enable all **Inspected Protocols**.
6. Select **Apply**.

**To configure AntiVirus for the Sales VDOM - CLI:**

```
config vdom
 edit Sales
 config antivirus profile
 edit "avStrict"
 config http
 set options scan file-filter
 end
 config ftp
 set options scan file-filter
 end
 config imap
 set options scan file-filter
 end
 config pop3
 set options scan file-filter
 end
 end
 end
 end
```

```

end
config smtp
 set options scan file-filter
end
config nntp
 set options scan file-filter
end
config im
 set options scan file-filter
end
set filepattable 1
set av-virus-log enable
set av-block-log enable
end
end

```

### To configure application control for the Sales VDOM - GUI:

1. Open the **Accounting** VDOM.
2. Go to **Security Profiles > Application Control**.
3. Select **Create New** (+ button at top right of page).
4. Enter `appStrict` for **Name** and select **OK**.
5. Select **Create New**.
6. In **Filters**, set **Category** to **game**.
7. In **Applications/Settings**, enter the following, and select **OK**.

<b>Action</b>	Block
<b>Packet Logging</b>	Enable

8. Select **Create New**.
9. In **Filters**, set **Category** to **p2p**.
10. In **Applications/Settings**, enter the following, and select **OK**.

<b>Action</b>	Block
<b>Packet Logging</b>	Enable

11. Select **Apply**.

### To configure application control for the Sales VDOM - CLI:

```

config vdom
 edit Sales
 config application list
 edit "appStrict"
 config entries
 edit 1
 set category 2
 next
 edit 2
 set category 8
 end
 end
 end
 end
end

```

```

 end
 end
end

```

### Configuring firewall settings for the Sales VDOM

Like the Accounting firewall settings, this configuration includes two firewall addresses and two firewall policies for the sales VDOM: one for the internal network, and one for the VDOM link with the management VDOM.

When entering the CLI commands, the number of the firewall policies must be high enough to be a new policy. Depending on the number of firewall policies on your FortiGate unit, this may require starting at a higher number than the 6 required for the default configuration. This number is added automatically when you configure firewall policies using the web manager interface.

The FortiClient application must be used on Sales network computers to ensure additional protection for the sensitive information and for protection against spam.

#### To configure firewall addresses - GUI:

1. Open the **Sales** VDOM.
2. Go to **Policy & Objects > Addresses**.
3. Select **Create New**, enter the following information, and select **OK**.

<b>Address Name</b>	SalesLocal
<b>Type</b>	Subnet / IP Range
<b>Subnet / IP Range</b>	172.100.0.0
<b>Interface</b>	port3

4. Go to **Policy & Objects > Addresses**.
5. Select **Create New**, enter the following information, and select **OK**.

<b>Address Name</b>	SalesManagement
<b>Type</b>	Subnet / IP Range
<b>Subnet / IP Range</b>	10.0.1.0
<b>Interface</b>	SalesVlnk

#### To configure the firewall addresses - CLI:

```

config vdom
 edit Sales
 config firewall address
 edit SalesLocal
 set type iprange
 set subnet 172.100.0.0
 set associated-interface port2
 next
 edit SalesManagement
 set type iprange

```

```

 set subnet 10.0.1.0
 set associated-interface SalesVlnk
 end
end

```

### To configure the firewall policies from SalesLocal to the Internet - GUI:

1. Open the **Sales** VDOM.
2. Go to **Policy & Objects > IPv4 Policy**.
3. Select **Create New**, enter the following information, and select **OK**.

<b>Name</b>	Sales-local-to-Management
<b>Incoming Interface</b>	port3
<b>Outgoing Interface</b>	SalesVlnk
<b>Source Address</b>	SalesLocal
<b>Destination Address</b>	SalesManagement
<b>Schedule</b>	always
<b>Service</b>	OfficeServices
<b>Action</b>	ACCEPT
<b>Log Allowed Traffic</b>	enabled

4. Open the **root** VDOM.
5. Go to **Policy & Objects > IPv4 Policy**.
6. Select **Create New**, enter the following information, and select **OK**.

<b>Name</b>	Sales-VDOM-to-Internet
<b>Incoming Interface</b>	SalesVlnk
<b>Outgoing Interface</b>	ManagementExternal
<b>Source Address</b>	SalesManagement
<b>Destination Address</b>	all
<b>Schedule</b>	always
<b>Service</b>	OfficeServices
<b>Action</b>	ACCEPT
<b>Log Allowed Traffic</b>	enabled

### To configure the firewall policies from SalesLocal to the Internet - CLI:

```

config vdom
edit root

```

```

config firewall policy
 edit 6
 set name "Sales-local-to-Management"
 set srcintf port2
 set srcaddr SalesLocal
 set dstintf SalesVlnk
 set dstaddr SalesManagement
 set schedule always
 set service OfficeServices
 set action accept
 set logtraffic enable
 end
end
config vdom
 edit Sales
 config firewall policy
 edit 7
 set name "Sales-VDOM-to-Internet"
 set srcintf SalesVlnk
 set srcaddr SalesManagement
 set dstintf external
 set dstaddr all
 set schedule always
 set service OfficeServices
 set action accept
 set logtraffic enable
 end
 end
 end
end

```

#### To configure the firewall policies from the Internet to SalesLocal - GUI:

1. Open the **root** VDOM.
2. Go to **Policy & Objects > IPv4 Policy**.
3. Select **Create New**, enter the following information, and select **OK**.

<b>Name</b>	Internet-access-to-Sales-VDOM
<b>Incoming Interface</b>	ManagementExternal
<b>Outgoing Interface</b>	SalesVlnk
<b>Source Address</b>	all
<b>Destination Address</b>	SalesManagement
<b>Schedule</b>	always
<b>Service</b>	OfficeServices
<b>Action</b>	ACCEPT
<b>Protection Profile</b>	scan
<b>Log Allowed Traffic</b>	enabled

4. Open the **Sales** VDOM.
5. Go to **Policy & Objects > IPv4 Policy**.
6. Select **Create New**, enter the following information, and select **OK**.

<b>Name</b>	Management-access-to-Sales-local
<b>Incoming Interface</b>	SalesVlnk
<b>Outgoing Interface</b>	port2
<b>Source Address</b>	SalesManagement
<b>Destination Address</b>	SalesLocal
<b>Schedule</b>	always
<b>Service</b>	OfficeServices
<b>Action</b>	ACCEPT
<b>Log Allowed Traffic</b>	enabled

**To configure the firewall policies from the Internet to SalesLocal - CLI:**

```

config vdom
 edit root
 config firewall policy
 edit 8
 set name "Internet-access-to-Sales-VDOM"
 set srcintf external
 set srcaddr all
 set dstintf SalesVlnk
 set dstaddr SalesManagement
 set schedule always
 set service OfficeServices
 set action accept
 set logtraffic enable
 end
 end
 config vdom
 edit Sales
 config firewall policy
 edit 9
 set name "Management-access-to-Sales-local"
 set srcintf SalesVlnk
 set srcaddr SalesManagement
 set dstintf port2
 set dstaddr SalesLocal
 set schedule always
 set service OfficeServices
 set action accept
 set logtraffic enable
 end
 end
 end
 end

```

## Configuring firewall settings between the Accounting and Sales VDOMs

Firewall policies are required for any communication between each internal network and the Internet. Policies are also required for the two internal networks to communicate with each other through the management VDOM.

The more limited AccountingSalesServices group of services will be used between Sales and Accounting to ensure the traffic is necessary business traffic only. These policies will result in a partially meshed VDOM configuration. The FortiClient application must be used to ensure additional protection for the sensitive accounting information.

Two firewall policies are required to allow traffic in both directions between Sales and Accounting.

### To configure the firewall policy between Sales and Accounting on the management VDOM - GUI:

1. Open the **root** VDOM.
2. Go to **Policy & Objects > IPv4 Policy**.
3. Select **Create New**, enter the following information, and select **OK**.

<b>Name</b>	Sales-VDOM-to-Accounting-VDOM
<b>Incoming Interface</b>	SalesVlnk
<b>Outgoing Interface</b>	AccountVlnk
<b>Source Address</b>	SalesManagement
<b>Destination Address</b>	AccountingManagement
<b>Schedule</b>	always
<b>Service</b>	AccountingSalesServices
<b>Action</b>	ACCEPT
<b>Protection Profile</b>	scan
<b>Log Allowed Traffic</b>	enabled

4. Go to **Policy & Objects > IPv4 Policy**.
5. Select **Create New**, enter the following information, and select **OK**.

<b>Name</b>	Accounting-VDOM-to-Sales-VDOM
<b>Incoming Interface</b>	AccountVlnk
<b>Outgoing Interface</b>	SalesVlnk
<b>Source Address</b>	AccountingManagement
<b>Destination Address</b>	SalesManagement
<b>Schedule</b>	always

<b>Service</b>	AccountingSalesServices
<b>Action</b>	ACCEPT
<b>Log Allowed Traffic</b>	enabled

**To configure the firewall policy between Sales and Accounting on the management VDOM - CLI:**

```

config vdom
 edit root
 config system firewall policy
 edit 9
 set name "Sales-VDOM-to-Accounting-VDOM"
 set srcintf SalesVlnk
 set srcaddr SalesManagement
 set dstintf AccountVlnk
 set dstaddr AccountManagement
 set schedule always
 set service AccountingSalesServices
 set action accept
 set logtraffic enable
 next
 edit 10
 set name "Accounting-VDOM-to-Sales-VDOM"
 set srcintf AccountVlnk
 set srcaddr AccountManagement
 set dstintf SalesVlnk
 set dstaddr SalesManagement
 set schedule always
 set service AccountingSalesServices
 set action accept
 set logtraffic enable
 end
 end
 end

```

## Testing the configuration

Once the inter-VDOM routing has been configured, tests must be conducted to confirm proper operation. If there are any problems, use the troubleshooting tips to resolve them.

This section includes the following topics:

- [Testing connectivity](#)
- [Troubleshooting Tips](#)

### Testing connectivity

Testing connectivity ensures that physical networking connections as well as FortiGate unit interface configurations, including firewall policies, are properly configured.

The easiest way to test connectivity is to use the `ping` and `traceroute` commands to confirm the connectivity of different routes on the network. Include testing:

- from AccountingLocal to Internet
- from Internet to AccountingLocal

- from SalesLocal to Internet
- from Internet to SalesLocal
- from AccountingLocal to SalesLocal.

When using the commands on a Windows computer, go to a command line prompt and enter either `ping <IP address>` or `tracert <IP address>`.

When using the commands on a FortiGate unit, go to the CLI and enter either `exec ping <IP address>` or `exec traceroute <IP address>`.

### Troubleshooting Tips

When there are problems with connectivity, the following troubleshooting tips will help resolve the issues.

- If a multiple hop test, such as traceroute, is not successful then reduce it to a single hop to simplify the test. Test each link of the path to see which hop is down. If all hops are up, check the FortiGate unit policies to ensure they allow basic traffic to flow as expected.
- If ping does not work, confirm that the FortiGate unit interfaces have Ping enabled and also ensure Ping is enabled in the firewall policies. Otherwise the Ping traffic will be blocked.
- If one protocol does not work but others do work, check the FortiGate unit firewall policies for that one protocol to ensure it is allowed.
- If there are unexplained connectivity problems, check the local computer to ensure it does not have a software firewall running that may be blocking traffic. MS Windows computers have a firewall running by default that can cause problems.

For additional troubleshooting, see [Troubleshooting Virtual Domains](#).

## Troubleshooting Virtual Domains

When you are configuring VDOMs you may run into some issues, with your VDOM configuration, your network configuration, or your device setup. This section addresses common problems and specific concerns that an administrator of a VDOM network may have.

This section includes:

- [VDOM admin having problems gaining access](#)
- [FortiGate unit running very slowly](#)
- [General VDOM tips and troubleshooting](#)

### VDOM admin having problems gaining access

With VDOMs configured, administrators have an extra layer of permissions and may have problems accessing their information.

#### Confirm the admin's VDOM

Each administrator account, other than the super\_admin account, is tied to one specific VDOM. That administrator is not able to access any other VDOM. It may be possible they are trying to access the wrong VDOM.

#### Confirm the VDOM's interfaces

An administrator can only access their VDOM through interfaces that are assigned to that VDOM. If interfaces on that VDOM are disabled or unavailable there will be no method of accessing that VDOM by its local administrator. The super\_admin will be required to either bring up the interfaces, fix the interfaces, or move another interface to that VDOM to restore access.

#### Confirm the VDOMs admin access

As with all FortiGate units, administration access on the VDOM's interfaces must be enabled for that VDOM's administrators to gain access. For example if SSH is not enabled, that is not available to administrators.

To enable admin access, the super\_admin will go to the **Global > Network > Interfaces** page, and for the interface in question enable the admin access.

### FortiGate unit running very slowly

You may experience a number of problems resulting from your FortiGate unit being overloaded. These problems may appear as:

- CPU and memory threshold limits exceeded on a continual basis
- AV failopen happening on a regular basis
- dropped traffic or sessions due to lack of resources

These problems are caused by a lack of system resources. There are a number of possible reasons for this.

## Too many VDOMs

If you have configured many VDOMs on your system, past the default ten VDOMs, this could easily be your problem.

Each VDOM you create on your FortiGate unit requires system resources to function - CPU cycles, memory, and disk space. When there are too many VDOMs configured there are not enough resources for operation. This may be a lack of memory in the session table, or no CPU cycles for processing incoming IPS traffic, or even a full disk drive.

Go to **Global > System > VDOM** and see the number of configured VDOMs on your system. If you are running 500 or more VDOMs, you must have a FortiGate 5000 chassis. Otherwise you need to reduce the number of VDOMs on your system to fix the problem. Even if you have the proper hardware, you may encounter noticeably slow throughput if you are using advanced features such as security profiles or deep content inspection with many configured VDOMs.

## One or more VDOMs are consuming all the resources

If you have sufficient hardware to support the number of VDOMs you are running, check the global resources on your FortiGate unit. At a glance it will tell you if you are running out of a particular resource such as sessions, or users. If this is the case, you can then check your VDOMs to see if one particular VDOM is using more than its share of resources. If that is the case you can change the resource settings to allow that VDOM (or those VDOMs) fewer resources and in turn allow the other VDOMs access to those resources.

## Too many Security Features in use

It is likely that reducing the Security Features in use regardless of number of VDOMs will greatly improve overall system performance and should be considered as an option.

Finally it is possible that your FortiGate unit configuration is incorrect in some other area, which is using up all your resources. For example, forgetting that you are running a network sniffer on an interface will create significant amounts of traffic that may prevent normal operation.

## General VDOM tips and troubleshooting

Besides ping and traceroute, there are additional tools for troubleshooting your VDOM configurations. These include packet sniffing and debugging the packet flow.

### Perform a sniffer trace

When troubleshooting networks, it helps to look inside the headers of packets to determine if they are traveling along the route you expect that they are. Packet sniffing can also be called a network tap, packet capture, or logic analyzing.

If your FortiGate unit has NP interfaces that are offloading traffic, this will change the sniffer trace. Before performing a trace on any NP interfaces, you should disable offloading on those interfaces.

### What sniffing packets can tell you

If you are running a constant traffic application such as ping, packet sniffing can tell you if the traffic is reaching the destination, what the port of entry is on the FortiGate unit, if the ARP resolution is correct, and if the traffic is

being sent back to the source as expected.

Sniffing packets can also tell you if the Fortigate unit is silently dropping packets for reasons such as RPF (Reverse Path Forwarding), also called Anti Spoofing, which prevents an IP packet from being forwarded if its Source IP does not either belong to a locally attached subnet (local interface), or be part of the routing between the FortiGate and another source (static route, RIP, OSPF, BGP). Note that RPF can be disabled by turning on asymmetric routing in the CLI (`config system setting, set asymmetric enable`), however this will disable stateful inspection on the FortiGate unit and cause many features to be turned off.

If you configure virtual IP addresses on your Fortigate unit, it will use those addresses in preference to the physical IP addresses. You will notice this when you are sniffing packets because all the traffic will be using the virtual IP addresses. This is due to the ARP update that is sent out when the VIP address is configured.

---

### How to sniff packets

When you are using VDOMs, you must be in a VDOM to access the `diag sniffer` command. At the global level, the command is not available. This is limit the packets only to the ones on your VDOM, and protects the privacy of other VDOM clients.

The general form of the internal FortiOS packet sniffer command is:

```
diag sniffer packet <interface_name> <'filter'> <verbose> <count>
```

To stop the sniffer, type `CTRL+C`.

<b>&lt;interface_name&gt;</b>	The name of the interface to sniff, such as "port1" or "internal". This can also be "any" to sniff all interfaces.
<b>&lt;'filter'&gt;</b>	What to look for in the information the sniffer reads. <code>none</code> indicates no filtering, and all packets will be displayed as the other arguments indicate.  The filter must be inside single quotes (').
<b>&lt;verbose&gt;</b>	The level of verbosity as one of:  1 - print header of packets  2 - print header and data from IP of packets  3 - print header and data from Ethernet of packets
<b>&lt;count&gt;</b>	The number of packets the sniffer reads before stopping. If you don't put a number here, the sniffer will run forever until you stop it with <CTRL C>.

For a simple sniffing example, enter the CLI command `diag sniffer packet port1 none 1 3`. This will display the next 3 packets on the port1 interface using no filtering, and using verbose level 1. At this verbosity level you can see the source IP and port, the destination IP and port, action (such as ack), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets, and 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diag sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]
0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757

0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808

0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

For a more advanced example of packet sniffing, the following commands will report packets on any interface travelling between a computer with the host name of PC1 and the computer with the host name of PC2. With verbosity 4 and above, the sniffer trace will display the interface names where traffic enters or leaves the FortiGate unit. Remember to stop the sniffer, type CTRL+C. Note that PC1 and PC2 may be VDOMs.

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2>" 4
```

or

```
FGT# diagnose sniffer packet any "(host <PC1> or host <PC2>) and icmp" 4
```

The following sniffer CLI command includes the ARP protocol in the filter which may be useful to troubleshoot a failure in the ARP resolution (for instance PC2 may be down and not responding to the FortiGate ARP requests).

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2> or arp" 4
```

## Debugging the packet flow

Traffic should come in and leave the VDOM. If you have determined that network traffic is not entering and leaving the VDOM as expected, debug the packet flow.

Debugging can only be performed using CLI commands. Debugging the packet flow requires a number of debug commands to be entered as each one configures part of the debug action, with the final command starting the debug.

If your FortiGate unit has NP interfaces that are offloading traffic, this will change the packet flow. Before performing the debug on any NP interfaces, you should disable offloading on those interfaces.

---

The following configuration assumes that PC1 is connected to the internal interface of the FortiGate unit and has an IP address of 10.11.101.200. PC1 is the host name of the computer.

To debug the packet flow in the CLI, enter the following commands:

```
FGT# diag debug enable
FGT# diag debug flow filter add <PC1>
FGT# diag debug flow show console enable
FGT# diag debug flow trace start 100
FGT# diag debug enable
```

The `start 100` argument in the above list of commands will limit the output to 100 packets from the flow. This is useful for looking at the flow without flooding your log or your display with too much information.

To stop all other debug activities, enter the command:

```
FGT# diag debug flow trace stop
```

The following is an example of debug flow output for traffic that has no matching Firewall Policy, and is in turn blocked by the FortiGate unit. The denied message indicates the traffic was blocked. Note that even with VDOMs not enabled, vd-root is still shown.

```
id=20085 trace_id=319 func=resolve_ip_tuple_fast line=2825 msg="vd-root received a
packet(proto=6, 192.168.129.136:2854->192.168.96.153:1863) from port3."

id=20085 trace_id=319 func=resolve_ip_tuple line=2924 msg="allocate a new session-
013004ac"

id=20085 trace_id=319 func=vf_ip4_route_input line=1597 msg="find a route: gw-
192.168.150.129 via port1"

id=20085 trace_id=319 func=fw_forward_handler line=248 msg=" Denied by forward policy
check"
```

# Chapter 33 - Virtual FortiOS

## Virtual FortiOS

FortiGate virtual appliances allow you to mitigate blind spots by implementing critical security controls within your virtual infrastructure. They also allow you to rapidly provision security infrastructure whenever and wherever it is needed. FortiGate virtual appliances feature all of the security and networking services common to traditional hardware-based FortiGate appliances. With the addition of virtual appliances from Fortinet, you can deploy a mix of hardware and virtual appliances, operating together and managed from a common centralized management platform.

## Document scope

This document describes how to deploy a FortiGate virtual appliance in several virtualization server environments. This includes how to configure the virtual hardware settings of the virtual appliance.

This document assumes:

- you have already successfully installed the virtualization server on the physical machine,
- you have installed appropriate VM management software on either the physical server or a computer to be used for VM management.

This document does not cover configuration and operation of the virtual appliance after it has been successfully installed and started. For these issues, see the FortiGate Handbook.

This document includes the following sections:

- [Virtual FortiOS Overview](#)
- [Deployment example – VMware](#)
- [Deployment example – MS Hyper-V](#)
- [Deployment example – KVM](#)
- [Deployment example – OpenXen](#)
- [Deployment example – Citrix XenServer](#)

## What's new in VM in 5.6

### New Features in 5.6.6

More Azure SDN Connector settings including support for regions and AzureStack. See [SDN Connector - Azure \(and AzureStack\)](#) on page 3420.

## New Features in 5.6.4

The following list contains new virtual FortiOS features added in FortiOS 5.6.4. Click on a link to navigate to that section for further information.

- [FortiGate VMX license status](#)
- [SDN connector addressing on page 3418](#)
- [Support for KVM-based hypervisor in AWS on page 3419](#)
- [HA support for GCP on page 3422](#)
- [Other Virtual FortiOS Products on page 3416](#)

### FortiGate VMX licence status

The VMX licence status is included in the output of `get system status`.

### SDN connector addressing

When setting the address for an SDN connection, the value can be a fully qualified domain name (FQDN) as well as an IP address. The setting that is currently called `server` was once called `server-ip`.

### Support for KVM-based hypervisor in AWS

FortiGate-VM can be provisioned in AWS C5 instances on the marketplace (BYOL/OnDemand). These instances are based on a home-brewed version of KVM that AWS started using. Systems deployed in C5 will see better performance compared to C3/C4 instances. Deploying FortiGate-VM in these instances requires no configuration on the part of the user.

### HA support for GCP

FortiOS supports the use of active/passive HA, using a unicast heartbeat, in Google Cloud Platform (GCP) similar to the HA support for Amazon Web Services (AWS).

### HA support for Azure

FortiOS supports the use of active/passive HA, similar to that for Amazon Web Services (AWS) in an Azure environment.

## New Features in 5.6.0

### FGT-VM VCPUs (308297)

Fortinet has now launched licensing for FortiGate VMs that support larger than 8 vCPUs. The new models/licenses include:

- Support for up to 16 vCPU - FortiGate-VM16
- Support for up to 32 vCPU - FortiGate-VM32
- Support for unlimited vCPU - FortiGate-VMUL

Each of these models should be able to support up to 500 VDOMs.

## Improvements to License page (382128)

The page has been rewritten with some minor improvements such as:

- An indicator to show when a VM is waiting for authentication or starting up
- Shows VM status when license is valid
- Shows CLI console window when VM is waiting too long for remote registration of server

## Citrix XenServer tools support for XenServer VMs (387984)

This support allows users, with Citrix XenServer tools to read performance statistics from XenServer clients and do Xenmotion with servers in the same cluster

Since FortiGates don't support hardware hotplugging, the ability to do network interface of disk changes is not supported at this time.

---

There are no changes to the GUI, but there are some changes to the CLI.

A setting has been edited to control the debug level of the XenServer tools daemon

```
diag debug application xstoolsd <integer>
```

Integer = Debug level

An additional update has been added to set the update frequency for XenServer tools

```
config system global
 set xstools-update-frequency Xenserver <integer>
end
```

Enter an integer value from 30 to 300 (default = 60).

## FOS VM supports more interfaces (393068)

The number of virtual interfaces that the VM version of FortiOS supports has been raised from 3 to 10.

## NSX security group importing (403975)

A feature has been added to allow the importation of security group information from VMware's NSX firewall.

### CLI Changes:

#### nsx group list

This is used to list NSX security Groups

#### Syntax:

```
execute nsx group list <name of the filter>
```

#### nsx group import

This is used to import NSX security groups.

**Syntax:**

```
execute nsx group import <vdom> <name of the filter>
```

**nsx group delete**

This is used to delete NSX security Groups

**Syntax:**

```
execute nsx group delete <vdom> <name of the filter>
```

**nsx.setting.update-period**

This is used to set the update period for the NSX security group

**Syntax:**

```
config.nsx.setting.update-period <0 - 3600 in seconds>
```

0 means disabled

**Default value:** 0

**Non-vdom VM models FGVM1V/FGVM2V/FGVM4V (405549)**

New models of the FortiGate-VM have been introduced. These match up with the existing FortiGate-VM models of FG-VM01, FG-VM02 and FG-VM04. The difference being that the new models don't support VDOMs.

Original FortiGate-VM	New FortiGate-VM without VDOM support
FG-VM01	FG-VM01v
FG-VM02	FG-VM02v
FG-VM04	FG-VM04v

## Virtual FortiOS Overview

The following topics are included in this section:

### FortiGate VM models and licensing

Fortinet offers the FortiGate VM in five virtual appliance models determined by license. When configuring your FortiGate VM, be sure to configure hardware settings within the ranges outlined below. Contact your Fortinet Authorized Reseller for more information.

#### FortiGate VM model information

Technical Specification	FG-VM00	FG-VM01	FG-VM02	FG-VM04	FG-VM08
<b>Virtual CPUs (min / max)</b>	1 / 1	1 / 1	1 / 2	1 / 4	1 / 8
<b>Virtual Network Interfaces (min / max)</b>			2 / 10		
<b>Virtual Memory (min / max)</b>	1GB / 2GB	1GB / 2GB	1GB / 4GB	1GB / 6GB	1GB /12GB
<b>Virtual Storage (min / max)</b>			32GB / 2TB		
<b>Managed Wireless APs (tunnel mode / global)</b>	32 / 32	32 / 64	256 / 512	256 / 512	1024 / 4096
<b>Virtual Domains (default / max)</b>	1 / 2	10 / 10	10 / 25	10 / 50	10 / 250

There may be times the min/max values can change. An example for this is when the maximum memory for FG-VM00 changed between 5.2 and 5.4 from 1 GB to 1.5 GB. If that is the case, the settings for the VM will have to be manually changed to accommodate the new parameters.

After placing an order for FortiGate VM, a license registration code is sent to the email address used on the order form. Use the registration number provided to register the FortiGate VM with Customer Service & Support and then download the license file. Once the license file is uploaded to the FortiGate VM and validated, your FortiGate VM appliance is fully functional.

The number of Virtual Network Interfaces is not solely dependent on the FortiGate VM. Some virtual environments have their own limitations on the number of interfaces allowed. As an example, if you go to <https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-multiple-nics>, you will find that Azure has its own restrictions for VMs, depending on the type of deployment or even the size of the VM.

### FortiGate VM evaluation license

FortiGate VM includes a limited embedded 15-day trial license that supports:

- 1 CPU maximum
- 1024 MB memory maximum
- low encryption only (no HTTPS administrative access)
- all features except FortiGuard updates

You cannot upgrade the firmware, doing so will lock the Web-based Manager until a license is uploaded. Technical support is not included. The trial period begins the first time you start FortiGate VM. After the trial license expires, functionality is disabled until you upload a license file.

## Registering FortiGate VM with Customer Service & Support

To obtain the FortiGate VM license file you must first register your FortiGate VM with [Customer Service & Support](#).

### To register your FortiGate VM:

1. Log in to the Customer Service & Support portal using an existing support account or select **Sign Up** to create a new account.
2. In the main page, under **Asset**, select **Register/Renew**.

The **Registration** page opens.

3. Enter the registration code that was emailed to you and select **Register**. A registration form will display.
4. After completing the form, a registration acknowledgement page will appear.
5. Select the **License File Download** link.
6. You will be prompted to save the license file (.lic) to your local computer. See "Upload the license file" for instructions on uploading the license file to your FortiGate VM via the Web-based Manager.

## Downloading the FortiGate VM deployment package

FortiGate VM deployment packages are included with FortiGate firmware images on the [Customer Service & Support](#) site. First, see the following table to determine the appropriate VM deployment package for your VM platform.

### Selecting the correct FortiGate VM deployment package for your VM platform

VM Platform	FortiGate VM Deployment File
Citrix XenServer v5.6sp2, 6.0 and later	FGT_VM64-v500-buildnnnn-FORTINET.out.CitrixXen.zip
OpenXen v3.4.3, 4.1	FGT_VM64-v500-buildnnnn-FORTINET.out.OpenXen.zip
Microsoft Hyper-V Server 2008R2 and 2012	FGT_VM64-v500-buildnnnn-FORTINET.out.hyperv.zip
KVM (qemu 0.12.1)	FGT_VM64-v500-buildnnnn-FORTINET.out.kvm.zip
VMware ESX 4.0, 4.1 ESXi 4.0/4.1/5.0/5.1/5.5	FGT_VM32-v500-buildnnnn-FORTINET.out.ovf.zip (32-bit)  FGT_VM64-v500-buildnnnn-FORTINET.out.ovf.zip

For more information see the FortiGate product datasheet available on the Fortinet web site, [https://www.fortinet.com/content/dam/fortinet/assets/data-sheets/FortiGate\\_VM.pdf](https://www.fortinet.com/content/dam/fortinet/assets/data-sheets/FortiGate_VM.pdf).

The firmware images FTP directory is organized by firmware version, major release, and patch release. The firmware images in the directories follow a specific naming convention and each firmware image is specific to the device model. For example, the FGT\_VM32-v500-build0151-FORTINET.out.ovf.zip image found in the v5.0 Patch Release 2 directory is specific to the FortiGate VM 32-bit environment.

You can also download the FortiOS Release Notes, FORTINET-FORTIGATE MIB file, FSSO images, and SSL VPN client in this directory. The Fortinet Core MIB file is located in the main FortiGate v5.00 directory.

### To download the FortiGate VM deployment package:

1. In the main page of the Customer Service & Support site, select **Download > Firmware Images**.

The **Firmware Images** page opens.

2. In the **Firmware Images** page, select **FortiGate**.
3. Browse to the appropriate directory on the FTP site for the version that you would like to download.
4. Download the appropriate .zip file for your VM server platform.

You can also download the FortiGate Release Notes.

5. Extract the contents of the deployment package to a new file folder.

## Deployment package contents

### Citrix XenServer

The FORTINET.out.CitrixXen.zip file contains:

- fortios.vhd: the FortiGate VM system hard disk in VHD format
- fortios.xva: binary file containing virtual hardware configuration settings
- in the ovf folder:
  - FortiGate-VM64.ovf: Open Virtualization Format (OVF) template file, containing virtual hardware settings for Xen
  - fortios.vmdk: the FortiGate VM system hard disk in VMDK format
  - datadrive.vmdk: the FortiGate VM log disk in VMDK format

The ovf folder and its contents is an alternative method of installation to the .xva and VHD disk image.

### OpenXEN

The FORTINET.out.OpenXen.zip file contains only fortios.qcow2, the FortiGate VM system hard disk in qcow2 format. You will need to manually:

- create a 32GB log disk
- specify the virtual hardware settings

### Microsoft Hyper-V

The FORTINET.out.hyperv.zip file contains:

- in the Virtual Hard Disks folder:
  - fortios.vhd: the FortiGate VM system hard disk in VHD format
  - DATADRIVE.vhd: the FortiGate VM log disk in VHD format
- In the Virtual Machines folder:
  - fortios.xml: XML file containing virtual hardware configuration settings for Hyper-V. This is compatible with Windows Server 2012.
- Snapshots folder: optionally, Hyper-V stores snapshots of the FortiGate VM state here

### KVM

The FORTINET.out.kvm.zip contains only fortios.qcow2, the FortiGate VM system hard disk in qcow2 format. You will need to manually:

- create a 32GB log disk
- specify the virtual hardware settings

### VMware ESX/ESXi

You will need to create a 32GB log disk.

The FORTINET.out.ovf.zip file contains:

- fortios.vmdk: the FortiGate VM system hard disk in VMDK format
- datadrive.vmdk: the FortiGate VM log disk in VMDK format
- Open Virtualization Format (OVF) template files:
  - FortiGate-VM64.ovf: OVF template based on Intel e1000 NIC driver
  - FortiGate-VM64.hw04.ovf: OVF template file for older (v3.5) VMware ESX server
  - FortiGate-VMxx.hw07\_vmxnet2.ovf: OVF template file for VMware vmxnet2 driver
  - FortiGate-VMxx.hw07\_vmxnet3.ovf: OVF template file for VMware vmxnet3 driver

Use the VMXNET3 interface (FortiGate-VMxx.hw07\_vmxnet3.ovf template) if the virtual appliance will distribute workload to multiple processor cores.

---

## Deploying the FortiGate VM appliance

Prior to deploying the FortiGate VM appliance, the VM platform must be installed and configured so that it is ready to create virtual machines. The installation instructions for FortiGate VM assume that

- You are familiar with the management software and terminology of your VM platform.
- An Internet connection is available for FortiGate VM to contact FortiGuard to validate its license or, for closed environments, a FortiManager can be contacted to validate the FortiGate VM license. See "Validate the FortiGate VM license with FortiManager".

For assistance in deploying FortiGate VM, refer to the deployment chapter in this guide that corresponds to your VMware environment. You might also need to refer to the documentation provided with your VM server. The deployment chapters are presented as examples because for any particular VM server there are multiple ways to create a virtual machine. There are command line tools, APIs, and even alternative graphical user interface tools.

Before you start your FortiGate VM appliance for the first time, you might need to adjust virtual disk sizes and networking settings. The first time you start FortiGate VM, you will have access only through the console window of your VM server environment. After you configure one FortiGate network interface with an IP address and administrative access, you can access the FortiGate VM web-based manager.

After deployment and license validation, you can upgrade your FortiGate VM appliance's firmware by downloading either FGT\_VM32-v500-buildnnnn-FORTINET.out (32-bit) or FGT\_VM64-v500-buildnnnn-FORTINET.out (64-bit) firmware. Firmware upgrading on a VM is very similar to upgrading firmware on a hardware FortiGate unit.

FortiGate-VM is not part of the FortiGuard Network for the purpose of upgrades.

---

## Performance and optimization

Performance is improved for FortiOS VM platforms by implementing features to improve efficiency and resource utilization.

## Interrupt affinity

You can configure interrupt affinity and packet distribution to optimize performance for your VM environment. Interrupt affinity allows you to align interrupts from interfaces to specific CPUs.

### Configuring interrupt affinity

Use the following commands to configure interrupt affinity for two 10G interfaces (port2 and port3).

Interrupts from first interface are assigned to core #0 and those from the second interface are assigned to core #1.

```
config system affinity-interrupt
 edit 1
 set interrupt "port2-TxRx-0"
 set affinity-cpumask "0x1"
 next
 edit 2
 set interrupt "port2-TxRx-1"
 set affinity-cpumask "0x1"
 next
 edit 3
 set interrupt "port3-TxRx-0"
 set affinity-cpumask "0x2"
 next
 edit 4
 set interrupt "port3-TxRx-1"
 set affinity-cpumask "0x2"
end
```

## Packet distribution

Packet distribution allows you to configure FortiGate-VM to distribute processing to multiple CPUs. Use the following commands to configure packet redistribution to redistribute packets from core #0 and #1 to all other cores.

### Configuring packet distribution

The example is based on VM08:

```
config system affinity-packet-redistribution
 edit 1
 set interface "port2"
 set affinity-cpumask "0xFC"
 next
 edit 2
 set interface "port3"
 set affinity-cpumask "0xFC"
end
```

## Other Virtual FortiOS Products

Just like a VM installed on a platform located on a physical computer, these are instances of the FortiOS firmware installed in virtual environments.

## SDN Environments

FortiOS-VM is now supported in a Number of SDN (Software Defined Network) environments through the use of a SDN connector. The software can be found on the [Fortinet Service and Support site](#). Documentation can be found on the [Fortinet Virtualization Documentation site](#).

The products include:

### FortiGate-VMX

### FortiOS On Demand

#### Connectors:

The SDN connectors provide integration and orchestration of Fortinet products with key SDN solutions. Fortinet provides SDN connector support for public cloud connectors, such as VMware NSX, Cisco Application Centric Infrastructure (ACI), and Nokia Nuage Virtualized Services Platform (VSP) . Fortinet also provides support for private cloud connectors, such as Amazon Web Services and Microsoft Azure. You can configure SDN connectors in the **System > SDN Connectors** menu.

Microsoft Azure only supports tag sets in Virtual Machines (VMs). You may only use one Azure subscription ID and one Azure resource group. Only resources that are in use by a running VM, such as a virtual network, subnet, or network security group, are extracted.

#### FortiADC Connector for Cisco ACI

- Versions available:
  - 1.0.0
  - 1.2.0
  - 1.3.0

#### FortiADC Connector for Cisco ACI

- Versions available:
  - 1.0.0
  - 1.2.0
  - 1.3.0

#### FortiGate Connector for HPE VAN SDN

- Versions available:
  - 1.0.5
  - 1.1.0

#### FortiGate Connector for OpenStack ML2

- Versions available:
  - 1.1

#### FortiManager Connector for Nuage Networks

- Versions available:
  - 1.0

## Fortinet SDN Connector for Nuage VSP

### Additional information relating to Connectors

While the product documentation concerns itself with the connector software, there is also settings within FortiOS that relates to the usage of those connectors.

### NSX Connector Support

There is support for NSX connector to upgrade to SDN connectors.

#### Change to config system sdn-connector:

```
config nsx setting
```

#### Change to config firewall address:

```
set type nsx

set type dynamic
set sdn nsx
```

When using the sdn nsx setting, the user should also use the nsx rest-api password.

---

### SDN connector addressing

When setting the address for an SDN connection, the value can be a fully qualified domain name (FQDN) as well as an IP address. The setting that is currently called `server` was once called `server-ip`.

#### CLI

```
config system sdn-connector
edit <example>
set server [<ip address>|<fqdn address>]
end
```

### Public Cloud Environments

Unlike SDNs where the user has administrative control over the virtual environment that the FortiOS is being placed into, the Public Cloud services are run and managed by 3rd party companies with their own methods and rules of provisioning that need to be followed to install the firmware into the environment.

#### Amazon Web Services (AWS)

Online documentation can be found at <http://cookbook.fortinet.com/amazon-web-services-aws/>

#### Additional information for AWS

While the online documentation is primarily for the installation of the FortiOS into the virtual environment, periodically improvements are made to the firmware that affects its interaction with the environment but isn't

really covered by installation instructions or information has changed in regards to those instructions but they may not have all been updated yet.

#### Support for KVM-based hypervisor in AWS

FortiGate-VM can be provisioned in AWS C5 instances on the marketplace (BYOL/OnDemand). These instances are based on a home-brewed version of KVM that AWS started using. Systems deployed in C5 will see better performance compared to C3/C4 instances. Deploying FortiGate-VM in these instances requires no configuration on the part of the user.

FortiGate-VM firmware can be placed in these instances because of:

- An NVME driver that is required to run C5 instances. It gets the correct partition name dependencies if an NVME device is being used.
- Removing the `xenstore` checking requirement in the AWS setup daemon that is not required in non-Xen based instances.

## HA

AWS supports the use of HA.

This includes two parts:

1. HA with unicast heartbeat traffic.
2. AWS API supports to move secondary IPs and update routing tables.

#### CLI:

Unicast HA config

```
config system ha
 unicast-hb [enable|disable]
 unicast-hb-peerip <Unicast Heartbeat Peer IP>
end
```

## SDN Connector - AWS

SDN connectors can be configured in the GUI by going to **System > SDN Connectors** and choosing the appropriate type to configure from the various virtual environments. AWS is supported in the GUI as well as the CLI.

1. `config aws setting` has been moved to the context of `config system sdn-connector`.

```
config system sdn-connector
 edit <string>
 set access-key <AWS access key ID>
 set secret-key <AWS secret access key>
 set region <AWS region name>
 set vpc-id <AWS VPC ID>
 end
```
2. Update to the GUI SDN connector edit page that supports allowing configuration of the following fields:
  - AWS access key ID
  - AWS secret access key
  - AWS region name
  - AWS VPC ID
  - Update Interval

3. Change to address edit page to allow configuration of the **Filter** field for Dynamic AWS address.
4. Update to the dynamic address monitor API to get resolved address list for dynamic AWS addresses.

## Azure

FortiOS supports the use of active/passive HA, similar to that for Amazon Web Services (AWS) in an Azure environment.

### SDN Connector - Azure (and AzureStack)

SDN connectors can be configured in the GUI by going to **System > SDN Connectors** and choosing the appropriate type to configure from the various virtual environments. Azure is supported in the GUI as well as the CLI. Azure connector options include the ability to select the region and the ability to configure Azure and AzureStack fields such as the Azure tenant ID, client ID, subscription ID and resource group.

CLI options are available to configure with Azure:

- The `system sdn-connector` contains a connector type for Azure environments called `azure`.
- The `nic` option enables you to configure the Azure network interface.
- The `route-table` option enables you to configure the Azure route table.

### Example:

```
config system sdn-connector
 edit "azd"
 set type azure
 config nic
 edit nic-eth2
 config ip
 edit ipconfig1
 set public-ip p3
 next
 end
 next
 edit nic-eth3
 config ip
 edit ipconfig1
 set public-ip p2
 next
 end
 next
 end
 config route-table
 edit 1
 config route
 edit 12
 set next-hop 111.233.222.233
 next
 end
 next
 end
```

In addition to the options for HA already specified, there are settings specific to Azure connectivity within the `system sdn-connector` context once the `type` has been set to `azure`.

Option	Description
<b>tenant-id</b>	Azure tenant ID (directory ID).
<b>subscription-id</b>	Azure subscription ID.
<b>client-id</b>	Azure client ID (application ID).
<b>client-secret</b>	Azure client secret (application key).
<b>resource-group</b>	Azure resource group.
<b>azure-region</b>	Global/China Azure Region.
<b>update-interval</b>	Dynamic object update interval in seconds (0 - 3600, 0 means disabled, default = 60).

### Google Cloud Platform (GCP)

The following FortiGate-VM models will be supported on Google Cloud Platform:

- FG-VM01
- FG-VM02
- FG-VM04
- FG-VM08

FG-VM00 is not supported.

Since GCP use netmask 32, static route must be configured on GCP VPC, instead of FGT.

Licenses will be interchangeable between platforms. A FG-VM04 license that functions in a VMware or Citrix environment can be also used in the GCP environment as well.

While an .out file will be necessary for upgrading, full downloadable images will not be needed for initial installation of the solution. GCP consists of pre-existing images that can be checked out of their library and deployed instantly. A difference between this environment and enterprise virtualization platforms is that machine size can never change. An n1-standard-4 has exactly 15 GB of RAM and 4 vCPUs. This can never be changed or edited by the end user or administrator.

The currently available GCP instances we are looking to support are as follows (these will/could change as vNIC values reveal themselves):

FG-VM	Equates to Instance Type	vCPU	RAM	Disks
FG-VM01-GC	n1-standard-1	1	3.75GB	16 (32 in Beta)
FG-VM02-GC	n1-standard-2	2	7.50 GB	16 (64 in Beta)

FG-VM	Equates to Instance Type	vCPU	RAM	Disks
FG-VM04-GC	n1-standard-4	4	15 GB	16 (64 in Beta)
FG-VM08-GC	n1-standard-8	8	30 GB	16 (128 in Beta)
FG-VM16-GC	n1-standard-16	16	60 GB	16 (128 in Beta)
FG-VM32-GC	n1-standard-32	32	88 GB	16 (128 in Beta)
FG-VMUL-GC	any of the above and any new that could be created.			

### HA support for GCP

FortiOS supports the use of active/passive HA, using a unicast heartbeat, in Google Cloud Platform (GCP) similar to the HA support for Amazon Web Services (AWS).

This support includes:

- HA in the same region within a project
- HA session and configuration synchronization
- Automatic failover to the passive unit (time dependant on configuration), using the built-in API call to GCP for changing the routing path from the active unit to the passive unit.

There is a new connector type, `gcp`, that has been added to the `type` option for `system sdn-connector` as well as a setting for the mask of the unicast heartbeat in `system ha`.

### GCP type example:

```
config system sdn-connector
 edit gcp
 set type gcp
 config external-ip
 edit gundam-public
 next
 end
 config route
 edit gundam-route
 next
 end
 next
end
```

### Unicast example:

```
config system ha
 set group-id 20
 set group-name "cluster1"
 set mode a-p
 set hbdev "port3" 50
 set ha-mgmt-status enable
 config ha-mgmt-interfaces
 edit 1
 set interface "port4"
 set gateway 172.16.100.1
```

```
 next
 end
 set override disable
 set priority 20
 set unicast-hb enable
 set unicast-hb-peerip 172.16.201.3
 set unicast-hb-netmask 255.255.255.0
end
```

Additional information from GCP: <https://cloud.google.com/compute/docs/images/building-custom-os>.

## Deployment example – VMware

Once you have downloaded the FGT\_VMxx-v5-build0xxx-FORTINET.out.ovf file from <http://support.fortinet.com> and extracted the package contents to a folder on your local computer, you can use the vSphere client to create the virtual machine from the deployment package OVF template.

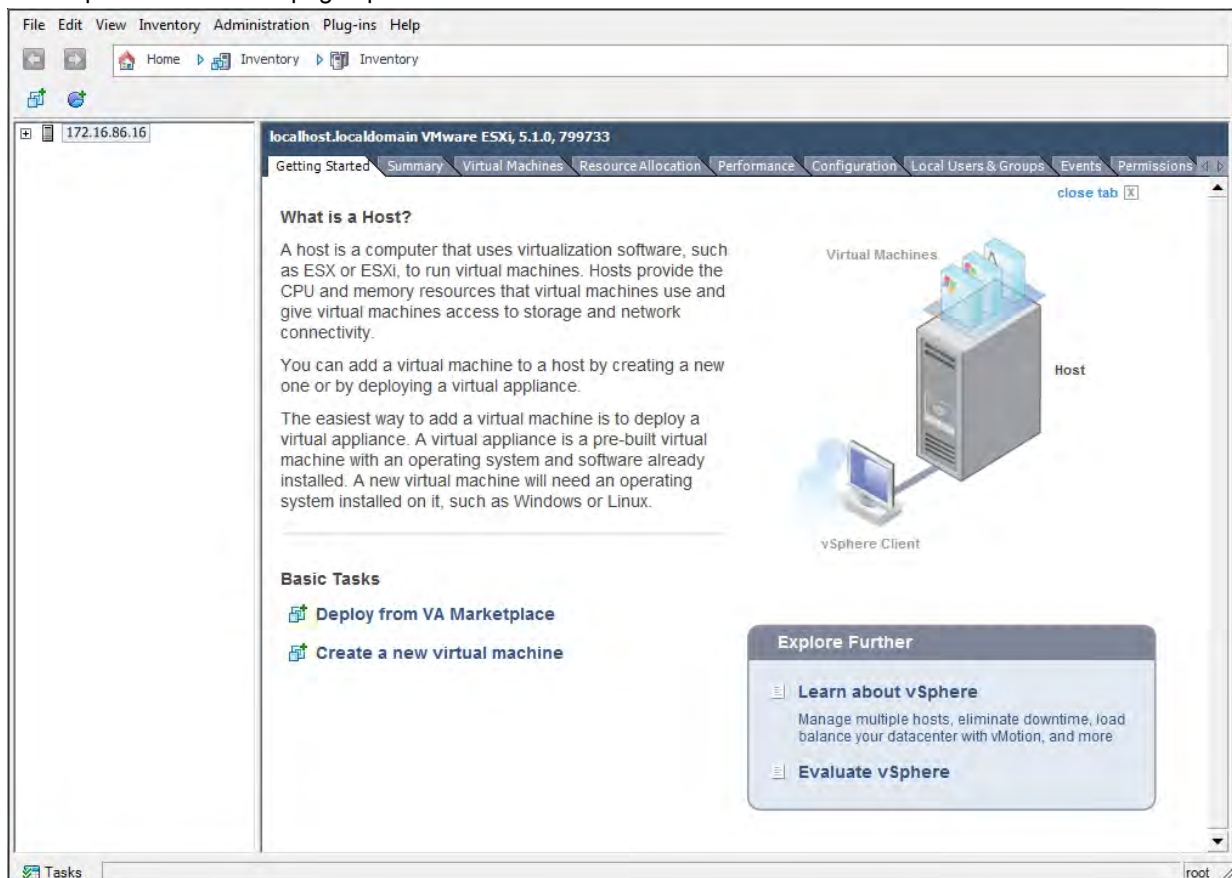

The following topics are included in this section:

### Open the FortiGate VM OVF file with the vSphere client

To deploy the FortiGate VM OVF template:

1. Launch the VMware vSphere client, enter the IP address or host name of your server, enter your user name and password and select **Login**.

The vSphere client home page opens.

2. Select **File > Deploy OVF Template** to launch the OVF Template wizard.

The OVF Template **Source** page opens.

3. Select the source location of the OVF file. Select **Browse** and locate the OVF file on your computer. Select **Next** to continue.

The OVF Template **Details** page opens.

**OVF Template Details**  
Verify OVF template details.

5. Read the end user license agreement for FortiGate VM. Select **Accept** and then select **Next** to continue.

The OVF Template **Name and Location** page opens.

The screenshot shows a web-based configuration interface for an OVF template. The main heading is "Name and Location" with a sub-instruction "Specify a name and location for the deployed template". On the left, a sidebar contains a list of steps: "Source", "OVF Template Details", "End User License Agreement", "Name and Location" (which is highlighted), "Disk Format", "Network Mapping", and "Ready to Complete". The main content area has a "Name:" label followed by a text input field containing "Fortigate-VM-01". Below the input field, a note states: "The name can contain up to 80 characters and it must be unique within the inventory folder." At the bottom of the window, there are three buttons: "Help", "< Back", and "Next >", with a "Cancel" button also visible on the right.

6. Enter a name for this OVF template. The name can contain up to 80 characters and it must be unique within the inventory folder. Select **Next** to continue.

The OVF Template **Disk Format** page opens.

7. Select one of the following:
  - **Thick Provision Lazy Zeroed:** Allocates the disk space statically (no other volumes can take the space), but does not write zeros to the blocks until the first write takes place to that block during runtime (which includes a full disk format).
  - **Thick Provision Eager Zeroed:** Allocates the disk space statically (no other volumes can take the space), and writes zeros to all the blocks.
  - **Thin Provision:** Allocates the disk space only when a write occurs to a block, but the total volume size is reported by VMFS to the OS. Other volumes can take the remaining space. This allows you to float space between your servers, and expand your storage when your size monitoring indicates there is a problem. Note that once a Thin Provisioned block is allocated, it remains on the volume regardless if you have deleted data, etc.
8. Select **Next** to continue.

The OVF Template **Network Mapping** page opens.

**Network Mapping**  
What networks should the deployed template use?

[Name and Location](#)  
[Disk Format](#)  
**Network Mapping**  
 Ready to Complete

Map the networks used in this OVF template to networks in your inventory

Source Networks	Destination Networks
Network 1	VM Network
Network 2	VM Network
Network 3	VM Network
Network 4	VM Network
Network 5	VM Network
Network 6	VM Network
Network 7	VM Network

Description:  
 The VM Network network

Warning: Multiple source networks are mapped to the host network: VM Network

Help < Back Next > Cancel

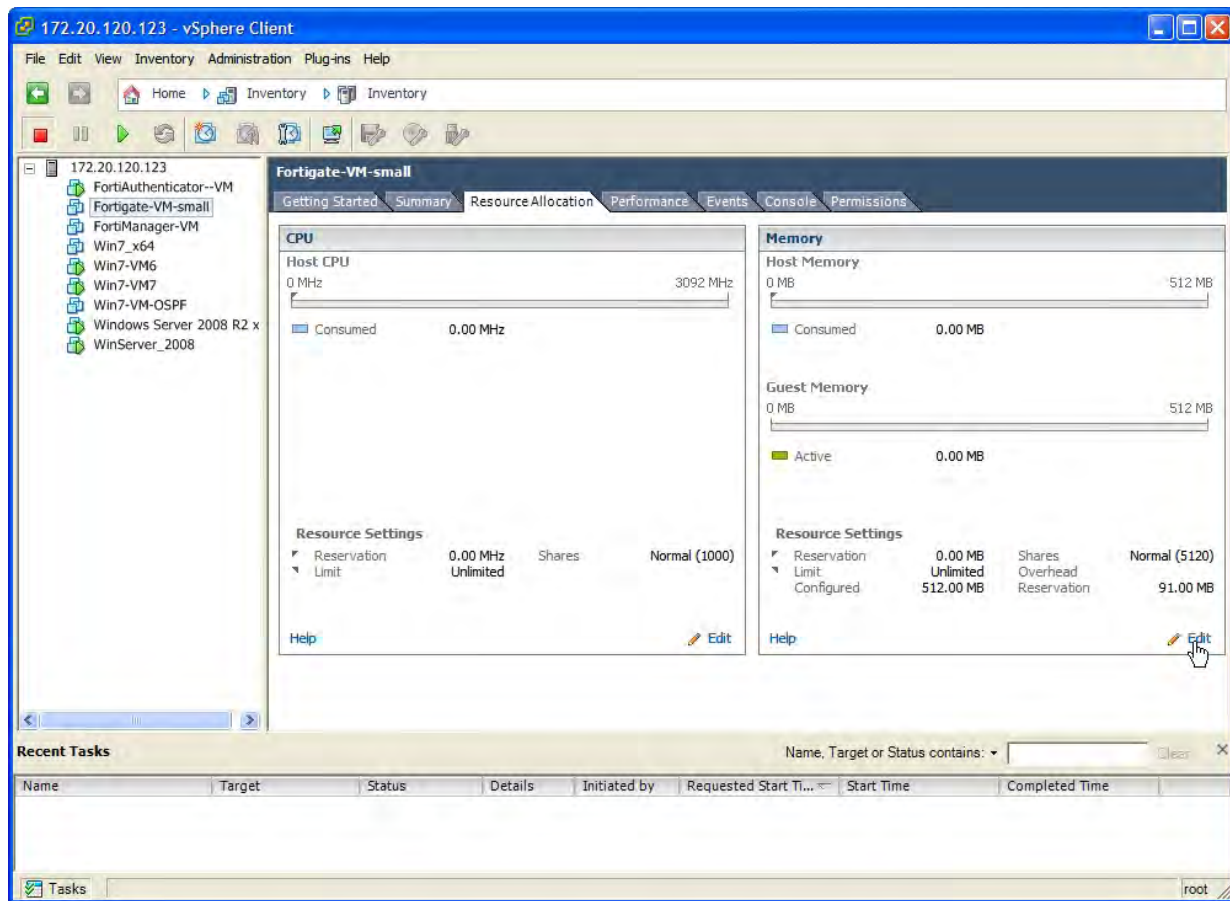

- Map the networks used in this OVF template to networks in your inventory. Network 1 maps to port1 of the FortiGate VM. You must set the destination network for this entry to access the device console. Select **Next** to continue.

The OVF Template **Ready to Complete** page opens.

- Review the template configuration. Make sure that **Power on after deployment** is not enabled. You might need to configure the FortiGate VM hardware settings prior to powering on the FortiGate VM.
- Select **Finish** to deploy the OVF template. You will receive a **Deployment Completed Successfully** dialog box once the FortiGate VM OVF template wizard has finished.

## Configure FortiGate VM hardware settings

Before powering on your FortiGate VM you must configure the virtual memory, virtual CPU, and virtual disk configuration to match your FortiGate VM license.

## Transparent mode VMware configuration

If you want to use your FortiGate-VM in transparent mode, your VMware server's virtual switches must operate in promiscuous mode. This permits these interfaces to receive traffic that will pass through the FortiGate unit but was not addressed to the FortiGate unit.

In VMware, promiscuous mode must be explicitly enabled:

1. In the vSphere client, select your VMware server in the left pane and then select the **Configuration** tab in the right pane.
2. In **Hardware**, select **Networking**.
3. Select **Properties** of vSwitch0.
4. In the **Properties** window left pane, select **vSwitch** and then select **Edit**.
5. Select the **Security** tab, set **Promiscuous Mode** to **Accept**, then select **OK**.
6. Select **Close**.
7. Repeat steps 3 through 6 for other vSwitches that your transparent mode FortiGate-VM uses.

## High Availability VMware configuration

If you want to combine two or more FortiGate-VM instances into a FortiGate Clustering Protocol (FGCP) High Availability (HA) cluster the VMware server's virtual switches used to connect the heartbeat interfaces must operate in promiscuous mode. This permits HA heartbeat communication between the heartbeat interfaces. HA

heartbeat packets are non-TCP packets that use Ethertype values 0x8890, 0x8891, and 0x8890. The FGCP uses link-local IPv4 addresses in the 169.254.0.x range for HA heartbeat interface IP addresses.

To enable promiscuous mode in VMware:

1. In the vSphere client, select your VMware server in the left pane and then select the **Configuration** tab in the right pane.
2. In **Hardware**, select **Networking**.
3. Select **Properties** of a virtual switch used to connect heartbeat interfaces.
4. In the **Properties** window left pane, select **vSwitch** and then select **Edit**.
5. Select the **Security** tab, set **Promiscuous Mode** to **Accept**, then select **OK**.
6. Select **Close**.

You must also set the virtual switches connected to other FortiGate interfaces to allow MAC address changes and to accept forged transmits. This is required because the FGCP sets virtual MAC addresses for all FortiGate interfaces and the same interfaces on the different VM instances in the cluster will have the same virtual MAC addresses.

To make the required changes in VMware:

1. In the vSphere client, select your VMware server in the left pane and then select the **Configuration** tab in the right pane.
2. In **Hardware**, select **Networking**.
3. Select **Properties** of a virtual switch used to connect FortiGate VM interfaces.
4. Set **MAC Address Changes** to **Accept**.
5. Set **Forged Transmits** to **Accept**.

## Power on your FortiGate VM

You can now proceed to power on your FortiGate VM. There are several ways to do this:

- Select the name of the FortiGate VM you deployed in the inventory list and select **Power on the virtual machine** in the **Getting Started** tab.
- In the inventory list, right-click the name of the FortiGate VM you deployed, and select **Power > Power On**.
- Select the name of the FortiGate VM you deployed in the inventory list. Click the **Power On** button on the toolbar.

Select the Console tab to view the console. To enter text, you must click in the console pane. The mouse is then captured and cannot leave the console screen. As the FortiGate console is text-only, no mouse pointer is visible. To release the mouse, press Ctrl-Alt.

## Deployment example – MS Hyper-V

Once you have downloaded the FGT\_VMxx\_HV-v5-build0xxx-FORTINET.out.hyperv.zip file and extracted the package contents to a folder on your Microsoft server, you can deploy the VHD package to your Microsoft Hyper-V environment.

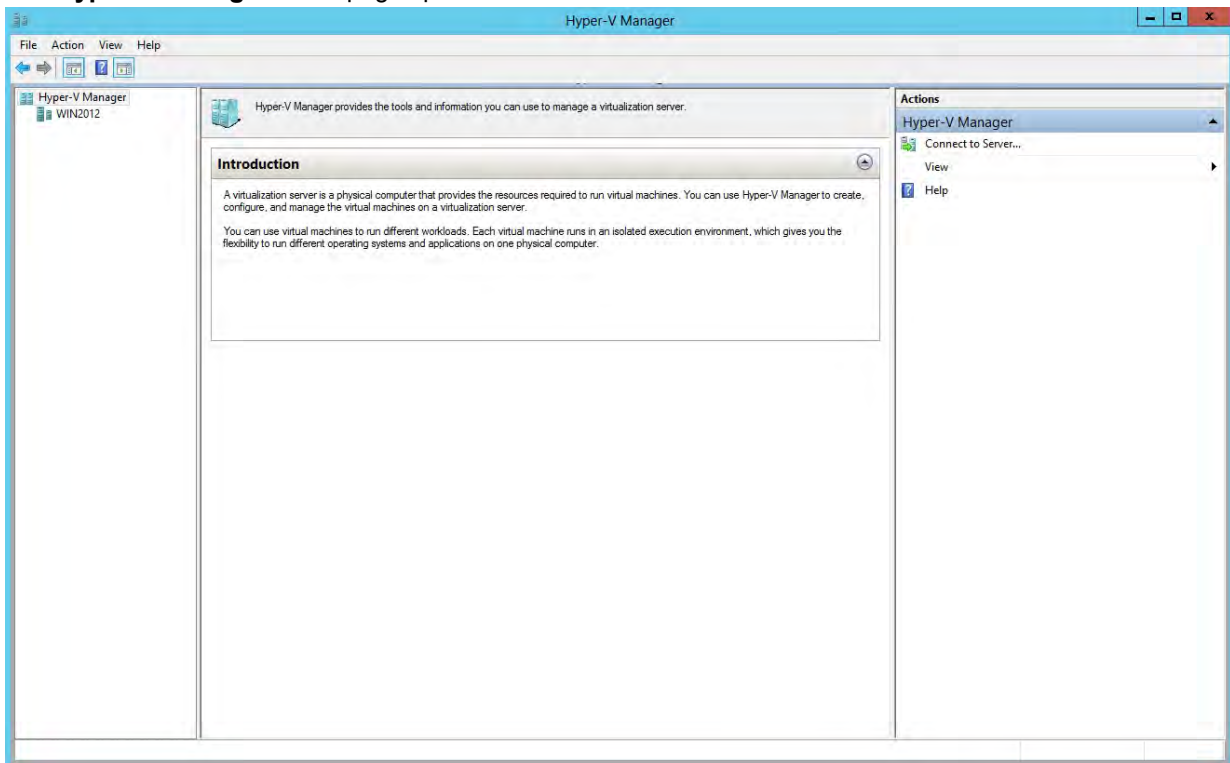

The following topics are included in this section:

### Create the FortiGate VM virtual machine

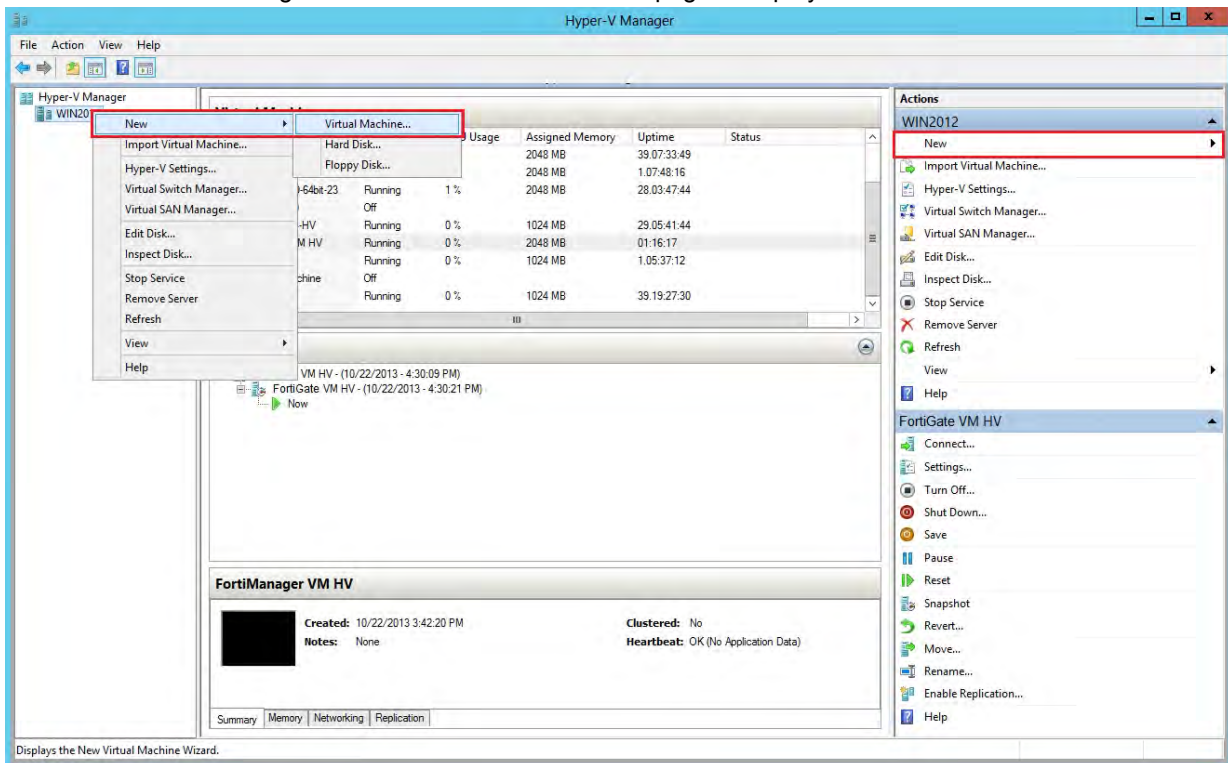

**To create the FortiGate VM virtual machine:**

1. Launch the Hyper-V Manager in your Microsoft server.

The **Hyper-V Manager** home page opens.

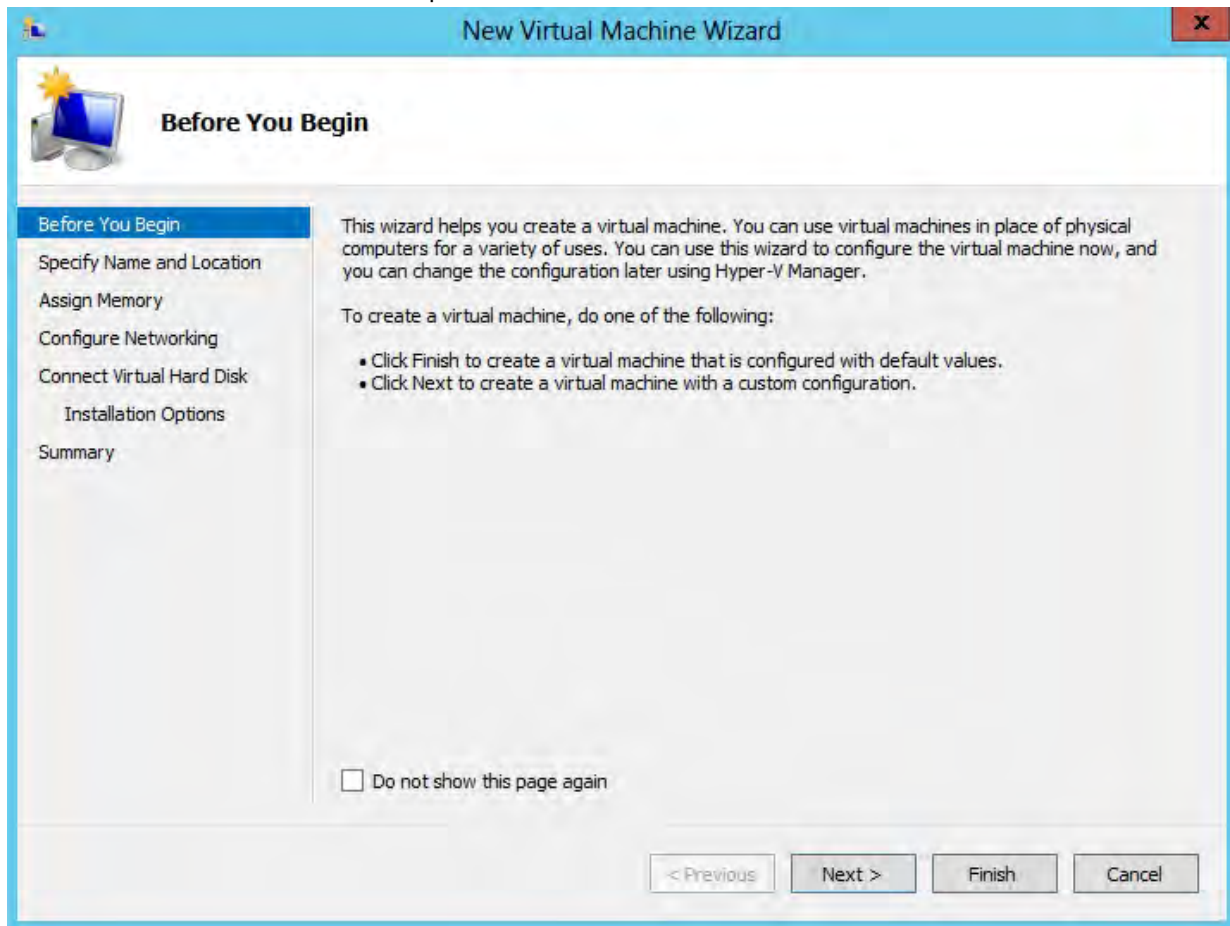

2. Select the server in the right-tree menu. The server details page is displayed.

3. Right-click the server and select **New** and select **Virtual Machine** from the menu. Optionally, in the **Actions** menu, select **New** and select **Virtual Machine** from the menu.

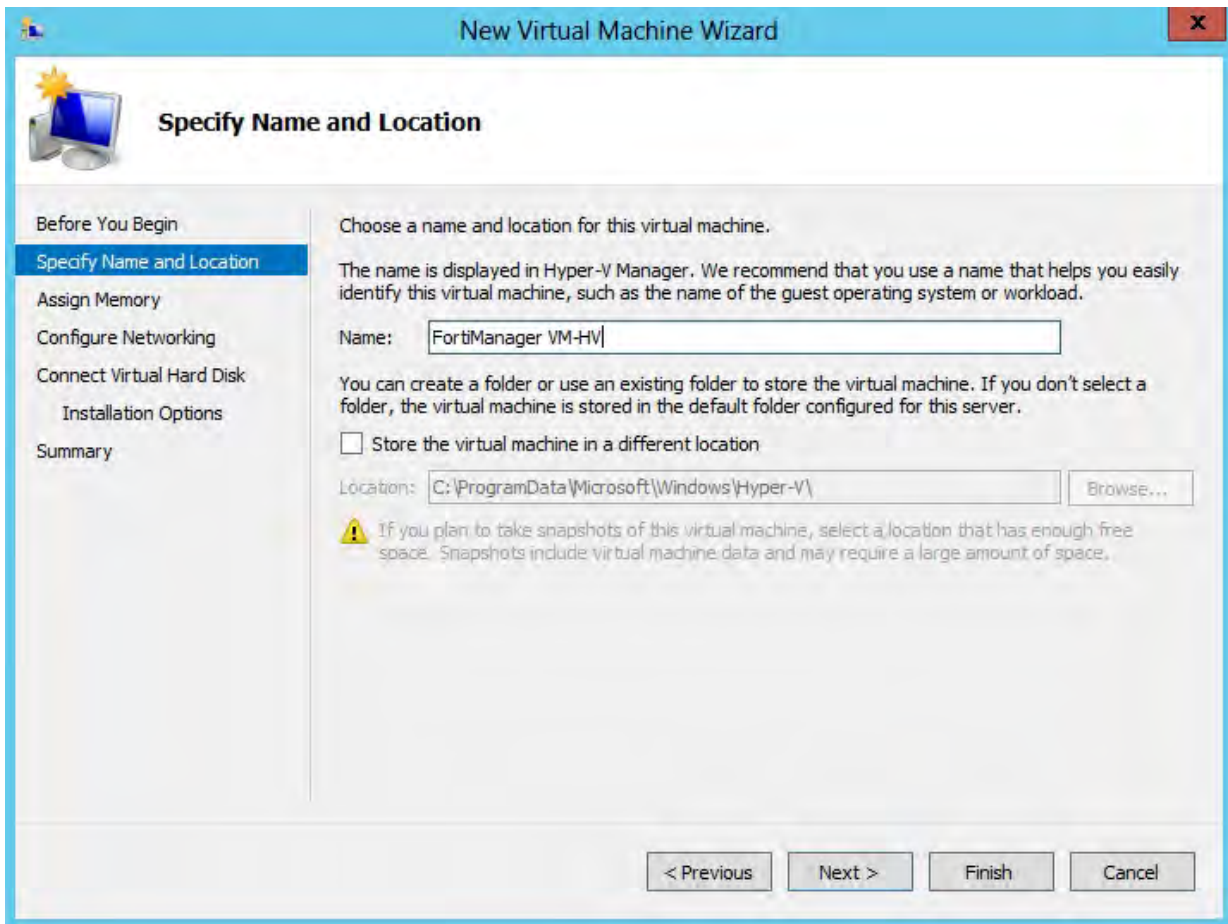

The **New Virtual Machine Wizard** opens.

4. Select **Next** to create a virtual machine with a custom configuration.

The **Specify Name and Location** page is displayed.

5. Enter a name for this virtual machine. The name is displayed in the Hyper-V Manager.

Select **Next** to continue. The **Assign Memory** page is displayed.

**New Virtual Machine Wizard**

**Assign Memory**

Before You Begin  
Specify Name and Location  
**Assign Memory**  
Configure Networking  
Connect Virtual Hard Disk  
Installation Options  
Summary

Specify the amount of memory to allocate to this virtual machine. You can specify an amount from 8 MB through 14100 MB. To improve performance, specify more than the minimum amount recommended for the operating system.

Startup memory:  MB

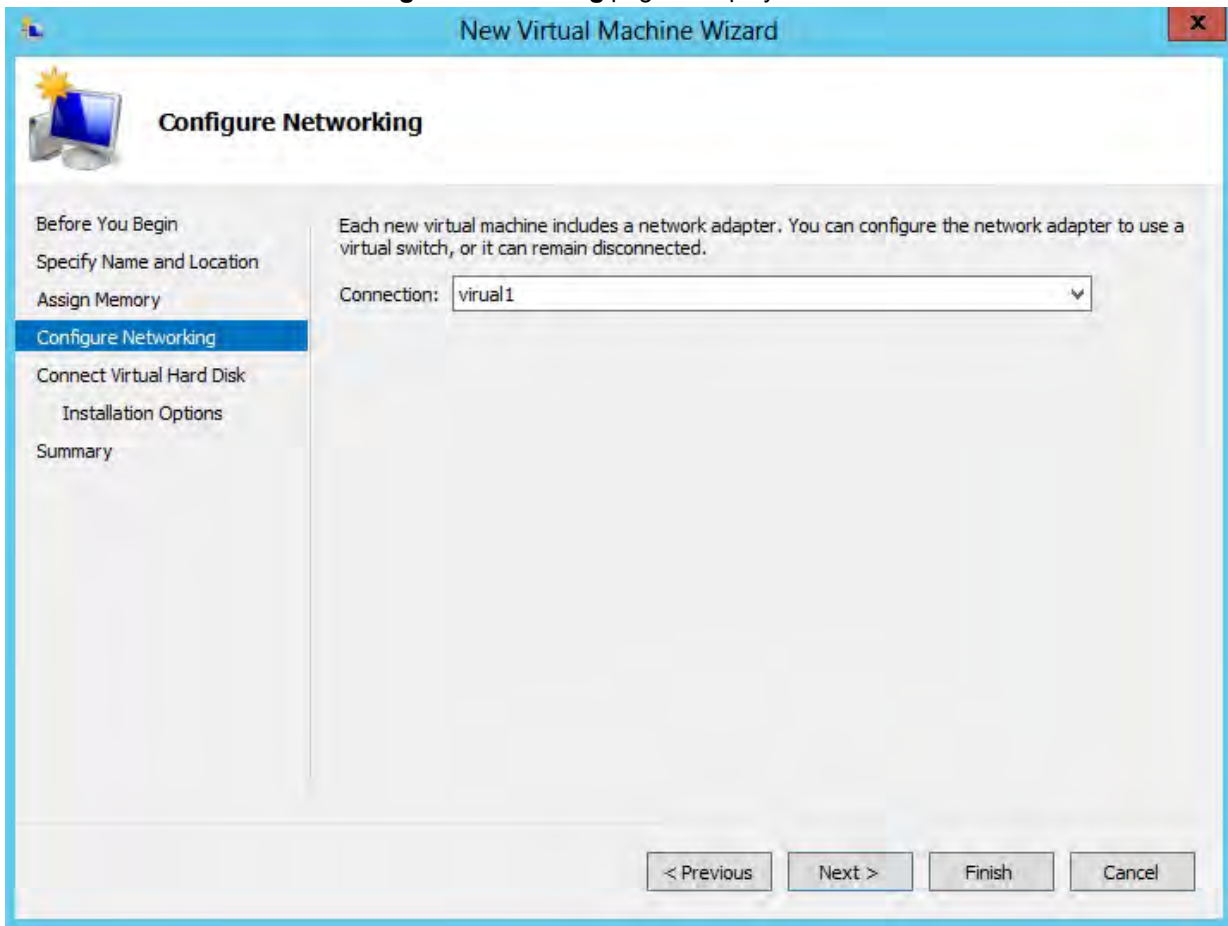

☐ Use Dynamic Memory for this virtual machine.

**i** When you decide how much memory to assign to a virtual machine, consider how you intend to use the virtual machine and the operating system that it will run.

< Previous   Next >   Finish   Cancel

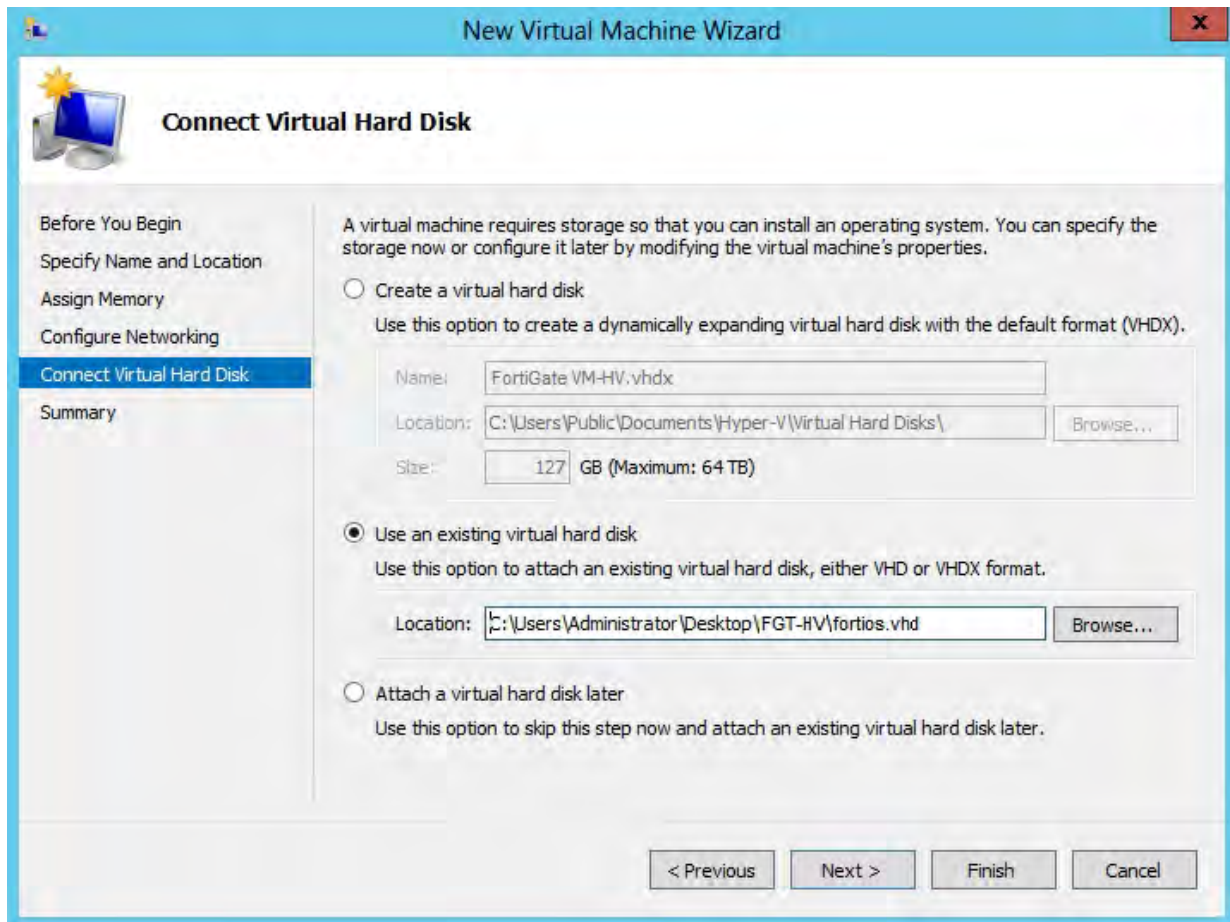

6. Specify the amount of memory to allocate to this virtual machine. The default memory for FortiGate VM is 1GB (1024MB).

Select **Next** to continue. The **Configure Networking** page is displayed.

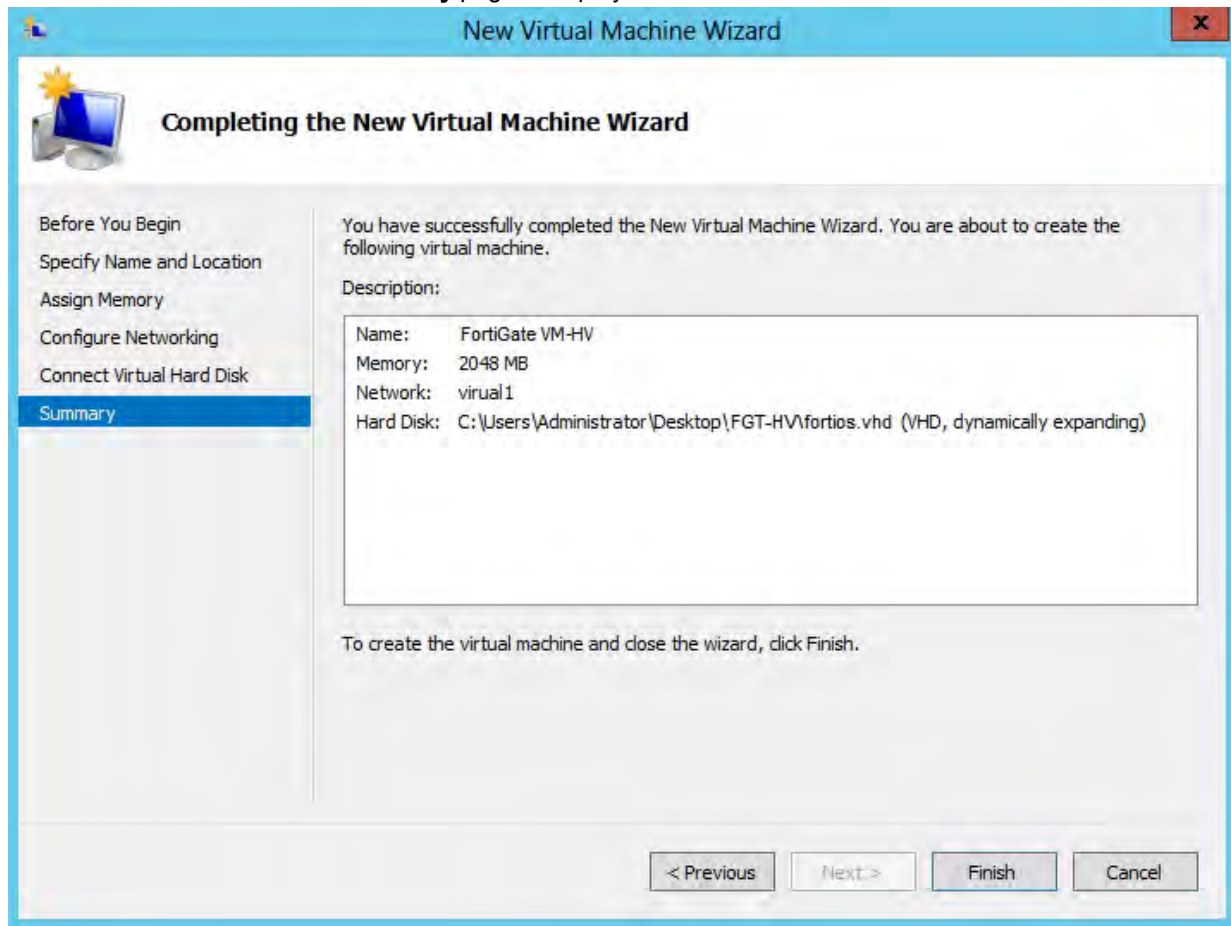

7. Each new virtual machine includes a network adapter. You can configure the network adapter to use a virtual switch, or it can remain disconnected. FortiGate VM requires four network adapters. You must configure network adapters in the **Settings** page.

Select **Next** to continue. The **Connect Virtual Hard Disk** page is displayed.

8. Select to use an existing virtual hard disk and browse for the `fortios.vhd` file that you downloaded from the [Fortinet Customer Service & Support](#) portal.

Select **Next** to continue. The **Summary** page is displayed.

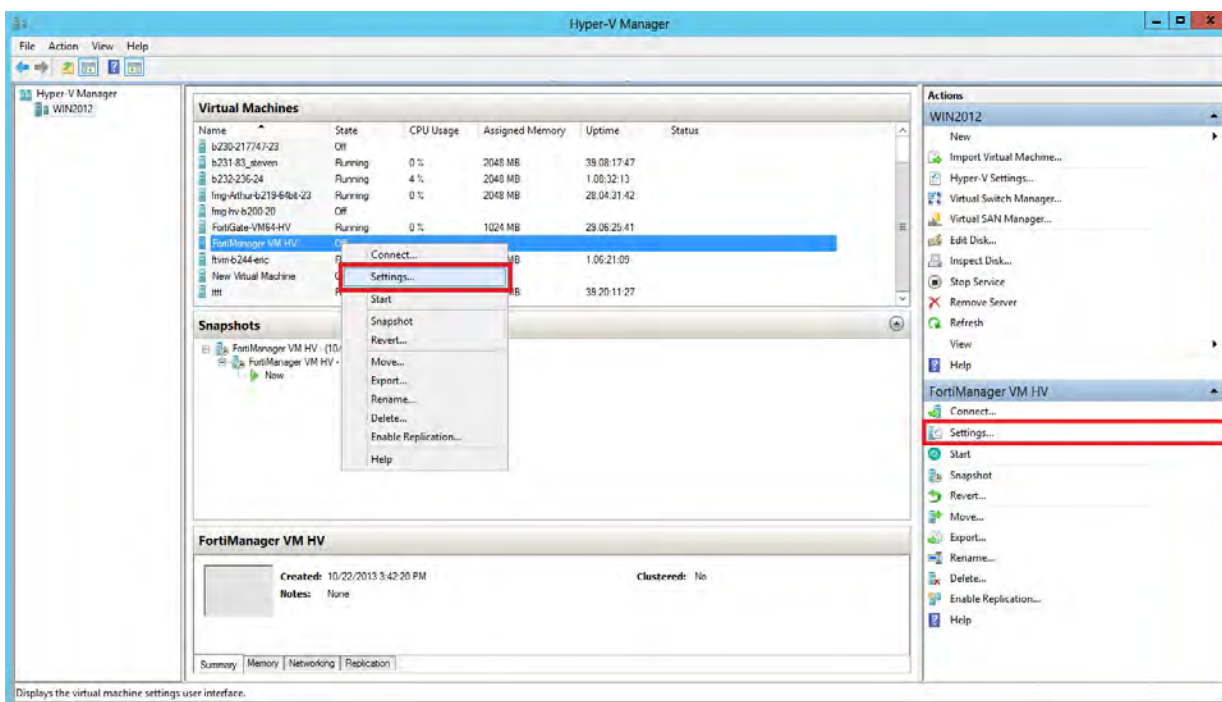

9. To create the virtual machine and close the wizard, select **Finish**.

## Configure FortiGate VM hardware settings

Before powering on your FortiGate VM you must configure the virtual memory, virtual CPU, and virtual disk configuration to match your FortiGate VM license.

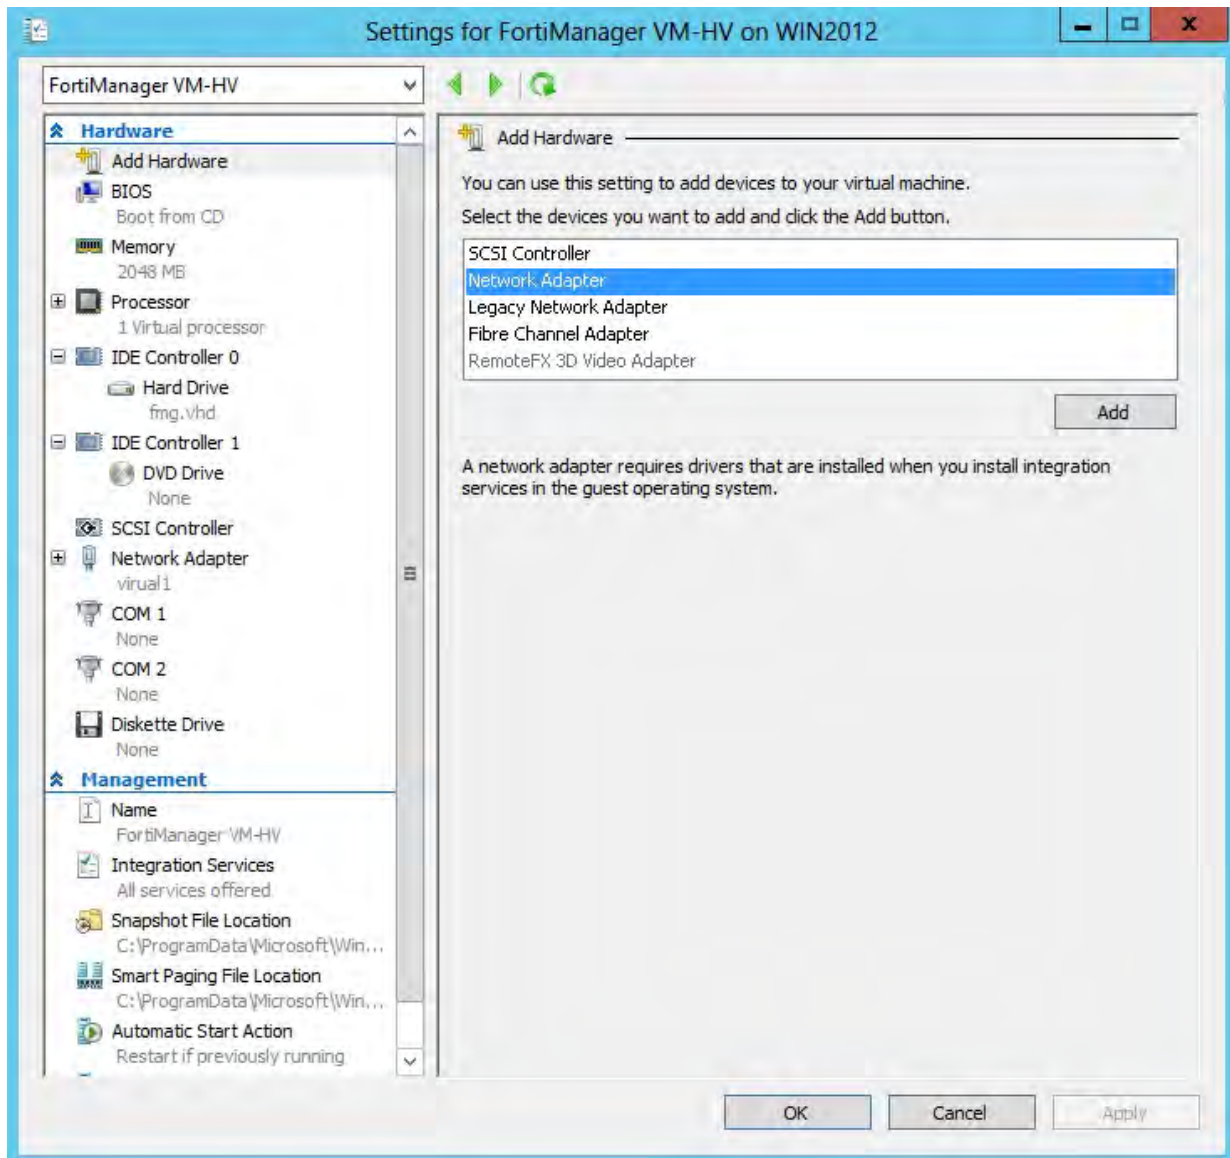

### To configure settings for FortiGate VM on the server:

1. In the Hyper-V Manager, locate the name of the virtual machine, right-click the entry, and select **Settings** from the menu. Optionally, you can select the virtual machine and select **Settings** in the **Actions** menu.

The **Settings** page is displayed.

2. Configure virtual processors, network adapters, and virtual hard drive settings.
3. Select **Apply** to save the settings and then select **OK** to close the settings page.

### FortiGate VM virtual processors

You must configure FortiGate VM virtual processors in the server settings page. The number of processors is dependent on your server environment.

#### Configure FortiGate VM virtual processors:

1. In the **Settings** page, select **Processor** from the **Hardware** menu.

The **Processor** page is displayed.

**Processor**

You can modify the number of virtual processors based on the number of processors on the physical computer. You can also modify other resource control settings.

Number of virtual processors:

**Resource control**

You can use resource controls to balance resources among virtual machines.

Virtual machine reserve (percentage):

Percent of total system resources:

Virtual machine limit (percentage):

Percent of total system resources:

Relative weight:

2. Configure the number of virtual processors for the FortiGate VM virtual machine. Optionally, you can use resource controls to balance resources among virtual machines.
3. Select **Apply** to save the settings.

### FortiGate VM network adapters

You must configure FortiGate VM network adapters in the server settings page. FortiGate VM supports four network adapters.

#### Configure FortiGate VM network adapters:

1. In the **Settings** page, select **Add Hardware** from the **Hardware** menu, select **Network Adapter** in the device list, and select the **Add** button.

The **Network Adapter** page is displayed.

The screenshot shows the 'Network Adapter' configuration page. At the top, it says 'Specify the configuration of the network adapter or remove the network adapter.' Below this, there's a 'Virtual switch:' dropdown menu with 'Broadcom NetXtreme Gigabit Ethernet - Virtual Switch' selected. Under 'VLAN ID', there's a checkbox for 'Enable virtual LAN identification' which is unchecked. Below that, a text box contains the value '2'. The 'Bandwidth Management' section has a checkbox for 'Enable bandwidth management' which is also unchecked. Below this, there are two rows for 'Minimum bandwidth:' and 'Maximum bandwidth:', each with a text box containing '0' and 'Mbps' next to it. A note at the bottom of this section says 'To leave the minimum or maximum unrestricted, specify 0 as the value.' At the bottom of the page, there's a 'Remove' button and a note: 'To remove the network adapter from this virtual machine, click Remove.' A final note at the very bottom says 'Use a legacy network adapter instead of this network adapter to perform a network-based installation of the guest operating system or when integration services are not installed in the guest operating system.'

1. You must manually configure four network adapters for FortiGate VM in the settings page. For each network adapter, select the virtual switch from the drop-down list.
2. Select **Apply** to save the settings.

### FortiGate VM virtual hard disk

You must configure the FortiGate VM virtual hard disk in the server settings page.

If you know your environment will expand in the future, it is recommended to increase the hard disk size beyond 30GB. The VM license limit is 2TB.

#### Configure a FortiGate VM virtual hard drive:

1. In the **Settings** page, select **IDE Controller 0 > Hard Drive** from the **Hardware** menu.

The **Hard Drive** page is displayed.

 **Hard Drive**

You can change how this virtual hard disk is attached to the virtual machine. If an operating system is installed on this disk, changing the attachment might prevent the virtual machine from starting.

Controller:  Location:

**Media**

You can compact or convert a virtual hard disk by editing the associated file. Specify the full path to the file.

☒ Virtual hard disk:

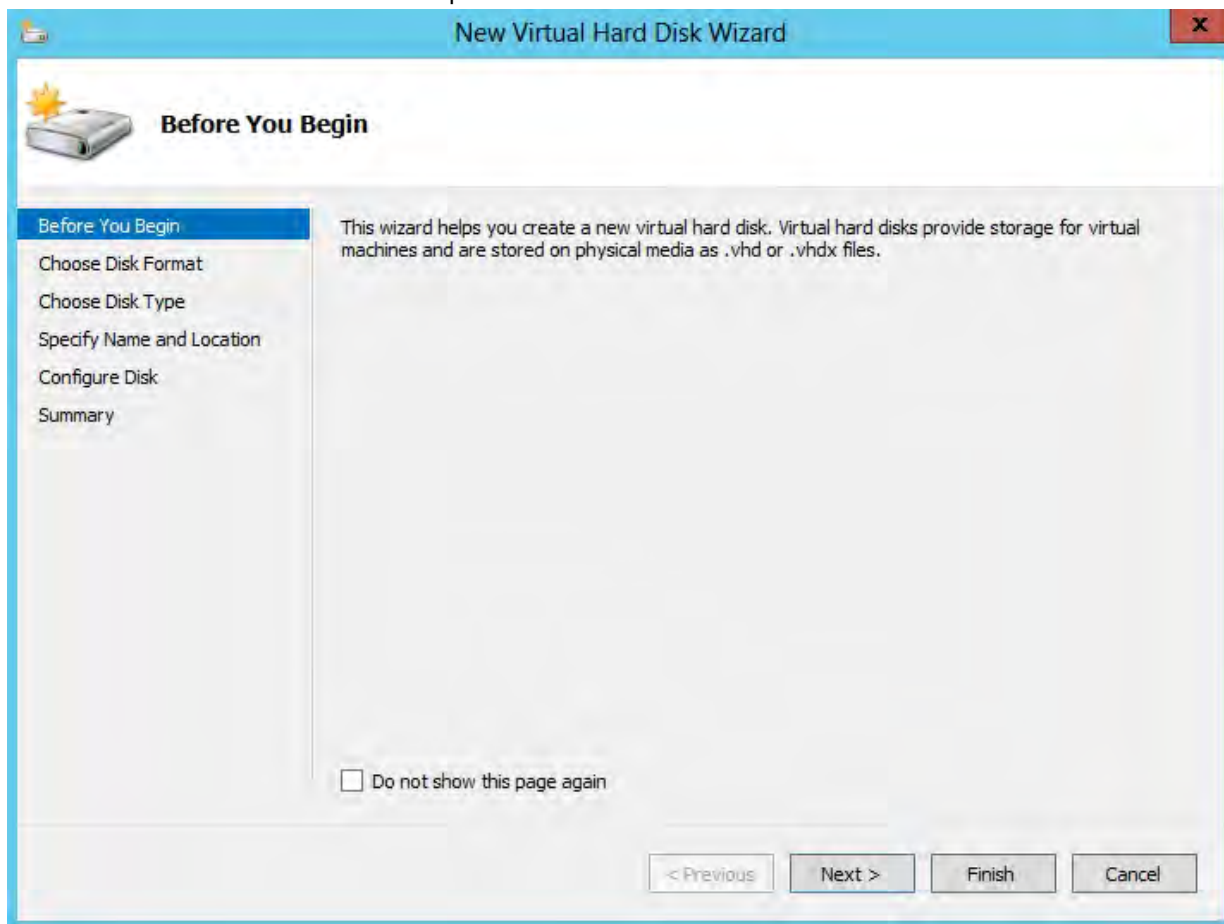

☐ Physical hard disk:

 If the physical hard disk you want to use is not listed, make sure that the disk is offline. Use Disk Management on the physical computer to manage physical hard disks.

To remove the virtual hard disk, click Remove. This disconnects the disk but does not delete the associated file.

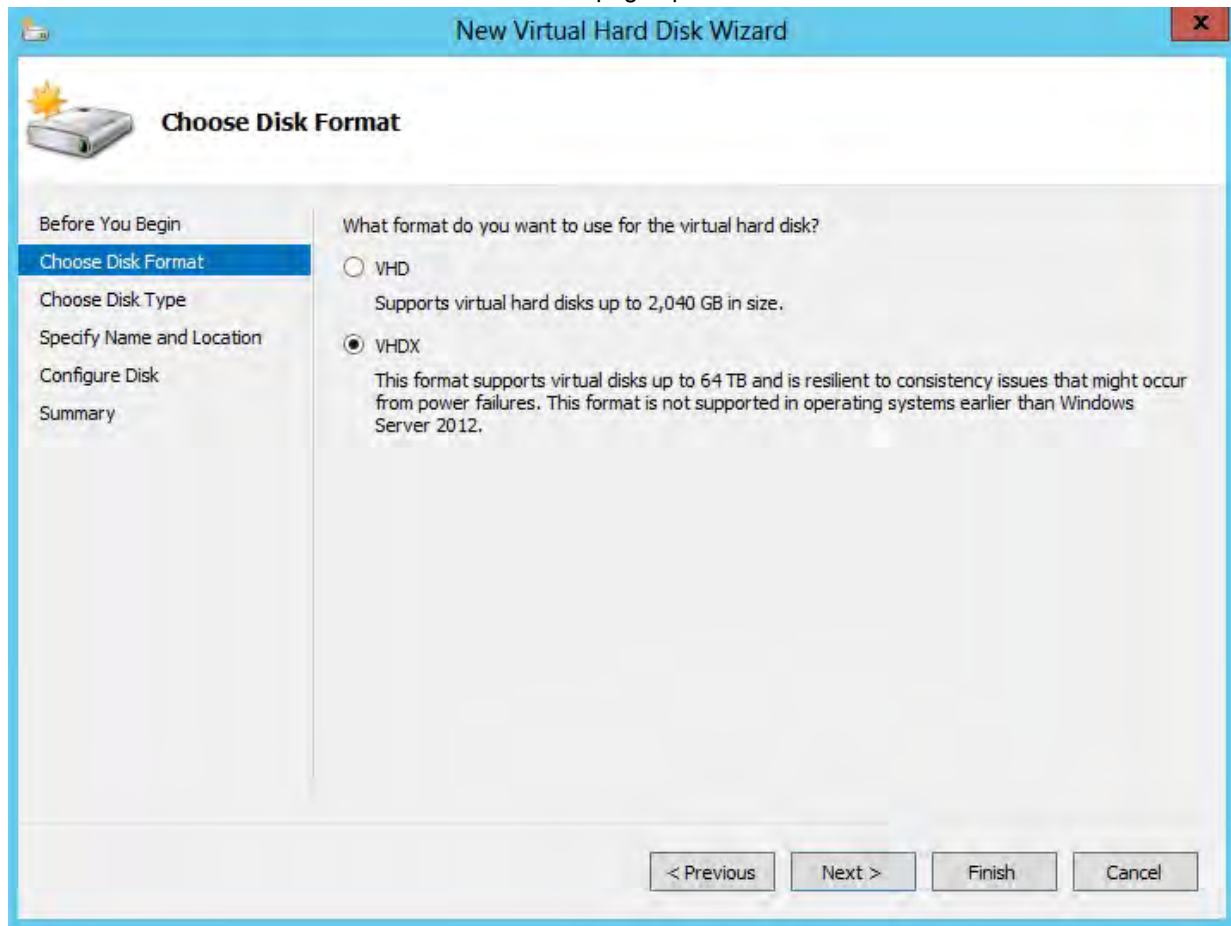

2. Select **New** to create a new virtual hard disk.

The **New Virtual Hard Disk Wizard** opens.

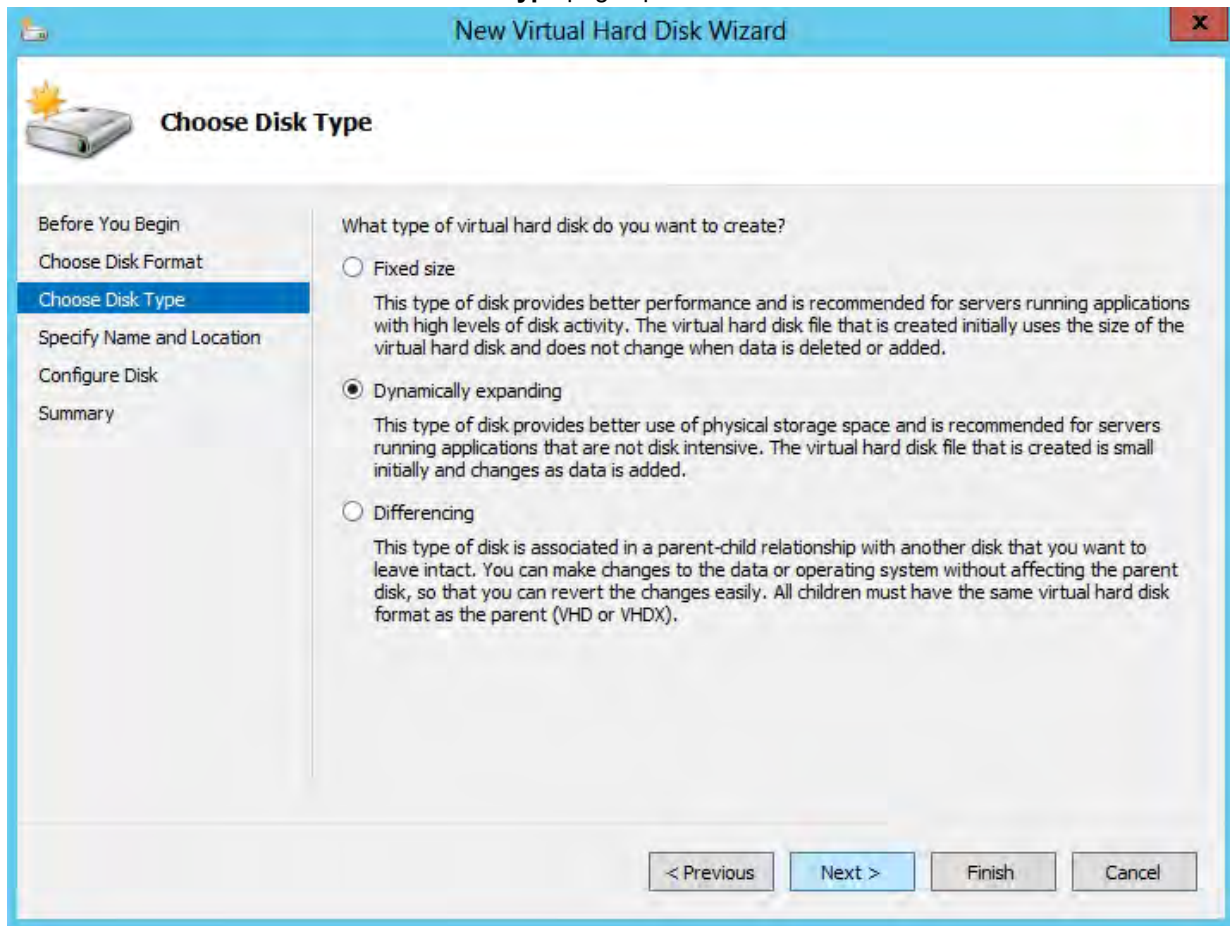

3. This wizard helps you to create a new virtual hard disk.

Select **Next** to continue. The **Choose Disk Format** page opens.

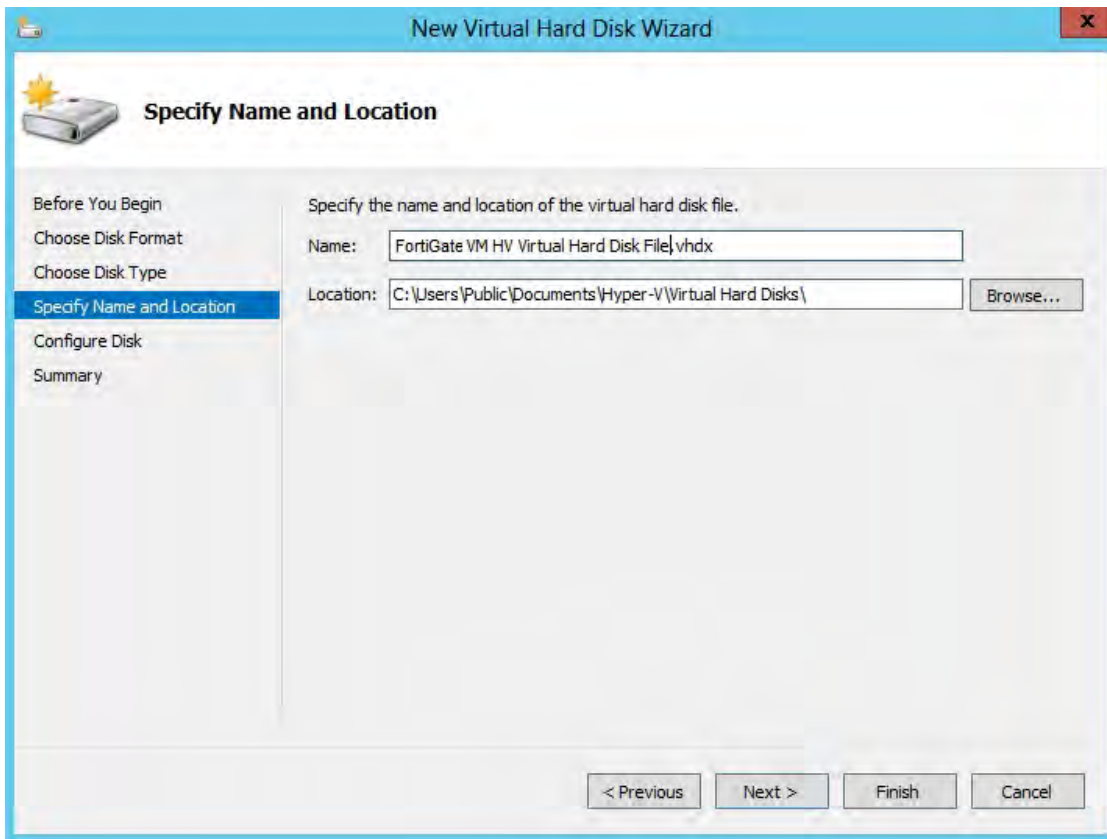

4. Select to use VHDX format virtual hard disks. This format supports virtual disks up to 64TB and is resilient to consistency issues that might occur from power failures. This format is not supported in operating systems earlier than Windows Server 2012. Note that FortiGate-VM does not support hard disks larger than 2TB.

Select **Next** to continue. The **Choose Disk Type** page opens.

5. Select the type of virtual disk you want to use. Select one of the following disk types:
- **Fixed size:** This type of disk provides better performance and is recommended for servers running applications with high levels of disk activity. The virtual hard disk file that is created initially uses the size of the virtual hard disk and does not change when data is deleted or added.
  - **Dynamic expanding:** This type of disk provides better use of physical storage space and is recommended for servers running applications that are not disk intensive. The virtual disk file that is created is small initially and changes as data is added.
  - **Differencing:** This type of disk is associated in a parent-child relationship with another disk that you want to leave intact. You can make changes to the data or operating system without affecting the parent disk, so that you can revert the changes easily. All children must have the same virtual hard disk format as the parent (VHD or VHDX).

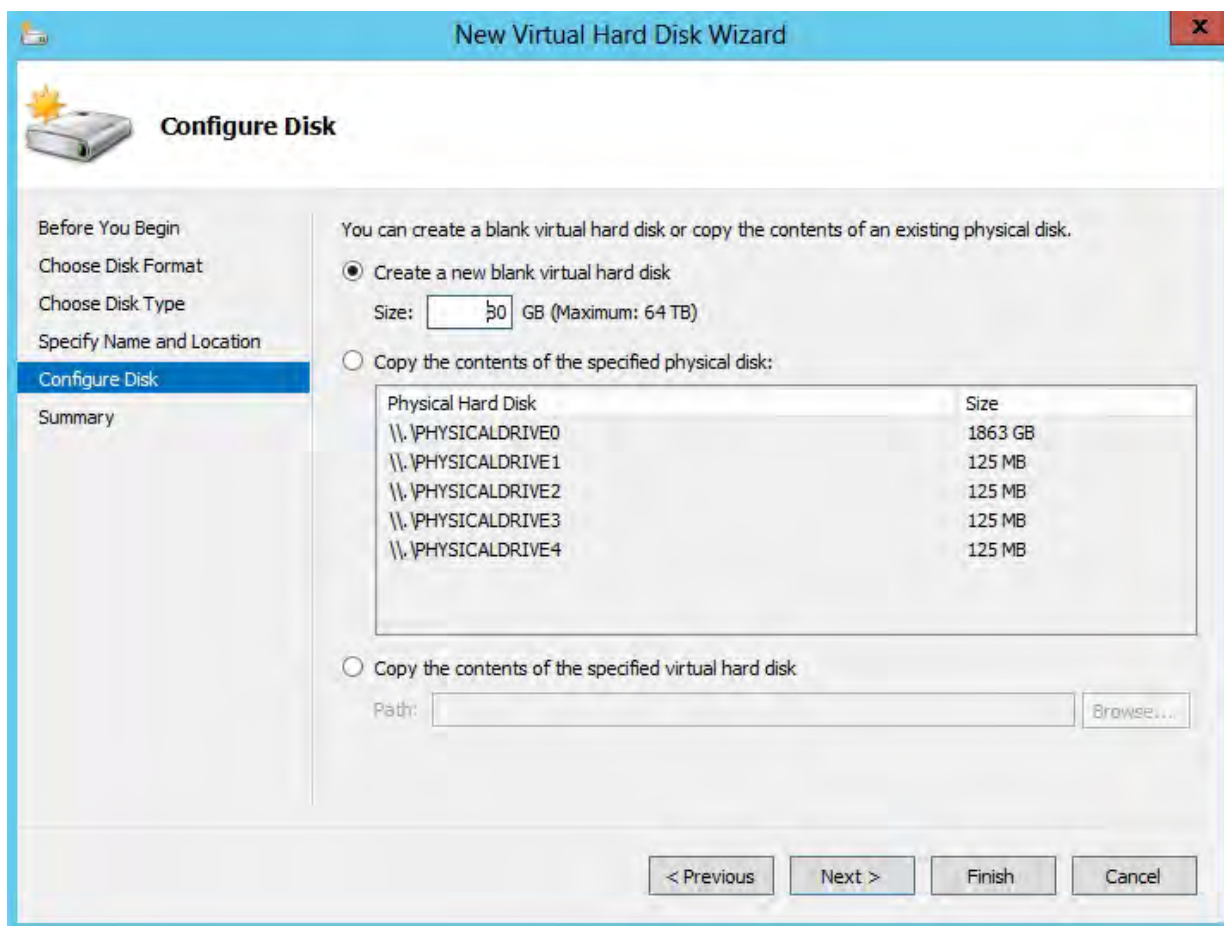

Select **Next** to continue. The **Specify Name and Location** page opens.

6. Specify the name and location of the virtual hard disk file. Use the **Browse** button to select a specific file folder on your server.

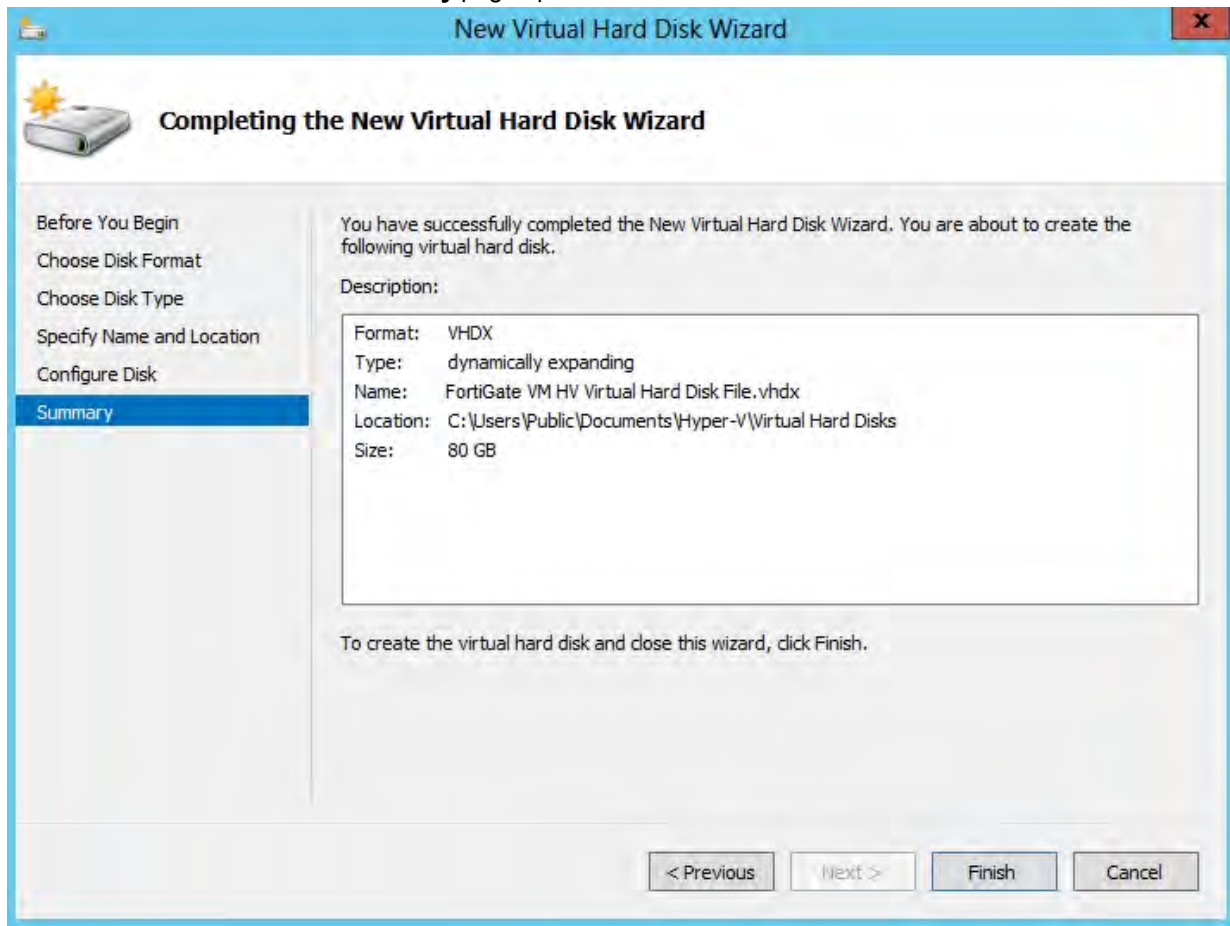

Select **Next** to continue. The **Configure Disk** page opens.

7. Select to **Create a new blank virtual hard disk** and enter the size of the disk in GB. The maximum size is dependent on your server environment.

Select **Next** to continue. The **Summary** page opens.

8. The summary page provides details of the virtual hard disk. Select **Finish** to create the virtual hard disk.
9. Select **Apply** to save the settings and select **OK** to exit the settings page.

## High Availability Hyper-V configuration

Promiscuous mode and support for MAC address spoofing is required for FortiGate-VM for Hyper-V to support FortiGate Clustering Protocol (FGCP) high availability (HA). By default the FortiGate-VM for Hyper-V has promiscuous mode enabled in the XML configuration file in the FortiGate-VM Hyper-V image. If you have problems with HA mode, confirm that this is still enabled.

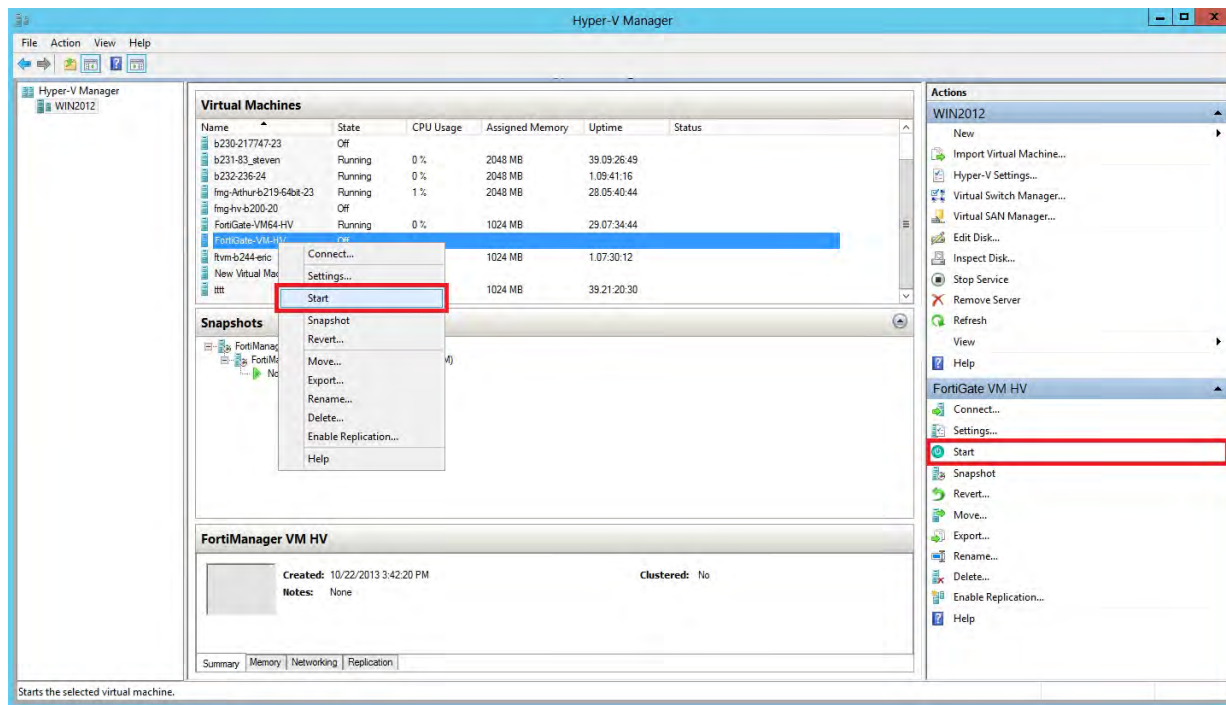

In addition, because the FGCP applies virtual MAC addresses to FortiGate data interfaces and because these virtual MAC addresses mean that matching interfaces of different FortiGate-VM instances will have the same virtual MAC addresses you have to configure Hyper-V to allow MAC spoofing. But you should only enable MAC spoofing for FortiGate-VM data interfaces. You should not enable MAC spoofing for FortiGate HA heartbeat interfaces.

With promiscuous mode enabled and the correct MAC spoofing settings you should be able to configure HA between two or more FortiGate-VM for Hyper-V instances.

## Start the FortiGate VM

You can now proceed to power on your FortiGate VM. Select the name of the FortiGate VM in the list of virtual machines, right-click, and select **Start** in the menu. Optionally, you can select the name of the FortiGate VM in the list of virtual machines and select **Start** in the **Actions** menu.

## Deployment example – KVM

Once you have downloaded the FORTINET.out.kvm.zip file and extracted virtual hard drive image file fortios.qcow2, you can create the virtual machine in your KVM environment.

The following topics are included in this section:

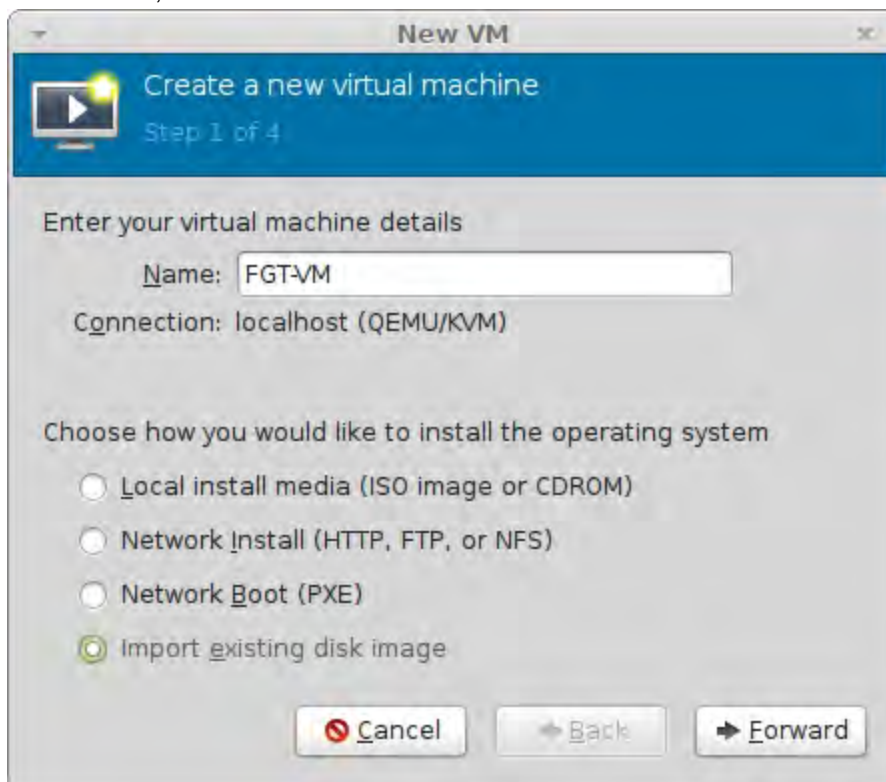

### Create the FortiGate VM virtual machine

**To create the FortiGate VM virtual machine:**

1. Launch Virtual Machine Manager (virt-manager) on your KVM host server.

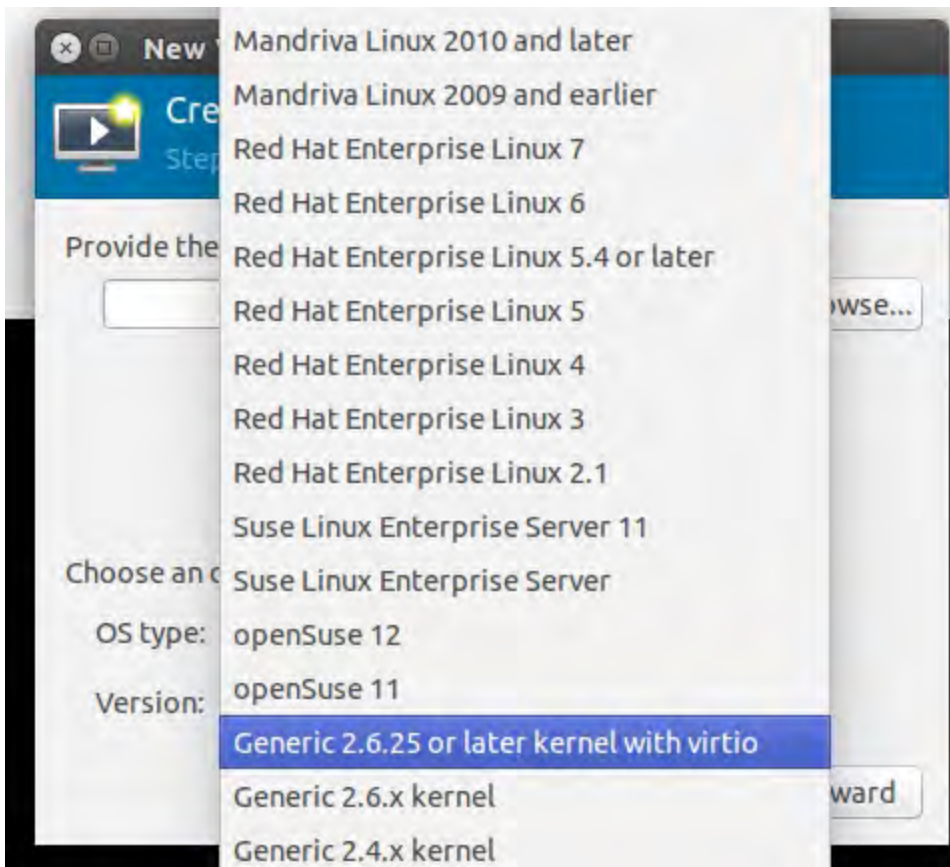

The **Virtual Machine Manager** home page opens.

2. In the toolbar, select **Create a new virtual machine**.

3. Enter a **Name** for the VM, FGT-VM for example.
4. Ensure that **Connection** is localhost. (This is the default.)
5. Select **Import existing disk image**.

6. Select **Forward**.

7. In **OS Type** select **Linux**.
8. In **Version**, select a Generic version with virtio.

9. Select **Browse**.

10. If you copied the fortios.qcow2 file to `/var/lib/libvirt/images`, it will be visible on the right. If you saved it somewhere else on your server, select **Browse Local** and find it.
11. Choose **Choose Volume**.
12. Select **Forward**.
13. Specify the amount of memory and number of CPUs to allocate to this virtual machine. The amounts must not exceed your license limits. See [Virtual FortiOS Overview on page 3411](#).
14. Select **Forward**.
15. Expand **Advanced options**. A new virtual machine includes one network adapter by default. Select a network adapter on the host computer. Optionally, set a specific MAC address for the virtual network interface. Set **Virt Type** to **virtio** and **Architecture** to **qcow2**.
16. Select **Finish**.

## Configure FortiGate VM hardware settings

Before powering on your FortiGate VM you must add the log disk and configure the virtual hardware of your FortiGate VM.

### To configure settings for FortiGate VM on the server:

1. In the Virtual Machine Manager, locate the name of the virtual machine and then select **Open** from the toolbar.
2. Select **Add Hardware**. In the **Add Hardware** window select **Storage**.
3. Select **Create a disk image on the computer's harddrive** and set the size to 30GB.

If you know your environment will expand in the future, it is recommended to increase the hard disk size beyond 30GB. The VM license limit is 2TB.

4. Enter:

<b>Device type</b>	Virtio disk
<b>Cache mode</b>	Default
<b>Storage format</b>	raw

Even though raw is the storage format listed, the qcow2 format is also supported.

5. Select **Network** to configure add more the network interfaces. The **Device type** must be **Virtio**.

A new virtual machine includes one network adapter by default. You can add more through the Add Hardware window. FortiGate VM requires four network adapters. You can configure network adapters to connect to a virtual switch or to network adapters on the host computer.

6. Select **Finish**.

## Start the FortiGate VM

You can now proceed to power on your FortiGate VM. Select the name of the FortiGate VM in the list of virtual machines. In the toolbar, select **Console** and then select **Start**.

## Deployment example – OpenXen

Once you have downloaded the FORTINET.out.OpenXen.zip file and extracted virtual hard drive image file fortios.qcow2, you can create the virtual machine in your OpenXen environment.

The following topics are included in this section:

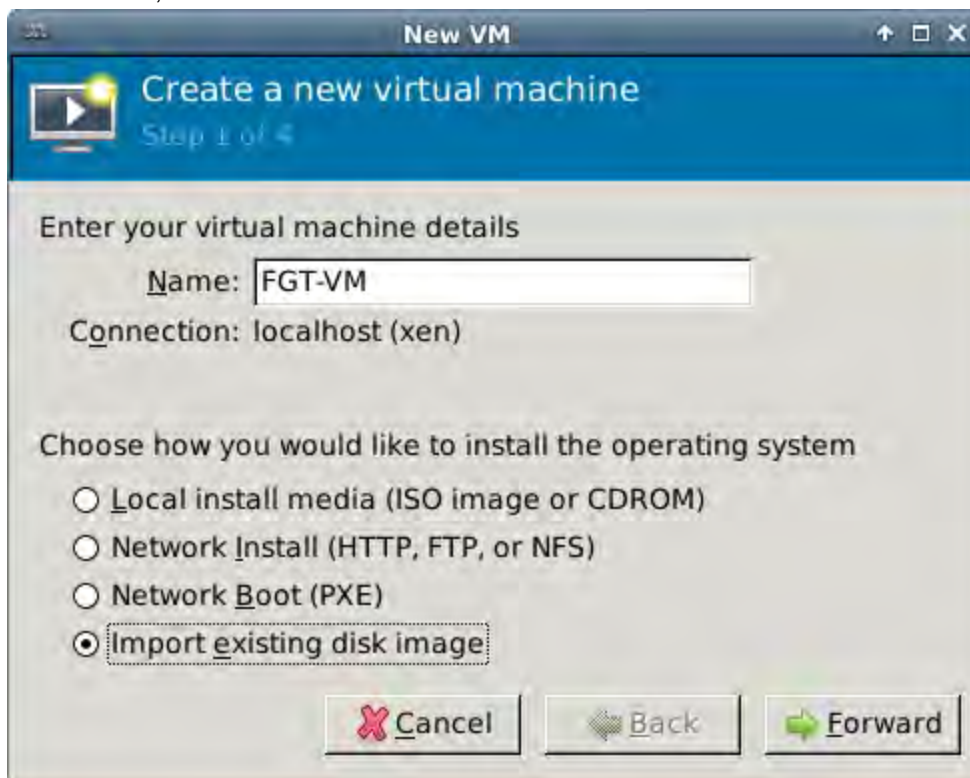

### Create the FortiGate VM virtual machine (VMM)

To create the FortiGate VM virtual machine:

1. Launch Virtual Machine Manager (virt-manager) on your OpenXen host server.

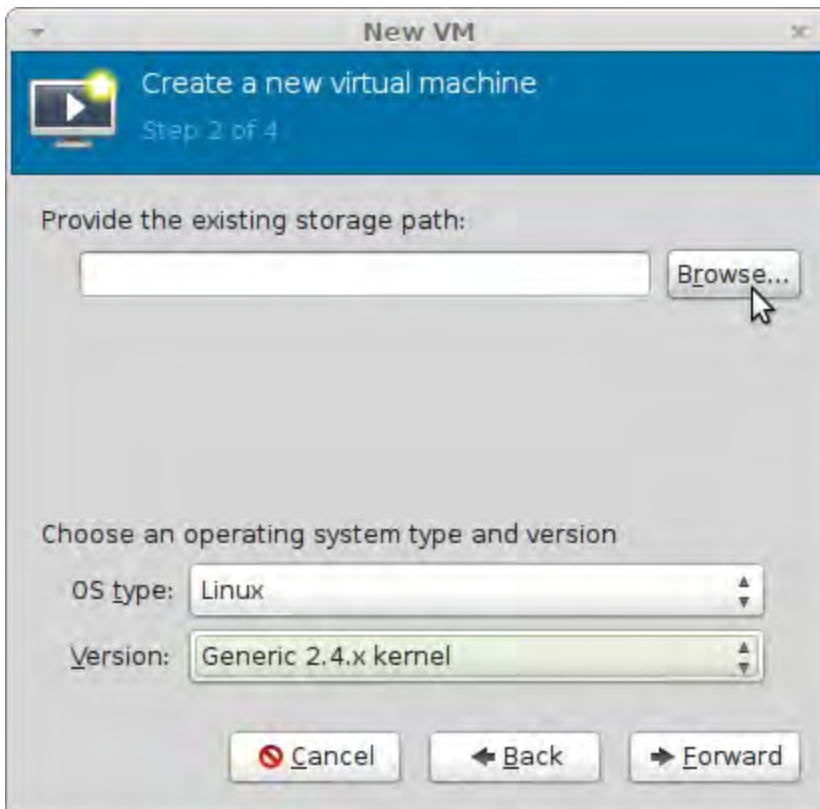

The **Virtual Machine Manager** home page opens.

2. In the toolbar, select **Create a new virtual machine**.

3. Enter a **Name** for the VM, FGT-VM for example.
4. Ensure that **Connection** is localhost. (This is the default.)
5. Select **Import existing disk image**.

6. Select **Forward**.

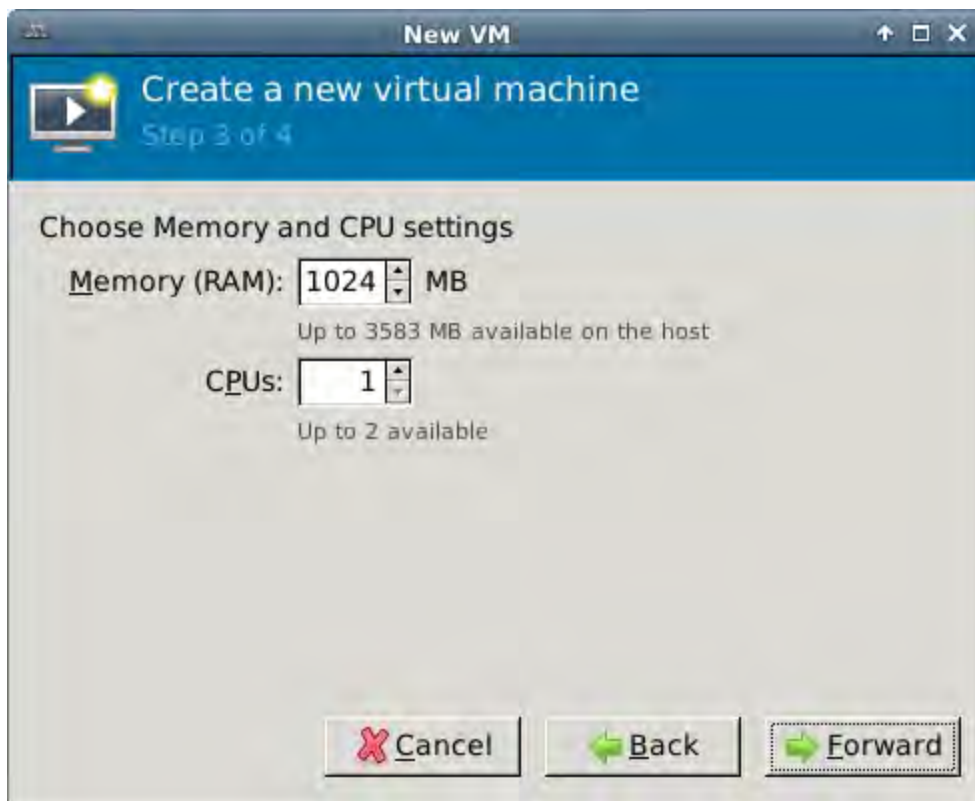

7. In **OS Type** select **Linux**.
8. In **Version**, select **Generic 2.4.x.kernel**.
9. Select **Browse**.

The **Locate or create storage volume** window opens.

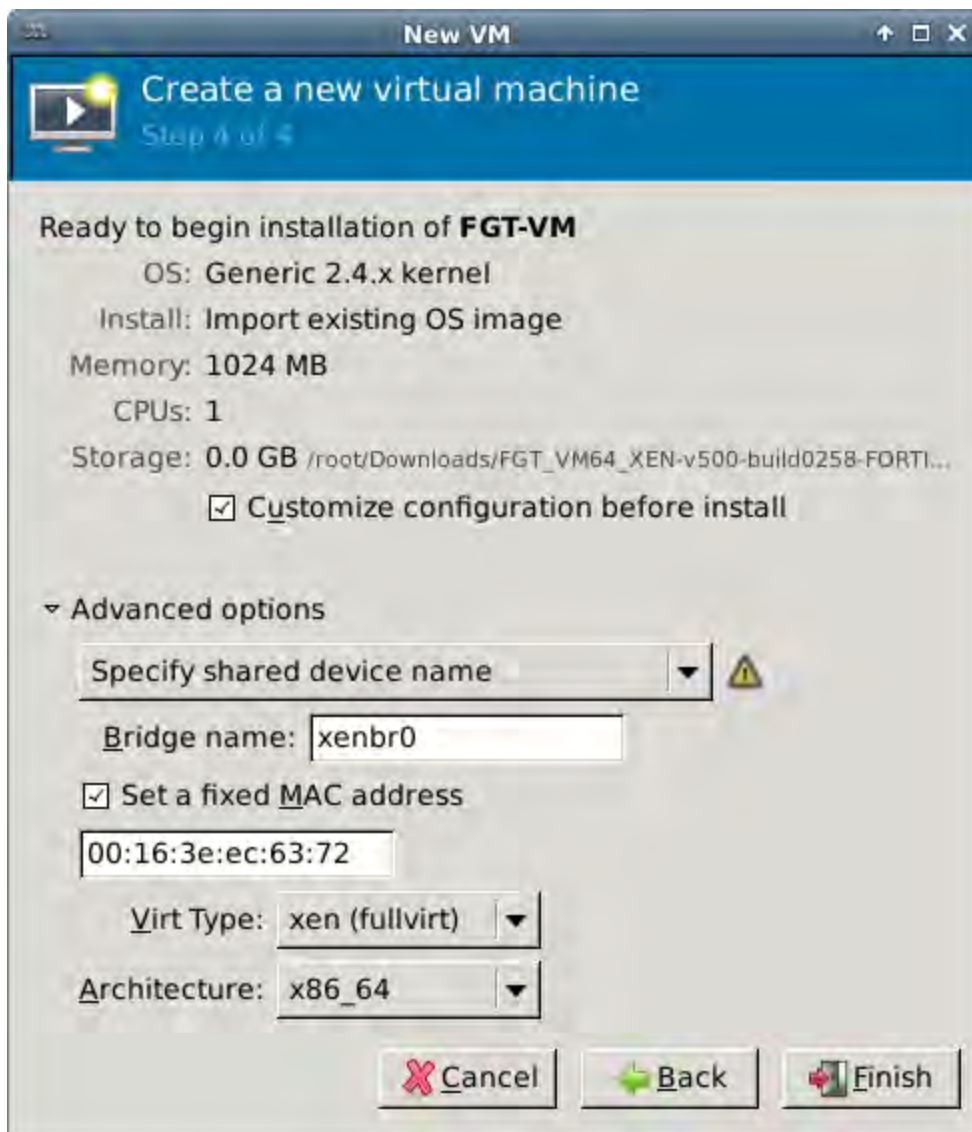

10. Select **Browse Local**, find the fortios.qcow2 disk image file.
11. Select fortios.qcow2 and select **Choose Volume**.

12. Select **Forward**.

13. Specify the amount of memory and number of CPUs to allocate to this virtual machine. The amounts must not exceed your license limits.

**14. Select Forward.**

- 15. Select **Customize configuration before install**.** This enables you to make some hardware configuration changes before VM creation is started.
- 16. Expand **Advanced options**.** A new virtual machine includes one network adapter by default. Select **Specify shared device name** and enter the name of the bridge interface on the OpenXen host. Optionally, set a specific MAC address for the virtual network interface. **Virt Type** and **Architecture** are set by default and should be correct.
- 17. Select **Finish**.**

The virtual machine hardware configuration window opens.

You can use this window to add hardware such as network interfaces and disk drives.

18. Select **Add Hardware**. In the **Add Hardware** window select **Storage**.
19. Select **Create a disk image on the computer's hddrive** and set the size to 30GB.

If you know your environment will expand in the future, it is recommended to increase the hard disk size beyond 30GB. The VM license limit is 2TB.

20. Enter:

<b>Device type</b>	Virtio disk
<b>Cache mode</b>	Default
<b>Storage format</b>	raw

21. Select **Network** to configure add more the network interfaces. The **Device type** must be **Virtio**.

A new virtual machine includes one network adapter by default. You can add more through the Add Hardware window. FortiGate VM requires four network adapters. You can configure network adapters to connect to a virtual

switch or to network adapters on the host computer.

22. Select **Finish**.
23. Select **Begin Installation**. After the installation completes successfully, the VM starts and the console window opens.

## Deployment example – Citrix XenServer

Once you have downloaded the FORTINET.out.CitrixXen.zip file and extracted the files, you can create the virtual machine in your Citrix Xen environment.

The following topics are included in this section:

### Create the FortiGate VM virtual machine (XenCenter)

#### To create the FortiGate VM virtual machine from the OVF file

1. Launch XenCenter on your management computer.

The management computer can be any computer that can run Citrix XenCenter, a Windows application.

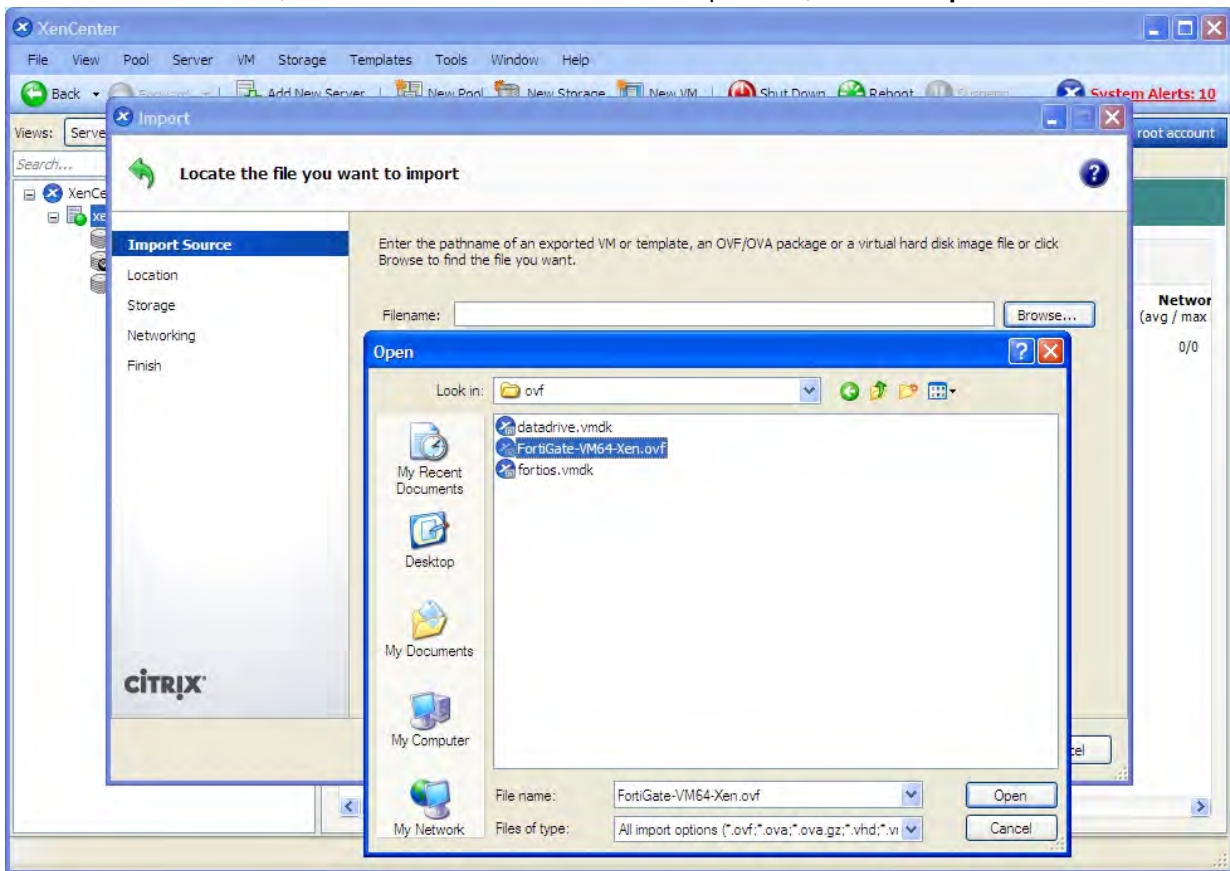

2. If you have not already done so, select **ADD a server**. Enter your Citrix XenServer IP address and the root logon credentials required to manage that server.

Your Citrix XenServer is added to the list in the left pane.

The **Virtual Machine Manager** home page opens.

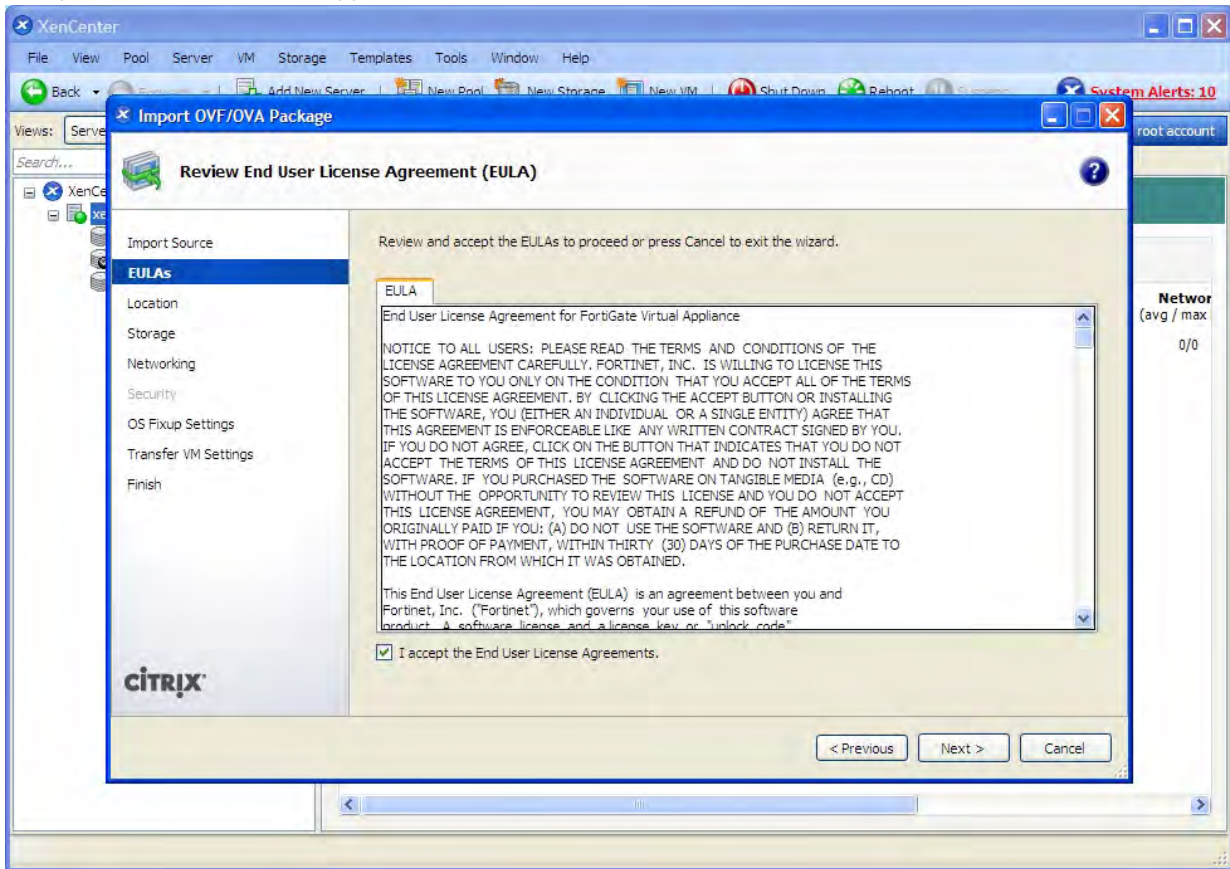

3. Go to **File > Import**. An import dialog will appear.

- Click the **Browse** button, find the FortiGate-VM64-Xen.ovf template file, then click **Open**.

- Select **Next**.

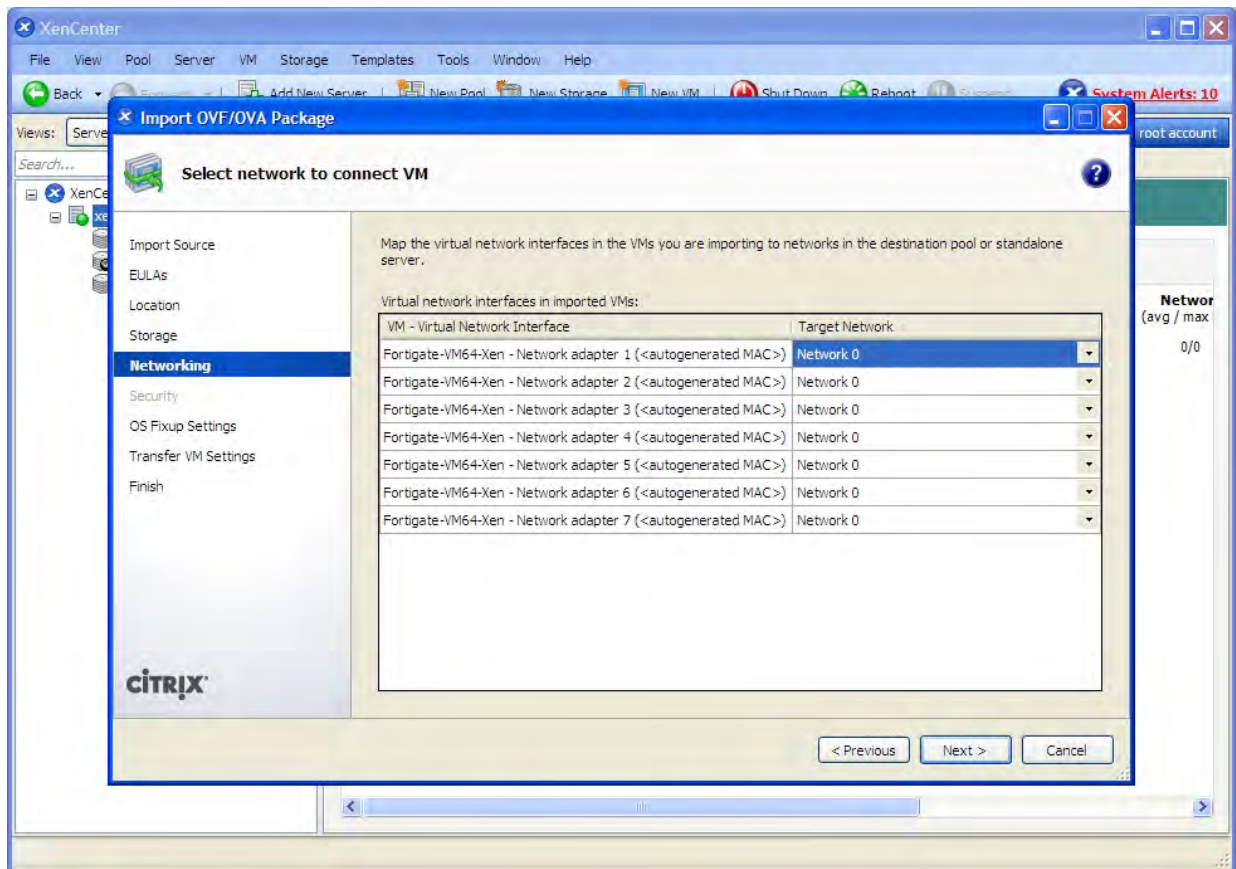

6. Accept the FortiGate Virtual Appliance EULA, then select **Next**.

7. Choose the pool or standalone server that will host the VM, then select **Next**.
8. Select the storage location for FortiGate VM disk drives or accept the default. Select **Next**.

9. Configure how each vNIC (virtual network adapter) in FortiGate VM will be mapped to each vNetwork on the Citrix XenServer, then click **Next**.

10. Click **Next** to skip OS fixup.
11. Select **Next** to use the default network settings for transferring the VM to the host.
12. Select **Finish**.

The Citrix XenServer imports the FortiGate VM files and configures the VM as specified in the OVF template. Depending on your computer's hardware speed and resource load, and also on the file size and speed of the network connection, this might take several minutes to complete.

When VM import is complete, the XenCenter left pane includes the FortiGate VM in the list of deployed VMs for your Citrix XenServer.

## Configure virtual hardware

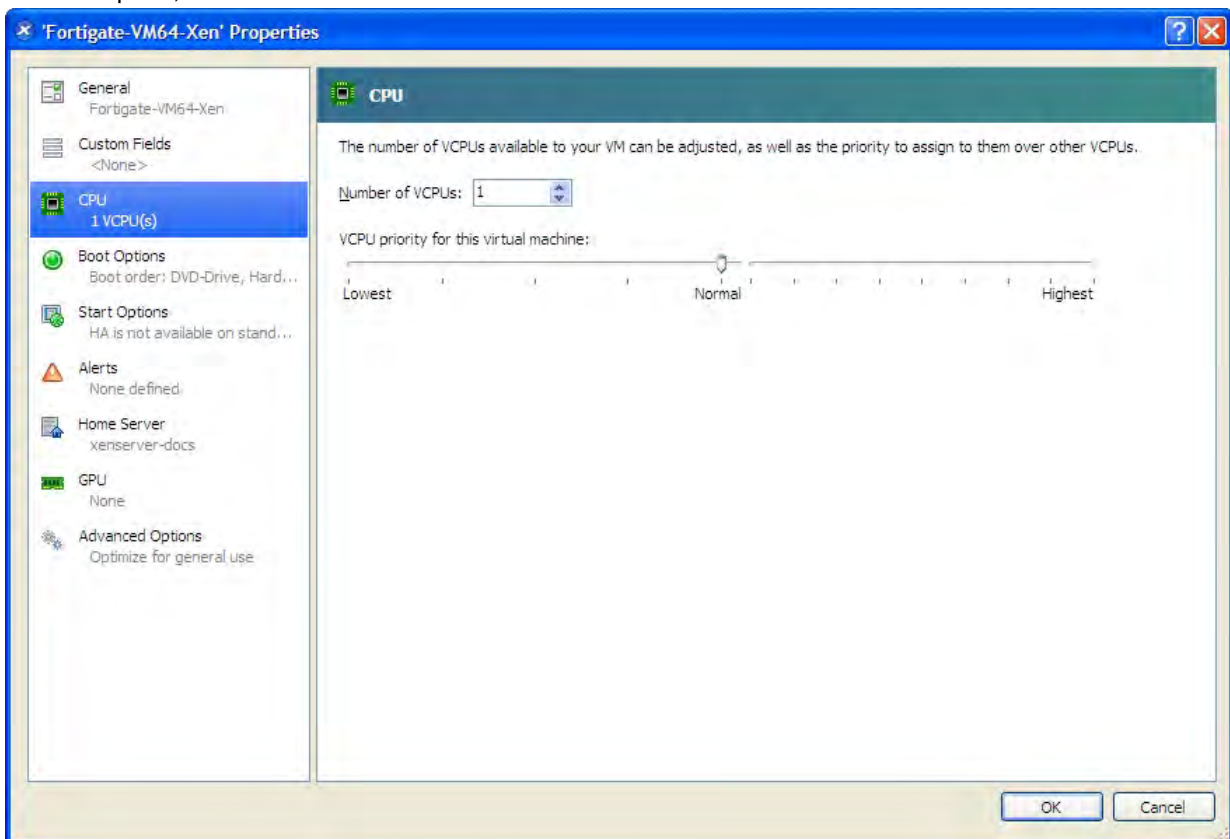

Before you start your FortiGate-VM for the first time, you need to adjust your virtual machine's virtual hardware settings to meet your network requirements.

## Configuring number of CPUs and memory size

Your FortiGate-VM license limits the number CPUs and amount of memory that you can use. The amounts you allocate must not exceed your license limits.

### To access virtual machine settings

1. Open XenCenter.
2. Select your FortiGate VM in the left pane.  
The tabs in the right pane provide access to the virtual hardware configuration. The Console tab provides access to the FortiGate console.
1. To set the number of CPUs
2. In the XenCenter left pane, right-click the FortiGate VM and select Properties.  
The Properties window opens.
3. In the left pane, select CPU.

4. Adjust **Number of CPUs** and then select **OK**.

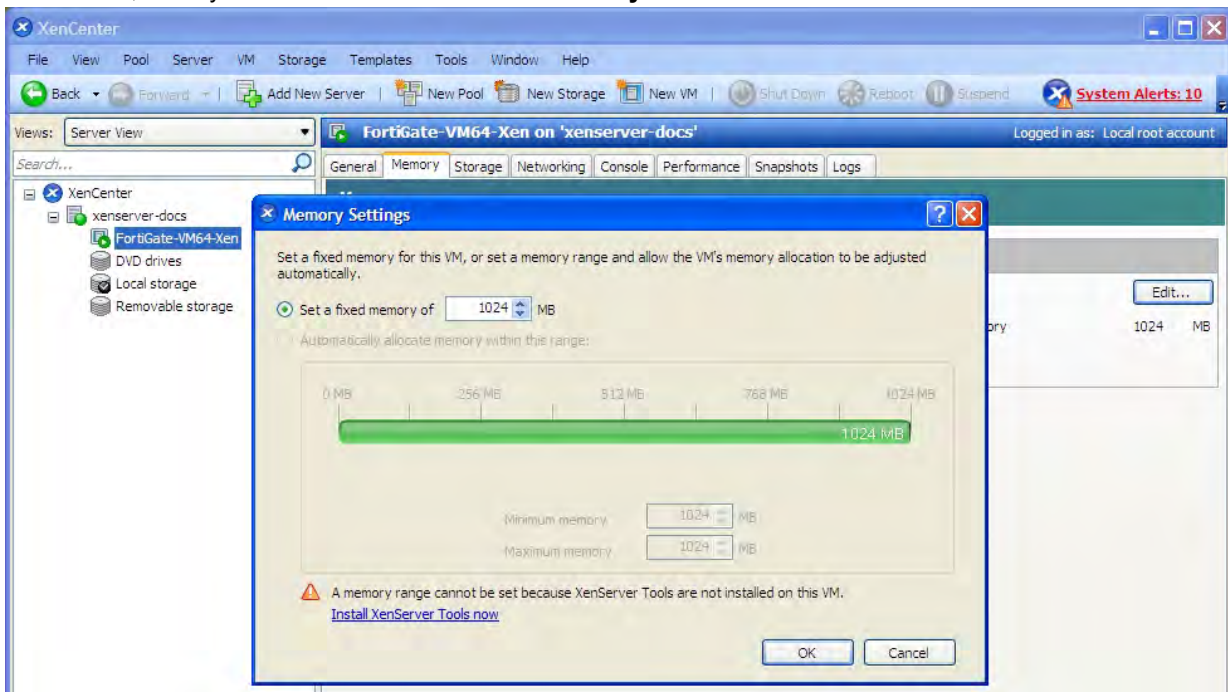

XenCenter will warn if you select more CPUs than the Xen host computer contains. Such a configuration might reduce performance.

### To set memory size

1. In the XenCenter left pane, select the FortiGate VM.
2. In the right pane, select the **Memory** tab.

3. Select **Edit**, modify the value in the **Set a fixed memory of** field and select **OK**.

## Configuring disk storage

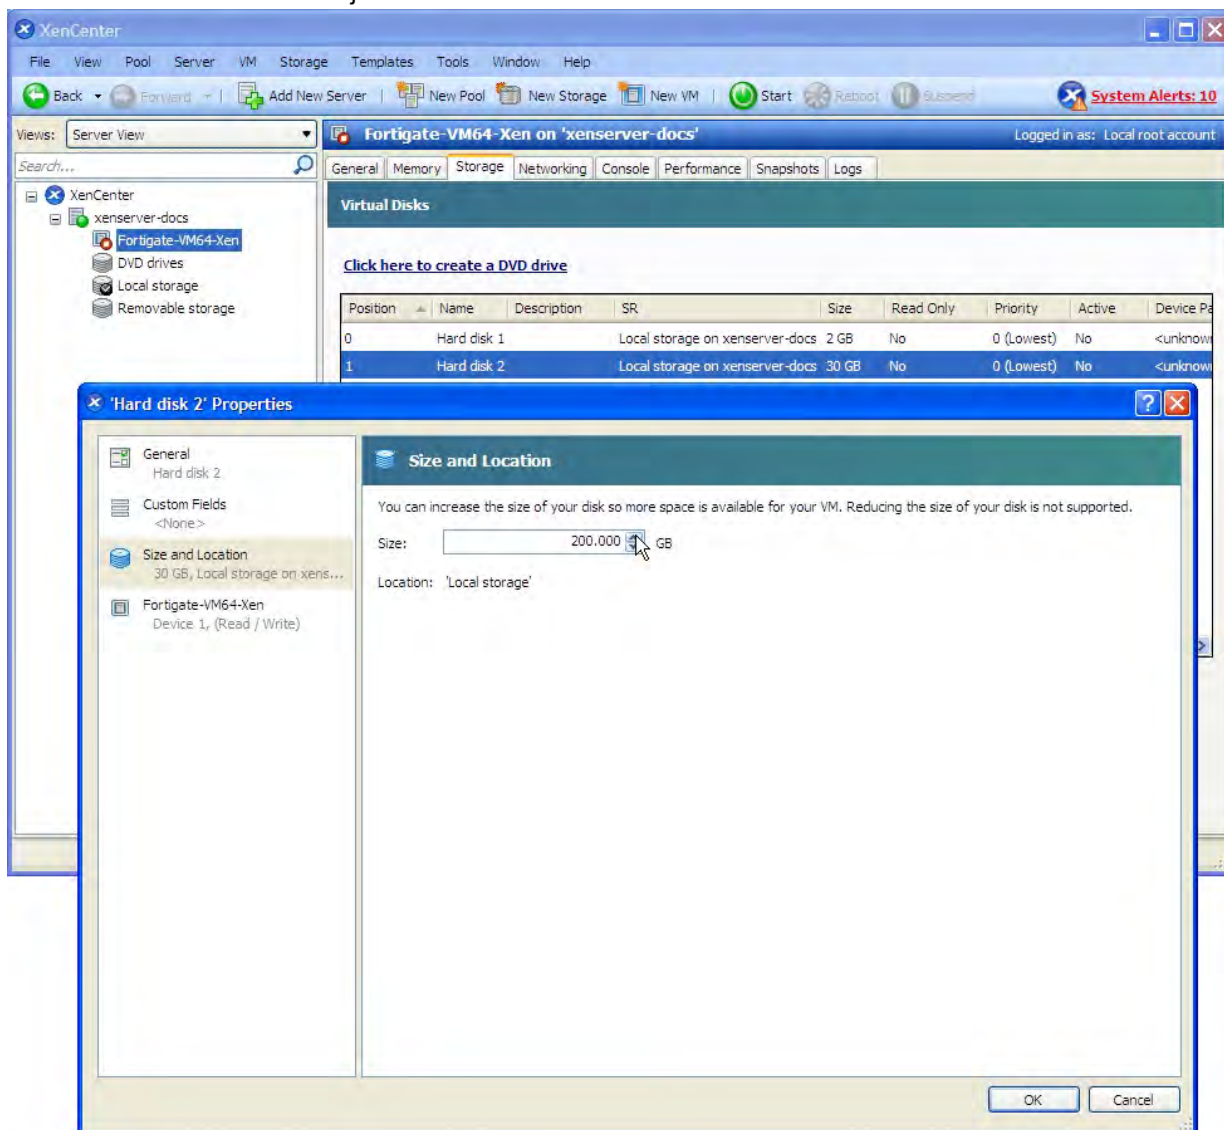

By default the FortiGate VM data disk 30GB. You will probably want to increase this. Disk resizing must be done before you start the VM for the first time.

### To resize the FortiGate data disk

1. In the XenCenter left pane, select the FortiGate VM.
2. Select the **Storage** tab. Select **Hard disk 2** (the 30GB drive), then select **Properties**.

The '**Hard disk 2** Properties' window opens.

3. Select **Size and Location**. Adjust **Size** and select **OK**.

## FortiGate VM Initial Configuration

Before you can connect to the FortiGate VM web-based manager you must configure a network interface in the FortiGate VM console. Once an interface with administrative access is configured, you can connect to the FortiGate VM web-based Manager and upload the FortiGate VM license file that you downloaded from the [Customer Service & Support](#) website.

The following topics are included in this section:

### Set FortiGate VM port1 IP address

Hypervisor management environments include a guest console window. On the FortiGate VM, this provides access to the FortiGate console, equivalent to the console port on a hardware FortiGate unit. Before you can access the Web-based manager, you must configure FortiGate VM port1 with an IP address and administrative access.

**To configure the port1 IP address:**

1. In your hypervisor manager, start the FortiGate VM and access the console window. You might need to press Return to see a login prompt.

**Example of FortiGate VM console access:**

The screenshot shows a hypervisor interface with a list of VMs on the left and a console window for 'Fortigate-VM-01' on the right. The console displays the following commands and output:

```

FortiGate-VM-01
Getting Started Summary Resource Allocation Performance Events Console Permissions

172.16.86.16
Fortigate-VM-01
Fortigate-VM-179
Fortigate-VM32-171
Fortigate-VM32-171-1
Fortigate-VM32-171-2
Fortigate-VM32-171-4
Fortigate-VM32-171-8
Fortigate-VM64
Fortigate-VM64-171
Fortigate-VM64-171-02
Fortigate-VM64-171-2
Fortigate-VM64-171-4
Fortigate-VM64-171-8
Fortigate-VM64-178
Fortigate-VM64-179
Fortigate-VM64-656
window8

FortiGate-UM64 #
FortiGate-UM64 login: admin
Password:
Welcome !

FortiGate-UM64 # config system interface
FortiGate-UM64 (interface) # edit port1
FortiGate-UM64 (port1) # set ip 192.168.1.92 255.255.255.0
FortiGate-UM64 (port1) # set allowaccess http https ssh
FortiGate-UM64 (port1) # end

FortiGate-UM64 #
config config object
get get dynamic and system information
show show configuration
diagnose diagnose facility
execute execute static commands
exit exit CLI

FortiGate-UM64 # _

```

2. At the FortiGate VM login prompt enter the username `admin`. By default there is no password. Just press Return.
3. Using CLI commands, configure the port1 IP address and netmask. Also, HTTP access must be enabled because until it is licensed the FortiGate VM supports only low-strength encryption. HTTPS access will not work.

For example:

```

config system interface
edit port1
set ip 192.168.0.100 255.255.255.0
append allowaccess http
end

```

You can also use the `append allowaccess` CLI command to enable other access protocols, such as `auto-ipsec`, `http`, `probe-response`, `radius-acct`, `snmp`, and `telnet`. The `ping`, `https`, `ssh`, and `fgfm` protocols are enabled on the `port1` interface by default.

4. To configure the default gateway, enter the following CLI commands:

```
config router static
edit 1
set device port1
set gateway <class_ip>
end
```

You must configure the default gateway with an IPv4 address. FortiGate VM needs to access the Internet to contact the FortiGuard Distribution Network (FDN) to validate its license.

---

5. To configure your DNS servers, enter the following CLI commands:

```
config system dns
set primary <Primary DNS server>
set secondary <Secondary DNS server>
end
```

The default DNS servers are 208.91.112.53 and 208.91.112.52.

---

6. To upload the FortiGate VM license from an FTP or TFTP server, use the following CLI command:

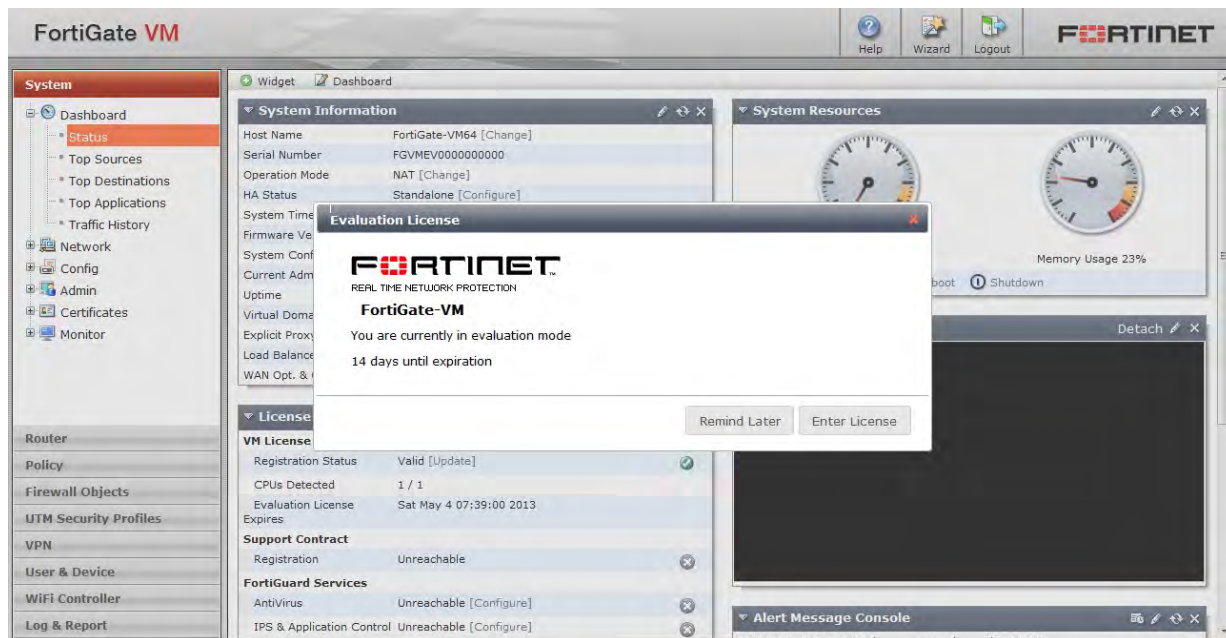

```
execute restore vmlicense {ftp | tftp} <VM license file name> <Server IP or FQDN>
[:server port]
```

You can also upload the license in the FortiGate VM Web-based Manager. See [Set FortiGate VM port1 IP address on page 3469](#).

---

## Web-based Manager and Evaluation License dialog box

## Connect to the FortiGate VM Web-based Manager

When you have configured the port1 IP address and netmask, launch a web browser and enter the IP address that you configured for port1. At the login page, enter the username `admin` and password field and select **Login**. The default password is no password. The Web-based Manager will appear with an **Evaluation License** dialog box.

Due to low encryption on the FortiGate side of the connection, some modern browsers will not allow the connection. If that is the case, the adjusting of the browser settings is unlikely to make a difference. There are two options:

- Use FTP or TFTP to apply the license
- Make sure that the interface on the port being accessed has been configured to allow HTTP/HTTPS access

## Upload the FortiGate VM license file

Every Fortinet VM includes a 15-day trial license. During this time the FortiGate VM operates in evaluation mode. Before using the FortiGate VM you must enter the license file that you downloaded from the [Customer Service & Support](#) website upon registration.

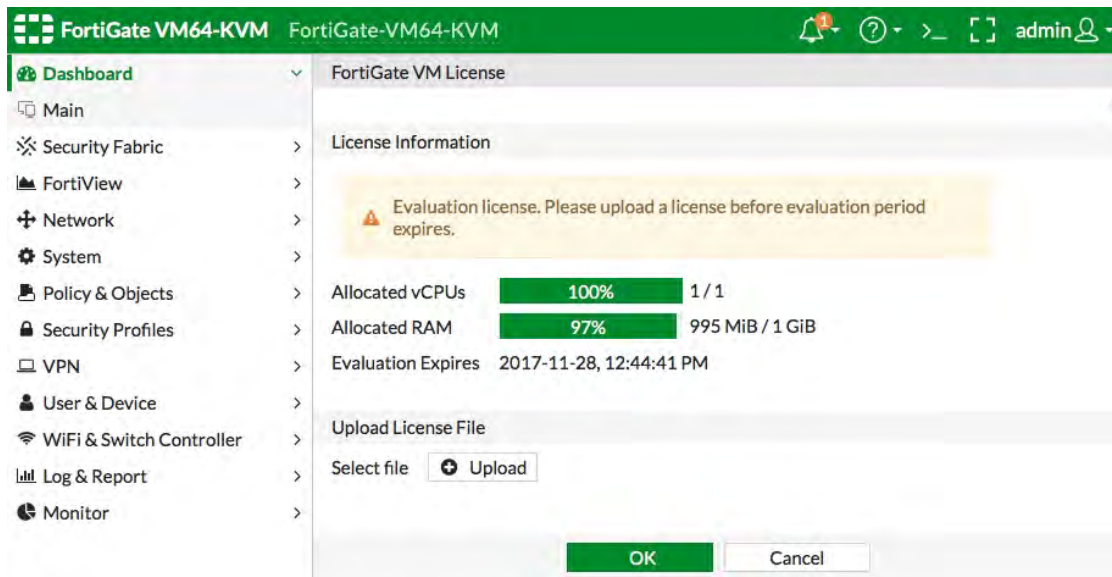

### GUI

To upload the FortiGate VM licence file:

1. There are 2 ways to get to the License upload window.

- i. In the **Dashboard > Main** window, in the **Virtual Machine** widget, left click on the **FGVMEV** (FortiGate-VM Evaluation) **License** icon. This will reveal a menu of selections to take you to directly to the **FortiGate VM License** window or to the **FortiGuard Details** window.
  - ii. Go to **System > FortiGuard**. In the **Licence Information** section, go to the **Virtual Machine** row and click on the link to **FortiGate VM License**.
2. In the **Evaluation License** dialog box, select **Enter License**.  
The license upload page opens.

#### License upload page:

3. Select **Upload** and locate the license file (.lic) on your computer. Select **OK** to upload the license file.
4. Refresh the browser to login.
5. Enter `admin` in the Name field and select **Login**. The VM registration status appears as valid in the License Information widget once the license has been validated by the FortiGuard Distribution Network (FDN) or FortiManager for closed networks.

Modern browsers can have an issue with allowing connecting to a FortiGate if the encryption on the device is too low. Adjusting browser settings does not normally mitigate the issue. If this happens, Admins must use a FTP/TFTP server to apply the license.

## CLI

You can also upload the license file via the CLI using the following CLI command:

```
execute restore vmlicense [ftp | tftp] <filename string> <ftp server>[:ftp port]
```

#### Example:

The following is an example output when using a tftp server to install license.

```
exec restore vmlicense tftp license.lic 10.0.1.2
This operation will overwrite the current VM license!Do you want to continue? (y/n)y
```

```
Please wait...Connect to tftp server 10.0.1.2 ...
Get VM license from tftp server OK.
VM license install succeeded.
Rebooting firewall.
```

The command has the side effect of rebooting the firewall without giving you a chance to back out or delay the reboot, so be careful about the timing of using the command.

## Validate the FortiGate VM license with FortiManager

You can validate your FortiGate VM license with some models of FortiManager. To determine whether your FortiManager unit has the VM Activation feature, see Features section of the [FortiManager Product Data sheet](#).

### To validate your FortiGate VM with your FortiManager:

1. To configure your FortiManager as a closed network, enter the following CLI command on your FortiManager:  

```
config fmupdate publicnetwork
 set status disable
end
```
2. To configure FortiGate VM to use FortiManager as its override server, enter the following CLI commands on your FortiGate VM:  

```
config system central-management
 set mode normal
 set type fortimanager
 set fmg <IPv4 address of the FortiManager device>
 set fmg-source-ip <Source IPv4 address when connecting to the FortiManager device>
 set include-default-servers disable
 set vdom <Enter the name of the VDOM to use when communicating with the FortiManager device>
end
```
3. Load the FortiGate VM license file in the Web-based Manager. Go to **System > Dashboard > Status**. In the **License Information** widget, in the **Registration Status** field, select **Update**. Browse for the `.lic` license file and select **OK**.
4. To activate the FortiGate VM license, enter the following CLI command on your FortiGate VM:  

```
execute update-now
```
5. To check the FortiGate VM license status, enter the following CLI commands on your FortiGate VM:  

```
get system status
```

The following output is displayed:

```
Version: Fortigate-VM v5.0,build0099,120910 (Interim)
Virus-DB: 15.00361(2011-08-24 17:17)
Extended DB: 15.00000(2011-08-24 17:09)
Extreme DB: 14.00000(2011-08-24 17:10)
IPS-DB: 3.00224(2011-10-28 16:39)
FortiClient application signature package: 1.456(2012-01-17 18:27)
Serial-Number: FGVM02Q105060000
License Status: Valid
BIOS version: 04000002
Log hard disk: Available
```

```

Hostname: Fortigate-VM
Operation Mode: NAT
Current virtual domain: root
Max number of virtual domains: 10
Virtual domains status: 1 in NAT mode, 0 in TP mode
Virtual domain configuration: disable
FIPS-CC mode: disable
Current HA mode: standalone
Distribution: International
Branch point: 511
Release Version Information: MR3 Patch 4
System time: Wed Jan 18 11:24:34 2012

```

```
diagnose hardware sysinfo vm full
```

The following output is displayed:

```

UUID: 564db33a29519f6b1025bf8539a41e92
valid: 1
status: 1
code: 200 (If the license is a duplicate, code 401 will be displayed)
warn: 0
copy: 0
received: 45438
warning: 0
recv: 201201201918
dup:

```

## Licensing timeout

In closed environments without Internet access, it is mandatory to perform offline licensing of the virtual FortiGate using a FortiManager as a license server. If the FortiGate-VM cannot perform license validation within the license timeout period, which is 30 days, the FortiGate will discard all packets and effectively ceasing operation as a firewall.

The status of the licence will go through some status changes before it times out.

Status	Description
Valid	The FortiGate can connect and validate against a FortiManager or FDS
Warning	The FortiGate <b>cannot</b> connect and validate against a FortiManager or FDS. A check is made against how many days the Warning status has been continuous. If the number is less the 30 days the status does not change.
Invalid	The FortiGate <b>cannot</b> connect and validate against a FortiManager or FDS. A check is made against how many days the Warning status has been continuous. If the number is 30 days or more, the status changes to Invalid. The firewall ceases to function properly.

There is only a single log entry after the virtual FortiGate cannot access the license server for the license expiration period. This means that when you go searching the logs for a reason for the FortiGate being offline there will not be a long list of error logs that draw attention to the issue. There will only be the one entry.

### Revalidation

To restore validation of the licence, reestablish connectivity to the Internet. The VM licences is automatically revalidated after access to the Internet is restored.

### Configure your FortiGate VM

Once the FortiGate VM license has been validated you can begin to configure your device. You can use the **Wizard** located in the top toolbar for basic configuration including enabling central management, setting the admin password, setting the time zone, and port configuration.

# Chapter 34 - VoIP Solutions: SIP

## VoIP solutions: SIP

This FortiOS Handbook chapter contains detailed information about how FortiGates processes SIP VoIP calls and how to configure the FortiGate to apply security features to SIP calls. This document describes all FortiGate SIP configuration options and contains detailed configuration examples.

This document uses numeric IP addresses for all SIP end points. SIP addresses can also use domain names instead of addresses. For the example, the following SIP addresses could refer to the same SIP end point:

```
inviter@10.31.101.20
inviter@example.com
```

## Before you begin

Before you begin to configure VoIP security profiles, including SIP, from the GUI you should go to **System > Feature Visibility** and turn on **VoIP** (under **Additional Features**).

Also, VoIP settings are only available if the FortiGate or current VDOM **Inspection Mode** is set to **Proxy**. To view the inspection mode go to **System > Settings** to confirm that **Inspection Mode** is set to **Proxy**. You can also use the following CLI command to change the inspection mode to proxy:

```
config system settings
 set inspection-mode proxy
end
```

The **System Information** dashboard widget also shows the current **Mode**.

## How this guide is organized

This FortiOS Handbook chapter contains the following sections:

[Inside FortiOS: VoIP Protection](#) introduces FortiOS VoIP Protection

[FortiGate VoIP solutions: SIP](#) introduces FortiGate SIP support.

[Common SIP VoIP configurations](#) describes some common SIP configurations.

[SIP messages and media protocols](#) describes SIP messages and some common SIP media protocols.

[The SIP session helper](#) describes how the SIP session helper works and how to configure SIP support using the SIP session helper.

[The SIP ALG](#) describes how the SIP Application Layer Gateway (ALG) works and how to configure SIP support using the SIP ALG.

[Conflicts between the SIP ALG and the session helper](#) describes how to sort out conflicts between the SIP session helper and the ALG.

[Stateful SIP tracking, call termination, and session inactivity timeout](#) describes how the SIP ALG performs SIP stateful tracking, call termination and session activity timeouts.

[SIP and RTP/RTCP](#) describes how SIP relates to RTP and RTCP.

[How the SIP ALG creates RTP pinholes](#) describes how the SIP ALG creates pinholes.

[Configuration example: SIP in Transparent Mode](#) describes how to configure a FortiGate in Transparent mode to support SIP.

[RTP enable/disable \(RTP bypass\)](#) describes RTP bypass.

[Opening and closing SIP register, contact, via and record-route pinholes](#) describes how FortiOS opens and closes these pinholes.

[Accepting SIP register responses](#) describes how to enable accepting SIP register responses.

[How the SIP ALG performs NAT](#) describes how the SIP ALG performs NAT.

[Enhancing SIP pinhole security](#) describes how to open smaller pinholes.

[Hosted NAT traversal](#) describes SIP hosted NAT traversal and how to configure it.

[SIP over IPv6](#) describes how to configure SIP over IPv6.

[Deep SIP message inspection](#) describes how deep SIP message inspection works.

[Blocking SIP request messages](#) describes how to block SIP request messages to prevent some common SIP attacks.

[SIP rate limiting](#) includes more options for preventing SIP attacks.

[SIP logging](#) describes how to enable SIP logging.

[Inspecting SIP over SSL/TLS \(secure SIP\)](#) describes how to inspect encrypted SIP traffic.

[SIP and HA-session failover and geographic redundancy](#) describes how to use FGCP HA to support SIP geographic redundancy.

[SIP and IPS](#) describes how to turn on IPS for SIP sessions.

[SIP debugging](#) describes some tools for debugging your SIP configuration.

## FortiOS 5.6 VoIP new features

FortiOS 5.6 includes the following new VoIP and SIP features:

### **SIP strict-register enabled by default in VoIP Profiles (380830)**

If `strict-register` is disabled, when REGISTER is received by a FortiGate, the source address (usually the IP address of PBX) and ports (usually port 5060) are translated by NAT to the external address of the FortiGate and port 65476. Pinholes are then opened for SIP and RTP. This tells the SIP provider to send incoming SIP traffic to the external address of the FortiGate on port 65476.

This creates a security hole since the port is open regardless of the source IP address so an attacker who scans all the ports by sending REGISTER messages to the external IP of the FortiGate will eventually have one register go through.

When `strict-register` is enabled (the new default) the pinhole is smaller because it will only accept packets from the SIP server.

Enabling `strict-register` can cause problems when the SIP registrar and SIP proxy server are separate entities with separate IP addresses.

### SIP diagnose command improvements (376853)

A diagnose command has been added to the CLI that outputs VDOM data located in the voipd daemon.

```
diagnose sys sip-proxy vdom
```

#### Example

```
(global) # diagnose sys sip-proxy vdom
VDOM list by id:
vdom 0 root (Kernel: root)
vdom 1 dmngmt-vdom (Kernel: dmngmt-vdom)
vdom 2 test2 (Kernel: test2)
vdom 3 test3 (Kernel: test3)
vdom 4 vdoma2 (Kernel: vdoma2)
vdom 5 vdomb2 (Kernel: vdomb2)
vdom 6 vdomc2 (Kernel: vdomc2)
vdom 7 vdoma (Kernel: vdoma)
vdom 8 vdomb (Kernel: vdomb)
vdom 9 vdomc (Kernel: vdomc)
VDOM list by name:
vdom 1 dmngmt-vdom (Kernel: dmngmt-vdom)
vdom 0 root (Kernel: root)
vdom 2 test2 (Kernel: test2)
vdom 3 test3 (Kernel: test3)
vdom 7 vdoma (Kernel: vdoma)
vdom 4 vdoma2 (Kernel: vdoma2)
vdom 8 vdomb (Kernel: vdomb)
vdom 5 vdomb2 (Kernel: vdomb2)
vdom 9 vdomc (Kernel: vdomc)
vdom 6 vdomc2 (Kernel: vdomc2)
```

## Inside FortiOS: Voice over IP (VoIP) Protection

The FortiOS SIP Application Layer Gateway (ALG) allows SIP calls to pass through a FortiGate by opening SIP and RTP pinholes and performing source and destination IP address and port translation for SIP and RTP packets.

There are a large number of SIP-related Internet Engineering Task Force (IETF) documents (Request for Comments) that define behavior of SIP and related applications. FortiOS completely support [RFC 3261](#) for SIP, [RFC 4566](#) for SDP and [RFC 3262](#) for Provisional Response Acknowledgment (PRACK). FortiOS also supports other SIP and SIP-related RFCs and performs Deep SIP message inspection for SIP statements defined in other SIP RFCs.

## Advanced Voice over IP Protection

The FortiOS SIP Application Level Gateway (ALG) protects Voice over IP (SIP and SDP) services in Unified Communication and NGN/IMS networks with the following advanced VoIP defense mechanisms.

### Deep SIP message inspection (also called deep SIP header inspection)

Verifies SIP and SDP header syntax and protects SIP servers from potential SIP Fuzzing attacks. When a violation is detected, FortiOS can impose counter measures and can also send automatic SIP response messages to offload processing from the SIP server.

### SIP message rate limiting

Allows rate limiting of SIP messages per SIP request method. This prevents a SIP server from overload or from DoS attacks using particular SIP methods. For example, FortiOS can protect SIP servers from a flood of SIP REGISTER or INVITE messages, which can be caused by a DoS attack or a flash crowd.

### RTP and RTCP pinholing

RTP pinholing only forwards RTP/RTCP packets that conform to the particular session description of the associated SIP dialog. If a SIP dialog is finished, FortiOS automatically closes the pinhole. RTP/RTCP pinholing

is supported by FortiASIC acceleration and achieves high packet throughput at low jitter and delay.

### **Stateful SIP dialog tracking**

FortiOS tracks SIP message sequences and prevents unwanted SIP messages that are not related to a particular SIP dialog. For instance, FortiOS can detect malicious SIP BYE messages that do not conform with the associated context of the SIP dialog.

### **Inspecting SIP over SSL/TLS (secure SIP)**

Some SIP phones and SIP servers use SSL or TLS to encrypt SIP signalling traffic. To allow SIP over SSL/TLS calls to pass through the FortiGate unit, the encrypted signalling traffic has to be unencrypted and inspected. FortiOS intercepts and unencrypts and inspects the SIP packets. Allowed packets are then re-encrypted and forwarded to their destination.

### **Inspecting SIP on multiple ports**

FortiOS can detect and inspect SIP and SDP UDP and TCP sessions and SIP SSL sessions and you can configure the ports that the SIP ALG monitors for these sessions. In addition you can configure two different ports for SIP UDP sessions and two different ports for SIP TCP sessions. The port configuration can be changed without affecting other parts of the SIP configuration.

## **Carrier Grade protection**

To protect VoIP infrastructure in carrier networks, FortiOS complies with typical carrier requirements for availability and robustness.

### **High Availability**

FortiOS supports a hot failover configuration with an active and a standby FortiGate device. FortiOS dynamically updates the context on the standby unit with SIP and RTP related data. This enables the standby unit to takeover stable voice calls in case of a planned or unplanned outage or failover of the active unit.

### **Geographical Redundancy of SIP servers**

In FortiOS SIP server cluster configurations the active and standby units can be deployed in different geographical locations. This configuration prevents a total outage of a SIP server infrastructure if one location goes offline. FortiOS supports the detection of SIP server outages (loss of heartbeats) and a redirect of SIP messages to the redundant SIP server location.

### **Logging and Reporting**

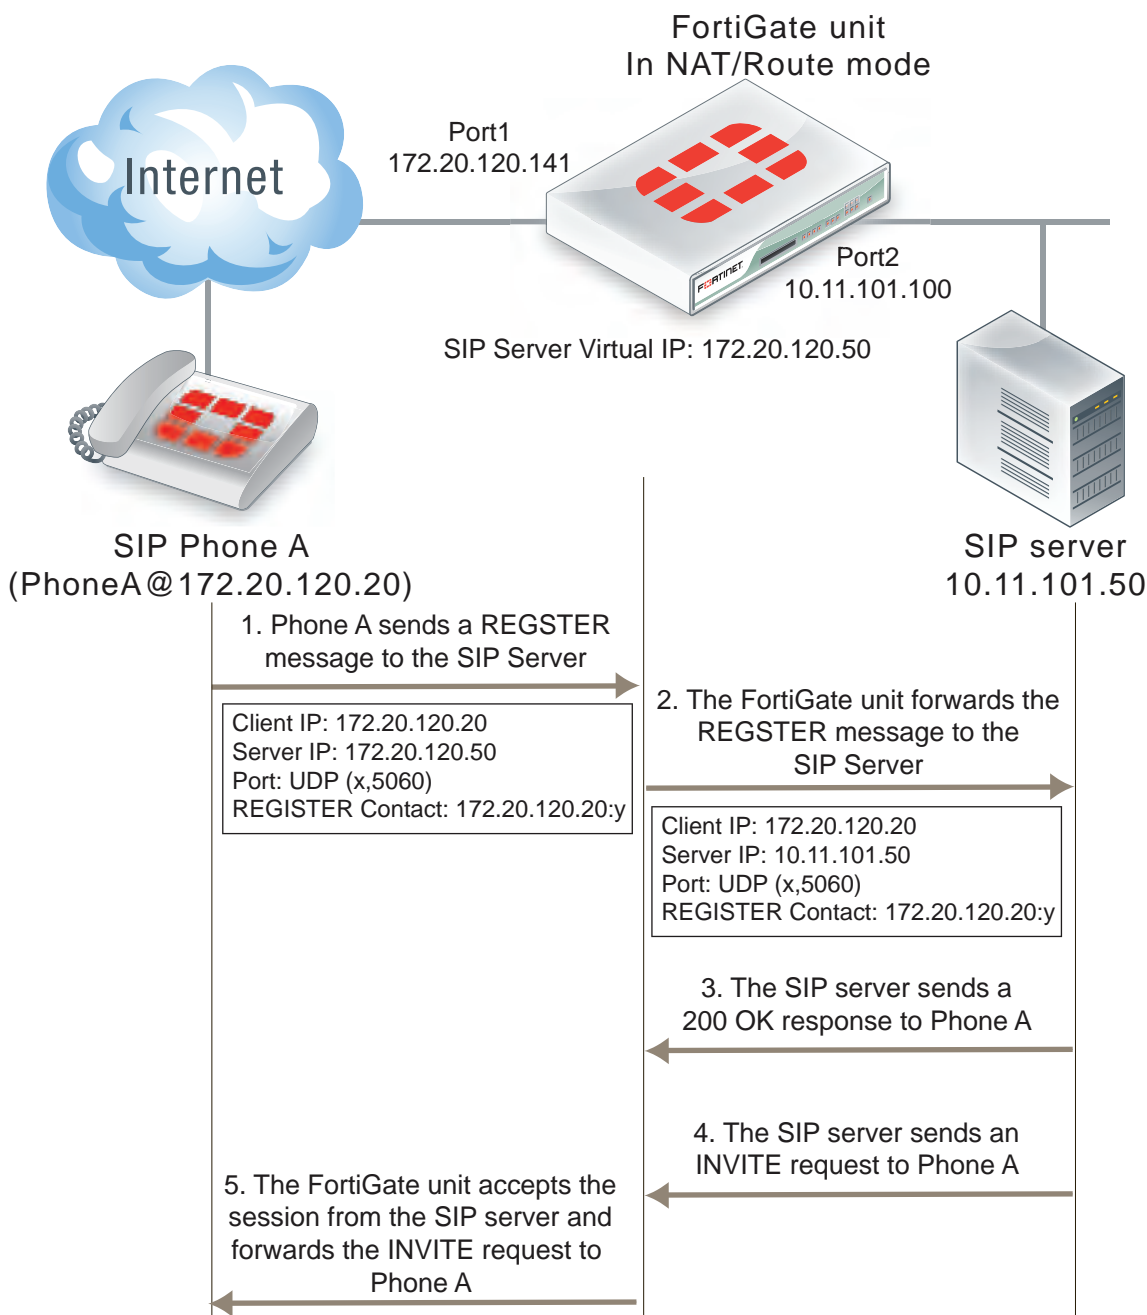

FortiOS can log call related information internally or to an external SYSLOG or FortiAnalyzer unit. This includes event logs that show particular SIP-related attacks or syntax violations with SIP messages or logs that summarize call statistics.

## **NAT/NAPT**

FortiOS performs configurable network address translation for IP addresses in the SIP and SDP header. The SIP ALG follows the configured NAT addresses in firewall virtual IPs and changes SIP header IP addresses accordingly. RTP NAT is controlled by SIP/SDP and the firewall policy. This allows translating an unlimited number of IP addresses without adding specific RTP policies.

## Header Manipulation

FortiOS SIP and SDP header manipulation supports SIP Network Address Translation (NAT) through FortiGate units configured as NAT firewalls.

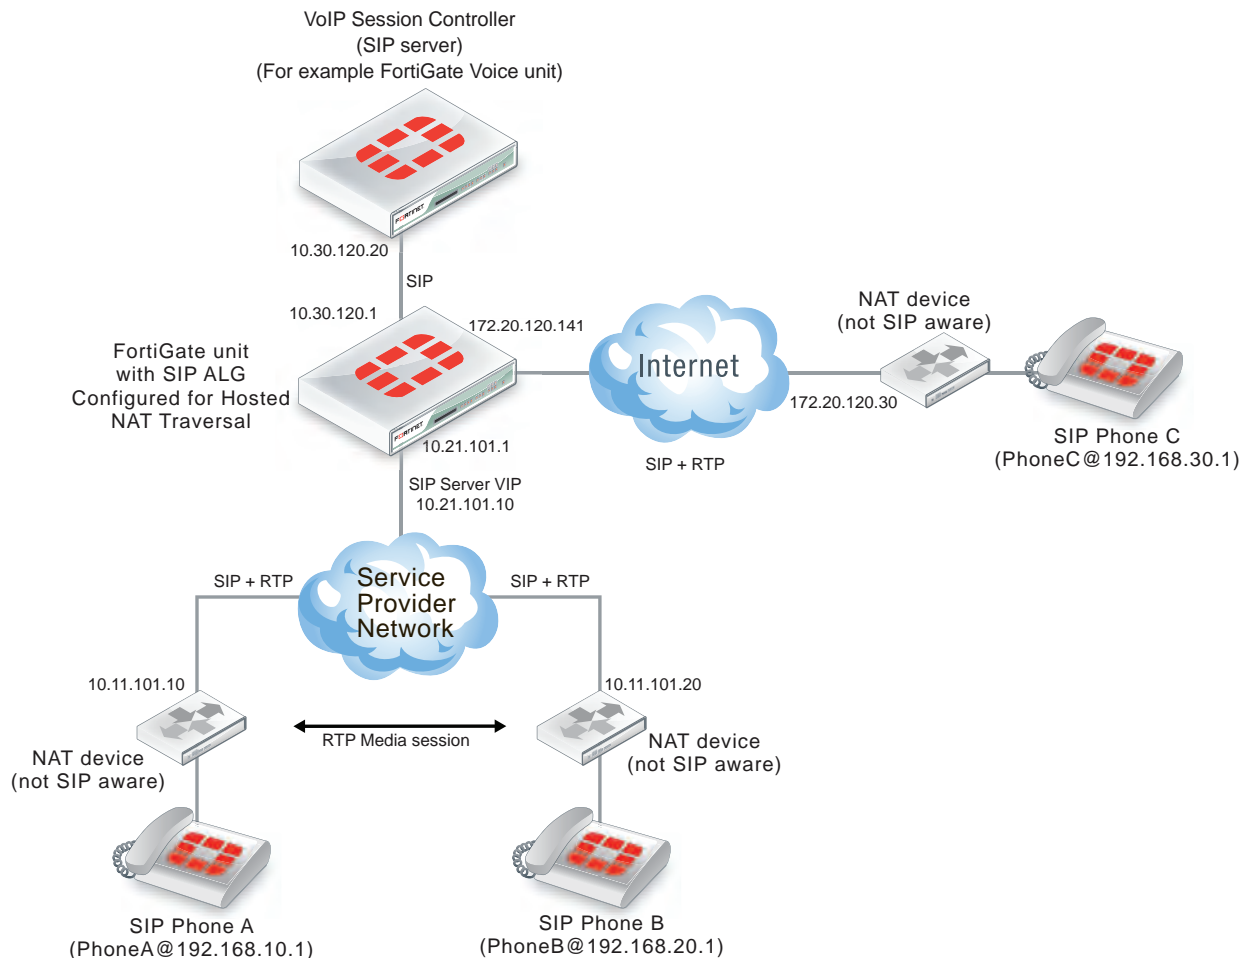

## Hosted NAT traversal (HNT)

In many service provider networks, CPE firewall devices provide NAT without application awareness. This causes issues for SIP/SDP and RTP traffic, since UAC IP address information references to the internal network behind the far end firewall. VoIP calls cannot be connected successfully. FortiOS mitigates far end NAT issues (called

Hosted NAT traversal) by probing the first RTP packet from the UAC and learning the far end NA(P)T binding. FortiOS then updates the internal NAT binding for RTP accordingly.

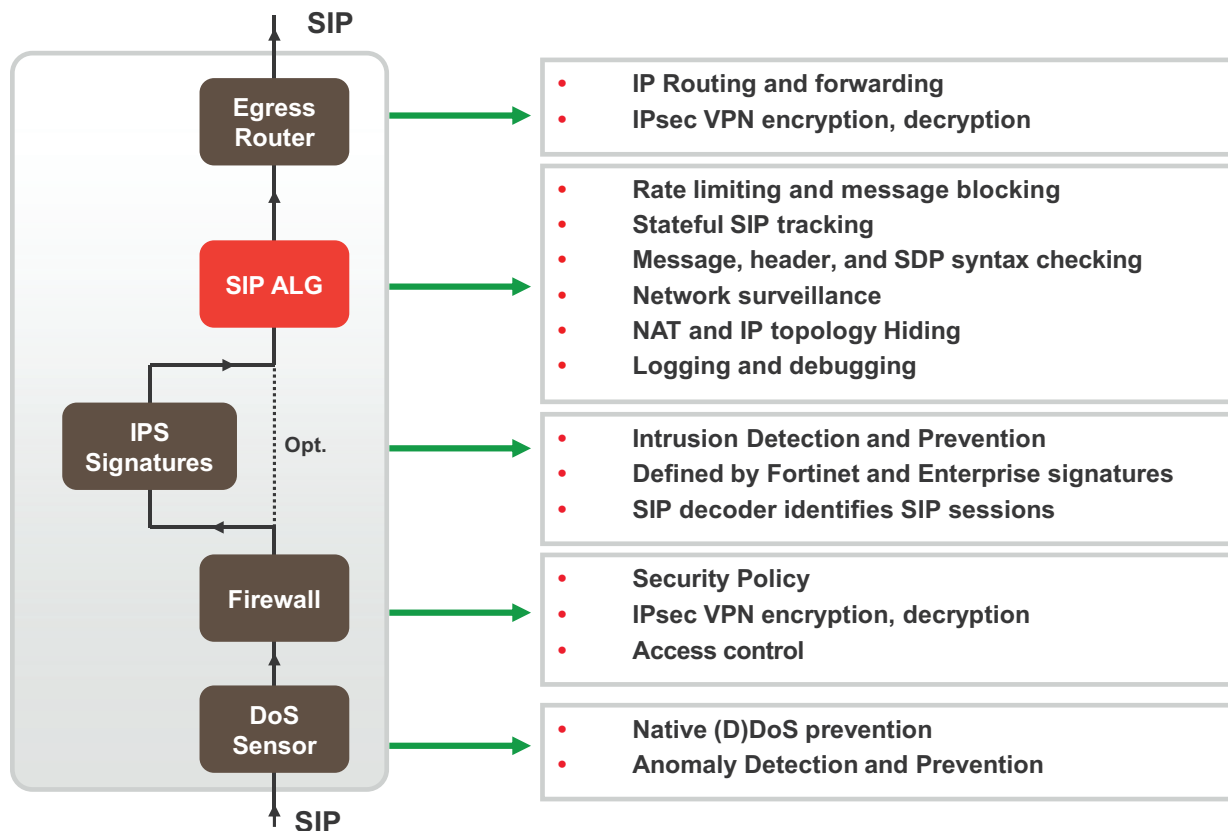

## IP Address conservation for NAT

In case of SIP and RTP NAT IP the original address information can get lost after translating to the provisioned IP addresses. This IP address information is sometimes required for detailed billing records or debugging purposes. FortiOS can maintain the original IP address information in a translated SIP header by adding it to the SIP/SDP info line (i=) or by adding it to the original attribute (o=). Either option can be selected depending on the SIP billing environment.

## SIP ALG activation

The FortiOS SIP ALG is applied to SIP traffic accepted by a firewall policy that includes a VoIP profile. The VoIP profile controls how the SIP ALG processes SIP sessions. FortiOS also includes a high-performance SIP session helper that provides limited SIP functionality. In most cases the SIP ALG should be used because the SIP ALG supports the complete range of FortiOS SIP features.

## SIP over IPv6

FortiOS, operating in NAT and in Transparent mode supports SIP over IPv6. The SIP ALG can process SIP messages that use IPv6 addresses in the headers, bodies, and in the transport stack. The SIP ALG cannot modify the IPv6 addresses in the SIP headers so FortiGate units cannot perform SIP or RTP NAT over IPv6 and also cannot translate between IPv6 and IPv4 addresses.

## Platform support and hardware acceleration

FortiOS supports VoIP protection with the SIP ALG on all FortiGate hardware platforms. Whenever a FortiGate unit provides FortiASIC or SPM HW acceleration, the SIP ALG will use this option to fast-path RTP/RTCP traffic.

As well, since the SIP ALG is proxy-based, SIP control packets are not offloaded to NP4 or NP6 processors. But actual voice or other media traffic can be offloaded to NP4 or NP6 processors after the SIP session is established. Many FortiGate units also support low latency hardware acceleration configurations that also enhance SIP voice transmission.

FortiGate hardware acceleration provides a high throughput solution at very low jitter and delay. FortiOS provides efficient and highly scalable protection for VoIP in emerging Enterprise and Carrier network. This complements Fortinet's NGFW and UTM offerings. VoIP protection can be easily added to any firewall policy just by adding a VoIP profile.

VoIP protection is supported in FortiAnalyzer and FortiManager. Centralized logging and management are essential for carrier and MSSP service provider and are influencing business case calculations.

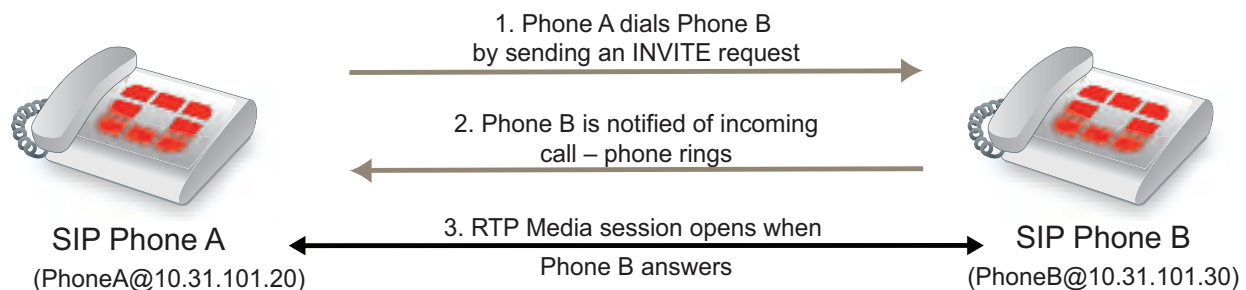

## Common SIP VoIP configurations

This section describes some common SIP VoIP configurations and simplified SIP dialogs for these configurations. This section also shows some examples of how adding a FortiGate affects SIP processing.

### Peer to peer configuration

In the peer to peer configuration shown below, two SIP phones (in the example, FortiFones) communicate directly with each other. The phones send SIP request and response messages back and forth between each other to establish the SIP session.

#### SIP peer to peer configuration

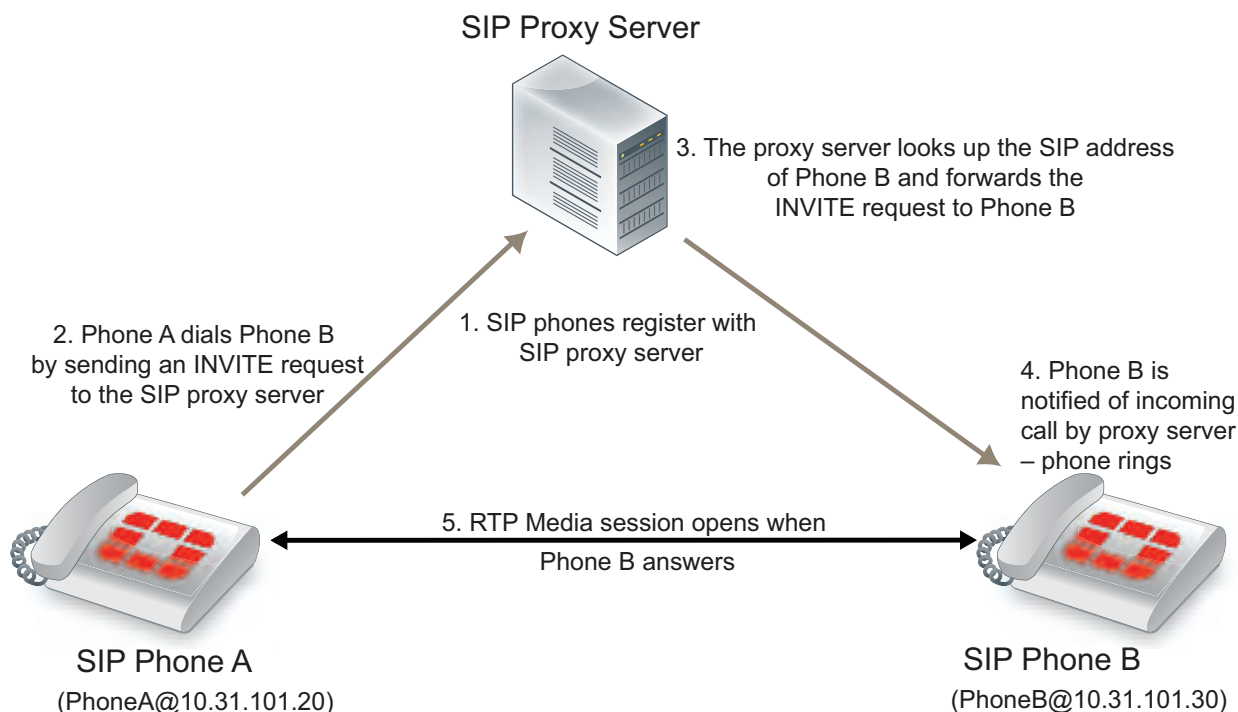

Peer to peer configurations are not very common because they require the SIP phones to keep track of the names and addresses of all of the other SIP phones that they can communicate with. In most cases a SIP proxy or re-direct server maintains addresses of a large number of SIP phones and a SIP phone starts a call by contacting the SIP proxy server.

### SIP proxy server configuration

A SIP proxy server acts as an intermediary between SIP phones and between SIP phones (for example, two FortiFones) and other SIP servers. As shown below, SIP phones send request and response messages to the SIP proxy server. The proxy server forwards the messages to other clients or to other SIP proxy servers. Proxy servers can hide SIP phones by proxying the signaling messages. To the other users on the VoIP network, the signaling invitations look as if they come from the SIP proxy server.

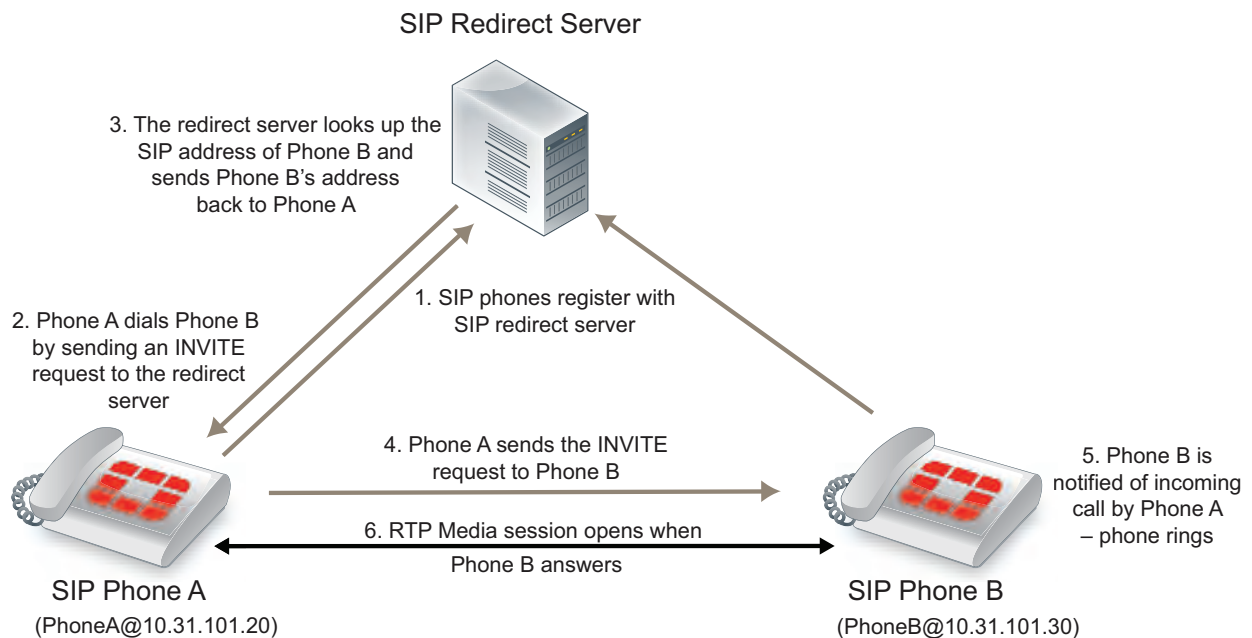

### SIP in proxy mode

A common SIP configuration would include multiple networks of SIP phones. Each of the networks would have its own SIP server. Each SIP server would proxy the communication between phones on its own network and between phones in different networks.

### SIP redirect server configuration

A SIP redirect server accepts SIP requests, maps the addresses in the request into zero or more new addresses and returns those addresses to the client. The redirect server does not initiate SIP requests or accept calls. As shown below, SIP clients send INVITE requests to the redirect server, which then looks up the destination address. The redirect server returns the destination address to the client. The client uses this address to send the INVITE request directly to the destination SIP client.

**SIP in redirect model****SIP registrar configuration**

A SIP registrar accepts SIP REGISTER requests from SIP phones for the purpose of updating a location database with this contact information. This database can then become a SIP location service that can be used by SIP proxy servers and redirect servers to locate SIP clients. As shown below, SIP clients send REGISTER requests to the SIP registrar.

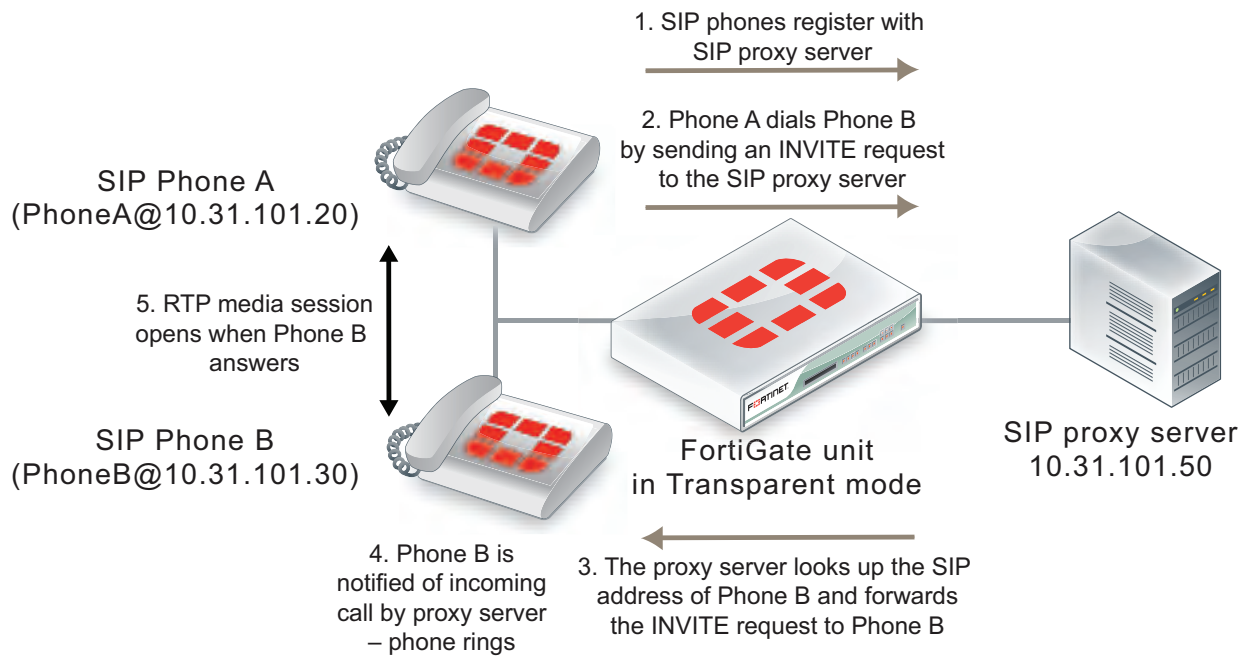

### SIP registrar and proxy servers

### SIP with a FortiGate

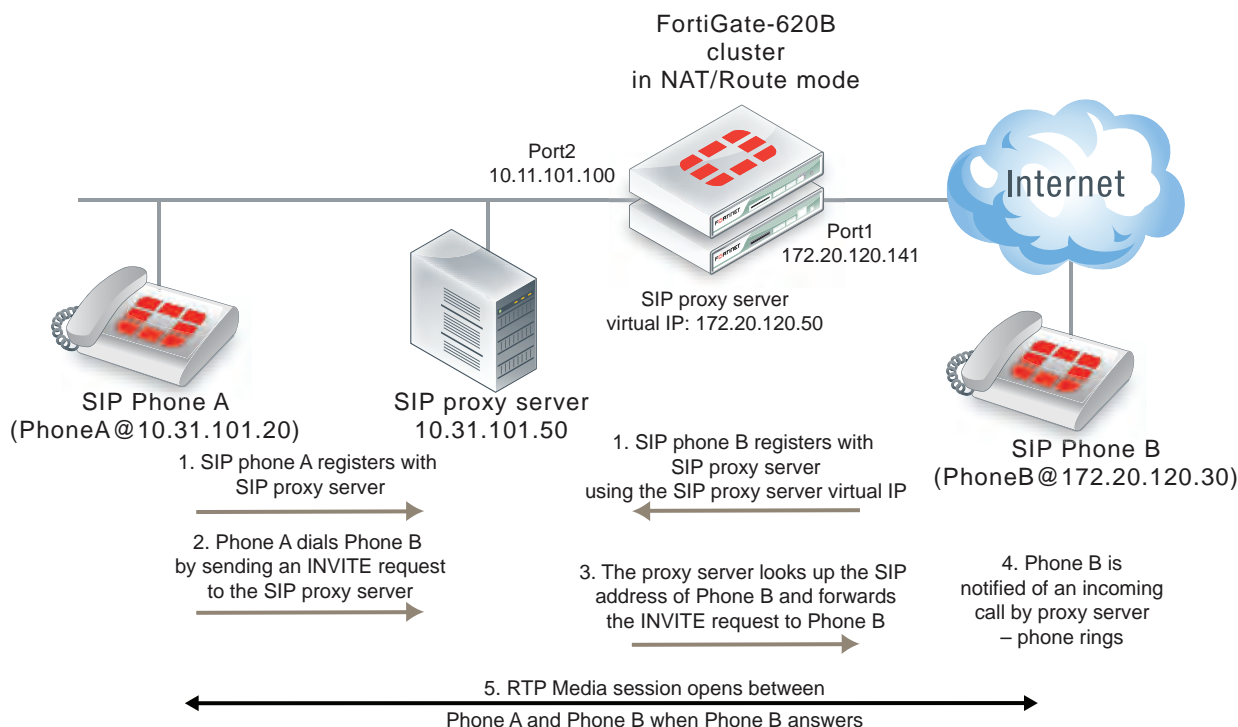

Depending on your security requirements and network configuration FortiGates may be in many different places in a SIP configuration. This section shows a few examples.

The diagram below shows a FortiGate installed between a SIP proxy server and SIP phones on the same network. The FortiGate is operating in Transparent mode so both the proxy server and the phones are on the same subnet. In this configuration, called SIP inspection without address translation, the FortiGate could be protecting the SIP proxy server on the private network by implementing SIP security features for SIP sessions between the SIP phones and the SIP proxy server.

**SIP network with FortiGate in Transparent mode**

The phones and server use the same SIP dialogs as they would if the FortiGate was not present. However, the FortiGate can be configured to control which devices on the network can connect to the SIP proxy server and can also protect the SIP proxy server from SIP vulnerabilities.

The following diagram shows a FortiGate operating in NAT mode and installed between a private network and the Internet. Some SIP phones and the SIP proxy server are connected to the private network and some SIP phones are connected to the Internet. The SIP phones on the Internet can connect to the SIP proxy server through the FortiGate and communication between SIP phones on the private network and SIP phones on the Internet must pass through the FortiGate.

**SIP network with FortiGate in NAT mode**

The phones and server use the same SIP dialog as they would if the FortiGate was not present. However, the FortiGate can be configured to control which devices on the network can connect to the SIP proxy server and can also protect the SIP proxy server from SIP vulnerabilities. In addition, the FortiGate has a firewall virtual IP that forwards packets sent to the SIP proxy server Internet IP address (172.20.120.50) to the SIP proxy server internal network IP address (10.31.101.30).

Since the FortiGate is operating in NAT mode it must translate packet source and destination IP addresses (and optionally ports) as the sessions pass through the FortiGate. Also, the FortiGate must translate the addresses contained in the SIP headers and SDP body of the SIP messages. As well the FortiGate must open SIP and RTP pinholes through the FortiGate. SIP pinholes allow SIP signaling sessions to pass through the FortiGate between phones and between phones and SIP servers. RTP pinholes allow direct RTP communication between the SIP phones once the SIP dialog has established the SIP call. Pinholes are opened automatically by the FortiGate. Administrators do not add security policies for pinholes or for RTP sessions. All that is required is a security policy that accepts SIP traffic.

Opening an RTP pinhole means opening a port on a FortiGate interface to allow RTP traffic to use that port to pass through the FortiGate between the SIP phones on the Internet and SIP phones on the internal network. A pinhole only accepts packets from one RTP session. Since a SIP call involves at least two media streams (one from Phone A to Phone B and one from Phone B to Phone A) the FortiGate opens two RTP pinholes. Phone A sends RTP packets through a pinhole in port2 and Phone B sends RTP packets through a pinhole in port1. The FortiGate opens the pinholes when required by the SIP dialog and closes the pinholes when the SIP call is completed. The FortiGate opens new pinholes for each SIP call.

Each RTP pinhole actually includes two port numbers. The RTP port number as defined in the SIP message and an RTCP port number, which is the RTP port number plus 1. For example, if the SIP call used RTP port 3346 the FortiGate would create a pinhole for ports 3346 and 3347.

## SIP messages and media protocols

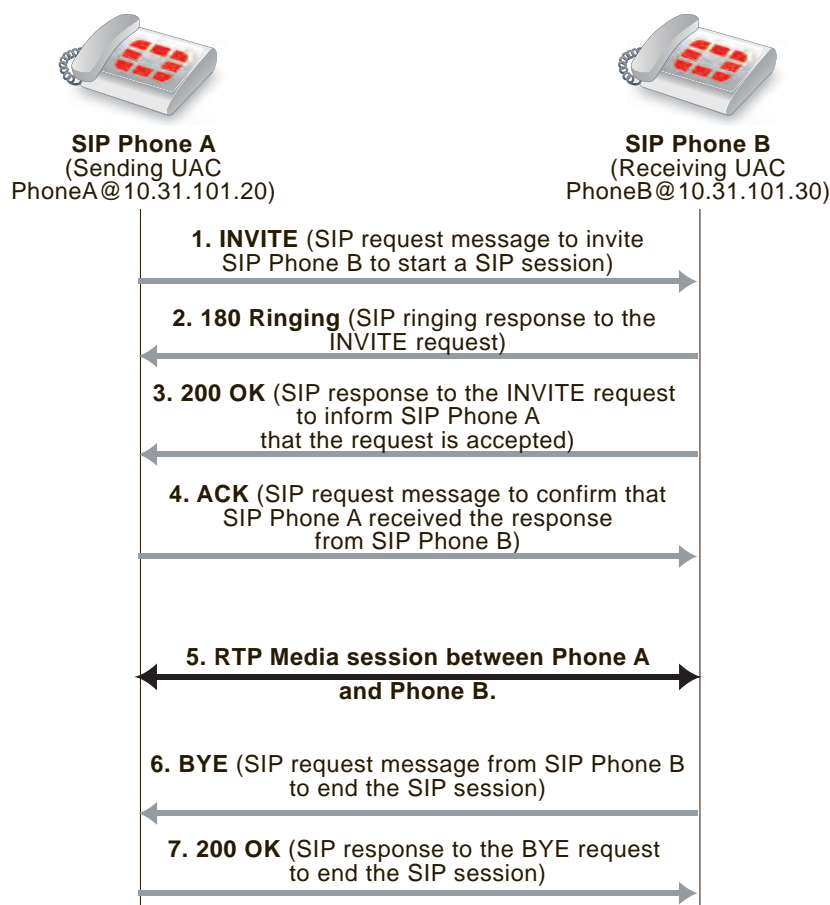

This section provides an overview of SIP messages and how they communicate information about SIP sessions and how SDP, RTP, and RTCP fits in with SIP communications.

SIP uses clear text messages to start, maintain, and end media sessions between SIP user agent clients (UACs) and user agent servers (UASs). These messages form a SIP dialog. A typical SIP dialog begins with an INVITE request message sent from a UAC to another UAC or to a UAS. The first INVITE request message attempts to start a SIP call and includes information about the sending UAC and the receiving UAC as well as information about the communication session.

If only two UACs are involved as shown below, the receiving UAC (Phone B) responds with a 180 Ringing and then a 200 OK SIP response message that informs Phone A that Phone B received and accepted the request. Phone A then sends an ACK message to notify Phone B that the SIP response was received. Phone A and Phone B can then participate in the RTP media session set up by the SIP messages.

When the phone call is complete, one of the UACs (in the example Phone B) hangs up sending a BYE request message to Phone A. Phone A then sends a 200 OK response to Phone B acknowledging that the session has ended.

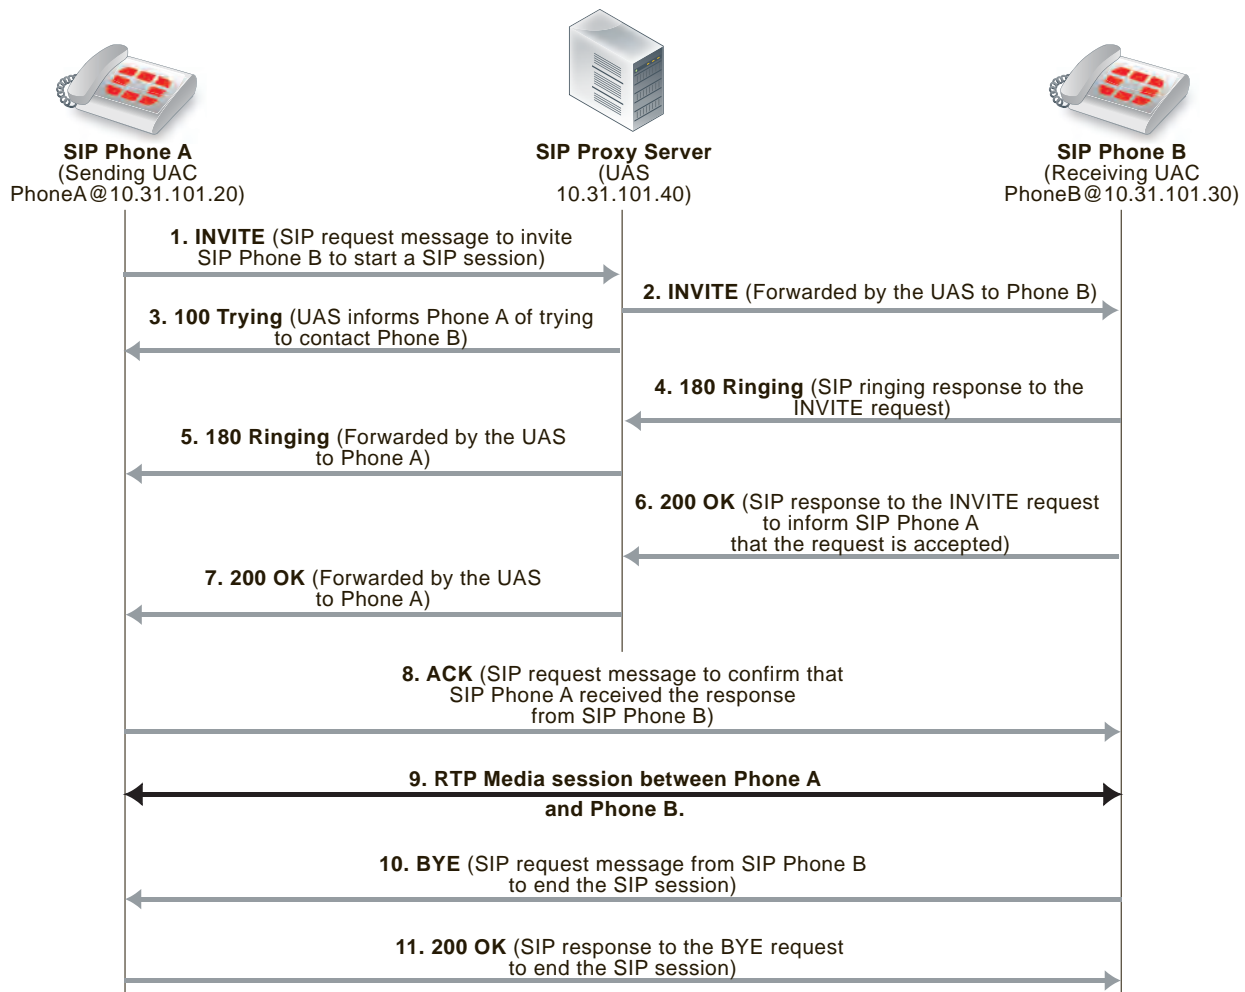

### Basic SIP dialog between two UACs

If a UAS in the form of a SIP proxy server is involved, similar messages are sent and received, but the proxy server participates as an intermediary in the initial call setup. In the example below the SIP proxy server receives the INVITE request from Phone A and forwards it to Phone B. The proxy server then sends a 100 Trying response to Phone A. Phone B receives the INVITE request and responds with a 180 Ringing and then a 200 OK SIP response message. These messages are received by the proxy server and forwarded to Phone A to notify Phone A that Phone B received and accepted the request. Phone A then sends an ACK message to notify Phone B that the SIP response was received. This response is received by the proxy server and forwarded to Phone B. Phone A and Phone B can then participate in the media session independently of the proxy server.

When the phone call is complete Phone B hangs up sending a BYE request message to Phone A. Phone A then sends a 200 OK response to Phone B acknowledging that the session has ended.

### Basic SIP dialog between UACs with a SIP proxy server UAS

The SIP messages include SIP headers that contain names and addresses of Phone A, Phone B and the proxy server. This addressing information is used by the UACs and the proxy server during the call set up.

The SIP message body includes Session Description Protocol (SDP) statements that Phone A and Phone B use to establish the media session. The SDP statements specify the type of media stream to use for the session (for example, audio for SIP phone calls) and the protocol to use for the media stream (usually the Real Time Protocol (RTP) media streaming protocol).

Phone A includes the media session settings that it would like to use for the session in the INVITE message. Phone B includes its response to these media settings in the 200 OK response. Phone A's ACK response confirms the settings that Phone A and Phone B then use for the media session.

## Hardware accelerated RTP processing

FortiGates can offload RTP packet processing to network processor (NP) interfaces. This acceleration greatly enhances the overall throughput and resulting in near speed RTP performance.

## SIP request messages

SIP sessions always start with a SIP request message (also just called a SIP request). SIP request messages also establish, maintain, and terminate SIP communication sessions. The following table lists some common SIP request message types.

### Common SIP request message types

Message Type	Description
<b>INVITE</b>	A client sends an INVITE request to invite another client to participate in a multimedia session. The INVITE request body usually contains the description of the session.
<b>ACK</b>	The originator of an INVITE message sends an ACK request to confirm that the final response to an INVITE request was received. If the INVITE request did not contain the session description, it must be included in the ACK request.
<b>PRACK</b>	In some cases, SIP uses provisional response messages to report on the progress of the response to a SIP request message. The provisional response messages are sent before the final SIP response message. Similar to an ACK request message, a PRACK request message is sent to acknowledge that a provisional response message has been received.
<b>OPTIONS</b>	The UA uses OPTIONS messages to get information about the capabilities of a SIP proxy. The SIP proxy server replies with a description of the SIP methods, session description protocols, and message encoding that are supported.
<b>BYE</b>	A client sends a BYE request to end a session. A BYE request from either end of the SIP session terminates the session.
<b>CANCEL</b>	A client sends a CANCEL request to cancel a previous INVITE request. A CANCEL request has no effect if the SIP server processing the INVITE sends a final response to the INVITE before receiving the CANCEL.
<b>REGISTER</b>	A client sends a REGISTER request to a SIP registrar server with information about the current location (IP address and so on) of the client. A SIP registrar server saves the information it receives in REGISTER requests and makes this information available to any SIP client or server attempting to locate the client.

Message Type	Description
<b>Info</b>	For distributing mid-session signaling information along the signaling path for a SIP call. I
<b>Subscribe</b>	For requesting the current state and state updates of a remote node.
<b>Notify</b>	Informs clients and servers of changes in state in the SIP network.
<b>Refer</b>	Refers the recipient (identified by the Request-URI) to a third party according to the contact information in the request.
<b>Update</b>	Opens a pinhole for new or updated SDP information.
<b>Response codes (1xx, 202, 2xx, 3xx, 4xx, 5xx, 6xx)</b>	Indicates the status of a transaction. For example: 200 OK, 202 Accepted, or 400 Bad Request.

## SIP response messages

SIP response messages (often just called SIP responses) provide status information in response to SIP request messages. All SIP response messages include a response code and a reason phrase. There are five SIP response message classes. They are described below.

There are also two types of SIP response messages, provisional and final. Final response messages convey the result of the request processing, and are sent reliably. Provisional responses provide information on the progress of the request processing, but may not be sent reliably. Provisional response messages start with 1xx and are also called informational response messages.

### Informational (or provisional)

Informational or provisional responses indicate that a request message was received and imply that the endpoint is going to process the request. Information messages may not be sent reliably and may not require an acknowledgement.

If the SIP implementation uses Provisional Response Acknowledgment (PRACK) ([RFC 3262](#)) then informational or provisional messages are sent reliably and require a PRACK message to acknowledge that they have been received.

Informational responses can contain the following reason codes and reason phrases:

```
100 Trying
180 Ringing
181 Call is being forwarded
182 Queued
183 Session progress
```

### Success

Success responses indicate that a request message was received, understood, and accepted. Success responses can contain the following reason codes and reason phrases:

```
200 OK
```

202 Accepted

## Redirection

Redirection responses indicate that more information is required for the endpoint to respond to a request message. Redirection responses can contain the following reason codes and reason phrases:

300 Multiple choices  
301 Moved permanently  
302 Moved temporarily  
305 Use proxy  
380 Alternative service

## Client error

Client error responses indicate that a request message was received by a server that contains syntax that the server cannot understand (i.e. contains a syntax error) or cannot comply with. Client error responses include the following reason codes and reason phrases:

400 Bad request	401 Unauthorized
402 Payment required	403 Forbidden
404 Not found	405 Method not allowed
406 Not acceptable	407 Proxy authentication required
408 Request time-out	409 Conflict
410 Gone	411 Length required
413 Request entity too large	414 Request-URL too large
415 Unsupported media type	420 Bad extension
480 Temporarily not available	
481 Call leg/transaction does not exist	
482 Loop detected	
484 Address incomplete	483 Too many hops
486 Busy here	485 Ambiguous
488 Not acceptable here	487 Request canceled

## Server error

Server error responses indicate that a server was unable to respond to a valid request message. Server error responses include the following reason codes and reason phrases:

500 Server internal error  
501 Not implemented  
502 Bad gateway  
502 Service unavailable  
504 Gateway time-out  
505 SIP version not supported

## Global failure

Global failure responses indicate that there are no servers available that can respond to a request message. Global failure responses include the following reason codes and reason phrases:

600 Busy everywhere  
603 Decline  
604 Does not exist anywhere  
606 Not acceptable

## SIP message start line

The first line in a SIP message is called the start line. The start line in a request message is called the request-line and the start line in a response message is called the status-line.

**Request-line** The first line of a SIP request message. The request-line includes the SIP message type, the SIP protocol version, and a Request URI that indicates the user or service to which this request is being addressed. The following example request-line specifies the INVITE message type, the address of the sender of the message (inviter@example.com), and the SIP version:

```
INVITE sip:inviter@example.com SIP/2.0
```

**Status-line** The first line of a SIP response message. The status-line includes the SIP protocol version, the response code, and the reason phrase. The example status-line includes the SIP version, the response code (200) and the reason phrase (OK).

```
SIP/2.0 200 OK
```

## SIP headers

Following the start line, SIP messages contain SIP headers (also called SIP fields) that convey message attributes and to modify message meaning. SIP headers are similar to HTTP header fields and always have the following format:

```
<header_name>:<value>
```

SIP messages can include the SIP headers listed in the following table:

### SIP headers

SIP Header	Description
<b>Allow</b>	Lists the set of SIP methods supported by the UA generating the message. All methods, including ACK and CANCEL, understood by the UA MUST be included in the list of methods in the Allow header field, when present. For example:  Allow: INVITE, ACK, OPTIONS, CANCEL, BYE
<b>Call-ID</b>	A globally unique identifier for the call, generated by the combination of a random string and the sender's host name or IP address. The combination of the To, From, and Call-ID headers completely defines a peer-to-peer SIP relationship between the sender and the receiver. This relationship is called a SIP dialog.  Call-ID: ddeg45e793@10.31.101.30

SIP Header	Description
<b>Contact</b>	<p>Included in SIP request messages, the Contact header contains the SIP URI of the sender of the SIP request message. The receiver uses this URI to contact the sender. For example:</p> <pre>Contact: Sender &lt;sip:sender@10.31.100.20&gt;t</pre>
<b>Content-Length</b>	<p>The number of bytes in the message body (in bytes).</p> <pre>Content-Length: 126</pre>
<b>Content-Type</b>	<p>In addition to SIP headers, SIP messages include a message body that contains information about the content or communication being managed by the SIP session. The Content-Type header specifies what the content of the SIP message is. For example, if you are using SIP with SDP, the content of the SIP message is SDP code.</p> <pre>Content-Type: application/sdp</pre>
<b>CSeq</b>	<p>The command sequence header contains a sequence integer that is increased for each new SIP request message (but is not incremented in the response message). This header also includes the request name found in the request message request-line. For example:</p> <pre>CSeq: 1 INVITE</pre>
<b>Expires</b>	<p>Gives the relative time after which the message (or content) expires. The actual time and how the header is used depends on the SIP method. For example:</p> <pre>Expires: 5</pre>
<b>From</b>	<p>Identifies the sender of the message. Responses to a message are sent to the address of the sender. The following example includes the sender's name (<i>Sender</i>) and the sender's SIP address (<i>sender@10.31.101.20</i>):</p> <pre>From: Sender &lt;sip:sender@10.31.101.20&gt;</pre>
<b>Max-forwards</b>	<p>An integer in the range 0-255 that limits the number of proxies or gateways that can forward the request message to the next downstream server. Also called the number of hops, this value is decreased every time the message is forwarded. This can also be useful when the client is attempting to trace a request chain that appears to be failing or looping in mid-chain.</p> <pre>For example: Max-Forwards: 30</pre>
<b>P-Asserted-Identity</b>	<p>The P-Asserted-Identity header is used among trusted SIP entities to carry the identity of the user sending a SIP message as it was verified by authentication. See <a href="#">RFC 3325</a>. The header contains a SIP URI and an optional display-name, for example:</p> <pre>P-Asserted-Identity: "Example Person" &lt;sip:10.31.101.50&gt;</pre>

SIP Header	Description
<b>RAck</b>	<p>Sent in a PRACK request to support reliability of information or provisional response messages. It contains two numbers and a method tag. For example:</p> <pre>RAck: 776656 1 INVITE</pre>
<b>Record-Route</b>	<p>Inserted into request messages by a SIP proxy to force future requests to be routed through the proxy. In the following example, the host at IP address 10.31.101.50 is a SIP proxy. The <code>lr</code> parameter indicates the URI of a SIP proxy in Record-Route headers.</p> <pre>Record-Route: &lt;sip:10.31.101.50;lr&gt;</pre>
<b>Route</b>	<p>Forces routing for a request message through one or more SIP proxies. The following example includes two SIP proxies:</p> <pre>Route: &lt;sip:172.20.120.10;lr&gt;, &lt;sip:10.31.101.50;lr&gt;</pre>
<b>RSeq</b>	<p>The RSeq header is used in information or provisional response messages to support reliability of informational response messages. The header contains a single numeric value. For example:</p> <pre>RSeq: 33456</pre>
<b>To</b>	<p>Identifies the receiver of the message. The address in this field is used to send the message to the receiver. The following example includes the receiver's name (<code>Receiver</code>) and the receiver's SIP address (<code>receiver@10.31.101.30</code>):</p> <pre>To: Receiver &lt;sip:receiver@10.31.101.30&gt;</pre>
<b>Via</b>	<p>Indicates the SIP version and protocol to be used for the SIP session and the address to which to send the response to the message that contains the Via field. The following example Via field indicates to use SIP version 2, UDP for media communications, and to send the response to 10.31.101.20 using port 5060.</p> <pre>Via: SIP/2.0/UDP 10.31.101.20:5060</pre>

## The SIP message body and SDP session profiles

The SIP message body describes the session to be initiated. For example, in a SIP phone call the body usually includes audio codec types, sampling rates, server IP addresses and so on. For other types of SIP session the body could contain text or binary data of any type which relates in some way to the session. The message body is included in request and response messages.

Two possible SIP message body types:

- Session Description Protocol (SDP), most commonly used for SIP VoIP.
- Multipurpose Internet Mail Extensions (MIME)

SDP is most often used for VoIP and FortiGates support SDP content in SIP message bodies. SDP is a text-based protocol used by SIP to control media sessions. SDP does not deliver media but provides a session profile

that contains media details, transport addresses, parameter negotiation, and other session description metadata for the participants in a media session. The participants use the information in the session profile to negotiate how to communicate and to manage the media session. SDP is described by [RFC 4566](#).

An SDP session profile always contains session information and may contain media information. Session information appears at the start of the session profile and media information (using the `m=` attribute) follows.

SDP session profiles can include the attributes listed in the following table.

#### SDP session profile attributes

Attribute	Description
<b>a=</b>	Attributes to extend SDP in the form <code>a=&lt;attribute&gt;</code> or <code>a=&lt;attribute&gt;:&lt;value&gt;</code> .
<b>b=</b>	Contains information about the bandwidth required for the session or media in the form <code>b=&lt;bandwidth_type&gt;:&lt;bandwidth&gt;</code> .
<b>c=</b>	Connection data about the session including the network type (usually IN for Internet), address type (IPv4 or IPv6), the connection source address, and other optional information. For example:  <code>c=IN IPv4 10.31.101.20</code>
<b>i=</b>	A text string that contains information about the session. For example:  <code>i=A audio presentation about SIP</code>
<b>k=</b>	Can be used to convey encryption keys over a secure and trusted channel. For example:  <code>k=clear:444gdduudjffdee</code>

Attribute	Description
<b>m=</b>	<p>Media information, consisting of one or more lines all starting with <b>m=</b> and containing details about the media including the media type, the destination port or ports used by the media, the protocol used by the media, and a media format description.</p> <pre>m=audio 49170 RTP 0 3 m-video 3345/2 udp 34 m-video 2910/2 RTP/AVP 3 56</pre> <p>Multiple media lines are needed if SIP is managing multiple types of media in one session (for example, separate audio and video streams).</p> <p>Multiple ports for a media stream are indicated using a slash. <code>3345/2 udp</code> means UDP ports 3345 and 3346. Usually RTP uses even-numbered ports for data with the corresponding one-higher odd ports used for the RTCP session belonging to the RTP session. So <code>2910/2 RTP/AVP</code> means ports 2910 and 2912 are used for RTP and 2911 and 2913 are used for RTCP.</p> <p>Media types include <code>udp</code> for an unspecified protocol that uses UDP, <code>RTP</code> or <code>RTP/AVP</code> for standard RTP and <code>RTP/SAVP</code> for secure RTP.</p>
<b>o=</b>	<p>The sender's username, a session identifier, a session version number, the network type (usually IN for Internet), the address type (for example, IPv4 or IPv6), and the sending device's IP address. The <b>o=</b> field becomes a universal identifier for this version of this session description. For example:</p> <pre>o=PhoneA 5462346 332134 IN IP4 10.31.101.20</pre>
<b>r=</b>	<p>Repeat times for a session. Used if a session will be repeated at one or more timed intervals. Not normally used for VoIP calls. The times can be in different formats. For example:</p> <pre>r=7d 1h 0 25h r=604800 3600 0 90000</pre>
<b>s=</b>	<p>Any text that describes the session or <b>s=</b> followed by a space. For example:</p> <pre>s=Call from inviter</pre>
<b>t=</b>	<p>The start and stop time of the session. Sessions with no time restrictions (most VoIP calls) have a start and stop time of 0.</p> <pre>t=0 0</pre>
<b>v=</b>	<p>SDP protocol version. The current SDP version is 0 so the <b>v=</b> field is always:</p> <pre>v=0</pre>
<b>z=</b>	<p>Time zone adjustments. Used for scheduling repeated sessions that span the time between changing from standard to daylight savings time.</p> <pre>z=2882844526 -1h 2898848070 0</pre>

## Example SIP messages

The following example SIP INVITE request message was sent by PhoneA to PhoneB. The first nine lines are the SIP headers. The SDP profile starts with v=0 and the media part of the session profile is the last line, starting with m=.

```
INVITE sip:PhoneB@172.20.120.30 SIP/2.0
Via: SIP/2.0/UDP 10.31.101.50:5060
From: PhoneA <sip:PhoneA@10.31.101.20>
To: PhoneB <sip:PhoneB@172.20.120.30>
Call-ID: 314159@10.31.101.20
CSeq: 1 INVITE
Contact: sip:PhoneA@10.31.101.20
Content-Type: application/sdp
Content-Length: 124
v=0
o=PhoneA 5462346 332134 IN IP4 10.31.101.20
s=Let's Talk
t=0 0
c=IN IP4 10.31.101.20
m=audio 49170 RTP 0 3
```

The following example shows a possible 200 OK SIP response message in response to the previous INVITE request message. The response includes 200 OK which indicates success, followed by an echo of the original SIP INVITE request followed by PhoneB's SDP profile.

```
SIP/2.0 200 OK
Via: SIP/2.0/UDP 10.31.101.50:5060
From: PhoneA <sip:PhoneA@10.31.101.20>
To: PhoneB <sip:PhoneB@172.20.120.30>
Call-ID: 314159@10.31.101.20
CSeq: 1 INVITE
Contact: sip:PhoneB@10.31.101.30
Content-Type: application/sdp
Content-Length: 107
v=0
o=PhoneB 124333 67895 IN IP4 172.20.120.30
s=Hello!
t=0 0
c=IN IP4 172.20.120.30
m=audio 3456 RTP 0
```

SIP can support multiple media streams for a single SIP session. Each media stream will have its own c= and m= lines in the body of the message. For example, the following message includes three media streams:

```
INVITE sip:PhoneB@172.20.120.30 SIP/2.0
Via: SIP/2.0/UDP 10.31.101.20:5060
From: PhoneA <sip:PhoneA@10.31.101.20>
To: PhoneB <sip:PhoneB@172.20.120.30>
Call-ID: 314159@10.31.101.20
CSeq: 1 INVITE
Contact: sip:PhoneA@10.31.101.20
Content-Type: application/sdp
Content-Length: 124
v=0
o=PhoneA 5462346 332134 IN IP4 10.31.101.20
s=Let's Talk
t=0 0
```

```
c=IN IP4 10.31.101.20
m=audio 49170 RTP 0 3
c=IN IP4 10.31.101.20
m=audio 49172 RTP 0 3
c=IN IP4 10.31.101.20
m=audio 49174 RTP 0 3
```

## The SIP session helper

The SIP session-helper is a high-performance solution that provides basic support for SIP calls passing through the FortiGate by opening SIP and RTP pinholes and by performing NAT of the addresses in SIP messages.

The SIP session helper:

- Understands SIP dialog messages.
- Keeps the states of the SIP transactions between SIP UAs and SIP servers.
- Translates SIP header and SDP information to account for NAT operations performed by the FortiGate.
- Opens up and closes dynamic SIP pinholes for SIP signalling traffic.
- Opens up and closes dynamic RTP and RTSP pinholes for RTP and RTSP media traffic.
- Provides basic SIP security as an access control device.
- Uses the intrusion protection (IPS) engine to perform basic SIP protocol checks.

## SIP session helper configuration overview

By default FortiOS uses the SIP ALG for SIP traffic. If you want to use the SIP session helper you need to enter the following command:

```
config system settings
 set default-voip-alg-mode kernel-helper-based
end
```

The SIP session helper is set to listen for SIP traffic on TCP or UDP port 5060. SIP sessions using port 5060 accepted by a security policy that does not include a VoIP profile are processed by the SIP session helper.

You can enable and disable the SIP session helper, change the TCP or UDP port that the session helper listens on for SIP traffic, and enable or disable SIP NAT tracing. If the FortiGate is operating with multiple VDOMs, each VDOM can have a different SIP session helper configuration.

To have the SIP session helper process SIP sessions you need to add a security policy that accepts SIP sessions on the configured SIP UDP or TCP ports. The security policies can have service set to ALL, or to the SIP pre-defined firewall service, or a custom firewall service. The SIP pre-defined firewall service restricts the security policy to only accepting sessions on UDP port 5060.

If NAT is enabled for security policies that accept SIP traffic, the SIP session helper translates addresses in SIP headers and in the RDP profile and opens up pinholes as required for the SIP traffic. This includes security policies that perform source NAT and security policies that contain virtual IPs that perform destination NAT and port forwarding. No special SIP configuration is required for this address translation to occur, it is all handled automatically by the SIP session helper according to the NAT configuration of the security policy that accepts the SIP session.

To use the SIP session helper you must not add a VoIP profile to the security policy. If you add a VoIP profile, SIP traffic bypasses the SIP session helper and is processed by the SIP ALG.

In most cases you would want to use the SIP ALG since the SIP session helper provides limited functionality. However, the SIP session helper is available and can be useful for high-performance solutions where a high level of SIP security is not a requirement.

## Disabling and enabling the SIP session helper

You can use the following steps to disable the SIP session helper. You might want to disable the SIP session helper if you don't want the FortiGate to apply NAT or other SIP session help features to SIP traffic. With the SIP session helper disabled, the FortiGate can still accept SIP sessions if they are allowed by a security policy, but the FortiGate will not be able to open pinholes or NAT the addresses in the SIP messages.

### To disable the sip session helper

1. Enter the following command to find the sip session helper entry in the session-helper list:

```
show system session-helper
.
.
.
edit 13
 set name sip
 set port 5060
 set protocol 17
next
.
.
.
```

This command output shows that the sip session helper listens in UDP port 5060 for SIP sessions.

2. Enter the following command to delete session-helper list entry number 13 to disable the sip session helper:

```
config system session-helper
 delete 13
end
```

If you want to use the SIP session helper you can verify whether it is enabled or disabled using the `show system session-helper` command.

You do not have to disable the SIP session helper to use the SIP ALG.

If the SIP session helper has been disabled by being removed from the session-helper list you can use the following command to enable the SIP session helper by adding it back to the session helper list:

```
config system session-helper
 edit 0
 set name sip
 set port 5060
 set protocol 17
 end
```

## Changing the port numbers that the SIP session helper listens on

You can use the following command to change the port number that the SIP session helper listens on for SIP traffic to 5064. The SIP session helper listens on the same port number for UDP and TCP SIP sessions. In this example, the SIP session helper is session helper 13:

```
config system session-helper
 edit 13
 set port 5064
 end
```

The `config system settings options sip-tcp-port, sip-udp-port, and sip-ssl-port` control the ports that the SIP ALG listens on for SIP sessions. See [Changing the port numbers that the SIP ALG listens on on page 3512](#).

Your FortiGate may use a different session helper number for SIP. Enter the following command to view the session helpers:

```
show system session-helper
.
.
.
edit 13
 set name sip
 set port 5060
 set protocol 17
end
.
.
.
```

## Configuration example: SIP session helper in Transparent Mode

The figure below shows an example SIP network consisting of a FortiGate operating in Transparent mode between two SIP phones. Since the FortiGate is operating in Transparent mode both phones are on the same network and the FortiGate and the SIP session helper does not perform NAT. Even though the SIP session helper is not performing NAT you can use this configuration to apply SIP session helper security features to the SIP traffic.

The FortiGate requires two security policies that accept SIP packets. One to allow SIP Phone A to start a session with SIP Phone B and one to allow SIP Phone B to start a session with SIP Phone A.

### SIP network with FortiGate in Transparent mode

## General configuration steps

The following general configuration steps are required for this SIP configuration that uses the SIP session helper. This example includes security policies that specifically allow SIP sessions using UDP port 5060 from Phone A to Phone B and from Phone B to Phone A. In most cases you would have more than two phones so would use more general security policies. Also, you can set the firewall service to ALL to allow traffic other than SIP on UDP port 5060.

This example assumes that you have entered the following command to enable using the SIP session helper:

```
config system settings
 set default-voip-alg-mode kernel-helper-based
end
```

1. Add firewall addresses for Phone A and Phone B.
2. Add a security policy that accepts SIP sessions initiated by Phone A.
3. Add a security policy that accepts SIP sessions initiated by Phone B.

## Configuration steps - GUI

### To add firewall addresses for the SIP phones

1. Go to **Policy & Objects > Addresses**.
2. Select **Create New > Address** to add the following addresses for Phone A and Phone B:

Category	Address
Name	Phone_A
Type	IP/Netmask
Subnet / IP Range	10.31.101.20/255.255.255.255
Interface	port1

Category	Address
Name	Phone_B
Type	IP/Netmask
Subnet / IP Range	10.31.101.30/255.255.255.255
Interface	port2

### To add security policies to accept SIP sessions

1. Go to **Policy & Objects > IPv4 Policy**.
2. Select **Create New** to add a security policy.
3. Add a security policy to allow Phone A to send SIP request messages to Phone B:

<b>Incoming Interface</b>	port1
<b>Outgoing Interface</b>	port2
<b>Source</b>	Phone_A
<b>Destination Address</b>	Phone_B
<b>Schedule</b>	always
<b>Service</b>	SIP
<b>Action</b>	ACCEPT

4. Select **OK**.

5. Add a security policy to allow Phone B to send SIP request messages to Phone A:

<b>Incoming Interface</b>	port2
<b>Outgoing Interface</b>	port1
<b>Source Address</b>	Phone_B
<b>Destination Address</b>	Phone_A
<b>Schedule</b>	always
<b>Service</b>	SIP
<b>Action</b>	ACCEPT

6. Select **OK**.

## Configuration steps - CLI

### To add firewall addresses for Phone A and Phone B and security policies to accept SIP sessions

1. Enter the following command to add firewall addresses for Phone A and Phone B.

```
config firewall address
edit Phone_A
set associated interface port1
set type ipmask
set subnet 10.31.101.20 255.255.255.255
next
edit Phone_B
set associated interface port2
set type ipmask
set subnet 10.31.101.30 255.255.255.255
end
```

2. Enter the following command to add security policies to allow Phone A to send SIP request messages to Phone B and Phone B to send SIP request messages to Phone A.

```
config firewall policy
edit 0
set srcintf port1
```

```

 set dstintf port2
 set srcaddr Phone_A
 set dstaddr Phone_B
 set action accept
 set schedule always
 set service SIP
 next
 edit 0
 set srcintf port2
 set dstintf port1
 set srcaddr Phone_B
 set dstaddr Phone_A
 set action accept
 set schedule always
 set service SIP
 set utm-status enable
 end

```

## SIP session helper diagnose commands

You can use the `diagnose sys sip` commands to display diagnostic information for the SIP session helper.

Use the following command to set the debug level for the SIP session helper. Different debug masks display different levels of detail about SIP session helper activity.

```
diagnose sys sip debug-mask <debug_mask_int>
```

Use the following command to display the current list of SIP dialogs being processed by the SIP session help. You can also use the `clear` option to delete all active SIP dialogs being processed by the SIP session helper.

```
diagnose sys sip dialog {clear | list}
```

Use the following command to display the current list of SIP NAT address mapping tables being used by the SIP session helper.

```
diagnose sys sip mapping list
```

Use the following command to display the current SIP session helper activity including information about the SIP dialogs, mappings, and other SIP session help counts. This command can be useful to get an overview of what the SIP session helper is currently doing.

```
diagnose sys sip status
```

## The SIP ALG

In most cases you should use the SIP Application Layer Gateway (ALG) for processing SIP sessions. The SIP ALG provides the same basic SIP support as the SIP session helper. Additionally, the SIP ALG provides a wide range of features that protect your network from SIP attacks, apply rate limiting to SIP sessions, check the syntax of SIP and SDP content of SIP messages, and provide detailed logging and reporting of SIP activity.

By default all SIP traffic is processed by the SIP ALG. If the policy that accepts the SIP traffic includes a VoIP profile the SIP traffic is processed by that profile. If the policy does not include a SIP profile the SIP traffic is processed by the SIP ALG using the default VoIP profile.

If a FortiGate or a VDOM has been configured to use the SIP session helper, you can change this behavior to the default configuration of using the SIP ALG with the following command:

```
config system settings
```

```
set default-voip-alg-mode proxy-based
end
```

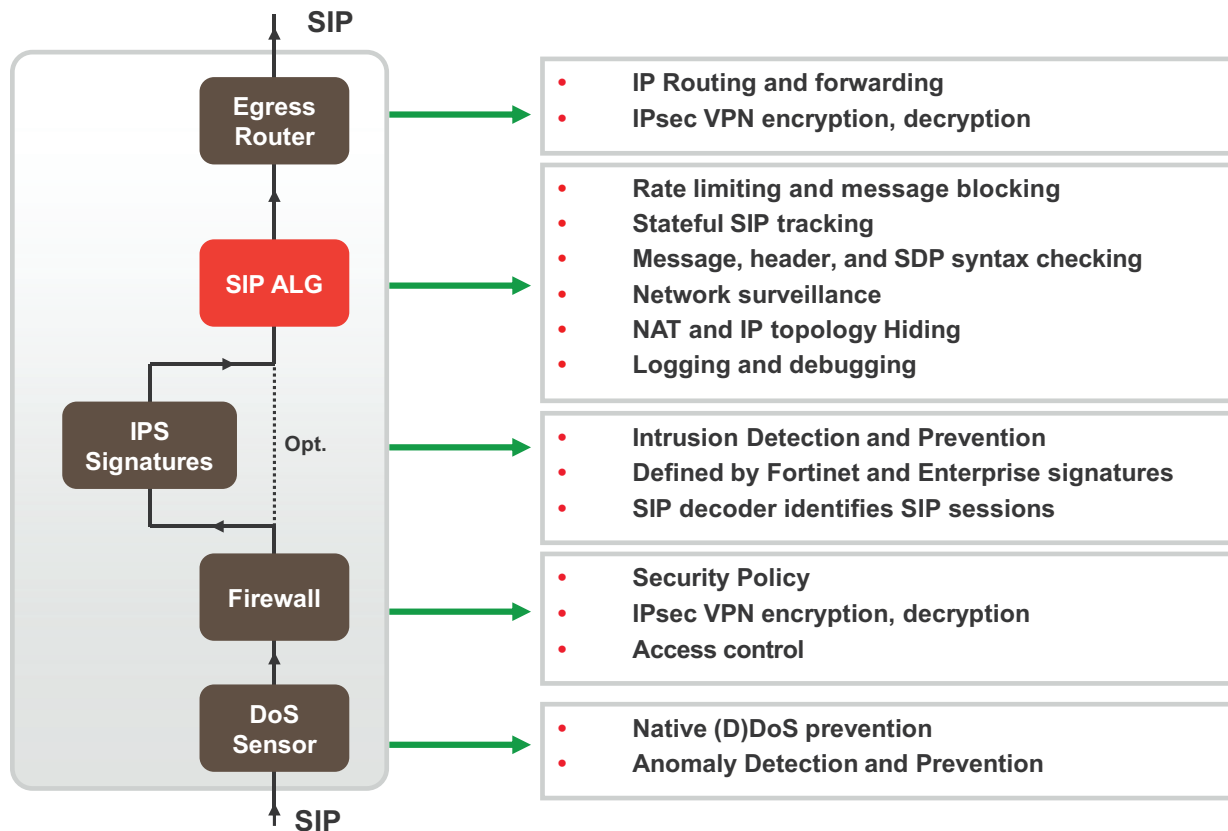

From the GUI you can only configure VoIP security profiles and add them to security policies if VoIP is turned on under **System > Feature Visibility** and if the **Inspection Mode** is set to **Proxy**. However, you can always configure VoIP profiles and add them to security profiles from the CLI. And if the `default-voip-alg` mode is set to `proxy-based` the default SIP profile will still be used even if VoIP security profiles are not visible from the GUI.

As shown in the figure below, the FortiGate SIP ALG intercepts SIP packets after they have been routed by the routing module, accepted by a security policy and passed through DoS and IPS Sensors (if DoS and IPS are enabled). The ALG raises SIP packets to the application layer, analyzes the SIP and SDP addressing information in the SIP messages, makes adjustments (for example, NAT) to this addressing if required, and then sends the packets out the egress interface to their destination.

The SIP ALG provides:

- All the same features as the SIP session helper including NAT and SIP and RTP Pinholes.
- In addition for the ALG you can enable or disable RTP pinholing, SIP register pinholing and SIP contact pinholing. In a signaling only environment where the RTP stream bypasses the FortiGate, you can disable RTP pinholing to improve performance.
- SIP TCP and UDP support
- SIP Message order checking
- Configurable Header line length maximums

The SIP ALG works at the application level after ingress packets are accepted by a security policy

- Message fragment assembly (TCP)
- If SIP messages are fragmented across multiple packets, the FortiGate assembles the fragments, does inspection and pass the message in its entirety to the SIP server as one packet. This offloads the server from doing all the TCP processing of fragments.
- L4 Protocol Translation
- Message Flood Protection
- Protects a SIP server from intentional or unintentional DoS of flooding INVITE, REGISTER, and other SIP methods by allowing control of the rate that these messages pass through the FortiGate.
- SIP message type filtering
- The FortiGate can prevent specified SIP message types from passing through the FortiGate to a SIP server. For example In a voice only SIP implementation, there may be no need to permit a SUBSCRIBE message to ever make it's way to the SIP call processor. Also, if a SIP server cannot process some SIP message types you can use SIP message type filtering to block them. For example, a SIP server could have a bug that prevents it from processing certain SIP messages. In this case you can temporarily block these message types until problem with the SIP server has been fixed.
- SIP statistics and logging
- SIP over IPv6
- SIP over SSL/TLS
- Deep SIP message syntax checking (also called deep SIP header inspection or SIP fuzzing protection). Prevents attacks that use malformed SIP messages. Can check many SIP headers and SDP statements. Configurable bypass and modification options.

- Hosted NAT traversal, Resolves IP address issue in SIP and SDP lines due to NAT-PT in far end firewall. Important feature for VoIP access networks.
- SIP High Availability (HA), including active-passive clustering and session pickup (session failover) for SIP sessions.
- Geographical Redundancy. In an HA configuration, if the active SIP server fails (missing SIP heartbeat messages or SIP traffic) SIP sessions can be redirected to a secondary SIP server in another location.
- SIP per request method message rate limitation with configurable threshold for SIP message rates per request method. Protects SIP servers from SIP overload and DoS attacks.
- RTP Bypass, Supports configurations with and without RTP pinholing. May inspect and protect SIP signaling only.
- SIP NAT with IP address conservation. Performs SIP and RTP aware IP Network Address translation. Preserves the lost IP address information in the SDP profile i= line for later processing/debugging in the SIP server. See [NAT with IP address conservation on page 3541](#).
- IP topology hiding
- The IP topology of a network can be hidden through NAT and NAPT manipulation of IP and SIP level addressing. For example, see [SIP NAT scenario: source address translation \(source NAT\) on page 3527](#).
- SIP inspection without address translation
- The SIP ALG inspects SIP messages but addresses in the messages are not translated. This feature can be applied to a FortiGate operating in Transparent mode or in NAT mode. In Transparent mode you add normal Transparent mode security policies that enable the SIP ALG and include a VoIP profile that causes the SIP ALG to inspect SIP traffic as required. For an example configuration, see [Configuration example: SIP in Transparent Mode on page 3517](#).
- For a FortiGate operating in NAT mode, if SIP traffic can pass between different networks without requiring NAT because is supported by the routing configuration, you can add security policies that accept SIP traffic without enabling NAT. In the VoIP profile you can configure the SIP ALG to inspect SIP traffic as required.

## Enabling VoIP support from the GUI

### SIP ALG configuration overview

To apply the SIP ALG, you add a SIP VoIP profile to a security policy that accepts SIP sessions. All SIP sessions accepted by the security policy will be processed by the SIP ALG using the settings in the VoIP profile. The VoIP profile contains settings that are applied to SIP, Session Initiation Protocol for Instant Messaging and Presence Leveraging Extensions (SIMPLE) and Skinny Call Control Protocol (SCCP) sessions. All SCCP sessions accepted by the security policy are also processed by the ALG. You configure SIP and SCCP settings separately. SIP settings also apply to SIMPLE sessions.

### VoIP profiles

You can customize the default VoIP profile or add new VoIP profiles.

To add a new VoIP profile from the GUI go to **Security Profiles > VoIP** and select **Create New** (the + button).

For SIP, from the GUI you can configure the VoIP profile to limit the number of SIP REGISTER and INVITE requests. Many additional options for configuring how the ALG processes SIP sessions are available from the CLI.

For SCCP you can limit the call setup time. Additional SCCP options are available from the CLI.

Use the following command to add a VoIP profile named VoIP\_Pro\_1 from the CLI:

```
config voip profile
```

```
edit VoIP_Pro_1
end
```

FortiGates include two pre-defined VoIP profiles. On the GUI these profiles look identical. However, the CLI-only settings result in the following functionality.

<b>default</b>	<p>The most commonly used VoIP profile. This profile enables both SIP and SCCP and places the minimum restrictions on what calls will be allowed to negotiate. This profile allows normal SCCP, SIP and RTP sessions and enables the following security settings:</p> <ul style="list-style-type: none"> <li>• <code>strict-register</code> to open smaller more secure pinholes (see <a href="#">Enhancing SIP pinhole security on page 3547</a>).</li> <li>• <code>block-long-lines</code> to block SIP messages with lines that exceed maximum line lengths.</li> <li>• <code>block-unknown</code> to block unrecognized SIP request messages.</li> <li>• <code>open-record-route-pinhole</code> to open pinholes for Record-Route messages.</li> <li>• <code>nat-trace</code> (see <a href="#">NAT with IP address conservation on page 3541</a>).</li> <li>• <code>contact-fixup</code> perform NAT on the IP addresses and port numbers in SIP headers in SIP CONTACT messages even if they don't match the session's IP address and port numbers.</li> <li>• <code>ips-rtp</code> to enable IPS in security policies that also accept SIP sessions to protect the SIP traffic from SIP-based attacks.</li> </ul>
<b>strict</b>	<p>This profile is available for users who want to validate SIP messages and to only allow SIP sessions that are compliant with RFC 3261. In addition to the settings in the default VoIP profile, the strict profile sets all SIP deep message inspection header checking options (for example, <code>malformed-request-line</code> and many others) to <code>discard</code>. So the strict profile blocks and drops SIP messages that contain malformed SIP or SDP lines that can be detected by the ALG. For more information about SIP deep header inspection, see <a href="#">Deep SIP message inspection on page 3555</a>.</p>

Neither of the default profiles applies SIP rate limiting. To apply more ALG features to SIP sessions you can clone (copy) the pre-defined VoIP profiles and make your own modifications to them. You can clone VoIP profiles from the GUI or the CLI. For example, from the CLI, to clone the default profile and configure the limit for SIP NOTIFY request messages to 1000 messages per second per security policy and block SIP INFO request messages.

```
config voip profile
 clone default to my_voip_pro
 edit my_voip_pro
 config sip
 set notify-rate 1000
 set block-info enable
 end
 end
```

## Changing the port numbers that the SIP ALG listens on

Most SIP configurations use TCP or UDP port 5060 for SIP sessions and port 5061 for SIP SSL sessions. If your SIP network uses different ports for SIP sessions you can use the following command to configure the SIP ALG to listen on a different TCP, UDP, or SSL ports. For example, to change the TCP port to 5064, the UDP port to 5065, and the SSL port to 5066.

```
config system settings
 set sip-tcp-port 5064
 set sip-udp-port 5065
 set sip-ssl-port 5066
end
```

You also configure the SIP ALG to listen in two different TCP ports and two different UDP ports for SIP sessions. For example, if you receive SIP TCP traffic on port 5060 and 5064 and UDP traffic on ports 5061 and 5065 you can enter the following command to receive the SIP traffic on all of these ports:

```
config system settings
 set sip-tcp-port 5060 5064
 set sip-udp-port 5061 5065
end
```

## Disabling the SIP ALG in a VoIP profile

SIP is enabled by default in a VoIP profile. If you are just using the VoIP profile for SCCP you can use the following command to disable SIP in the VoIP profile.

```
config voip profile
 edit VoIP_Pro_2
 config sip
 set status disable
 end
```

## SIP ALG diagnose commands

You can use the `diagnose sys sip-proxy` command to display diagnostic information for the SIP ALG. A number of options are available including:

Use the following command to list all active SIP calls being processed by the SIP ALG. You can also use the `clear` option to delete all active SIP calls being processed by the SIP ALG, the `idle` option to list idle SIP calls, and the `invite` option to list SIP invite transactions.

```
diagnose sys sip-proxy calls {clear | list | idle | invite}
```

Use the following commands to employ filters to display specific information about the SIP ALG and the session that it is processing. You can build up a filter by including a number of options such as source address, VoIP profile, policy, and so on.

```
diagnose sys sip-proxy filter <filter_options>
```

```
diagnose sys sip-proxy log-filter <filter_options>
```

Use the following command to display the active SIP rate limiting meters and their current settings.

```
diagnose sys sip-proxy meters list
```

Use the following command to display status information about the SIP sessions being processed by the SIP ALG. You can also clear all SIP ALG statistics.

```
diagnose sys sip-proxy stats {clear | list}
```

## Conflicts between the SIP ALG and the session helper

If you suspect that the SIP session helper is being used instead of the ALG, you can use the `diagnose sys sip` command to determine if the SIP session helper is processing SIP sessions. For example, the following command displays the overall status of the SIP sessions being processed by the SIP session helper:

The `diagnose sys sip` command only displays current status information. To see activity the SIP session helper has to actually be processing SIP sessions when you enter the command. For example, if the SIP session helper had been used for processing calls that ended 5 minutes ago, the command output would show no SIP session helper activity.

---

```
diagnose sys sip status
dialogs: max=32768, used=0
mappings: used=0
dialog hash by ID: size=2048, used=0, depth=0
dialog hash by RTP: size=2048, used=0, depth=0
mapping hash: size=2048, used=0, depth=0
count0: 0
count1: 0
count2: 0
count3: 0
count4: 0
```

This command output shows that the session helper is not processing SIP sessions because all of the used and count fields are 0. If any of these fields contains non-zero values then the SIP session helper may be processing SIP sessions.

Also, you can check to see if some ALG-only features are not being applied to all SIP sessions. For example, FortiView pages displays statistics for SIP and SCCP calls processed by the ALG but not for calls processed by the session helper. So if you see fewer calls than expected the session helper may be processing some of them.

Finally, you can check the policy usage and session information dashboard widgets to see if SIP sessions are being accepted by the wrong security policies.

## Stateful SIP tracking, call termination, and session inactivity timeout

The SIP ALG tracks SIP dialogs over their lifespan between the first INVITE message and the Final 200 OK and ACK messages. For every SIP dialog, stateful SIP tracking reviews every SIP message and makes adjustment to SIP tracking tables as required. These adjustments include source and destination IP addresses, address translation, dialog expiration information, and media stream port changes. Such changes can also result in

dynamically opening and closing pinholes. You can use the `diagnose sys sip-proxy stats list` and the `diagnose sys sip-proxy filter` command to view the SIP call data being tracked by the SIP ALG.

The SIP ALG uses the SIP Expires header line to time out a SIP dialog if the dialog is idle and a Re-INVITE or UPDATE message is not received. The SIP ALG gets the Session-Expires value, if present, from the 200 OK response to the INVITE message. If the SIP ALG receives an INVITE before the session times out, all timeout values are reset to the settings in the new INVITE message or to default values. As a precautionary measure, the SIP ALG uses hard timeout values to set the maximum amount of time a call can exist. This ensures that the FortiGate is protected if a call ends prematurely.

When a SIP dialog ends normally, the SIP ALG deletes the SIP call information and closes open pinholes. A SIP call can also end abnormally due to an unexpected signaling or transport event that cuts off the call. When a call ends abnormally the SIP messages to end the call may not be sent or received. A call can end abnormally for the following reasons:

- Phones or servers crash during a call and a BYE message is not received.
- To attack a SIP system, a malicious user never send a BYE message.
- Poor implementations of SIP fail to process Record-Route messages and never send a BYE message.
- Network failures prevent a BYE message from being received.

Any phone or server in a SIP call can cancel the call by sending a CANCEL message. When a CANCEL message is received by the FortiGate, the SIP ALG closes open pinholes. Before terminating the call, the ALG waits for the final 200 OK message.

The SIP ALG can be configured to terminate SIP calls if the SIP dialog message flow or the call RTP (media) stream is interrupted and does not recover. You can use the following commands to configure terminating inactive SIP sessions and to set timers or counters to control when the call is terminated by the SIP ALG.

## Adding a media stream timeout for SIP calls

Use the following command in a VoIP profile to terminate SIP calls accepted by a security policy containing the VoIP profile when the RTP media stream is idle for 100 seconds.

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set call-keepalive 100
 end
 end
```

You can adjust this setting between 1 and 10,080 seconds. The default call keepalive setting of 0 disables terminating a call if the media stream is interrupted. Set call keepalive higher if your network has latency problems that could temporarily interrupt media streams. If you have configured call keepalive and the FortiGate terminates calls unexpectedly you can increase the call keepalive time to resolve the problem.

Call keep alive should be used with caution because enabling this feature results in extra FortiGate CPU overhead and can cause delay/jitter for the VoIP call. Also, the FortiGate terminates the call without sending SIP messages to end the call. And if the SIP endpoints send SIP messages to terminate the call they will be blocked by the FortiGate if they are sent after the FortiGate terminates the call.

## Adding an idle dialog setting for SIP calls

Use the following command in a VoIP profile to terminate SIP calls when for a single security policy, when the configured number of SIP calls (or dialogs) has stopped receiving SIP messages or has not received legitimate SIP messages. Using this command you can configure how many dialogs that have been accepted by a security policy that the VoIP profile is added to become idle before the SIP ALG deletes the oldest ones. The following command sets the maximum number of idle dialogs to 200:

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set max-idle-dialogs 200
 end
 end
```

Idle dialogs would usually be dialogs that have been interrupted because of errors or problems or as the result of a SIP attack that opens a large number of SIP dialogs without closing them. This command provides a way to remove these dialogs from the dialog table and recover memory and resources being used by these open and idle dialogs.

You can adjust this setting between 1 and a very high number. The default maximum idle dialogs setting of 0 disables this feature. Set maximum dialogs higher if your network has latency problems that could temporarily interrupt SIP messaging. If you have configured max idle dialogs and the FortiGate terminates calls unexpectedly you can increase the max idle dialogs number to resolve the problem.

## Changing how long to wait for call setup to complete

In some cases and some configurations your SIP system may experience delays during call setup. If this happens, some SIP ALG timers may expire before call setup is complete and drop the call. In some cases you may also want to reduce the amount of time the SIP ALG allows for call setup to complete.

You can use the `provisional-invite-expiry-time` SIP VoIP profile option to control how long the SIP ALG waits for provisional INVITE messages before assuming that the call setup has been interrupted and the SIP call should be dropped. The default value for this timer is 210 seconds. You can change it to between 10 and 3600 seconds.

Use the following command to change the expiry time to 100 seconds.

```
config voip profile
 edit Profile_name
 config sip
 set provisional-invite-expiry-time 100
 end
 end
```

## SIP and RTP/RTCP

FortiGates support the Real Time Protocol (RTP) application layer protocol for the VoIP call audio stream. RTP uses dynamically assigned port numbers that can change during a call. SIP control messages that start a call and that are sent during the call inform callers of the port number to use and of port number changes during the call.

During a call, each RTP session will usually have a corresponding Real Time Control Protocol (RTCP) session. By default, the RTCP session port number is one higher than the RTP port number.

The RTP port number is included in the `m=` part of the SDP profile. In the example above, the SIP INVITE message includes RTP port number is 49170 so the RTCP port number would be 49171. In the SIP response message the RTP port number is 3456 so the RTCP port number would be 3457.

## How the SIP ALG creates RTP pinholes

The SIP ALG requires the following information to create a pinhole. The SIP ALG finds this information in SIP messages and some is provided by the SIP ALG:

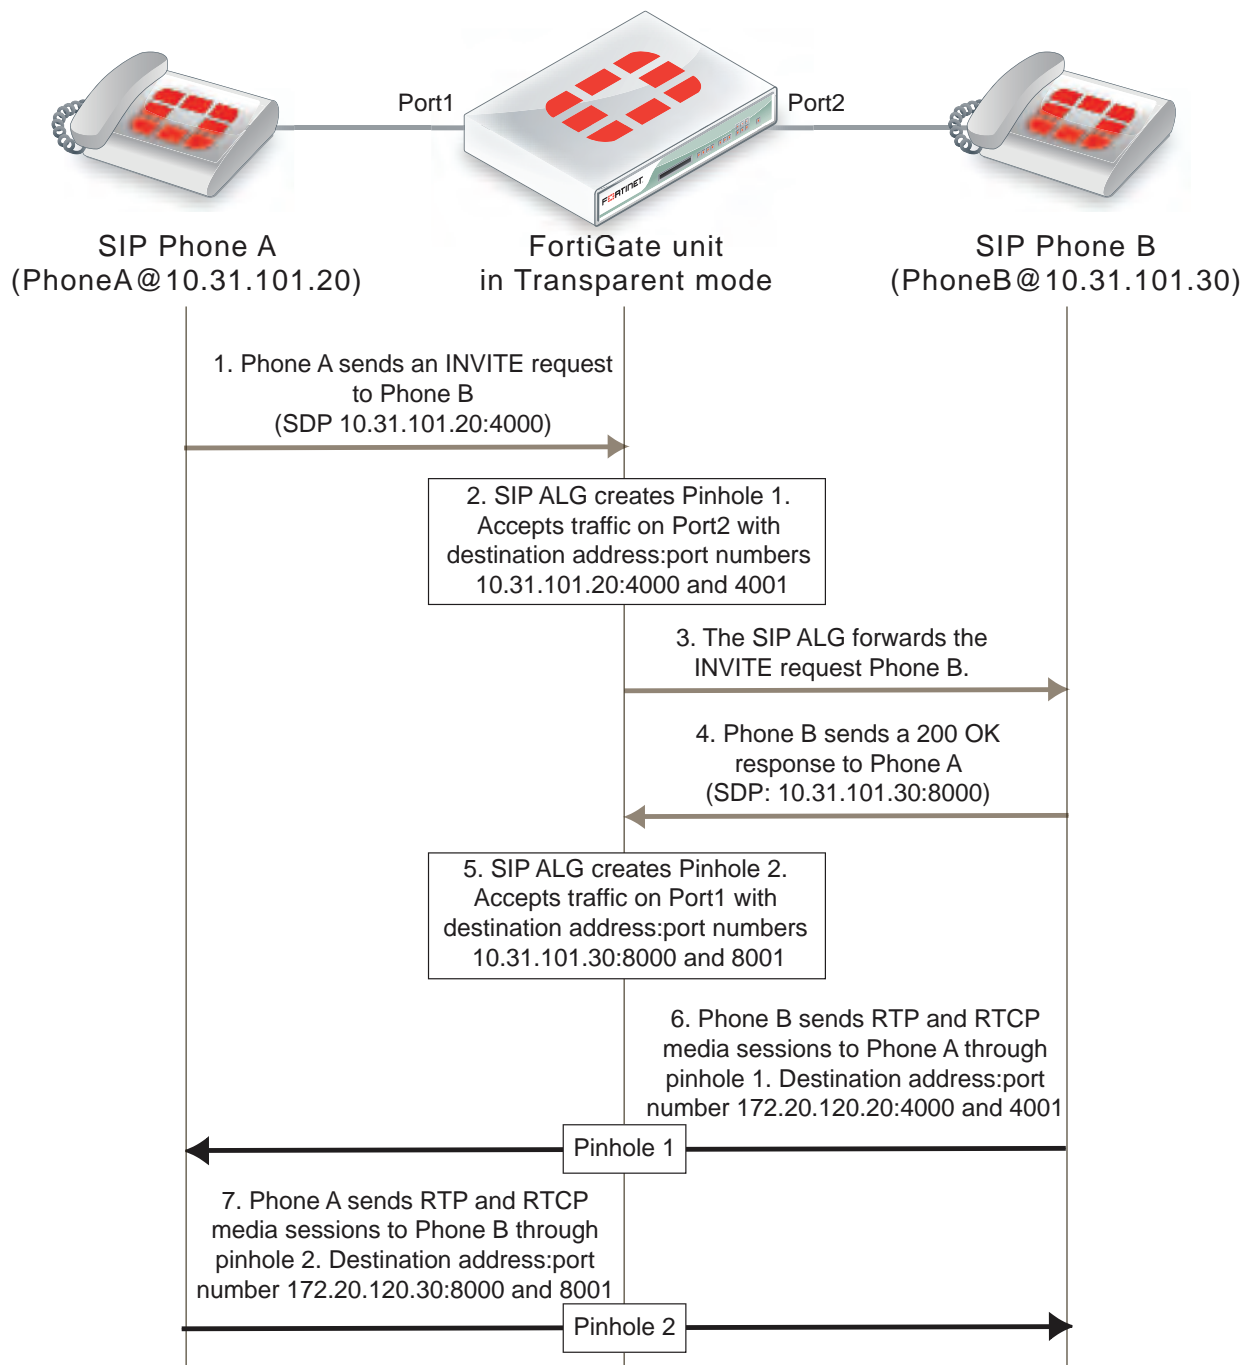

<b>Protocol</b>	UDP (Extracted from SIP messages by the SIP ALG.)
<b>Source IP</b>	Any
<b>Source port</b>	Any
<b>Destination IP</b>	The SIP ALG extracts the destination IP address from the <code>c=</code> line in the SDP profile. The <code>c=</code> line can appear in either the session or media part of the SDP profile. The SIP ALG uses the IP address in the <code>c=</code> line of the media part of the SDP profile first. If the media part does not contain a <code>c=</code> line, the SIP ALG checks the <code>c=</code> line in the session part of the SDP profile. If the session part of the profile doesn't contain a <code>c=</code> line the packet is dropped. Pinholes for RTP and RTCP sessions share the same destination IP address.
<b>Destination port</b>	The SIP ALG extracts the destination port number for RTP from the <code>m=</code> field and adds 1 to this number to get the RTCP port number.
<b>Lifetime</b>	The length of time during which the pinhole will be open. When the lifetime ends, the SIP ALG removes the pinhole.

The SIP ALG keeps RTP pinholes open as long as the SIP session is alive. When the associated SIP session is terminated by the SIP ALG or the SIP phones or servers participating in the call, the RTP pinhole is closed.

The figure below shows a simplified call setup sequence that shows how the SIP ALG opens pinholes. Phone A and Phone B are installed on either side of a FortiGate operating in Transparent mode. Phone A and Phone B are on the same subnet. The FortiGate includes a security policy that accepts SIP sessions from port1 to port2 and from port2 to port1. The FortiGate does not require an RTP security policy, just the SIP policy.

You can see from this diagram that the SDP profile in the INVITE request from Phone A indicates that Phone A is expecting to receive a media stream sent to its IP address using port 4000 for RTP and port 4001 for RTCP. The SIP ALG creates pinhole 1 to allow this media traffic to pass through the FortiGate. Pinhole 1 is opened on the Port2 interface and will accept media traffic sent from Phone B to Phone A.

When Phone B receives the INVITE request from Phone A, Phone B will know to send media streams to Phone A using destination IP address 10.31.101.20 and ports 4000 and 4001. The 200 OK response sent from Phone B indicates that Phone B is expecting to receive a media stream sent to its IP address using ports 8000 and 8001. The SIP ALG creates pinhole 2 to allow this media traffic to pass through the FortiGate. Pinhole 2 is opened on the Port1 interface and will accept media traffic sent from Phone A to Phone B.

**SIP call setup with a FortiGate in Transparent mode****Configuration example: SIP in Transparent Mode**

The figure below shows an example SIP network consisting of a FortiGate operating in Transparent mode between two SIP phones. Since the FortiGate is operating in Transparent mode both phones are on the same

network and the FortiGate and the SIP ALG does not perform NAT. Even though the SIP ALG is not performing NAT you can use this configuration to apply SIP security features to the SIP traffic.

The FortiGate requires two security policies that accept SIP packets. One to allow SIP Phone A to start a session with SIP Phone B and one to allow SIP Phone B to start a session with SIP Phone A.

### SIP network with FortiGate in Transparent mode

## General configuration steps

The following general configuration steps are required for this SIP configuration. This example uses the default VoIP profile. The example also includes security policies that specifically allow SIP sessions using UDP port 5060 from Phone A to Phone B and from Phone B to Phone A. In most cases you would have more than two phones so would use more general security policies. Also, you can set the security service to ALL to allow traffic other than SIP on UDP port 5060.

1. Add firewall addresses for Phone A and Phone B.
2. Add a security policy that accepts SIP sessions initiated by Phone A and includes the default VoIP profile.
3. Add a security policy that accepts SIP sessions initiated by Phone B and includes the default VoIP profile.

## Configuration steps - GUI

Before you begin this procedure you may have to go to **System > Feature Visibility** and turn on VoIP.

### To add firewall addresses for the SIP phones

1. Go to **Policy & Objects > Addresses**.
2. Add the following addresses for Phone A and Phone B:

Category	Address
Name	Phone_A
Type	IP/Netmask
Subnet / IP Range	10.31.101.20/255.255.255.255
Interface	port1

<b>Category</b>	Address
<b>Name</b>	Phone_B
<b>Type</b>	IP/Netmask
<b>Subnet / IP Range</b>	10.31.101.30/255.255.255.255
<b>Interface</b>	port2

### To add security policies to apply the SIP ALG to SIP sessions

1. Go to **Policy & Objects > IPv4 Policy**.
2. Add a security policy to allow Phone A to send SIP request messages to Phone B:

<b>Incoming Interface</b>	port1
<b>Outgoing Interface</b>	port2
<b>Source</b>	Phone_A
<b>Destination Address</b>	Phone_B
<b>Schedule</b>	always
<b>Service</b>	SIP
<b>Action</b>	ACCEPT

3. Turn on **VoIP** and select the **default** VoIP profile.
4. Select **OK**.
5. Add a security policy to allow Phone B to send SIP request messages to Phone A:

<b>Incoming Interface</b>	port2
<b>Outgoing Interface</b>	port1
<b>Source</b>	Phone_B
<b>Destination Address</b>	Phone_A
<b>Schedule</b>	always
<b>Service</b>	SIP
<b>Action</b>	ACCEPT

6. Turn on **VoIP** and select the **default** VoIP profile.
7. Select **OK**.

## Configuration steps - CLI

### To add firewall addresses for Phone A and Phone B and security policies to apply the SIP ALG to SIP sessions

1. Enter the following command to add firewall addresses for Phone A and Phone B.

```
config firewall address
edit Phone_A
set associated-interface port1
set type ipmask
set subnet 10.31.101.20 255.255.255.255
next
edit Phone_B
set associated-interface port2
set type ipmask
set subnet 10.31.101.30 255.255.255.255
end
```

2. Enter the following command to add security policies to allow Phone A to send SIP request messages to Phone B and Phone B to send SIP request messages to Phone A.

```
config firewall policy
edit 0
set srcintf port1
set dstintf port2
set srcaddr Phone_A
set dstaddr Phone_B
set action accept
set schedule always
set service SIP
set utm-status enable
set voip-profile default
next
edit 0
set srcintf port2
set dstintf port1
set srcaddr Phone_B
set dstaddr Phone_A
set action accept
set schedule always
set service SIP
set utm-status enable
set voip-profile default
end
```

## RTP enable/disable (RTP bypass)

You can configure the SIP ALG to stop from opening RTP pinholes. Called RTP bypass, this configuration can be used when you want to apply SIP ALG features to SIP signalling messages but do not want the RTP media streams to pass through the FortiGate. The FortiGate only acts as a signalling firewall and RTP media session bypass the FortiGate and no pinholes need to be created.

Enter the following command to enable RTP bypass in a VoIP profile by disabling opening RTP pinholes:

```
config voip profile
 edit VoIP_Pro_1
 config sip
 set rtp disable
 end
 end
```

## Opening and closing SIP register, contact, via and record-route pinholes

You can use the `open-register-pinhole`, `open-contact-pinhole`, `open-via-port`, and `open-record-route-pinhole` VoIP profile CLI options to control whether the FortiGate opens various pinholes.

If `open-register-pinhole` is enabled (the default setting) the FortiGate opens pinholes for SIP Register request messages. You can disable `open-register-pinhole` so that the FortiGate does not open pinholes for SIP Register request messages.

If `open-contact-pinhole` is enabled (the default setting) the FortiGate opens pinholes for non-Register SIP request messages. You can disable `open-contact-pinhole` so that the FortiGate does not open pinholes for non-register requests. Non-register pinholes are usually opened for SIP INVITE requests.

If `open-via-pinhole` is disabled (the default setting) the FortiGate does not open pinholes for Via messages. You can enable `open-via-pinhole` so that the FortiGate opens pinholes for Via messages.

If `open-record-route-pinhole` is enabled (the default setting) the FortiGate opens pinholes for Record-Route messages. You can disable `open-record-route-pinhole` so that the FortiGate does not open pinholes for Record-Route messages.

Usually you would want to open these pinholes. Keeping them closed may prevent SIP from functioning properly through the FortiGate. They can be disabled, however, for interconnect scenarios (where all SIP traffic is between proxies and traveling over a single session). In some cases these settings can also be disabled in access scenarios if it is known that all users will be registering regularly so that their contact information can be learned from the register request.

You might want to prevent pinholes from being opened to avoid creating a pinhole for every register or non-register request. Each pinhole uses additional system memory, which can affect system performance if there are hundreds or thousands of users, and requires refreshing which can take a relatively long amount of time if there are thousands of active calls.

To configure a VoIP profile to prevent opening register and non-register pinholes:

```
config voip profile
 edit VoIP_Pro_1
 config sip
 set open-register-pinhole disable
 set open-contact-pinhole disable
 end
 end
```

In some cases you may not want to open pinholes for the port numbers specified in SIP Contact headers. For example, in an interconnect scenario when a FortiGate is installed between two SIP servers and the only SIP traffic through the FortiGate is between these SIP servers pinholes may not need to be opened for the port numbers specified in the Contact header lines.

If you disable `open-register-pinhole` then pinholes are not opened for ports in Contact header lines in SIP Register messages. If you disable `open-contact-pinhole` then pinholes are not opened for ports in Contact header lines in all SIP messages except SIP Register messages.

## Accepting SIP register responses

You can enable the VoIP profile `open-via-pinhole` options to accept a SIP Register response message from a SIP server even if the source port of the Register response message is different from the destination port.

Most SIP servers use 5060 as the source port in the SIP register response. Some SIP servers, however, may use a different source port. If your SIP server uses a different source port, you can enable `open-via-pinhole` and the SIP ALG will create a temporary pinhole when the Register request from a SIP client includes a different source port. The FortiGate will accept a SIP Register response with any source port number from the SIP server.

Enter the following command to enable accepting any source port from a SIP server:

```
config voip profile
 edit VoIP_Pro_1
 config sip
 set open-via-pinhole enable
 end
 end
```

## How the SIP ALG performs NAT

In most Network Address Translation (NAT) configurations, multiple hosts in a private network share a single public IP address to access the Internet. For sessions originating on the private network for the Internet, NAT replaces the private IP address of the PC in the private subnet with the public IP address of the NAT device. The NAT device converts the public IP address for responses from the Internet back into the private address before sending the response over the private network to the originator of the session.

Using NAT with SIP is more complex because of the IP addresses and media stream port numbers used in SIP message headers and bodies. When a caller on the private network sends a SIP message to a phone or SIP server on the Internet, the SIP ALG must translate the private network addresses in the SIP message to IP addresses and port numbers that are valid on the Internet. When the response message is sent back to the caller, the SIP ALG must translate these addresses back to valid private network addresses.

In addition, the media streams generated by the SIP session are independent of the SIP message sessions and use varying port numbers that can also change during the media session. The SIP ALG opens pinholes to accept these media sessions, using the information in the SIP messages to determine the pinholes to open. The ALG may also perform port translation on the media sessions.

When an INVITE message is received by the SIP ALG, the FortiGate extracts addressing and port number information from the message header and stores it in a SIP dialog table. Similar to an IP session table the data in the dialog table is used to translate addresses in subsequent SIP messages that are part of the same SIP call.

When the SIP ALG receives a response to the INVITE message arrives, (for example, an ACK or 200 OK), the SIP ALG compares the addresses in the message fields against the entries in the SIP dialog table to identify the call context of the message. The SIP ALG then translates addresses in the SIP message before forwarding them to their destination.

The addressing and port number information in SDP fields is used by the ALG to reserve ports for the media session and create a NAT mapping between them and the ports in the SDP fields. Because SDP uses sequential ports for the RTP and RTCP channels, the ALG provides consecutive even-odd ports.

## SIP ALG source address translation

When a SIP call is started by a phone on a private network destined for a phone on the Internet, only source address translation is required. The phone on the private network attempts to contact the actual IP address of the phone on the Internet. However, the source address of the phone on the private network is not routable on the Internet so the SIP ALG must translate all private IP addresses in the SIP message into public IP addresses.

To configure the FortiGate for source address translation you add security policy that accepts sessions from the internal network destined for the Internet. You must enable NAT for the security policy and add a VoIP profile.

When a SIP request is received from the internal to the external network, the SIP ALG replaces the private network IP addresses and port numbers in the SIP message with the IP address of the FortiGate interface connected to the Internet. Depending on the content of the message, the ALG translates addresses in the Via:, Contact:, Route:, and Record-Route: SIP header fields. The message is then forwarded to the destination (either a VoIP phone or a SIP server on the Internet).

The VoIP phone or server in the Internet sends responses to these SIP messages to the external interface of the FortiGate. The addresses in the response messages are translated back into private network addresses and the response is forwarded to the originator of the request.

For the RTP communication between the SIP phones, the SIP ALG opens pinholes to allow media through the FortiGate on the dynamically assigned ports negotiated based on information in the SDP and the Via:, Contact:, and Record-Route: header fields. The pinholes also allow incoming packets to reach the Contact:, Via:, and Record-Route: IP addresses and ports. When processing return traffic, the SIP ALG inserts the original Contact:, Via:, Route:, and Record-Route: SIP fields back into the packets.

## SIP ALG destination address translation

Incoming calls are directed from a SIP phone on the Internet to the interface of the FortiGate connected to the Internet. To receive these calls you must add a security policy to accept SIP sessions from the Internet. The security policy requires a firewall virtual IP. SIP INVITE messages from the Internet connect to the external IP address of the virtual IP. The SIP ALG uses the destination address translation defined in the virtual IP to translated the addresses in the SIP message to addresses on the private network.

When a 200 OK response message arrives from the private network, the SIP ALG translates the addresses in the message to Internet addresses and opens pinholes for media sessions from the private network to the Internet.

When the ACK message is received for the 200 OK, it is also intercepted by the SIP ALG. If the ACK message contains SDP information, the SIP ALG checks to determine if the IP addresses and port numbers are not changed from the previous INVITE. If they are, the SIP ALG deletes pinholes and creates new ones as required. The ALG also monitors the Via:, Contact:, and Record-Route: SIP fields and opens new pinholes as required.

## SIP Call Re-invite messages

SIP Re-INVITE messages can dynamically add and remove media sessions during a call. When new media sessions are added to a call the SIP ALG opens new pinholes and update SIP dialog data. When media sessions are ended, the SIP ALG closes pinholes that are no longer needed and removes SIP dialog data.

## How the SIP ALG translates IP addresses in SIP headers

The SIP ALG applies NAT to SIP sessions by translating the IP addresses contained in SIP headers. For example, the following SIP message contains most of the SIP fields that contain addresses that need to be translated:

```
INVITE PhoneB@172.20.120.30 SIP/2.0
Via: SIP/2.0/UDP 172.20.120.50:5434
From: PhoneA@10.31.101.20
To: PhoneB@172.20.120.30
Call-ID: a12abcde@172.20.120.50
Contact: PhoneA@10.31.101.20:5434
Route: <sip:example@172.20.120.50:5060>
Record-Route: <sip:example@172.20.120.50:5060>
```

How IP address translation is performed depends on whether source NAT or destination NAT is applied to the session containing the message:

### Source NAT translation of IP addresses in SIP messages

Source NAT translation occurs for SIP messages sent from a phone or server on a private network to a phone or server on the Internet. The source addresses in the SIP header fields of the message are typically set to IP addresses on the private network. The SIP ALG translates these addresses to the address the FortiGate interface connected to the Internet.

#### Source NAT translation of IP addresses in SIP request messages

SIP header	NAT action
<b>To:</b>	None
<b>From:</b>	Replace private network address with IP address of FortiGate interface connected to the Internet.
<b>Call-ID:</b>	Replace private network address with IP address of FortiGate interface connected to the Internet.
<b>Via:</b>	Replace private network address with IP address of FortiGate interface connected to the Internet.
<b>Request-URI:</b>	None
<b>Contact:</b>	Replace private network address with IP address of FortiGate interface connected to the Internet.
<b>Record-Route:</b>	Replace private network address with IP address of FortiGate interface connected to the Internet.
<b>Route:</b>	Replace private network address with IP address of FortiGate interface connected to the Internet.

Response messages from phones or servers on the Internet are sent to the FortiGate interface connected to the Internet where the destination addresses are translated back to addresses on the private network before forwarding the SIP response message to the private network.

#### Source NAT translation of IP addresses in SIP response messages

SIP header	NAT action
<b>To:</b>	None
<b>From:</b>	Replace IP address of FortiGate interface connected to the Internet with private network address.
<b>Call-ID:</b>	Replace IP address of FortiGate interface connected to the Internet with private network address.
<b>Via:</b>	Replace IP address of FortiGate interface connected to the Internet with private network address.
<b>Request-URI:</b>	N/A
<b>Contact:</b>	None
<b>Record-Route:</b>	Replace IP address of FortiGate interface connected to the Internet with private network address.
<b>Route:</b>	Replace IP address of FortiGate interface connected to the Internet with private network address.

#### Destination NAT translation of IP addresses in SIP messages

Destination NAT translation occurs for SIP messages sent from a phone or server on the Internet to a firewall virtual IP address. The destination addresses in the SIP header fields of the message are typically set to the virtual IP address. The SIP ALG translates these addresses to the address of a SIP server or phone on the private network on the other side of the FortiGate.

#### Destination NAT translation of IP addresses in SIP request messages

SIP header	NAT action
<b>To:</b>	Replace VIP address with address on the private network as defined in the firewall virtual IP.
<b>From:</b>	None
<b>Call-ID:</b>	None
<b>Via:</b>	None

SIP header	NAT action
<b>Request-URI:</b>	Replace VIP address with address on the private network as defined in the firewall virtual IP.
<b>Contact:</b>	None
<b>Record-Route:</b>	None
<b>Route:</b>	None

SIP response messages sent in response to the destination NAT translated messages are sent from a server or a phone on the private network back to the originator of the request messages on the Internet. These reply messages are accepted by the same security policy that accepted the initial request messages. The firewall VIP in the original security policy contains the information that the SIP ALG uses to translate the private network source addresses in the SIP headers into the firewall virtual IP address.

#### Destination NAT translation of IP addresses in SIP response messages

SIP header	NAT action
<b>To:</b>	None
<b>From:</b>	Replace private network address with firewall VIP address.
<b>Call-ID:</b>	None
<b>Via:</b>	None
<b>Request-URI:</b>	N/A
<b>Contact:</b>	Replace private network address with firewall VIP address.
<b>Record-Route:</b>	Replace private network address with firewall VIP address.
<b>Route:</b>	None

### How the SIP ALG translates IP addresses in the SIP body

The SDP session profile attributes in the SIP body include IP addresses and port numbers that the SIP ALG uses to create pinholes for the media stream.

The SIP ALG translates IP addresses and port numbers in the o=, c=, and m= SDP lines. For example, in the following lines the ALG could translate the IP addresses in the o= and c= lines and the port number (49170) in the m= line.

```
o=PhoneA 5462346 332134 IN IP4 10.31.101.20
c=IN IP4 10.31.101.20
m=audio 49170 RTP 0 3
```

If the SDP session profile includes multiple RTP media streams, the SIP ALG opens pinholes and performs the required address translation for each one.

The two most important SDP attributes for the SIP ALG are `c=` and `m=`. The `c=` attribute is the connection information attribute. This field can appear at the session or media level. The syntax of the connection attribute is:

```
c=IN {IPV4 | IPV6} <destination_ip_address>
```

Where

- `IN` is the network type. FortiGates support the `IN` or Internet network type.
- `{IPV4 | IPV6}` is the address type. FortiGates support IPv4 or IPv6 addresses in SDP statements. However, FortiGates do not support all types of IPv6 address translation. See [SIP over IPv6 on page 3554](#).
- `<destination_IP_address>` is the unicast numeric destination IP address or domain name of the connection in either IPv4 or IPv6 format.

The syntax of the media attribute is:

```
m=audio <port_number> RTP <format_list>
```

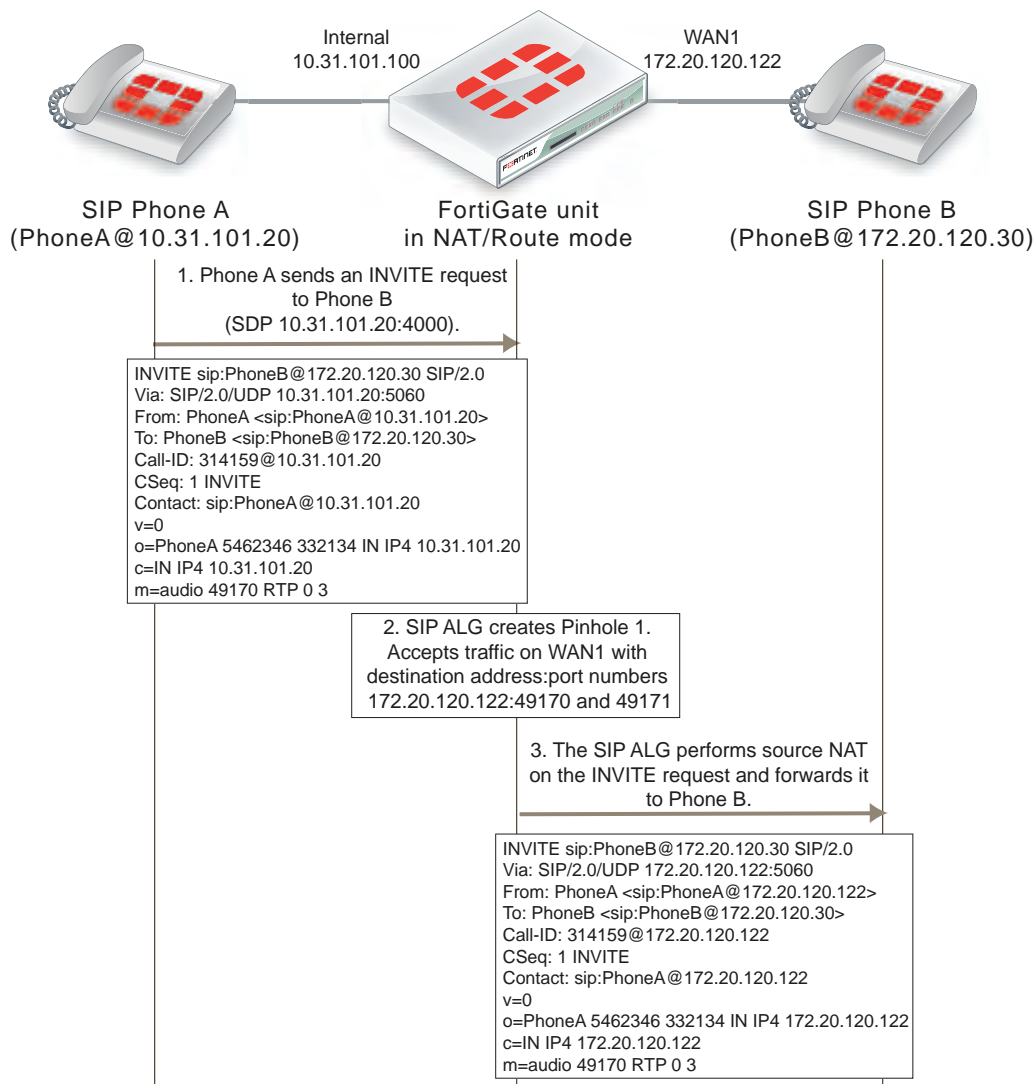

Where

- `audio` is the media type. FortiGates support the `audio` media type.
- `<port_number>` is the destination port number used by the media stream.
- `RTP` is the application layer transport protocol used for the media stream. FortiGates support the Real Time Protocol (RTP) transport protocol.
- `<format_list>` is the format list that provides information about the application layer protocol that the media uses.

## SIP NAT scenario: source address translation (source NAT)

The following figures show a source address translation scenario involving two SIP phones on different networks, separated by a FortiGate. In the scenario, SIP Phone A sends an INVITE request to SIP Phone B and SIP Phone B replies with a 200 OK response and then the two phones start media streams with each other.

To simplify the diagrams, some SIP messages are not included (for example, the Ringing and ACK response messages) and some SIP header lines and SDP profile lines have been removed from the SIP messages.

**SIP source NAT scenario part 1: INVITE request sent from Phone A to Phone B**

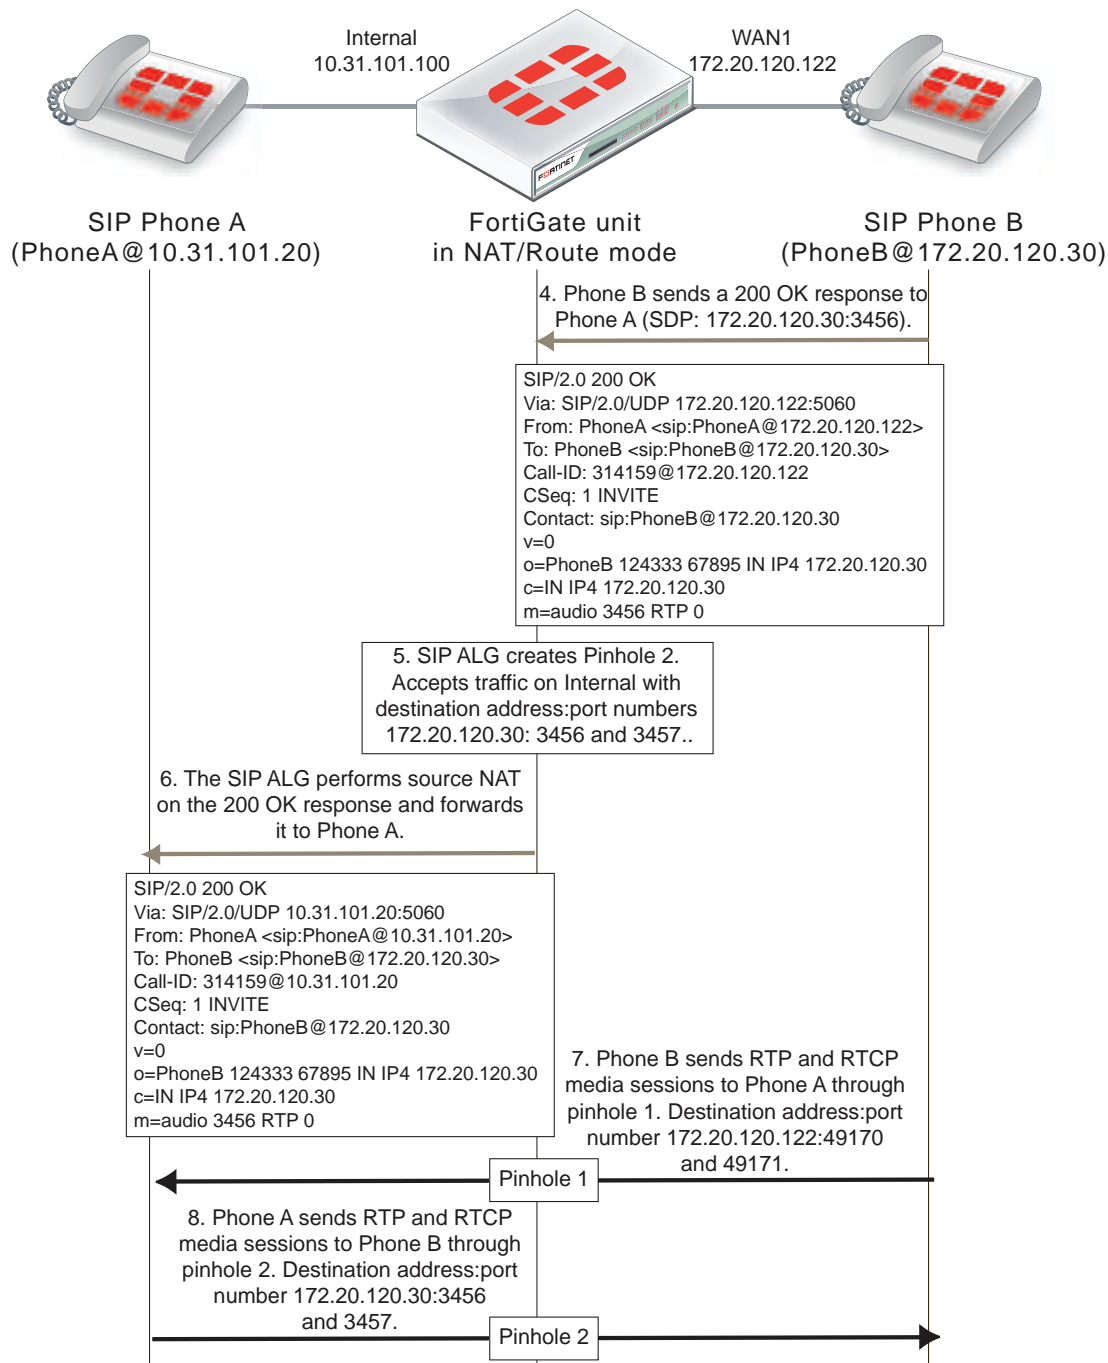

For the replies to SIP packets sent by Phone A to be routable on Phone B's network, the FortiGate uses source NAT to change their source address to the address of the WAN1 interface. The SIP ALG makes similar changes to the source addresses in the SIP headers and SDP profile. For example, the original INVITE request from Phone A includes the address of Phone A (10.31.101.20) in the from header line. After the INVITE request passes through the FortiGate, the address of Phone A in the From SIP header line is translated to 172.20.120.122, the address of the FortiGate WAN1 interface. As a result, Phone B will reply to SIP messages from Phone A using the WAN1 interface IP address.

The FortiGate also opens a pinhole so that it can accept media sessions sent to the WAN1 IP address using the port number in the m= line of the INVITE request and forward them to Phone A after translating the destination address to the IP address of Phone A.

Phone B sends the 200 OK response to the INVITE message to the WAN1 interface. The SDP profile includes the port number that Phone B wants to use for its media stream. The FortiGate forwards 200 OK response to Phone A after translating the addresses in the SIP and SDP lines back to the IP address of Phone A. The SIP ALG also

opens a pinhole on the Internal interface that accepts media stream sessions from Phone A with destination address set to the IP address of Phone B and using the port that Phone B added to the SDP m= line.

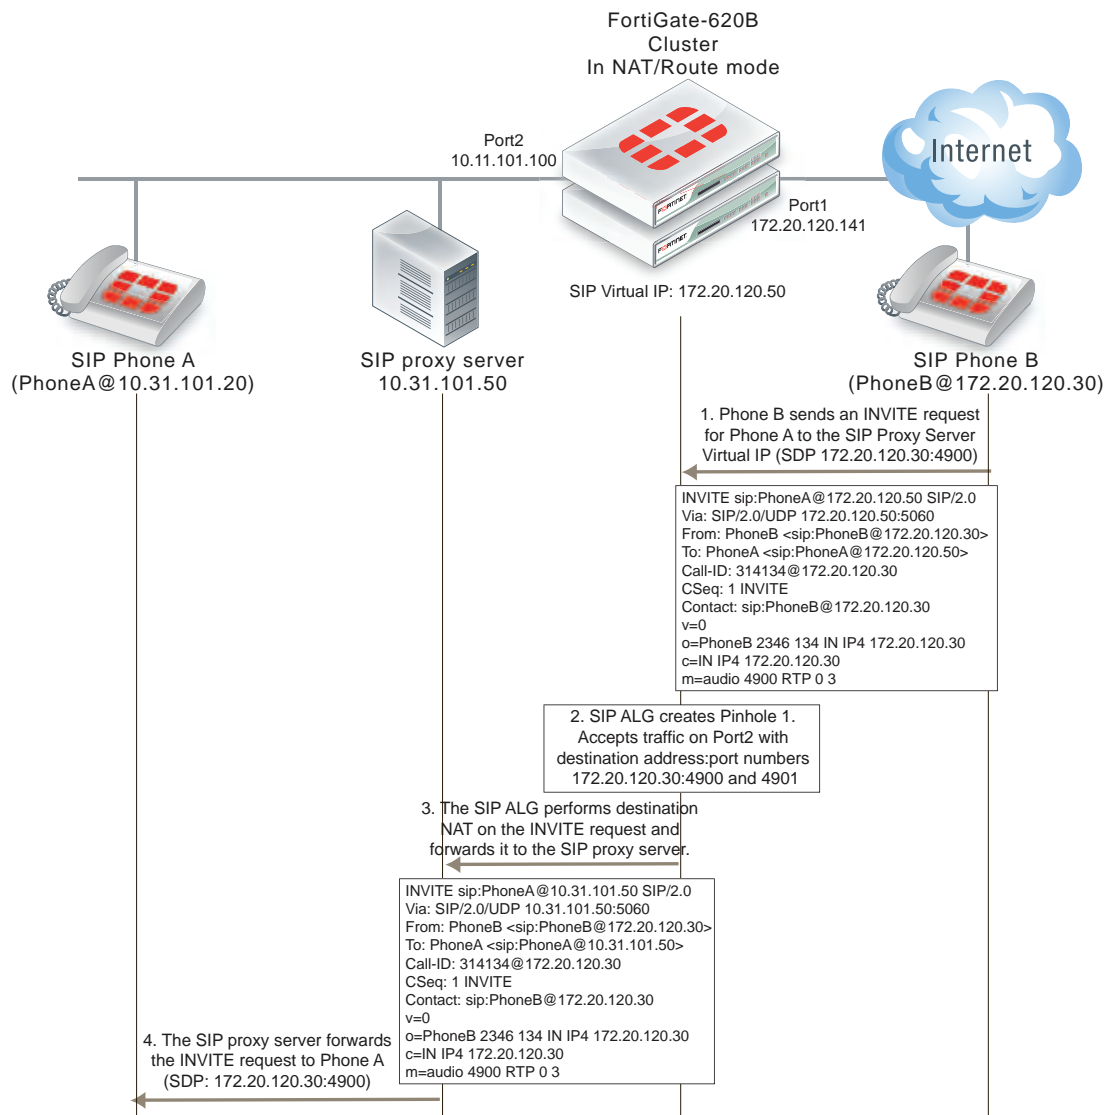

### SIP source NAT scenario part 2: 200 OK returned and media streams established

## SIP NAT scenario: destination address translation (destination NAT)

The following figures show how the SIP ALG translates addresses in a SIP INVITE message sent from SIP Phone B on the Internet to SIP Phone A on a private network using the SIP proxy server. Because the addresses on the private network are not visible from the Internet, the security policy on the FortiGate that accepts SIP sessions includes a virtual IP. Phone A sends SIP the INVITE message to the virtual IP address. The FortiGate accepts the INVITE message packets and using the virtual IP, translates the destination address of the packet to the IP address of the SIP proxy server and forwards the SIP message to it.

### SIP destination NAT scenario part 1: INVITE request sent from Phone B to Phone A

To simplify the diagrams, some SIP messages are not included (for example, the Ringing and ACK response messages) and some SIP header lines and SDP profile lines have been removed from the SIP messages.

The SIP ALG also translates the destination addresses in the SIP message from the virtual IP address (172.20.120.50) to the SIP proxy server address (10.31.101.50). For this configuration to work, the SIP proxy

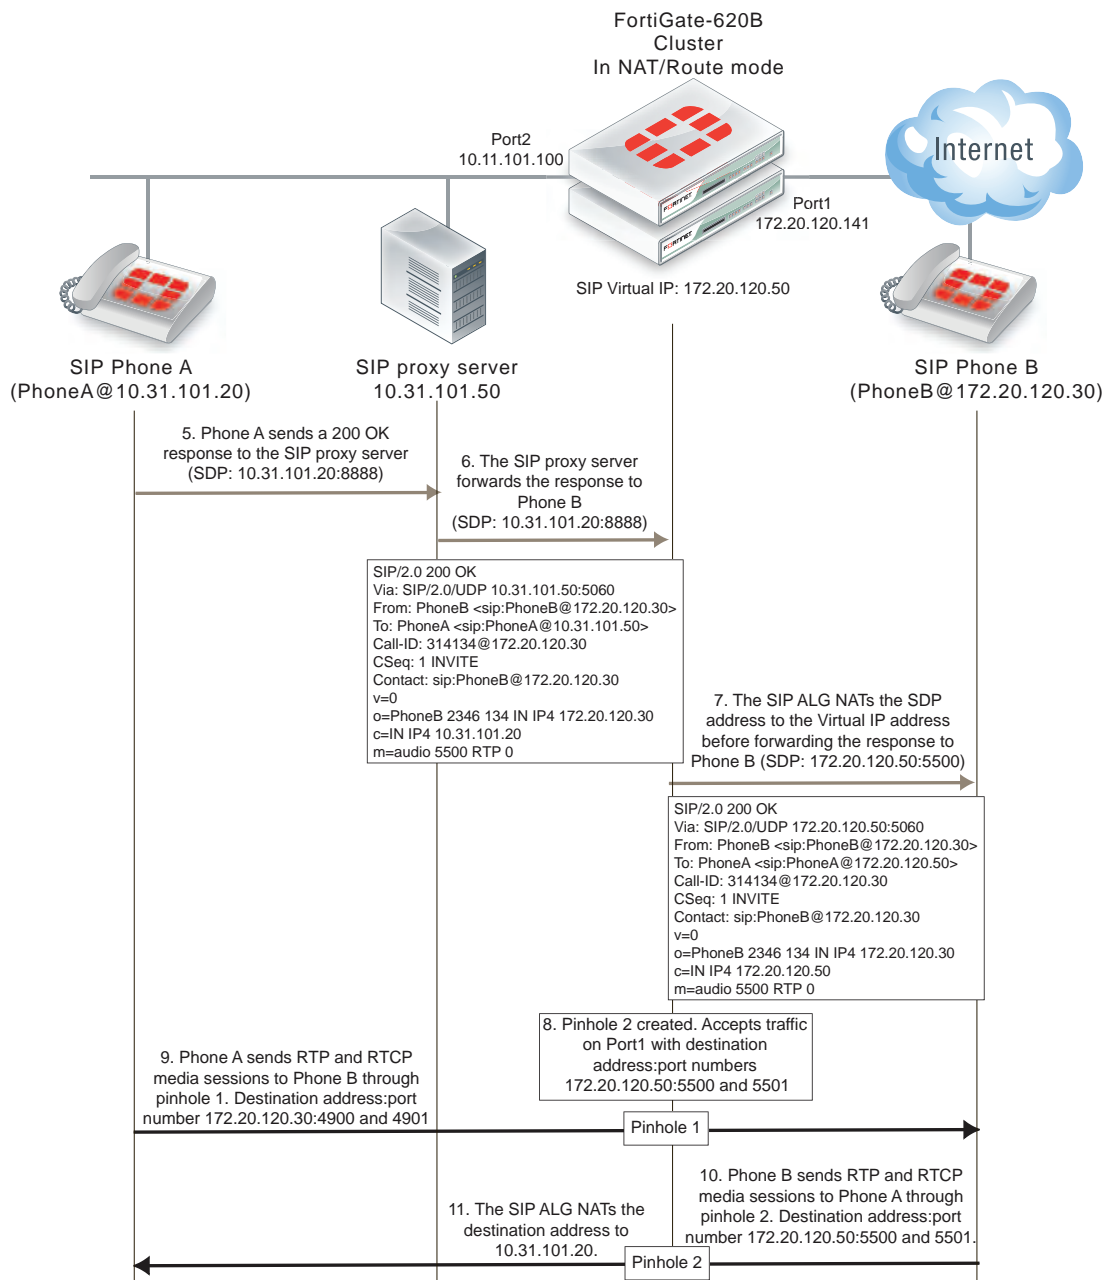

server must be able to change the destination addresses for Phone A in the SIP message from the address of the SIP proxy server to the actual address of Phone A.

The SIP ALG also opens a pinhole on the Port2 interface that accepts media sessions from the private network to SIP Phone B using ports 4900 and 4901.

Phone A sends a 200 OK response back to the SIP proxy server. The SIP proxy server forwards the response to Phone B. The FortiGate accepts the 100 OK response. The SIP ALG translates the Phone A addresses back to the SIP proxy server virtual IP address before forwarding the response back to Phone B. The SIP ALG also opens a pinhole using the SIP proxy server virtual IP which is the address in the o= line of the SDP profile and the port number in the m= line of the SDP code.

### SIP destination NAT scenario part 2: 200 OK returned to Phone B and media streams established

The media stream from Phone A is accepted by pinhole one and forwarded to Phone B. The source address of this media stream is changed to the SIP proxy server virtual IP address. The media stream from Phone B is accepted by pinhole 2 and forwarded to Phone B. The destination address of this media stream is changed to the IP address of Phone A.

## SIP NAT configuration example: source address translation (source NAT)

This configuration example shows how to configure the FortiGate to support the source address translation scenario shown below. The FortiGate requires two security policies that accept SIP packets. One to allow SIP Phone A to start a session with SIP Phone B and one to allow SIP Phone B to start a session with SIP Phone A. Both of these policies must include source NAT. In this example the networks are not hidden from each other so destination NAT is not required.

### SIP source NAT configuration

### General configuration steps

The following general configuration steps are required for this SIP configuration. This example uses the default VoIP profile. The example also includes security policies that specifically allow SIP sessions using UDP port 5060 from Phone A to Phone B and from Phone B to Phone A. In most cases you would have more than two phones so would use more general security policies. Also, you can set the firewall service to ALL to allow traffic other than SIP on UDP port 5060.

1. Add firewall addresses for Phone A and Phone B.
2. Add a security policy that accepts SIP sessions initiated by Phone A and includes the default VoIP profile.
3. Add a security policy that accepts SIP sessions initiated by Phone B and includes the default VoIP profile.

### Configuration steps - GUI

#### To add firewall addresses for the SIP phones

1. Go to **Policy & Objects > Addresses**.
2. Add the following addresses for Phone A and Phone B:

Category	Address
Name	Phone_A
Type	IP/Netmask

<b>Subnet / IP Range</b>	10.31.101.20/255.255.255.255
<b>Interface</b>	Internal

<b>Category</b>	Address
<b>Name</b>	Phone_B
<b>Type</b>	IP/Netmask
<b>Subnet / IP Range</b>	172.20.120.30/255.255.255.255
<b>Interface</b>	wan1

### To add security policies to apply the SIP ALG to SIP sessions

1. Go to **Policy & Objects > Policy > IPv4**.
2. Add a security policy to allow Phone A to send SIP request messages to Phone B:

<b>Incoming Interface</b>	internal
<b>Outgoing Interface</b>	wan1
<b>Source</b>	Phone_A
<b>Destination Address</b>	Phone_B
<b>Schedule</b>	always
<b>Service</b>	SIP
<b>Action</b>	ACCEPT

3. Turn on **NAT** and select **Use Outgoing Interface Address**.
4. Turn on **VoIP** and select the **default** VoIP profile.
5. Select **OK**.
6. Add a security policy to allow Phone B to send SIP request messages to Phone A:

<b>Incoming Interface</b>	wan1
<b>Outgoing Interface</b>	internal
<b>Source</b>	Phone_B
<b>Destination Address</b>	Phone_A
<b>Schedule</b>	always
<b>Service</b>	SIP
<b>Action</b>	ACCEPT

7. Turn on **NAT** and select **Use Outgoing Interface Address**.
8. Turn on **VoIP** and select the **default** VoIP profile.
9. Select **OK**.

## Configuration steps - CLI

**To add firewall addresses for Phone A and Phone B and security policies to apply the SIP ALG to SIP sessions**

1. Enter the following command to add firewall addresses for Phone A and Phone B.

```
config firewall address
 edit Phone_A
 set associated interface internal
 set type ipmask
 set subnet 10.31.101.20 255.255.255.255
 next
 edit Phone_B
 set associated interface wan1
 set type ipmask
 set subnet 172.20.120.30 255.255.255.255
 end
```

2. Enter the following command to add security policies to allow Phone A to send SIP request messages to Phone B and Phone B to send SIP request messages to Phone A.

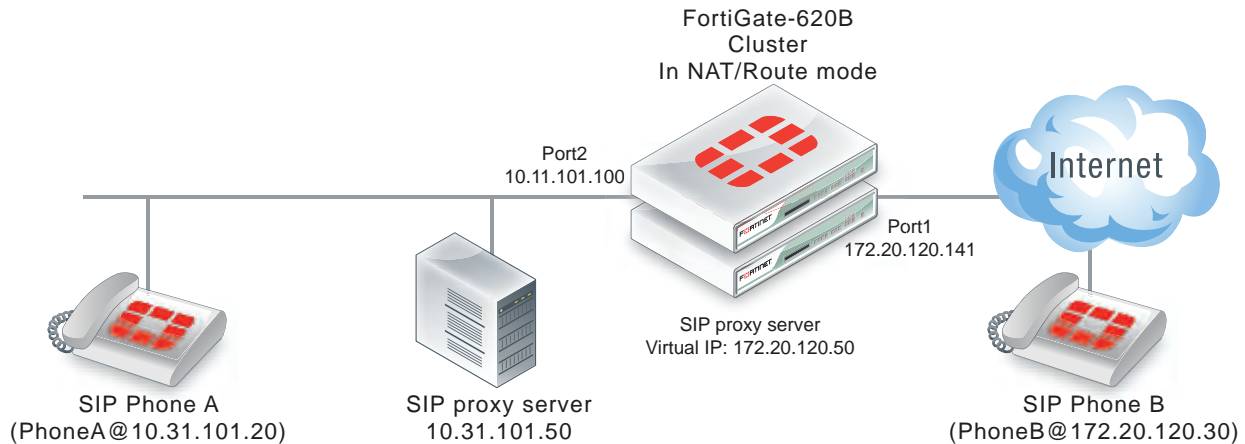

```
config firewall policy
 edit 0
 set srcintf internal
 set dstintf wan1
 set srcaddr Phone_A
 set dstaddr Phone_B
 set action accept
 set schedule always
 set service SIP
 set nat enable
 set utm-status enable
 set voip-profile default
 next
 edit 0
 set srcintf wan1
 set dstintf internal
 set srcaddr Phone_B
 set dstaddr Phone_A
 set action accept
 set schedule always
 set service SIP
 set nat enable
 set utm-status enable
 set voip-profile default
 end
```

## SIP NAT configuration example: destination address translation (destination NAT)

This configuration example shows how to configure the FortiGate to support the destination address translation scenario shown in the figure below. The FortiGate requires two SIP security policies:

- A destination NAT security policy that allows SIP messages to be sent from the Internet to the private network. This policy must include destination NAT because the addresses on the private network are not routable on the Internet.
- A source NAT security policy that allows SIP messages to be sent from the private network to the Internet.

### SIP destination NAT scenario part two: 200 OK returned to Phone B and media streams established

### General configuration steps

The following general configuration steps are required for this destination NAT SIP configuration. This example uses the default VoIP profile.

1. Add the SIP proxy server firewall virtual IP.
2. Add a firewall address for the SIP proxy server on the private network.
3. Add a destination NAT security policy that accepts SIP sessions from the Internet destined for the SIP proxy server virtual IP and translates the destination address to the IP address of the SIP proxy server on the private network.
4. Add a security policy that accepts SIP sessions initiated by the SIP proxy server and destined for the Internet.

### Configuration steps - GUI

#### To add the SIP proxy server firewall virtual IP

1. Go to **Policy & Objects > Virtual IPs**.
2. Add the following SIP proxy server virtual IP.

<b>VIP Type</b>	IPv4
<b>Name</b>	SIP_Proxy_VIP
<b>Interface</b>	port1
<b>Type</b>	Static NAT
<b>External IP Address/Range</b>	172.20.120.50
<b>Mapped IP Address/Range</b>	10.31.101.50

**To add a firewall address for the SIP proxy server**

1. Go to **Policy & Objects > Addresses**.
2. Add the following for the SIP proxy server:

<b>Address Name</b>	SIP_Proxy_Server
<b>Type</b>	Subnet
<b>Subnet/IP Range</b>	10.31.101.50/255.255.255.255
<b>Interface</b>	port2

**To add the security policies**

1. Go to **Policy & Objects > IPv4 Policy**.
2. Add a destination NAT security policy that includes the SIP proxy server virtual IP that allows Phone B (and other SIP phones on the Internet) to send SIP request messages to the SIP proxy server.

<b>Incoming Interface</b>	port1
<b>Outgoing Interface</b>	port2
<b>Source</b>	all
<b>Destination Address</b>	SIP_Proxy_VIP
<b>Schedule</b>	always
<b>Service</b>	SIP
<b>Action</b>	ACCEPT

3. Turn on **NAT** and select **Use Outgoing Interface Address**.
4. Turn on **VoIP** and select the **default** VoIP profile.
5. Select **OK**.
6. Add a source NAT security policy to allow the SIP proxy server to send SIP request messages to Phone B and the Internet:

<b>Incoming Interface</b>	port2
<b>Destination Address</b>	all
<b>Source</b>	SIP_Proxy_Server
<b>Schedule</b>	always
<b>Service</b>	SIP
<b>Action</b>	ACCEPT

7. Turn on **NAT** and select **Use OutgoingInterface Address**.
8. Turn on **VoIP** and select the **default** VoIP profile.

9. Select **OK**.

## Configuration steps - CLI

### To add the SIP proxy server firewall virtual IP and firewall address

1. Enter the following command to add the SIP proxy server firewall virtual IP.

```
config firewall vip
edit SIP_Proxy_VIP
set type static-nat
set extip 172.20.120.50
set mappedip 10.31.101.50
set extintf port1
end
```

2. Enter the following command to add the SIP proxy server firewall address.

```
config firewall address
edit SIP_Proxy_Server
set associated interface port2
set type ipmask
set subnet 10.31.101.50 255.255.255.255
end
```

### To add security policies

1. Enter the following command to add a destination NAT security policy that includes the SIP proxy server virtual IP that allows Phone B (and other SIP phones on the Internet) to send SIP request messages to the SIP proxy server.

```
config firewall policy
edit 0
set srcintf port1
set dstintf port2
set srcaddr all
set dstaddr SIP_Proxy_VIP
set action accept
set schedule always
set service SIP
set nat enable
set utm-status enable
set voip-profile default
end
```

2. Enter the following command to add a source NAT security policy to allow the SIP proxy server to send SIP request messages to Phone B and the Internet:

```
config firewall policy
edit 0
set srcintf port2
set dstintf port1
set srcaddr SIP_Proxy_Server
set dstaddr all
set action accept
set schedule always
set service SIP
set nat enable
set utm-status enable
set voip-profile default
```

end

## SIP and RTP source NAT

In the source NAT scenario shown below, a SIP phone connects to the Internet through a FortiGate with an IP address configured using PPPoE. The SIP ALG translates all private IPs in the SIP contact header into public IPs.

You need to configure an internal to external SIP security policy with NAT selected, and include a VoIP profile with SIP enabled.

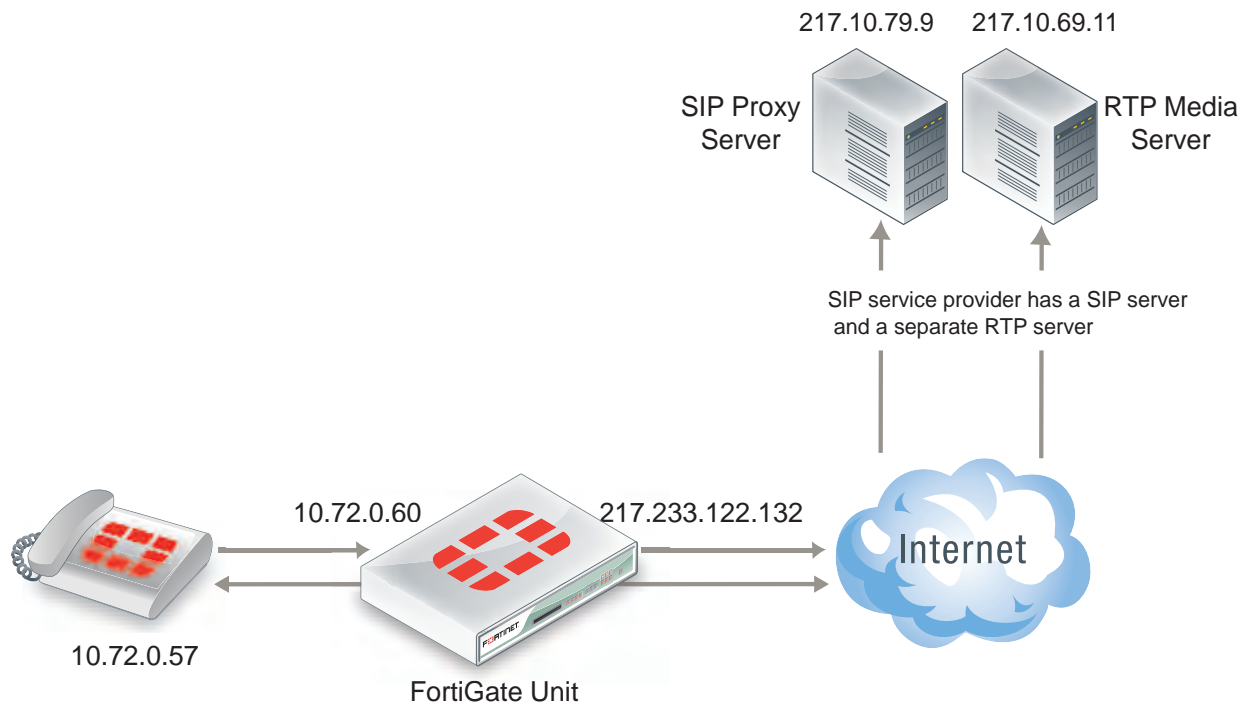

### SIP source NAT

## SIP and RTP destination NAT

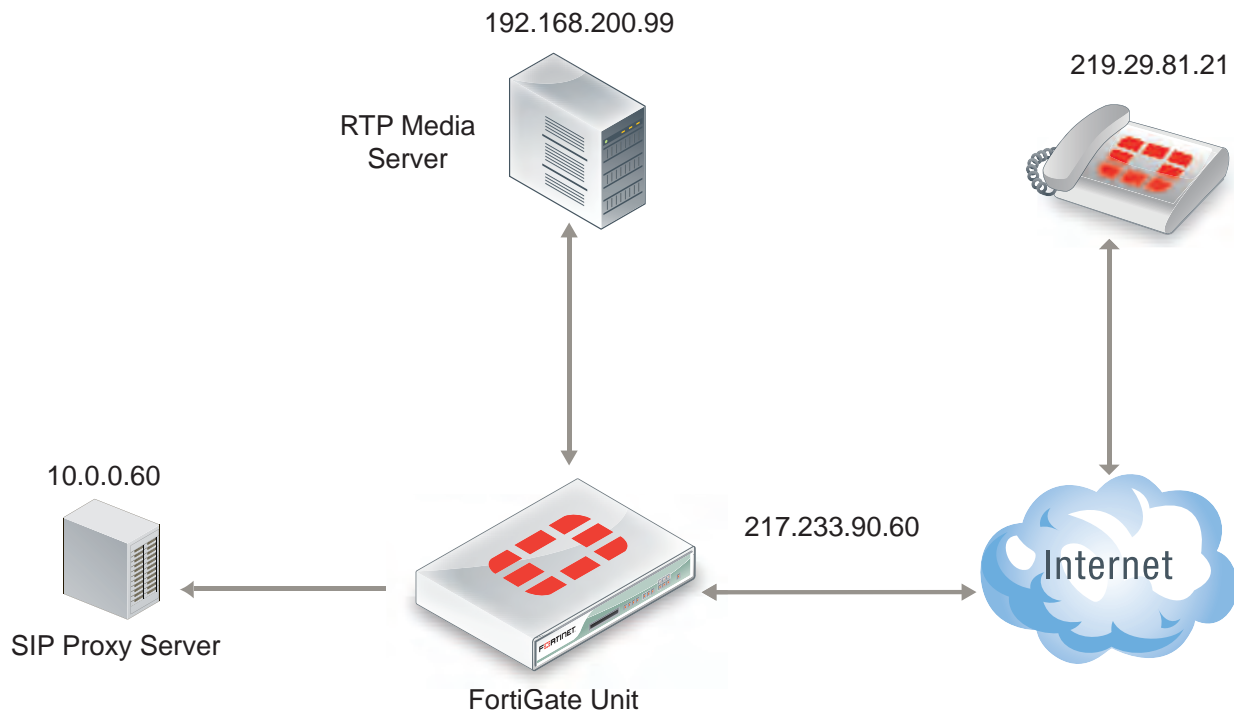

In the following destination NAT scenario, a SIP phone can connect through the FortiGate to a private IP address using a firewall virtual IP (VIP). The SIP ALG translates the SIP contact header to the IP of the real SIP proxy server located on the Internet.

**SIP destination NAT**

In the scenario, shown above, the SIP phone connects to a VIP (10.72.0.60). The SIP ALG translates the SIP contact header to 217.10.79.9, opens RTP pinholes, and manages NAT.

The FortiGate also supports a variation of this scenario where the RTP media server's IP address is hidden on a private network or DMZ.

**SIP destination NAT-RTP media server hidden**

In the scenario shown above, a SIP phone connects to the Internet. The VoIP service provider only publishes a single public IP. The FortiGate is configured with a firewall VIP. The SIP phone connects to the FortiGate (217.233.90.60) and using the VIP the FortiGate translates the SIP contact header to the SIP proxy server IP address (10.0.0.60). The SIP proxy server changes the SIP/SDP connection information (which tells the SIP phone which RTP media server IP it should contact) also to 217.233.90.60.

**Source NAT with an IP pool**

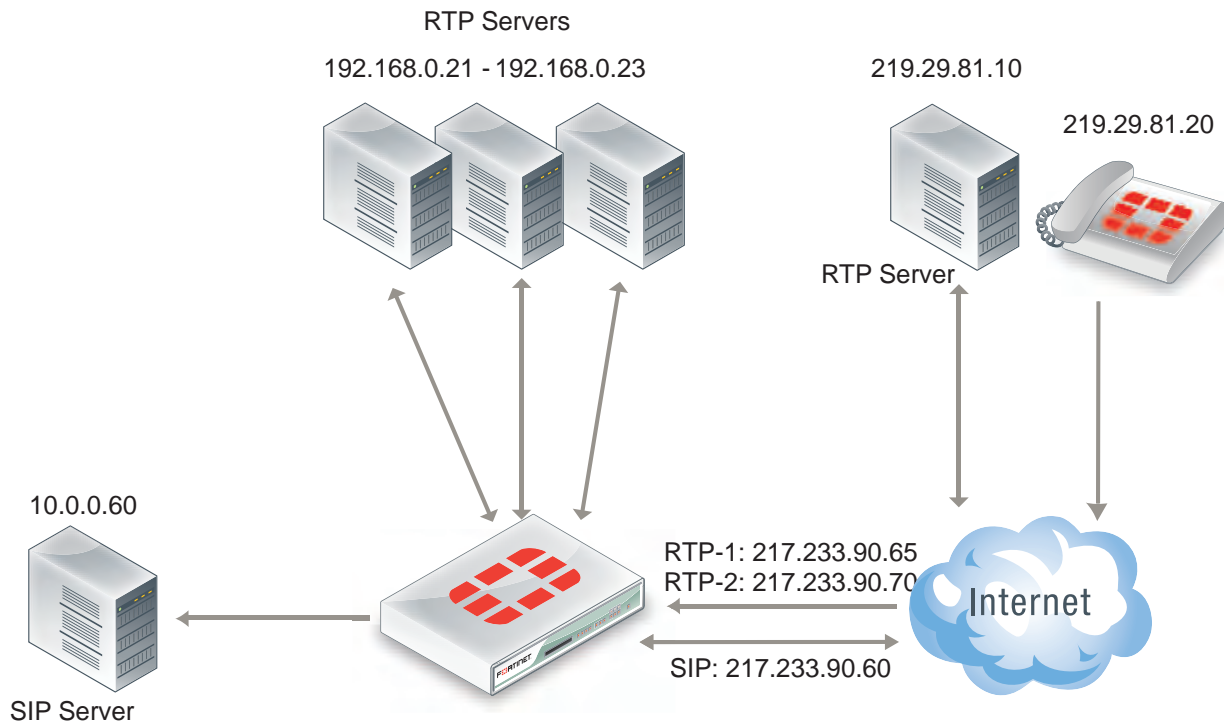

You can choose **NAT** with the **Dynamic IP Pool** option when configuring a security policy if the source IP of the SIP packets is different from the interface IP. The FortiGate ALG interprets this configuration and translates the SIP header accordingly.

This configuration also applies to destination NAT.

**Different source and destination NAT for SIP and RTP**

This is a more complex scenario that a SIP service provider may use. It can also be deployed in large-scale SIP environments where RTP has to be processed by the FortiGate and the RTP server IP has to be translated differently than the SIP server IP.

### Different source and destination NAT for SIP and RTP

In this scenario, shown above, assume there is a SIP server and a separate media gateway. The SIP server is configured so that the SIP phone (219.29.81.20) will connect to 217.233.90.60. The media gateway (RTP server: 219.29.81.10) will connect to 217.233.90.65.

What happens is as follows:

1. The SIP phone connects to the SIP VIP. The FortiGate ALG translates the SIP contact header to the SIP server: 219.29.81.20 > 217.233.90.60 (> 10.0.0.60).
2. The SIP server carries out RTP to 217.233.90.65.
3. The FortiGate ALG opens pinholes, assuming that it knows the ports to be opened.
4. RTP is sent to the RTP-VIP (217.233.90.65.) The FortiGate ALG translates the SIP contact header to 192.168.0.21.

### NAT with IP address conservation

In a source or destination NAT security policy that accepts SIP sessions, you can configure the SIP ALG or the SIP session helper to preserve the original source IP address of the SIP message in the `i=` line of the SDP profile. NAT with IP address conservation (also called SIP NAT tracing) changes the contents of SIP messages by adding the source IP address of the originator of the message into the SDP `i=` line of the SIP message. The SDP `i=` line is used for free-form text. However, if your SIP server can retrieve information from the SDP `i=` line, it can be useful for keeping a record of the source IP address of the originator of a SIP message when operating in a NAT environment. You can use this feature for billing purposes by extracting the IP address of the originator of the message.

## Configuring SIP IP address conservation for the SIP ALG

You can use the following command to enable or disable SIP IP address conservation in a VoIP profile for the SIP ALG. SIP IP address conservation is enabled by default in a VoIP profile.

```
config voip profile
 edit VoIP_Pro_1
 config sip
 set nat-trace disable
 end
 end
```

If the SIP message does not include an `i=` line and if the original source IP address of the traffic (before NAT) was 10.31.101.20 then the FortiGate would add the following `i=` line.

```
i=(o=IN IP4 10.31.101.20)
```

You can also use the `preserve-override` option to configure the SIP ALG to either add the original `o=` line to the end of the `i=` line or replace the `i=` line in the original message with a new `i=` line in the same form as above for adding a new `i=` line.

By default, `preserve-override` is disabled and the SIP ALG adds the original `o=` line to the end of the original `i=` line. Use the following command to configure the SIP ALG to replace the original `i=` line:

```
config voip profile
 edit VoIP_Pro_1
 config sip
 set preserve-override enable
 end
 end
```

## Configuring SIP IP address conservation for the SIP session helper

You can use the following command to enable or disable SIP IP address conservation for the SIP session helper. IP address conservation is enabled by default for the SIP session helper.

```
config system settings
 set sip-nat-trace disable
end
```

If the SIP message does not include an `i=` line and if the original source IP address of the traffic (before NAT) was 10.31.101.20 then the FortiGate would add the following `i=` line.

```
i=(o=IN IP4 10.31.101.20)
```

## Controlling how the SIP ALG NATs SIP contact header line addresses

You can enable `contact-fixup` so that the SIP ALG performs normal SIP NAT translation to SIP contact headers as SIP messages pass through the FortiGate.

Disable `contact-fixup` if you do not want the SIP ALG to perform normal NAT translation of the SIP contact header if a Record-Route header is also available. If `contact-fixup` is disabled, the FortiGate ALG does the following with contact headers:

- For Contact in Requests, if a Record-Route header is present and the request comes from the external network, the SIP Contact header is not translated.
- For Contact in Responses, if a Record-Route header is present and the response comes from the external network, the SIP Contact header is not translated.

If `contact-fixup` is disabled, the SIP ALG must be able to identify the external network. To identify the external network, you must use the `config system interface` command to set the `external` keyword to `enable` for the interface that is connected to the external network.

Enter the following command to perform normal NAT translation of the SIP contact header:

```
config voip profile
 edit VoIP_Pro_1
 config sip
 set contact-fixup enable
 end
 end
```

## Controlling NAT for addresses in SDP lines

You can use the `no-sdp-fixup` option to control whether the FortiGate performs NAT on addresses in SDP lines in the SIP message body.

The `no-sdp-fixup` option is disabled by default and the FortiGate performs NAT on addresses in SDP lines. Enable this option if you don't want the FortiGate to perform NAT on the addresses in SDP lines.

```
config voip profile
 edit VoIP_Pro_1
 config sip
 set no-sdp-fixup enable
 end
 end
```

## Translating SIP session destination ports

Using port forwarding virtual IPs you can change the destination port of SIP sessions as they pass through the FortiGate.

### Translating SIP sessions to a different destination port

To configure translating SIP sessions to a different destination port you must add a static NAT virtual IP that translates the SIP destination port to another port destination. In the example the destination port is translated from 5060 to 50601. This configuration can be used if SIP sessions use different destination ports on different networks.

**Example translating SIP sessions to a different destination port****To translate SIP sessions to a different destination port**

1. Add the static NAT virtual IP.

This virtual IP forwards traffic received at the port1 interface for IP address 172.20.120.20 and destination port 5060 to the SIP server at IP address 192.168.10.20 with destination port 5061.

```
config firewall vip
 edit "sip_port_trans_vip"
 set type static-nat
 set portforward enable
 set protocol tcp
 set extip 172.20.120.20
 set extport 5060
 set extintf "port1"
 set mappedip 192.168.10.20
 set mappedport 50601
 set comment "Translate SIP destination port"
 end
```

2. Add a security policy that includes the virtual IP and the default VoIP profile.

```
config firewall policy
 edit 1
 set srcintf "port1"
 set dstintf "port2"
 set srcaddr "all"
```

```

set dstaddr "sip_port_trans_vip"
set action accept
set schedule "always"
set service "ALL"
set utm-status enable
set profile-protocol-options default
set comments "Translate SIP destination port"
end

```

## Translating SIP sessions to multiple destination ports

You can use a load balance virtual IP to translate SIP session destination ports to a range of destination ports. In this example the destination port is translated from 5060 to the range 50601 to 50603. This configuration can be used if your SIP server is configured to receive SIP traffic on multiple ports.

### Example translating SIP traffic to multiple destination ports

### To translated SIP sessions to multiple destination ports

1. Add the load balance virtual IP.

This virtual IP forwards traffic received at the port1 interface for IP address 172.20.120.20 and destination port 5060 to the SIP server at IP address 192.168.10.20 with destination port 5061.

```
config firewall vip
```

```

edit "sip_port_ldbl_vip"
 set type load-balance
 set portforward enable
 set protocol tcp
 set extip 172.20.120.20
 set extport 5060
 set extintf "port1"
 set mappedip 192.168.10.20
 set mappedport 50601-50603
 set comment "Translate SIP destination port range"
end

```

## 2. Add a security policy that includes the virtual IP and VoIP profile.

```

config firewall policy
 edit 1
 set srcintf "port1"
 set dstintf "port2"
 set srcaddr "all"
 set dstaddr "sip_port_ldbl_vip"
 set action accept
 set schedule "always"
 set service "ALL"
 set utm-status enable
 set voip-profile default
 set comments "Translate SIP destination port"
 end

```

## Adding the original IP address and port to the SIP message header after NAT

In some cases your SIP configuration may require that the original IP address and port from the SIP contact request is kept after NAT. For example, the original SIP contact request could include the following:

```
Contact: <sip:0150302438@172.20.120.110:5060>;
```

After the packet goes through the FortiGate and NAT is performed, the contact request could normally look like the following (the IP address translated to a different IP address and the port to a different port):

```
Contact: <sip:0150302438@10.10.10.21:33608>;
```

You can enable `register-contact-trace` in a VoIP profile to have the SIP ALG add the original IP address and port in the following format:

```
Contact: <sip:0150302438@<nated-ip>:<nated-port>;o=<original-ip>: <original-port>>;
```

So the contact line after NAT could look like the following:

```
Contact: <sip:0150302438@10.10.10.21:33608;o=172.20.120.110:5060>;
```

Enter the following command to enable keeping the original IP address and port:

```

config voip profile
 edit Profile_name
 config sip
 set register-contract-trace enable
 end
 end

```

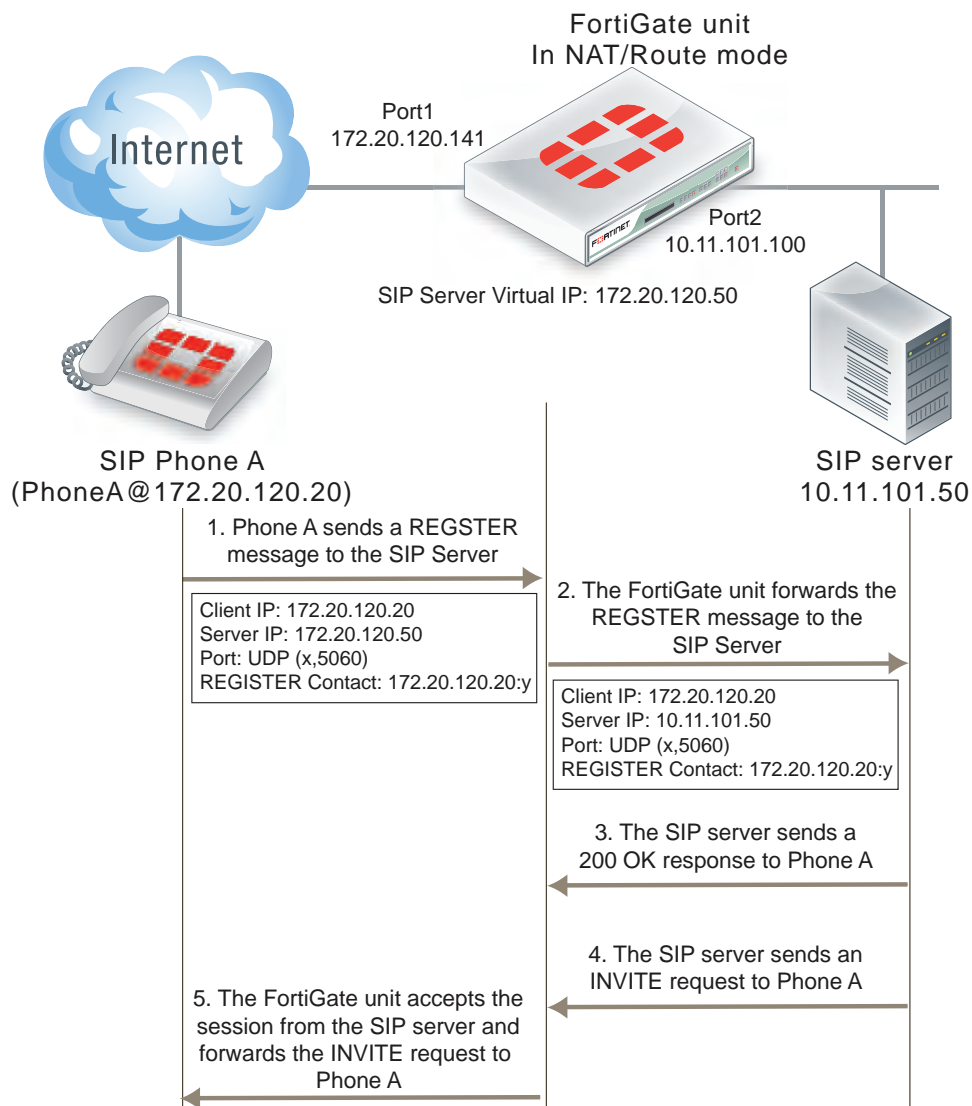

## Enhancing SIP pinhole security

You can use the `strict-register` option in a SIP VoIP profile to open smaller pinholes. This option is enabled by default on the default VoIP profiles and in all new VoIP profiles that you create.

As shown below, when FortiGate is protecting a SIP server on a private network, the FortiGate does not have to open a pinhole for the SIP server to send INVITE requests to a SIP Phone on the Internet after the SIP Phone has registered with the server.

### FortiGate protecting a SIP server on a private network

In the example, a client (SIP Phone A) sends a REGISTER request to the SIP server with the following information:

```
Client IP: 10.31.101.20
Server IP: 10.21.101.50
Port: UDP (x,5060)
```

```
REGISTER Contact: 10.31.101.20:y
```

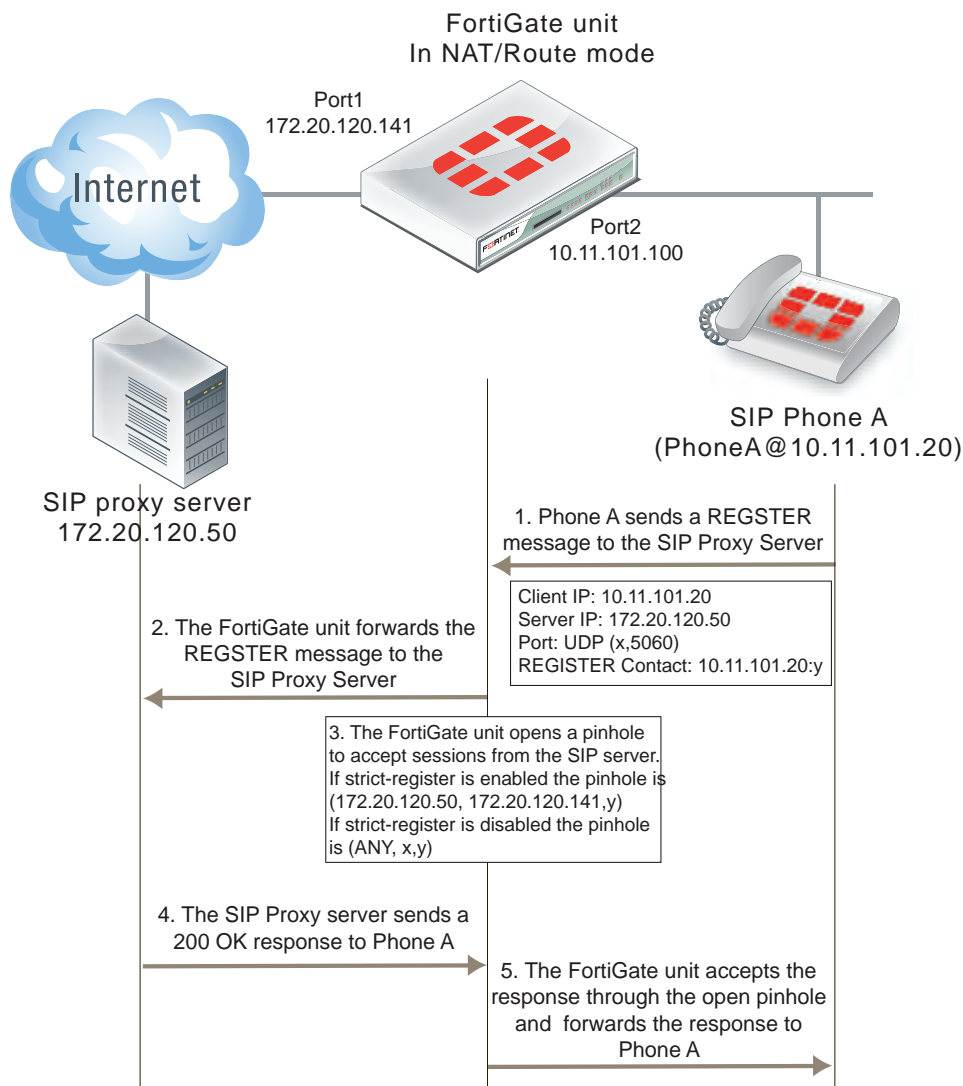

Where  $x$  and  $y$  are ports chosen by Phone A.

As soon as the server sends the 200 OK reply it can forward INVITE requests from other SIP phones to SIP Phone A. If the SIP proxy server uses the information in the REGISTER message received from SIP Phone A the INVITE messages sent to Phone A will only get through the FortiGate if a policy has been added to allow the server to send traffic from the private network to the Internet. Or the SIP ALG must open a pinhole to allow traffic from the server to the Internet. In most cases the FortiGate is protecting the SIP server so there is no reason not to add a security policy to allow the SIP server to send outbound traffic to the Internet.

In a typical SOHO scenario, shown below, SIP Phone A is being protected from the Internet by a FortiGate. In most cases the FortiGate would not allow incoming traffic from the Internet to reach the private network. So the only way that an INVITE request from the SIP server can reach SIP Phone A is if the SIP ALG creates an incoming pinhole. All pinholes have three attributes:

```
(source address, destination address, destination port)
```

### SOHO configuration, FortiGate protecting a network with SIP phones

The more specific a pinhole is the more secure it is because it accept less traffic. In this situation, the pinhole would be more secure if it only accepted traffic from the SIP server. This is what happens if `strict-register` is enabled in the VoIP profile that accepts the REGISTER request from Phone A.

(SIP server IP address, client IP address, destination port)

If `strict-register` is disabled (the default configuration) the pinhole is set up with the following attributes

(ALL IP addresses, client IP address, destination port)

This pinhole allows connections through the FortiGate from ALL source address which is a much bigger and less secure pinhole. In most similar network configurations you should enable `strict-register` to improve pinhole security.

Enabling `strict-register` can cause problems when the SIP registrar and SIP proxy server are separate entities with separate IP addresses.

Enter the following command to enable `strict-register` in a VoIP profile.

```
config voip profile
 edit Profile_name
 config sip
 set strict-register enable
 end
```

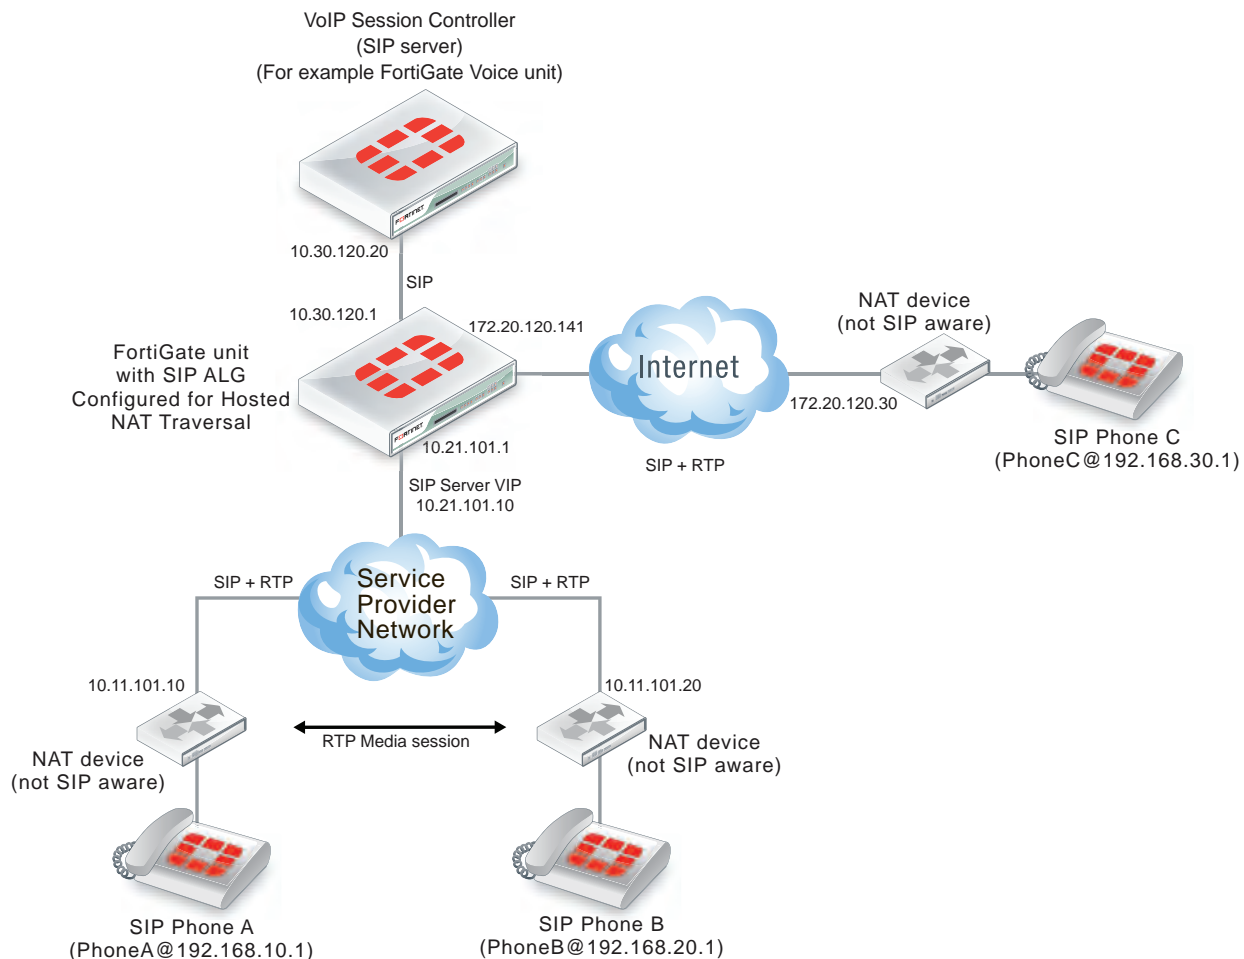

## Hosted NAT traversal

With the increase in the use of VoIP and other media traffic over the Internet, service provider network administrators must defend their networks from threats while allowing voice and multimedia traffic to flow transparently between users and servers and among users. A common scenario could involve providing SIP VoIP services for customers with SIP phones installed behind NAT devices that are not SIP aware. NAT devices that are not SIP aware cannot translate IP addresses in SIP headers and SDP lines in SIP packets but can and do perform source NAT on the source or addresses of the packets. In this scenario the user's SIP phones would communicate with a SIP proxy server to set up calls between SIP phones. Once the calls are set up RTP packets would be communicated directly between the phones through each user's NAT device.

The problem with this configuration is that the SIP headers and SDP lines in the SIP packets sent from the phones and received by the SIP proxy server would contain the private network addresses of the VoIP phones that would not be routable on the service provider network or on the Internet. One solution could be to for each customer to install and configure SIP aware NAT devices. If this is not possible, another solution requires implement hosted NAT traversal.

In a hosted NAT traversal (HNT) configuration, a FortiGate is installed between the NAT device and the SIP proxy server and configured with a VoIP profile that enables SIP hosted NAT traversal. Security policies that include the VoIP profile also support destination NAT using a firewall virtual IP. When the SIP phones connect to the SIP server IP address the security policy accepts the SIP packets, the virtual IP translates the destination addresses of the packets to the SIP server IP address, and the SIP ALG NAT traversal configuration translates the source IP addresses on the SIP headers and SDP lines to the source address of the SIP packets (which would be the external IP address of the NAT devices). The SIP server then sees the SIP phone IP address as the external IP address of the NAT device. As a result SIP and RTP media sessions are established using the external IP addresses of the NAT devices instead of the actual IP addresses of the SIP phones.

### FortiGate SIP Hosted NAT Traversal configuration

### Configuration example: Hosted NAT traversal for calls between SIP Phone A and SIP Phone B

The following address translation takes place to allow a SIP call from SIP Phone A to SIP Phone B in the above diagram.

1. SIP Phone A sends a SIP Invite message to the SIP server. Packet source IP address: 192.168.10.1, destination IP address: 10.21.101.10.
2. The SIP packets are received by the NAT device which translates the source address of the SIP packets from 192.168.10.1 to 10.11.101.20.
3. The SIP packets are received by the FortiGate which translates the packet destination IP address to 10.30.120.20. The SIP ALG also translates the IP address of the SIP phone in the SIP header and SDP lines from 192.168.10.1 to 10.11.101.20.
4. The SIP server accepts the Invite message and forwards it to SIP Phone B at IP address 10.11.101.20. The SIP server has this address for SIP Phone B because SIP packets from SIP Phone B have also been translated using the hosted NAT traversal configuration of the SIP ALG.
5. When the SIP call is established, the RTP session is between 10.11.101.10 and 10.11.101.20 and does not pass through the FortiGate. The NAT devices translated the destination address of the RTP packets to the private IP addresses of the SIP phones.

## General configuration steps

The following general configuration steps are required for this destination NAT SIP configuration. This example uses the default VoIP profile.

1. Add a VoIP profile that enables hosted NAT translation.
2. Add a SIP proxy server firewall virtual IP.
3. Add a firewall address for the SIP proxy server on the private network.
4. Add a destination NAT security policy that accepts SIP sessions from the Internet destined for the SIP proxy server virtual IP and translates the destination address to the IP address of the SIP proxy server on the private network.
5. Add a security policy that accepts SIP sessions initiated by the SIP proxy server and destined for the Internet.

## Configuration steps - GUI

### To add the SIP proxy server firewall virtual IP

1. Go to **Policy & Objects > Virtual IPs**.
2. Add the SIP proxy server virtual IP.

<b>Name</b>	SIP_Proxy_VIP
<b>External Interface</b>	port1
<b>Type</b>	Static NAT
<b>External IP Address/Range</b>	172.20.120.50
<b>Mapped IP Address/Range</b>	10.31.101.50

### To add a firewall address for the SIP proxy server

1. Go to **Policy & Objects > Addresses**.
2. Add the following for the SIP proxy server:

<b>Category</b>	Address
<b>Name</b>	SIP_Proxy_Server
<b>Type</b>	Subnet
<b>Subnet / IP Range</b>	10.31.101.50/255.255.255.255
<b>Interface</b>	port2

### To add the security policies

1. Go to **Policy & Objects > IPv4 Policy**.
2. Add a destination NAT security policy that includes the SIP proxy server virtual IP that allows Phone B (and other SIP phones on the Internet) to send SIP request messages to the SIP proxy server.

<b>Incoming Interface</b>	port1
<b>Outgoing Interface</b>	port2
<b>Source</b>	all
<b>Destination Address</b>	SIP_Proxy_VIP
<b>Schedule</b>	always
<b>Service</b>	SIP
<b>Action</b>	ACCEPT

3. Turn on **NAT** and select **Use Outgoing Interface Address**.
4. Turn on **VoIP** and select the **default** VoIP profile.
5. Select **OK**.
6. Add a source NAT security policy to allow the SIP proxy server to send SIP request messages to Phone B and the Internet:

<b>Incoming Interface</b>	port2
<b>Outgoing Interface</b>	port1
<b>Source</b>	SIP_Proxy_Server
<b>Destination Address</b>	all
<b>Schedule</b>	always
<b>Service</b>	SIP
<b>Action</b>	ACCEPT

7. Turn on **NAT** and select **Use Outgoing Interface Address**.
8. Turn on **VoIP** and select the **default** VoIP profile.
9. Select **OK**.

## Configuration steps - CLI

### To add a VoIP profile that enables hosted NAT translation

1. Enter the following command to add a VoIP profile named HNT that enables hosted NAT traversal. This command shows how to clone the default VoIP profile and enable hosted NAT traversal.

```
config voip profile
 clone default to HNT
 edit HNT
 config sip
 set hosted-nat-traversal enable
 end
 end
```

**To add the SIP proxy server firewall virtual IP and firewall address**

1. Enter the following command to add the SIP proxy server firewall virtual IP.

```
config firewall vip
edit SIP_Proxy_VIP
set type static-nat
set extip 10.21.101.10
set mappedip 10.30.120.20
set extintf port1
end
```

2. Enter the following command to add the SIP proxy server firewall address.

```
config firewall address
edit SIP_Proxy_Server
set associated interface port2
set type ipmask
set subnet 10.30.120.20 255.255.255.255
end
```

**To add security policies**

1. Enter the following command to add a destination NAT security policy that includes the SIP proxy server virtual IP that allows Phone A to send SIP request messages to the SIP proxy server.

```
config firewall policy
edit 0
set srcintf port1
set dstintf port2
set srcaddr all
set dstaddr SIP_Proxy_VIP
set action accept
set schedule always
set service SIP
set nat enable
set utm-status enable
set profile-protocol-options default
set voip-profile HNT
end
```

2. Enter the following command to add a source NAT security policy to allow the SIP proxy server to send SIP request messages to Phone B:

```
config firewall policy
edit 0
set srcintf port2
set dstintf port1
set srcaddr SIP_Proxy_Server
set dstaddr all
set action accept
set schedule always
set service SIP
set nat enable
set utm-status enable
set profile-protocol-options default
set voip-profile default
end
```

## Hosted NAT traversal for calls between SIP Phone A and SIP Phone C

The following address translation takes place to allow a SIP call from SIP Phone A to SIP Phone C in the previous diagram.

1. SIP Phone A sends a SIP Invite message to the SIP server. Packet source IP address: 192.168.10.1 and destination IP address: 10.21.101.10.
2. The SIP packets are received by the NAT device which translates the source address of the SIP packets from 192.168.10.1 to 10.11.101.20.
3. The SIP packets are received by the FortiGate which translates the packet destination IP address to 10.30.120.20. The SIP ALG also translates the IP address of the SIP phone in the SIP header and SDP lines from 192.168.10.1 to 10.11.101.20.
4. The SIP server accepts the Invite message and forwards it to SIP Phone C at IP address 172.20.120.30. The SIP server has this address for SIP Phone C because SIP packets from SIP Phone C have also been translated using the hosted NAT traversal configuration of the SIP ALG.
5. When the SIP call is established, the RTP session is between 10.11.101.10 and 172.20.120.30. The packets pass through the FortiGate which performs NAT as required.

## Restricting the RTP source IP

Use the following command in a VoIP profile to restrict the RTP source IP to be the same as the SIP source IP when hosted NAT traversal is enabled.

```
config voip profile
 edit VoIP_HNT
 config sip
 set hosted-nat-traversal enable
 set hnt-restrict-source-ip enable
 end
 end
```

## SIP over IPv6

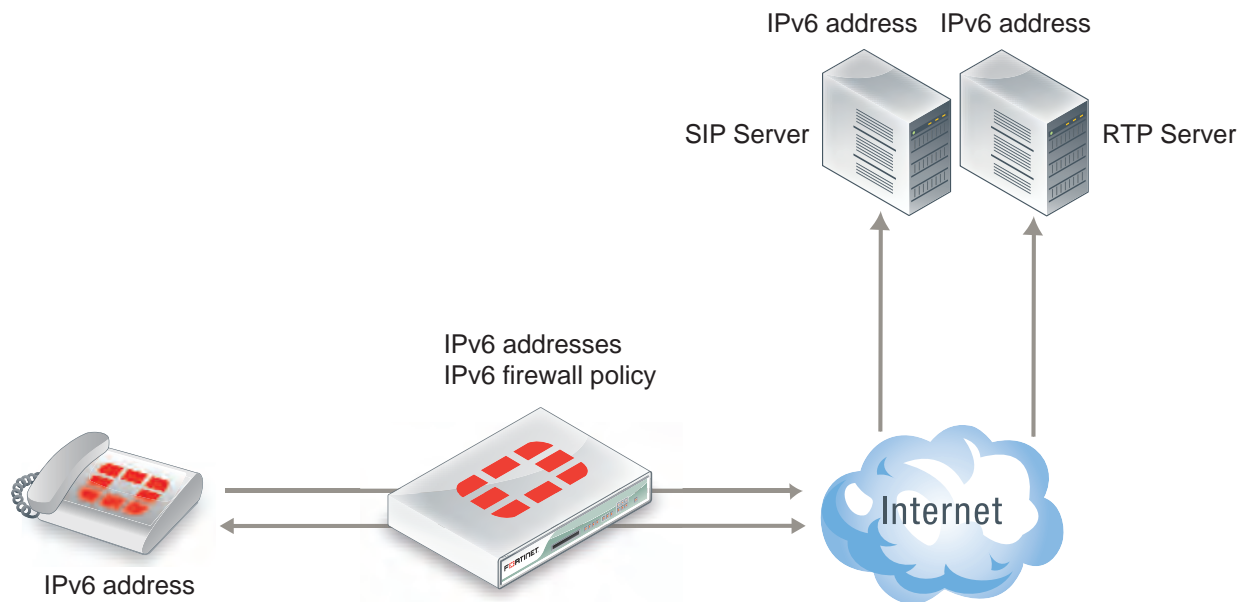

FortiGates operating in NAT and in Transparent mode support SIP over IPv6. The SIP ALG can process SIP messages that use IPv6 addresses in the headers, bodies, and in the transport stack. The SIP ALG cannot modify the IPv6 addresses in the SIP headers so FortiGates cannot perform SIP or RTP NAT over IPv6 and also cannot translate between IPv6 and IPv4 addresses.

In the scenario shown in the figure below, a SIP phone connects to the Internet through a FortiGate operating. The phone and the SIP and RTP servers all have IPv6 addresses.

The FortiGate has IPv6 security policies that accept SIP sessions. The SIP ALG understands IPv6 addresses and can forward IPv6 sessions to their destinations. Using SIP application control features the SIP ALG can also apply rate limiting and other settings to SIP sessions.

## SIP support for IPv6

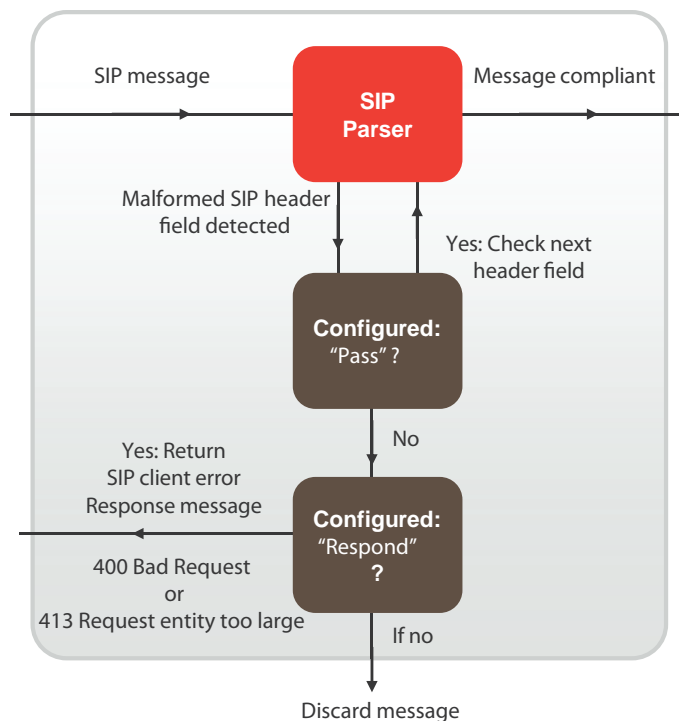

To enable SIP support for IPv6 add an IPv6 security policy that accepts SIP packets and includes a VoIP profile.

## Deep SIP message inspection

Deep SIP message syntax inspection (also called Deep SIP header inspection or SIP fuzzing protection) provides protection against malicious SIP messages by applying SIP header and SDP profile syntax checking. SIP Fuzzing attacks can be used by attackers to discover and exploit vulnerabilities of a SIP entity (for example a SIP proxy server). Most often these attacks could crash or compromise the SIP entity.

## Deep SIP message inspection

- Checks the SIP request message Request-line
- Checks the following SIP header fields:
  - Allow, CallId, Contact, Content-length, Content-type, CSeq, Expires, From, Max-Forwards, P-asserted-identity, Rack, Record-Route, Route, Rseq, To, Via
- Checks all SDP profile lines
- Configurable header and body length checks
- Optional logging of message violations

Deep SIP message inspection checks the syntax of each SIP header and SDP profile line to make sure they conform to the syntax defined in the relevant RFC and IETF standard. You can also configure the SIP ALG to inspect for:

- Unknown SIP message types (message types not defined in a SIP RFC) this option is enabled by default and can be disabled. When enabled unknown message types are discarded. Configured using the `block-unknown` option.
- Unknown line types (message line types that are not defined in any SIP or SDP RFC). Configured using the `unknown-header` option.
- Messages that are longer than a configured maximum size. Configured using the `max-body-length` option.
- Messages that contain one or more lines that are longer than a set maximum line length (default 998 characters). Configured using the `max-line-length` option.

## Actions taken when a malformed message line is found

When a malformed message line or other error is found the SIP ALG can be configured to discard the message containing the error, pass the message without any other actions, or responding to the message with a 400 Bad Request or 413 Request entity too large client error SIP response message and then discard the message. (For information about client error SIP response messages, see [Client error on page 3495](#).)

If a message line is longer than the configured maximum, the SIP ALG sends the following message:

```
SIP/2.0 413 Request Entity Too Large, <optional_info>
```

If a message line is incorrect or in an unknown message line is found, the SIP ALG sends the following message:

```
SIP/2.0 400 Bad Request, <optional_info>
```

The `<optional_info>` provides more information about why the message was rejected. For example, if the SIP ALG finds a malformed Via header line, the response message may be:

SIP/2.0 400 Bad Request, malformed Via header

If the SIP ALG finds a malformed message line, and the action for this message line type is discard, the message is discarded with no further checking or responses. If the action is pass, the SIP ALG continues parsing the SIP message for more malformed message lines. If the action is respond, the SIP ALG sends the SIP response message and discards the message containing the malformed line with no further checking or response. If only malformed message line types with action set to pass are found, the SIP ALG extracts as much information as possible from the message (for example for NAT and opening pinholes, and forwards the message to its destination).

If a SIP message containing a malformed line is discarded the SIP ALG will not use the information in the message for call processing. This could result in the call being terminated. If a malformed line in a SIP message includes information required for the SIP call that the SIP ALG cannot interpret (for example, if an IP address required for SIP NAT is corrupted) the SIP ALG may not be able to continue processing the call and it could be terminated. Discarded messages are counted by SIP ALG static message counters.

## Logging and statistics

To record a log message each time the SIP ALG finds a malformed header, enable logging SIP violations in a VoIP profile. In all cases, when the SIP ALG finds an error the FortiGate records a malformed header log message that contains information about the error. This happens even if the action is set to pass.

If, because of recording log messages for deep message inspection, the CPU performance is affected by a certain amount, the FortiGate records a critical log message about this event and stops writing log messages for deep SIP message inspection.

The following information is recorded in malformed header messages:

- The type of message line in which the error was found.
- The content of the message line in which the error was found (it will be truncated if it makes the log message too long)
- The column or character number in which the error was found (to make it easier to determine what caused the error)

## Deep SIP message inspection best practices

Because of the risks imposed by SIP header attacks or incorrect data being allowed and because selecting drop or respond does not require more CPU overhead than pass you would want to set all tests to drop or respond. However, in some cases malformed lines may be less of a threat or risk. For example, the SDP `i=` does not usually contain information that is parsed by any SIP device so a malformed `i=` line may not pose a threat.

You can also use the pre-defined VoIP profiles to apply different levels of deep message inspection. The default VoIP profile sets all deep message inspection options to pass and the strict VoIP profile sets all deep message inspection options to discard. From the CLI you can use the `clone` command to copy these pre-defined VoIP profiles and then customize them for your requirements.

## Configuring deep SIP message inspection

You configure deep SIP message inspection in a VoIP profile. All deep SIP message inspection options are available only from the CLI.

Enter the following command to configure deep SIP message inspection to discard messages with malformed Request-lines (the first line in a SIP request message):

```
config voip profile
```

```

edit VoIP_Pro_Name
 config sip
 set malformed-request-line respond
 end
end

```

You cannot configure message inspection for the Status-line, which is the first line in a SIP response message.

The following table lists the SIP header lines that the SIP ALG can inspect and the CLI command for configuring the action for each line type. The table also lists the RFC that the header line is defined in.

#### SIP header lines that the SIP ALG can inspect for syntax errors

SIP Header line	VoIP profile option	RFC
<b>Allow</b>	malformed-header-allow	RFC 3261
<b>Call-ID</b>	malformed-header-call-id	RFC 3261
<b>Contact</b>	malformed-header-contact	RFC 3261
<b>Content-Length</b>	malformed-header-content-length	RFC 3261
<b>Content-Type</b>	malformed-header-content-type	RFC 3261
<b>CSeq</b>	malformed-header-cseq	RFC 3261
<b>Expires</b>	malformed-header-expires	RFC 3261
<b>From</b>	malformed-header-from	RFC 3261
<b>Max-forwards</b>	malformed-header-max-forwards	RFC 3261
<b>P-Asserted-Identity</b>	malformed-header-p-asserted-identity	RFC 3325
<b>RAck</b>	malformed-header-rack	RFC 3262
<b>Record-Route</b>	malformed-header-record-route	RFC 3261
<b>Route</b>	malformed-header-route	RFC 3261
<b>RSeq</b>	malformed-header-rseq	RFC 3262
<b>To</b>	malformed-header-to	RFC 3261
<b>Via</b>	malformed-header-via	RFC 3261

The table below lists the SDP profile lines that the SIP ALG inspects and the CLI command for configuring the action for each line type. SDP profile lines are defined by RFC 4566 and RFC 2327.

### SDP profile lines that the SIP ALG can inspect for syntax errors

Attribute	VoIP profile option
<b>a=</b>	malformed-header-sdb-a
<b>b=</b>	malformed-header-sdp-b
<b>c=</b>	malformed-header-sdp-c
<b>i=</b>	malformed-header-sdp-i
<b>k=</b>	malformed-header-sdp-k
<b>m=</b>	malformed-header-sdp-m
<b>o=</b>	malformed-header-sdp-o
<b>r=</b>	malformed-header-sdp-r
<b>s=</b>	malformed-header-sdp-s
<b>t=</b>	malformed-header-sdp-t
<b>v=</b>	malformed-header-sdp-v
<b>z=</b>	malformed-header-sdp-z

### Discarding SIP messages with some malformed header and body lines

Enter the following command to configure deep SIP message inspection to discard SIP messages with a malformed Via line, a malformed route line or a malformed m= line but to pass messages with a malformed i= line or a malformed Max-Forwards line

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set malformed-header-via discard
 set malformed-header-route discard
 set malformed-header-sdp-m discard
 set malformed-header-sdp-i pass
 set malformed-header-max-forwards pass
 end
 end
```

### Discarding SIP messages with an unknown SIP message type

Enter the following command to discard SIP messages with an unknown SIP message line type as defined in all current SIP RFCs:

```
config voip profile
```

```
edit VoIP_Pro_Name
 config sip
 set unknown-header discard
 end
end
```

### Discarding SIP messages that exceed a message size

Enter the following command to set the maximum size of a SIP message to 200 bytes. Messages longer than 200 bytes are discarded.

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set max-body-length 200
 end
 end
```

The `max-body-length` option checks the value in the SIP Content-Length header line to determine body length. The Content-Length can be larger than the actual size of a SIP message if the SIP message content is split over more than one packet. SIP message sizes vary widely. The size of a SIP message can also change with the addition of Via and Record-Route headers as the message is transmitted between users and SIP servers.

### Discarding SIP messages with lines longer than 500 characters

Enter the following command to set the length of a SIP message line to 500 characters and to block messages that include lines with 500 or more characters:

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set max-line-length 500
 set block-long-lines enable
 end
 end
```

## Blocking SIP request messages

You may want to block different types of SIP requests:

- to prevent SIP attacks using these messages.
- If your SIP server cannot process some SIP messages because of a temporary issue (for example a bug that crashes or compromises the server when it receives a message of a certain type).
- Your SIP implementation does not use certain message types.

When you enable message blocking for a message type in a VoIP profile, whenever a security policy containing the VoIP profile accepts a SIP message of this type, the SIP ALG silently discards the message and records a log message about the action.

Use the following command to configure a VoIP profile to block SIP CANCEL and Update request messages:

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set block-cancel enable
 set block-update enable
```

end  
end

SIP uses a variety of text-based messages or requests to communicate information about SIP clients and servers to the various components of the SIP network. Since SIP requests are simple text messages and since the requests or their replies can contain information about network components on either side of the FortiGate, it may be a security risk to allow these messages to pass through.

The following table lists all of the VoIP profile SIP request message blocking options. All of these options are disabled by default.

Blocking SIP OPTIONS messages may prevent a redundant configuration from operating correctly. See [Supporting geographic redundancy when blocking OPTIONS messages on page 3569](#) for information about resolving this problem.

### Options for blocking SIP request messages

SIP request message	SIP message blocking CLI Option
<b>ACK</b>	block-ack
<b>BYE</b>	block-bye
<b>Cancel</b>	block-cancel
<b>INFO</b>	block-info
<b>INVITE</b>	block-invite
<b>Message</b>	block-message
<b>Notify</b>	block-notify
<b>Options</b>	block-options
<b>PRACK</b>	block-prack
<b>Publish</b>	block-publish
<b>Refer</b>	block-refer
<b>Register</b>	block-register
<b>Subscribe</b>	block-subscribe
<b>Update</b>	block-update

## SIP rate limiting

Configurable threshold for SIP message rates per request method. Protects SIP servers from SIP overload and DoS attacks.

### SIP rate limiting

FortiGates support rate limiting for the following types of VoIP traffic:

- Session Initiation Protocol (SIP)
- Skinny Call Control Protocol (SCCP) (most versions)
- Session Initiation Protocol for Instant Messaging and Presence Leveraging Extensions (SIMPLE).

You can use rate limiting of these VoIP protocols to protect the FortiGate and your network from SIP and SCCP Denial of Service (DoS) attacks. Rate limiting protects against SIP DoS attacks by limiting the number of SIP REGISTER and INVITE requests that the FortiGate receives per second. Rate limiting protects against SCCP DoS attacks by limiting the number of SCCP call setup messages that the FortiGate receives per minute.

You configure rate limiting for a message type by specifying a limit for the number of messages that can be received per second. The rate is limited per security policy. When VoIP rate limiting is enabled for a message

type, if the a single security policy accepts more messages per second than the configured rate, the extra messages are dropped and log messages are written when the messages are dropped.

Use the following command to configure a VoIP profile to limit the number of INVITE messages accepted by each security policy that the VoIP profile is added to 100 INVITE messages a second:

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set invite-rate 100
 end
 end
```

If you are experiencing denial of service attacks from traffic using these VoIP protocols, you can enable VoIP rate limiting and limit the rates for your network. Limit the rates depending on the amount of SIP and SCCP traffic that you expect the FortiGate to be handling. You can adjust the settings if some calls are lost or if the amount of SIP or SCCP traffic is affecting FortiGate performance.

The table below lists all of the VoIP profile SIP rate limiting options. All of these options are set to 0 so are disabled by default.

Blocking SIP OPTIONS messages may prevent a redundant configuration from operating correctly. See [Supporting geographic redundancy when blocking OPTIONS messages on page 3569](#) for information about resolving this problem.

### Options for SIP rate limiting

SIP request message	Rate Limiting CLI Option
ACK	ack-rate
BYE	bye-rate
Cancel	cancel-rate
INFO	info-rate
INVITE	invite-rate
Message	message-rate
Notify	notify-rate
Options	options-rate
PRACK	prack-rate
Publish	publish-rate
Refer	refer-rate
Register	register-rate

SIP request message	Rate Limiting CLI Option
<b>Subscribe</b>	subscribe-rate
<b>Update</b>	update-rate

## Limiting the number of SIP dialogs accepted by a security policy

In addition to limiting the rates for receiving SIP messages, you can use the following command to limit the number of SIP dialogs (or SIP calls) that the FortiGate accepts.

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set max-dialogs 2000
 end
 end
```

This command sets the maximum number of SIP dialogs that can be open for SIP sessions accepted by any security policy that you add the VoIP profile to. The default setting of 0 does not limit the number of dialogs. You can add a limit to control the number of open dialogs and raise and lower it as required. You might want to limit the number of open dialogs for protection against SIP-based attackers opening large numbers of SIP dialogs. Every dialog takes memory and FortiGate CPU resources to process. Limiting the number of dialogs may improve the overall performance of the FortiGate. Limiting the number of dialogs will not drop calls in progress but may prevent new calls from connecting.

## SIP logging

You can enable SIP logging and logging of SIP violations in a VoIP profile.

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set log-call-summary enable
 set log-violations enable
 end
 end
```

To view SIP log messages go to **Log & Report > Forward Traffic**.

## Inspecting SIP over SSL/TLS (secure SIP)

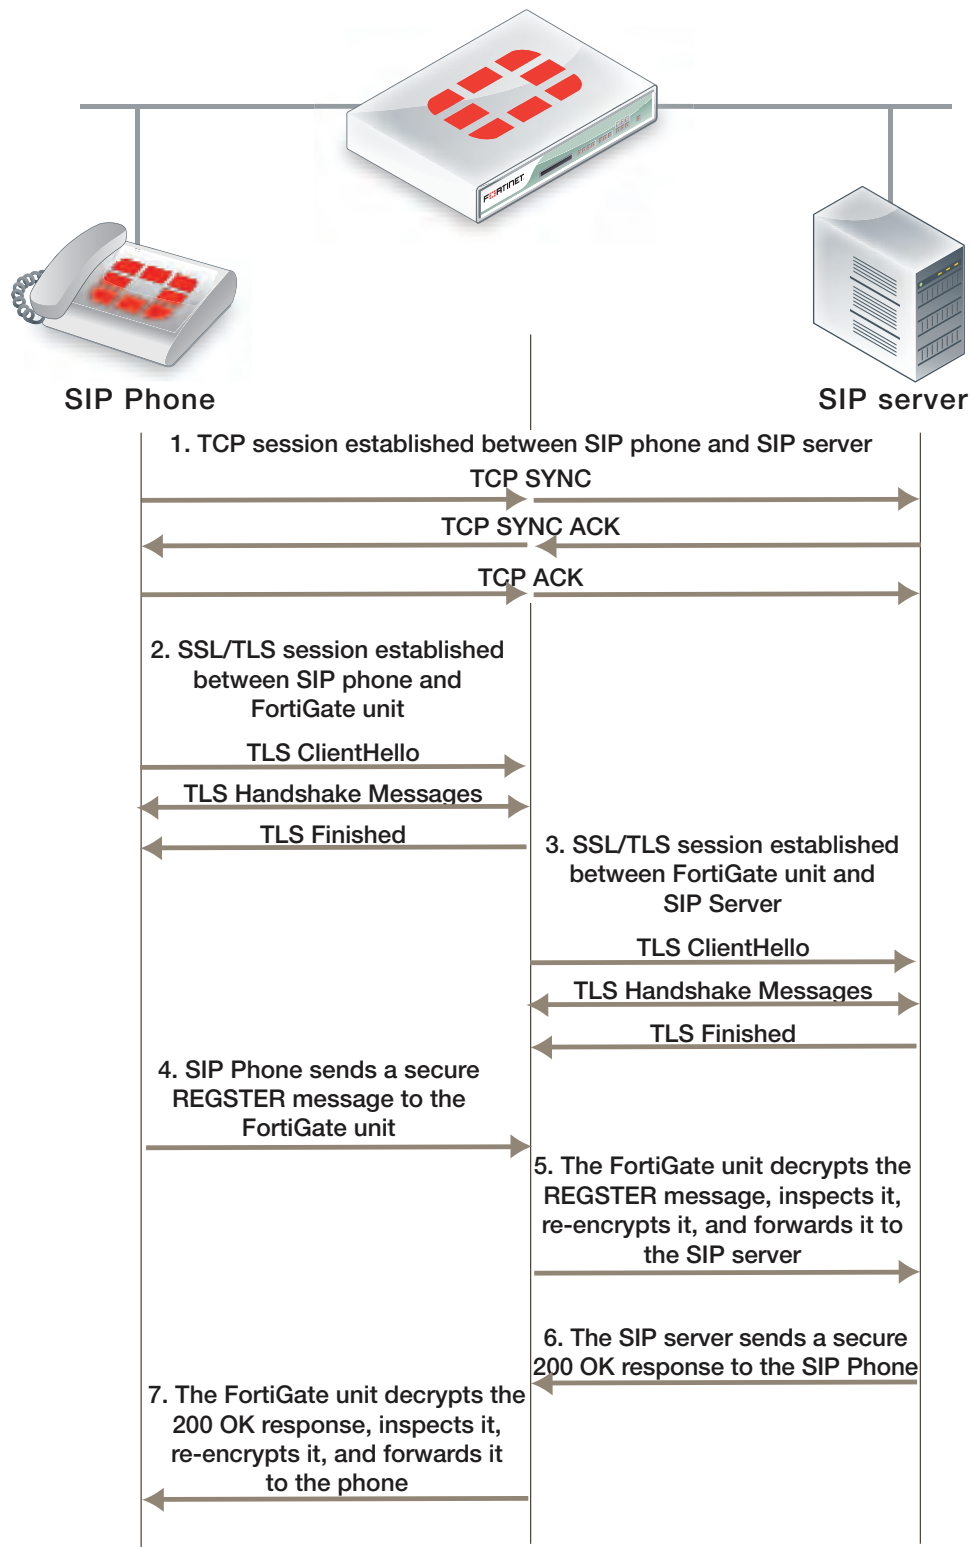

Some SIP phones and SIP servers can communicate using SSL or TLS to encrypt the SIP signaling traffic. To allow SIP over SSL/TLS calls to pass through the FortiGate, the encrypted signaling traffic has to be unencrypted and inspected. To do this, the FortiGate SIP ALG intercepts and unencrypts and inspects the SIP packets. The packets are then re-encrypted and forwarded to their destination.

Normally SIP over SSL/TLS uses port 5061. You can use the following command to change the port that the FortiGate listens on for SIP over SSL/TLS sessions to port 5066:

```
config system settings
 set sip-ssl-port 5066
end
```

The SIP ALG supports full mode SSL/TLS only. Traffic between SIP phones and the FortiGate and between the FortiGate and the SIP server is always encrypted.

You enable SSL/TLS SIP communication by enabling SSL mode in a VoIP profile. You also need to install the SIP server and client certificates on your FortiGate and add them to the SSL configuration in the VoIP profile.

**SIP over SSL/TLS between a SIP phone and a SIP server**

Other than enabling SSL mode and making sure the security policies accept the encrypted traffic, the FortiGate configuration for SSL/TLS SIP is the same as any SIP configuration. SIP over SSL/TLS is supported for all supported SIP configurations.

## Adding the SIP server and client certificates

A VoIP profile that supports SSL/TLS SIP requires one certification for the SIP server and one certificate that is used by all of the clients. Use the following steps to add these certificates to the FortiGate. Before you start, make sure the client and server certificate files and their key files are accessible from the management computer.

1. Go to **System > Certificates** and select **Import**.
2. Set **Type** to **Certificate**.
3. Browse to the **Certificate file** and the **Key file** and select **OK**.
4. Enter a password for the certificate and select **OK**.  
The certificate and key are uploaded to the FortiGate and added to the **Local Certificates** List.
5. Repeat to upload the other certificate.

The certificates are added to the list of Local Certificates as the filenames you uploaded. You can add comments to make it clear where its from and how it is intended to be used.

## Adding SIP over SSL/TLS support to a VoIP profile

Use the following commands to add SIP over SSL/TLS support to the default VoIP profile. The following command enables SSL mode and adds the client and server certificates and passwords, the same ones you entered when you imported the certificates:

```
config voip profile
edit default
config sip
set ssl-mode full
set ssl-client-certificate "Client_cert"
set ssl-server-certificate "Server_cert"
set ssl-auth-client "check-server"
set ssl-auth-server "check-server-group"
end
end
```

Other SSL mode options are also available:

<code>ssl-send-empty-frags {disable   enable}</code>	Enable to send empty fragments to avoid CBC IV attacks. Compatible with SSL 3.0 and TLS 1.0 only. Default is <code>enable</code> .
<code>ssl-client-renegotiation {allow   deny   secure}</code>	Control how the ALG responds when a client attempts to renegotiate the SSL session. You can allow renegotiation or block sessions when the client attempts to renegotiate. You can also select <code>secure</code> to reject an SSL connection that does not support <a href="#">RFC 5746</a> secure renegotiation indication. Default is <code>allow</code> .

<code>ssl-algorithm {high   low   medium}</code>	Select the relative strength of the algorithms that can be selected. You can select <code>high</code> , the default, to allow only AES or 3DES, <code>medium</code> , to allow AES, 3DES, or RC4 or <code>low</code> , to allow AES, 3DES, RC4, or DES.
<code>ssl-pfs {allow   deny   require}</code>	Select whether to allow, deny, or require perfect forward secrecy (PFS). Default is <code>allow</code> .
<code>ssl-min-version {ssl-3.0   tls-1.0   tls-1.1}</code>	Select the minimum level of SSL support to allow. The default is <code>ssl-3.0</code> .
<code>ssl-max-version {ssl-3.0   tls-1.0   tls-1.1}</code>	Select the maximum level of SSL support to allow. The default is <code>tls-1.1</code> .

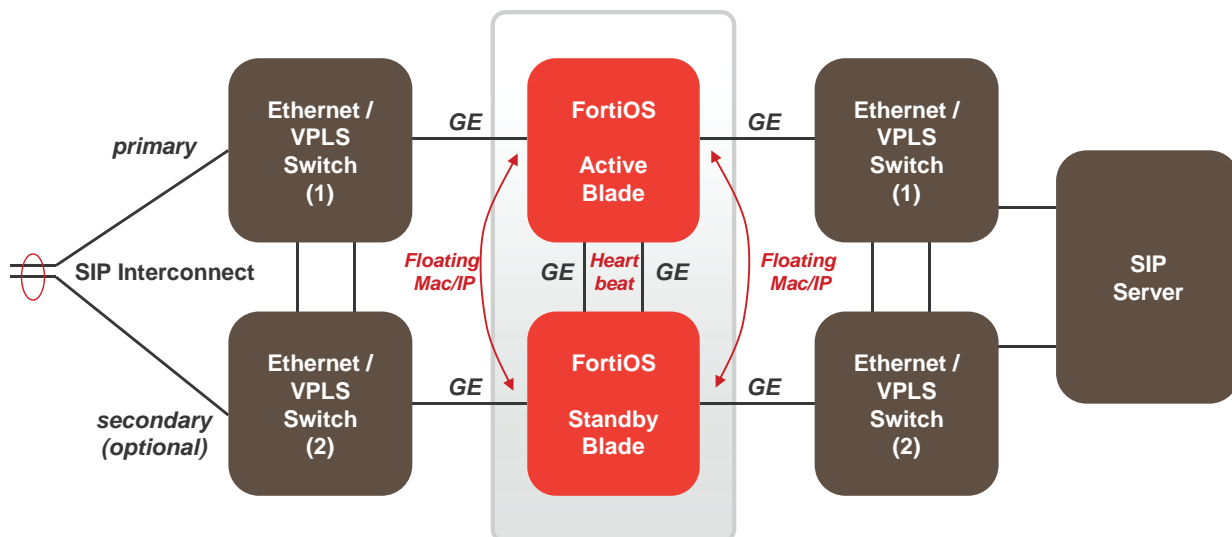

## SIP and HA—session failover and geographic redundancy

FortiGate active-passive high availability (HA) supports SIP UDP session failover (also called stateful failover) if the SIP sessions are processed by the SIP ALG. To support SIP UDP session failover, create a standard HA configuration and select the enable **Session Pick-up** option.

SIP session failover replicates SIP states to all cluster units. If an HA failover occurs, all in-progress SIP UDP calls (setup complete) and their RTP flows are maintained and the calls continue after the failover with minimal or no interruption.

SIP calls being set up at the time of a failover may lose signaling messages. In most cases the SIP clients and servers should use message retransmission to complete the call setup after the failover has completed. As a result, SIP users may experience a delay if their calls are being set up when an HA failover occurs. But in most cases the call setup should be able to continue after the failover.

### SIP HA session failover

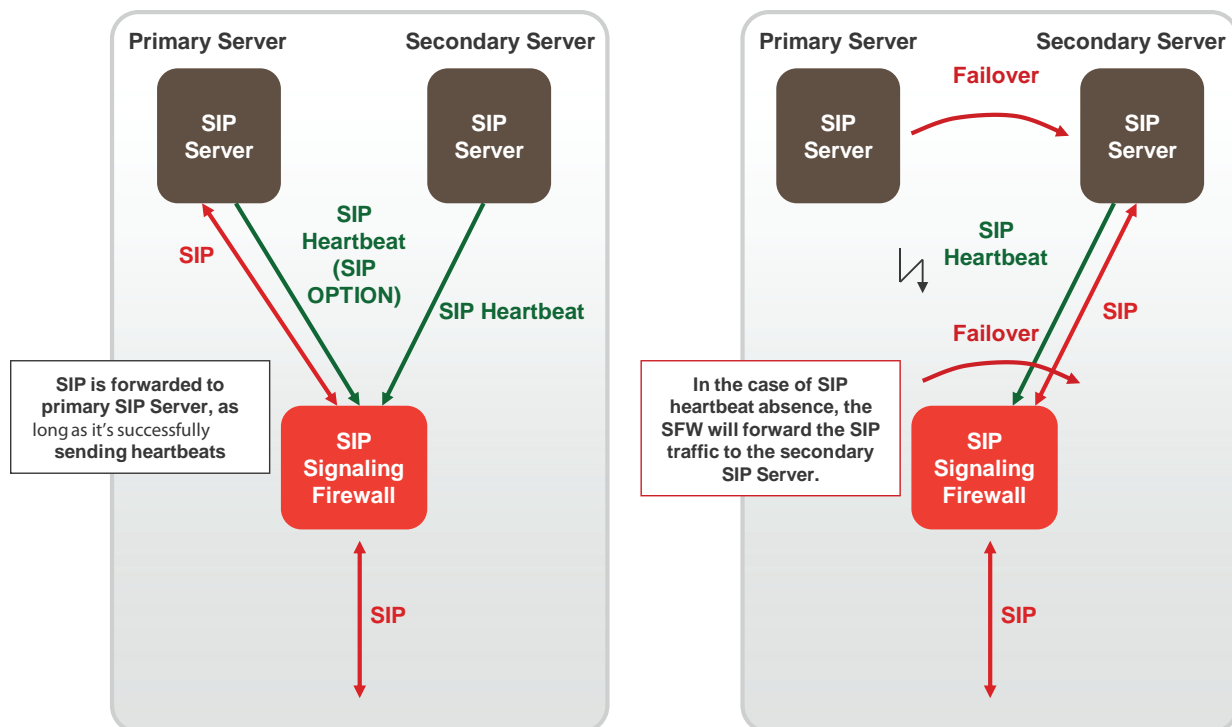

In some cases, failover during call tear down can result in hanging RTP connections that can accumulate over time and use up system memory. If this becomes a problem, you can set a time for the `call-keepalive` SIP VoIP profile setting. This setting causes the FortiGate to terminate calls with no activity after the time limit has exceeded. Range is 1 to 10,080 seconds. This options should be used with caution because it results in extra FortiGate CPU overhead and can cause delay and jitter for the VoIP call. Also, the FortiGate terminates the call without sending SIP messages to end the call. And if the SIP endpoints send SIP messages to terminate the call they will be blocked by the FortiGate if they are sent after the FortiGate terminates the call.

## SIP geographic redundancy

Maintains a active-standby SIP server configuration, which even supports geographical distribution. If the active SIP server fails (missing SIP heartbeat messages or SIP traffic) FortiOS will redirect the SIP traffic to a secondary SIP server. No special configuration is required for geographic redundancy, just standard HA configuration.

### Geographic redundancy

## Supporting geographic redundancy when blocking OPTIONS messages

For some geographic redundant SIP configurations, the SIP servers may use SIP OPTIONS messages as heartbeats to notify the FortiGate that they are still operating (or alive). This is a kind of passive SIP monitoring mechanism where the FortiGate isn't actively monitoring the SIP servers and instead the FortiGate passively receives and analyzes OPTIONS messages from the SIP servers.

If FortiGates block SIP OPTIONS messages because `block-options` is enabled, the configuration may fail to operate correctly because the OPTIONS messages are blocked by one or more FortiGates.

However, you can work around this problem by enabling the `block-geo-red-options` application control list option. This option causes the FortiGate to refresh the local SIP server status when it receives an OPTIONS

message before dropping the message. The end result is the heartbeat signals between geographically redundant SIP servers are maintained but OPTIONS messages do not pass through the FortiGate.

Use the following command to block OPTIONS messages while still supporting geographic redundancy:

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set block-options disable
 set block-geo-red-options enable
 end
 end
```

The `block-options` option setting overrides the `block-geo-red-options` option. If `block-options` is enabled the FortiGate only blocks SIP OPTIONS messages and does not refresh local SIP server status.

---

## Support for RFC 2543-compliant branch parameters

RFC 3261 is the most recent SIP RFC, it obsoletes RFC 2543. However, some SIP implementations may use RFC 2543-compliant SIP calls.

The `rfc2543-branch` VoIP profile option allows the FortiGate to support SIP calls that include an RFC 2543-compliant branch parameter in the SIP Via header. This option also allows FortiGates to support SIP calls that include Via headers that are missing the branch parameter.

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set rfc2543-branch enable
 end
 end
```

## SIP and IPS

You can enable IPS in security policies that also accept SIP sessions to protect the SIP traffic from SIP-based attacks. If you enable IPS in this way then by default the pinholes that the SIP ALG creates to allow RTP and RTCP to flow through the firewall will also have IPS enabled.

This inheritance of the IPS setting can cause performance problems if the RTP traffic volume is high since IPS checking may reduce performance in some cases. Also if you are using network processor (NP) interfaces to accelerate VoIP performance, when IPS is enabled for the pinhole traffic is diverted to the IPS and as a result is not accelerated by the network processors.

You can use the following CLI command to disable IPS for the RTP pinhole traffic.

```
config voip profile
 edit VoIP_Pro_Name
 config sip
 set ips-rtp disable
 end
 end
```

## SIP debugging

This chapter includes some information to help with debugging SIP configurations.

### SIP debug log format

Assuming that diagnose debug console timestamp is enabled then the following shows the debug that is generated for an INVITE if diag debug appl sip -1 is enabled:

```
2010-01-04 21:39:59 sip port 26 locate session for 192.168.2.134:5061 ->
172.16.67.192:5060

## SIP-proxy filter per VDOM

You can use the `diagnose sys sip-proxy xxx` command in a VDOM to get info about how SIP is operating in each VDOM.

## SIP-proxy filter command

Use the `diagnose sys sip-proxy filter` to filter diagnose information for the SIP ALG. The following filters are available:

```

diag sys sip-proxy filter vd
diag sys sip-proxy filter dst-addr4
diag sys sip-proxy filter dst-addr6
diag sys sip-proxy filter dst-port
diag sys sip-proxy filter identity-policy
diag sys sip-proxy filter negate
diag sys sip-proxy filter policy
diag sys sip-proxy filter policy-type
diag sys sip-proxy filter profile-group
diag sys sip-proxy filter src-addr4
diag sys sip-proxy filter src-addr6
diag sys sip-proxy filter src-port
diag sys sip-proxy filter vd
diag sys sip-proxy filter voip-profile

```

You can clear, view and negate/invert the sense of a filter using these commands:

```

diag sys sip-proxy filter clear
diag sys sip-proxy filter list
diag sys sip-proxy filter negate

```

## SIP debug setting

Control of the SIP debug output is governed by the following command

```
diagnose debug application sip <debug_level_int>
```

Where the `<debug_level_int>` is a bitmask and the individual values determine whether the listed items are logged or not. The `<debug_level_int>` can be:

<b>1</b>	Configuration changes, mainly addition/deletion/modification of virtual domains.
<b>2</b>	TCP connection accepts or connects, redirect creation.

<b>4</b>	Create or delete a session.
<b>16</b>	Any IO read or write.
<b>32</b>	An ASCII dump of all data read or written.
<b>64</b>	Include HEX dump in the above output.
<b>128</b>	Any activity related to the use of the FortiCarrier dynamic profile feature to determine the correct profile-group to use.
<b>256</b>	Log summary of interesting fields in a SIP call.
<b>1024</b>	Any activity related to SIP geo-redundancy.
<b>2048</b>	Any activity related to HA syncing of SIP calls.

## Display SIP rate-limit data

You can use the `diagnose sys sip-proxy meters` command to display SIP rate limiting data.

For the following command output `rate 1` shows that the current (over last second) measured rate for INVITE/ACK and BYE was 1 per second, the `peak 1` shows that the peak rate recorded is 1 per second, the `max 0` shows that there is no maximum limit set, the `count 18` indicates that 18 messages were received and `drop 0` indicates that none were dropped due to being over the limit.

```

diagnose sys sip-proxy meters
sip

Performance and other metrics contained herein were attained in internal lab tests under ideal conditions, and actual performance and other results may vary. Network variables, different network environments and other conditions may affect performance results. Nothing herein represents any binding commitment by Fortinet, and Fortinet disclaims all warranties, whether express or implied, except to the extent Fortinet enters a binding written contract, signed by Fortinet's General Counsel, with a purchaser that expressly warrants that the identified product will perform according to certain expressly-identified performance metrics and, in such event, only the specific performance metrics expressly identified in such binding written contract shall be binding on Fortinet. For absolute clarity, any such warranty will be limited to performance in the same ideal conditions as in Fortinet's internal lab tests. In no event does Fortinet make any commitment related to future deliverables, features, or development, and circumstances may change such that any forward-looking statements herein are not accurate. Fortinet disclaims in full any covenants, representations, and guarantees pursuant hereto, whether express or implied. Fortinet reserves the right to change, modify, transfer, or otherwise revise this publication without notice, and the most current version of the publication shall be applicable.
